
MySQL Cluster Manager 1.3 Release Notes

Abstract

This document contains information about changes in successive versions of MySQL Cluster Manager 1.3, starting with the most recent release (MySQL Cluster Manager 1.3.6). Changes in previous MySQL Cluster Manager releases can be found afterwards, ordered from newest to oldest.

For additional MySQL Cluster Manager 1.3 documentation, see <https://dev.mysql.com/doc/mysql-cluster-manager/1.3/en/>.

Updates to these notes occur as new product features are added, so that everybody can follow the development process. If a recent version is listed here that you cannot find on the download page (<https://dev.mysql.com/downloads/>), the version has not yet been released.

The documentation included in source and binary distributions may not be fully up to date with respect to release note entries because integration of the documentation occurs at release build time. For the most up-to-date release notes, please refer to the online documentation instead.

For legal information, see the [Legal Notices](#).

For help with using MySQL, please visit either the [MySQL Forums](#) or [MySQL Mailing Lists](#), where you can discuss your issues with other MySQL users.

Changes in MySQL Cluster Manager 1.3.6 (2015-07-02)

This section documents all changes and bug fixes that have been applied in MySQL Cluster Manager 1.3.6 since the release of MySQL Cluster Manager version 1.3.5.

- [Functionality Added or Changed](#)
- [Bugs Fixed](#)

Functionality Added or Changed

- **Agent:** When a cluster was stopped, it was possible to `set` an invalid value for `LogDestination`, which caused a segmentation fault when the cluster was restarted. With this fix, validation of `LogDestination` is now performed when it is being set. (Bug #20948621)
- **Agent:** When a “wild” cluster's configuration was being imported with the `import config` command and the PID files for the cluster processes were available to `mcmd`, attributes that can only be set at the process type level (for example, `MaxNoOfAttributes`), if specified differently for different instances in the cluster's configuration file, received different values for the different process instances. With this fix, when an attempt is made to set such an attribute at the instance level, `mcmd` sets the attribute at the process type level instead, and a warning is issued to the agent log. If the same attempt was made more than once with different values during a configuration import, the last value seen by `mcmd` is used, and a warning is issued in the log. (Bug #20948149)
- **Agent:** When MySQL Cluster Manager imports a MySQL Cluster of an older version than the one it is itself running on, any deprecated configuration settings are no longer imported; instead, warnings are issued to the agent log that the settings have been skipped during the import. (Bug #20887560)
- **Agent:** A new command, `backup agents`, has been introduced for backing up `mcmd` agents' configuration data. For more details, see [Backing Up and Restoring MySQL Cluster Manager Agents](#). (Bug #20070946)
- **Client:** Warnings are now issued when users try to set internal options (options used only for internal testing) with the `mcm` client. (Bug #21253863)
- **Client:** For configuration parameters of the enumeration type, when invalid values for them are set, `mcm` now include a list of valid values in the error message. (Bug #18502419)
- **Client:** A warning message is now issued when the `add package` command is used to add to MySQL Cluster Manager a version of MySQL Cluster that has already been deprecated. (Bug #17894620)

Bugs Fixed

- **Agent:** A rolling restart of a cluster was timed out when no events were received from a restarting data node for more than two minutes. (Bug #221287290)
- **Agent:** During the recovery of a cluster, if the cluster's network configuration had been changed since it was last defined and a host could not be connected to, the recovery process would hang. With this fix, at the situation, a warning is written to the log of any agent that is unable to properly resolve host names of other agents of the site. (Bug #21169405)
- **Agent:** After setting `BackupDataDir`, if some of the data nodes used the same backup directory, the `list backups` command displayed incorrect information about the backups. (Bug #21144638)
- **Agent:** On Windows platforms, the backup of the agent configuration automatically created by `mcmd` during a cluster upgrade was inconsistent, with contents different from those in the original agent repository. (Bug #21135075)

- **Agent:** When a `mysqld` node using a non-default location for its data directory was added to cluster that was already running, trying to start the added node with `start process --added` command resulted in a timeout error. (Bug #21111944)
- **Agent:** `restore cluster` timed out when some nodes held onto `ndpapi` slots that they did not need, so that the node responsible for rebuilding the indexes could not have the free API slot it was waiting for. This fix makes sure that API slots are not needlessly occupied while `restore cluster` is being executed. (Bug #20956393)
- **Agent:** After a cluster backup was completed, `show status --backup` resulted in an `Unable to get backup status for cluster` error if `NoOfReplicas` was set to 1. (Bug #20950494)
- **Agent:** When `show status` was executed on a cluster, `mcmd` tried to connect to and query a management node even if the cluster was known to have stopped. On Windows platforms, the query took a long time to finish. This fix eliminates the unnecessary query for the stopped node. (Bug #20916482)
- **Agent:** When using the `import config` command, loading of extra configuration files by `!include` or `!includedir` directives in a configuration file failed if there were extra spaces between the directives and the file paths that followed. This fix corrects the way whitespace is handled for those directives. (Bug #20888600)
- **Agent:** A segmentation fault occurred for the `import config` command when a `key = value` pair in the configuration file had only spaces after the “=”. This fix corrects the ways whitespace characters in `key = value` entries are handled during an import. (Bug #20871452)
- **Agent:** While performing a `stop cluster` command, the `mcmd` agent hung after being unable to stop a `mysqld` node. With this fix, `stop cluster` times out, and `mcmd` immediately throws an error when the next non-forced `stop cluster` command is attempted. (Bug #19805950)
- **Agent:** When `LogDestination` is set to `CONSOLE` or `SYSLOG`, `mcmd` is not able to detect whether the `ndb_mgmd` node is running, or to scan the log from the `ndb_mgmd` node. Although this is expected behavior, no error was thrown when this occurred. With this fix, an error is thrown, with a message stating that the log must go to a file. (Bug #13040093)
- **Client:** When using the `add process` command after a `create cluster --import` command but before an `import cluster` command, the added processes hung with status `added` status even after the cluster import. This later caused `mcmd` to crash due to an assertion failure when performing other cluster operations; sometimes, even the repository might get corrupted, making a cluster restart impossible. (Bug #20985984)

Changes in MySQL Cluster Manager 1.3.5 (2015-04-15)

This section documents all changes and bug fixes that have been applied in MySQL Cluster Manager 1.3.5 since the release of MySQL Cluster Manager version 1.3.4.

- [Functionality Added or Changed](#)
- [Bugs Fixed](#)

Functionality Added or Changed

- **Agent:** A site can now be scaled down using the new `remove hosts` command. (Bug #20677633)
- **Agent:** The start up of a new cluster on Windows platforms is now faster due to the reduction of the wait time by `mcmd` for the bootstrapping of SQL nodes. (Bug #20593752)
- **Client:** The `upgrade cluster` command now supports a `--set` option, allowing users to set new values for configuration attributes for the upgraded cluster. (Bug #20700483)
- **Client:** Execution of client commands is now faster, as unnecessary wait time for events to complete is now eliminated. (Bug #20559800)

- **Client:** Error messages for syntax errors involving integers (or lists of integers) in value lists for operands or options have been improved to pinpoint the issues. (Bug #19845253)

Bugs Fixed

- **Agent:** When trying to use the `delete package` command to remove a package from a host with only unmanaged processes, the command failed with an error, complaining that the package is in use by the cluster. (Bug #20719467)
- **Agent:** During a cluster restart or recovery, the agent tried to connect too soon to the cluster processes, causing repeated connection failures. This fix makes sure connection attempts to the processes are triggered only when the processes are ready. (Bug #20204375, Bug #19047715)
- **Agent:** The `list backups` command sometimes caused an agent to hang, as another agent on another host might fail to reply to its query for backup information and keep it waiting. (Bug #15854331)
- **Client:** In the output of the `list backups` command, the timestamps for the backups were inaccurate. (Bug #20731491)
- **Client:** When applied to the last host on a site, the `delete package` command failed to remove the package from the host, causing a subsequent `delete site` command to fail with the error `Package exists in site site_name`. (Bug #20719467)
- **Client:** The suffixes `K`, `M`, and `G` cannot be used when setting the numeric value of a configuration attribute of type `DOUBLE`, but such use of these suffixes were not rejected by the client. (Bug #20686014)
- **Client:** When executing the `backup cluster` command, the `mcm` client sometimes hung due to a timeout, because it took too long for the client to receive the message from a node that backup had started. To avoid that, this fix extends the timeout period from 2.5 minutes to 5 minutes. (Bug #20677633)
- **Client:** The `show warnings` command sometimes failed to show warnings triggered by a `SET GLOBAL` statement, which is sent by `mcmd` to a `mysqld` node for setting a dynamic variable. (Bug #20593156)
- **Client:** An assertion error occurred when, at an early stage of a recovery, a node failed to fulfill the request for a process status update from another node, because no composite status of the cluster had yet been received. With this fix, the request is ignored, with a warning added to the log. (Bug #20552220)
- **Client:** When a `backup cluster` command's failure was due to a node failure, that was not clearly stated in the error message shown by `mcmcd`. (Bug #20032694)

Changes in MySQL Cluster Manager 1.3.4 (2015-02-26)

This section documents all changes and bug fixes that have been applied in MySQL Cluster Manager 1.3.4 since the release of MySQL Cluster Manager version 1.3.3.

- [Functionality Added or Changed](#)
- [Bugs Fixed](#)

Functionality Added or Changed

- **Client:** The configuration files for maintaining the MySQL configuration options have been cleaned up and consolidated. This means that there are fewer `*_configdef_*.xml` files under the `var` directory in the `mcm` installation directory than previously, and corrections have been made to some minor problems with the handling of some options by `mcm`. (Bug #20318036)

- **Client:** Support for a number of `ndb_restore` options have been added to the `restore cluster` command; see this command's description for details. (Bug #20310081)
- **Client:** The restriction against manually assigning a node ID less than 49 to a process other than a data node with the `create cluster` or `add process` command has now been lifted. Note that users are still recommended to follow the best practice of reserving node ID 1 to 48 for data nodes, which cannot take a node ID greater than 48. (Bug #20284278, Bug #75331)
- **Client:** A warning is now written to the agent log file (`mcmd.log`) when users try to set a deprecated configuration variable. (Bug #20242779)
- **Client:** A new command, `show settings`, has been added for showing the current values of a number of `mcmd` options. (Bug #20102394)
- **Client:** When listing options for a specific `mcm` command using the `--help` option, options already listed under `Required options` are no longer repeated under `Valid options` (Bug #19910130)
- **Client:** Process lists resulting from commands like `list processes`, `create cluster -v`, `add process -v` and `show status --process` are now sorted first by process type, and then by node ID. Before, it was sorted by the order in which the processes were created. (Bug #19881161)
- **Client:** MySQL Cluster Manager now fully supports multiple entries for replication attributes that accept more than one value (for example, `replicate_ignore_table`, `replicate_ignore_db`, and `replicate_do_table`); see the descriptions for the `get` and `reset` commands for details. (Bug #19845790)
- **Client:** For the `mcm` configuration commands (`get`, `set`, and `reset`), the process name can now be omitted from the filter specification list. For example, `get DataMemory::2 mycluster` is now a valid command. (Bug #19035112, Bug #73063)
- **Client:** [For Unix-like platforms only] To separate history logging for the `mcm` and the `mysql` clients, the `mcm` client history is now logged, by default, in the `.mcm_history` file under the home directory of the user who runs `mcm`. To change the default file path for the log file, set the environment variable `MCM_HISTFILE` with the desired value before starting `mcm`. (Bug #18186455)
- **Client:** The new `show warnings` command allows you to check for any warnings issued in the agent log (`mcmd.log`) for the last command you entered in the `mcm` client. (Bug #16633542)
- **Client:** When setting a dynamic attribute for a `mysqld` node, `mcmd` no longer restarts the node immediately, but sends a `SET GLOBAL` statement to apply the new value to the `mysqld` node, and also saves the value in the `mysqld` configuration file in order to have the value applied again at the next restart of the `mysqld` node. (Bug #16633542)
- **Client:** When referring to cluster attributes in an `mcm` configuration command (`get`, `reset`, or `set`), dashes (-) and underscores (_) can now be used interchangeably within attribute names. For example, `set ndb-cluster-connection-pool:mysql=12 mycluster` now works the same as `set ndb_cluster_connection_pool:mysql=12 mycluster`. Previously, only the latter was accepted. (Bug #11761809, Bug #54335)

Bugs Fixed

- **Agent:** After recovering from a failed cluster upgrade, the output from `show status --process` showed the wrong package name for the `mysqld` processes, which did not reflect the package that would be used for the subsequent restart. (Bug #20482379)
- **Agent:** After an agent recovered itself from a failure, it might wrongly reported the status of the cluster node. This fix makes sure the correct node status is detected and reported. (Bug #20430481)
- **Agent:** The dropping or recreating of a node group that took place when adding data nodes could sometimes fail when, for example, the nodes were not added in the sequential order of the node groups. This fix relaxes the assertion for node group consistency in the code that caused the failure. (Bug #20104357)

- **Agent:** After stopping an `ndbd` process that had never been started before, adding a new `ndbd` process and stopping it resulted in an internal error. (Bug #20092204)
- **Agent:** When an agent restarted and attempted to reconnect to other site members, one of the contacted agents might end up failing with an XCOM error. This was due to a too-strict assertion regarding the XCOM version requirement, which has been removed by this fix. (Bug #19414104)
- **Agent:** When an agent on a cluster host replied to another host's enquiry for a list of backups, at the end of its reply, it also sent a critical warning on the network connection. This fix stops the warning by having the agent perform a proper reset for its network connection. (Bug #19209223)
- **Agent:** An internal error occurred when the argument for `LogDestination` contained a colon (:), which is common in Windows file paths. With this fix, `mcmd` can now handle appropriately the disk designators in Windows file paths. (Bug #19193738)
- **Agent:** After issuing an `import config` command, file paths in Windows format in the cluster configuration files were converted to Unix format. (Bug #19053590)
- **Client:** A cluster upgrade sometimes failed because some agents did not load the configuration definition for the package early enough, causing the agents to go out-of-sync with each other with respect to the reconfiguration plan. This fix forces all agents to load the configuration definition before sending out the status update that indicates completion of the reconfiguration. (Bug #20469039)
- **Client:** Out-of-range values for the attribute `binlog_cache_size` used in a `set` command were not rejected by `mcm`, which caused an error when the cluster was started. This fix corrects the faulty boundary test on the attribute. (Bug #20351340)
- **Client:** When the `upgrade cluster` command used the package that MySQL Cluster Manager was already using, the upgrade process failed. With this fix, `mcm` first checks the package version before starting any upgrade process and throws an error in the described situation. (Bug #20144280)
- **Client:** If `stop cluster` was issued immediately following a `restart cluster` command which had been issued by another client and was still running, the `restart cluster` command failed. With this fix, the two commands are now carried out successfully in the order they are issued. (Bug #19125493)

Changes in MySQL Cluster Manager 1.3.3 (2014-12-01)

This section documents all changes and bug fixes that have been applied in MySQL Cluster Manager 1.3.3 since the release of MySQL Cluster Manager version 1.3.2.

- [Functionality Added or Changed](#)
- [Bugs Fixed](#)

Functionality Added or Changed

- **Agent:** For a node on which an expected backup is not found, the output from `list backups` now displays `None` for `BackupId` and `No backups` under `Comment`. (Bug #19208671)
- A `remove process` command has been added, providing a means to scale down a cluster offline. See [The remove process Command](#) for details.

Bugs Fixed

- **Agent:** When a cluster was in single-user mode, any `mcm` command that caused a configuration change and subsequent rolling restart (for example, a `set`, `add process`, or `restart cluster`) stopped the first data node in each node group but was then be unable to restart it, due to a limitation with MySQL Cluster. With this fix, `mcm` rejects such commands with an error, instead of allowing the data nodes to be stopped. (Bug #20026523)

- **Agent:** When MySQL Cluster Manager tried to create a temporary directory (`tmpdir`) for a `mysqld` node under its data directory (`manager-dir`), it did not always follow the specification for `manager-dir` for this node, which sometimes resulted in putting the temporary directory in the wrong location. (Bug #20026523)
- **Agent:** When the `--log-use-syslog` option was set during the startup of `mcmd`, an error was thrown, stating that the option `--log-file` was also being used (which is not allowed) even if `--log-file` was not really set. (Bug #19972864)
- **Agent:** If a data node went from the `running` into the `added` state for some reason, it became irrecoverable by MySQL Cluster Manager because, as a safeguard, MySQL Cluster Manager did not start a newly added data node automatically when the cluster was running. The safeguard is now removed, in order to allow the recovery of a data node in the described situation. (Bug #19787156)
- **Agent:** During the recovery of an `mcmd` agent from a crash, if the cluster's management node could not be contacted for information, the agent reported the status of the managed processes as they were last known, which might not reflect the actual status of the processes (for example, a process might have just crashed, and the agent would still report it as running). With this fix, the `mcmd` agent will report the status of the processes as "unknown" in the described situation. (Bug #19321446)
- **Agent:** When bootstrapping a default cluster with the `--bootstrap` option, the `ndbd` process was used for data nodes. With this fix, the multithreaded `ndbmttd` process is used instead, which is preferable from a performance perspective. (Bug #18068338)
- **Agent:** An `mcmd` agent crashed when trying to stop a cluster that was hanging during an operation to restore itself. (Bug #17957393)
- **Agent:** Configuration attribute values starting and ending with double quotes could not be set using the `set` command. (Bug #13040122)
- **Client:** When setting the `LogDestination` configuration attribute using the `set` command, `mcm` threw a syntax error when the attribute's value was single-quoted. (Bug #19435351)
- **Client:** The error reporting for a data node crash by the MySQL Cluster Manager client did not include the cause of `ALERT` conditions. With this fix, `ALERT` is included as a matching pattern for errors in data node logs, which might result in more information on the crash being provided. (Bug #19426279)
- **Client:** When attempting to add to a site a host that already belonged to another site, the MySQL Cluster Manager client hung; even after the client was restarted, proper control of the agent (to which the client was connected) could be recovered only after deleting the site (for which `add hosts` was attempted). With this fix, MySQL Cluster Manager checks whether the host already belongs to some other site when `create site` or `add hosts` is issued, and throws an error if that is the case. (Bug #18424613)
- **Client:** A newline contained inside a multi-line `set` command caused `mcm` to throw an error. (Bug #11759662, Bug #51992)

Changes in MySQL Cluster Manager 1.3.2 (2014-08-15)

This section documents all changes and bug fixes that have been applied in MySQL Cluster Manager 1.3.2 since the release of MySQL Cluster Manager version 1.3.1.

- [Functionality Added or Changed](#)
- [Bugs Fixed](#)

Functionality Added or Changed

- **Agent; Client:** In order to improve execution robustness, MySQL Cluster Manager now fails any commands that reconfigure a cluster with the message `ERROR 5027 Unable to perform`

command due to utility `<proc_name>` with pid `<ospid>` on `<host>` if any utility process (for example, `mysql_upgrade`, `mysql_install_db`, or `ndb_restore`) that was started by a previous command still remained (running or hung) on any host when the command was issued. (Bug #18966650)

- **Client:** MySQL Cluster Manager now throws an error if the user tries to import a cluster or a cluster configuration using `import cluster` or `import config` when the user running the `mcmd` process does not have permission to access PID files for the cluster processes. This happens typically when `mcmd` is started as the `mysql` the user but the cluster is started as `root`. (Bug #18887139)

Bugs Fixed

- **Agent; Client:** On Windows platforms, when a data node could not be restarted during a rolling restart of the cluster, it was not reported to the user. With this fix, the user now gets a report when a maintenance restart of a data node fails. (Bug #19227535)
- **Agent; Client:** The `import config` command did not import configuration settings from a cluster's `my.cnf` file properly. Problems with the import included the following:
 - Some settings in the `[mysqld]` section were left out (for example, `key_buffer_size` and `query_cache_type`).
 - Some options in the `[client]` section were included by mistake.
 - The `!include` and `!includedir` statements for including settings from other files were ignored
 - Quoted values were not handled properly—the quotes were taken literally.
 - Lines starting with a semicolon (`;`) were not treated as comments.
 - The option modifiers `loose_` and `maximum_` were not recognized.
 - Option groups for specific release series (for example, `[mysqld-5.6]`) were not imported. (Bug #19078129)
- **Agent; Client:** When the configuration of a running cluster was imported using `import config`, even if the parameter `ThreadConfig` was not defined in the `config.ini` file, its value could be imported from the running node's setting for it. The imported value overrode the configuration prescribed by the `MaxNoOfExecutionThreads` parameter in `config.ini`, which is supposed to set the thread configuration when `ThreadConfig` is not specified in `config.ini`. This fix prevents the importation of the value for `ThreadConfig` from the running node, making MySQL Cluster Manager rely on the `config.ini` file for the thread configuration. (Bug #19032714)
- **Agent; Client:** When using the `import config` command, the format of an imported configuration setting was sometimes changed from that which was used in the `config.ini` file—for example, a value in megabytes was imported as a value in bytes and then shown as such by the `get` command. That made it more difficult for the user to compare the original and the imported value. This fix makes MySQL Cluster Manager follow the original format in the `config.ini` file when importing a cluster's configuration. (Bug #18651726)
- **Agent; Client:** The `import config` command sometimes imported MySQL server default values that were not specified in the cluster's configuration files. With this fix, no such values are imported. (Bug #18651301)
- **Agent:** Executing `import config` when managing more than one cluster could cause the MySQL Cluster Manager agent to fail. (Bug #19380825)
- **Agent:** During a recovery for a MySQL Cluster Manager agent that used IP addresses instead of hostnames, the agent sent out an excessive amount of information, the processing of which slowed down the restart process considerably. This fix changes the way the IP addresses are handled, reducing the amount of sent information to a much more reasonable level. (Bug #19269735)

- **Agent:** When a wild cluster's process PIDs were not available to MySQL Cluster Manager, executing an `import cluster` command resulted in a process error and the complaint that a process handle could not be opened. With this fix (which is a side effect of the fix for Bug #19209870), MySQL Cluster Manager no longer attempts to open handles for unknown PIDs. (Bug #19205183)

References: See also: Bug #19209870.

- **Agent:** Upgrades from MySQL Cluster Manager 1.2.4 (to 1.3.1) failed when the last command executed before the upgrade was any one of `backup cluster`, `restore cluster`, `abort backup`, or `import cluster`. This problem has been fixed, and users of version 1.2.4 can now upgrade to version 1.3.2. (Bug #19199645)
- **Agent:** The MySQL Cluster Manager agent sometimes threw `SIGABRT` errors while executing SQL statements. (Bug #19032927)
- **Agent:** `mcmd` crashed due to an out-of-memory error after a combination of the following conditions:
 - An abrupt failure of one of the site hosts, instead of a clean stop.
 - Only a minority of the agents were available.
 - Some unmanaged SQL slots came into use, changed their states to `connected`, and the changes were reported by a `ndb_mgmd` process.

(Bug #18781345)

- **Client:** Restoration of a cluster failed when the cluster contained API nodes with and without specified hostnames. (Bug #19313429)
- **Client:** If a `mysqld` process was specified in a `create cluster` statement using `mysqld@*` syntax (with no host specified), the `show status --process` commands did not show the process as connected, even when it was. (Bug #19152161)
- **Client:** When using the `show status` command with the `--backup` option, the MySQL Cluster Manager client sometimes accepted additional options, which was actually meaningless. This fix makes the client throw an error when any other option is used in combination with `--backup`. (Bug #19032714)
- **Client:** MySQL Cluster Manager threw an error when the `add package` command was run with the argument for the `--basedir` option being double quoted, which claimed that the path did not exist. This was because MySQL Cluster Manager took the double quotes literally, as parts of the path name. (Bug #18973711)
- **Client:** On Windows platforms, the MySQL Cluster Manager client's response to the `list hosts` command was very slow when any one of the MySQL Cluster Manager agents was down. (Bug #18966650)
- **Client:** When the configuration of a running cluster was being imported, the `import config` command took the settings from the global session variables instead of the configuration files of the cluster and the MySQL servers. This fix makes MySQL Cluster Manager import the settings from the configuration files, and only use values of the global session variables when it cannot find, open, or access the configuration files. (Bug #18652366)
- **Client:** When using the `import config` command, some process-level settings in the cluster's `config.ini` file were imported as instance-level settings. (Bug #18651663)

Changes in MySQL Cluster Manager 1.3.1 (2014-04-30)

This section documents all changes and bug fixes that have been applied in MySQL Cluster Manager 1.3.1 since the release of MySQL Cluster Manager version 1.3.0.

- [Functionality Added or Changed](#)

- [Bugs Fixed](#)

Functionality Added or Changed

- **Important Change; Client:** Added the `import config` command. This command simplifies the process of importing a previously autonomous MySQL Cluster into MySQL Cluster Manager by importing automatically most of the cluster's configuration data into the cluster definition that has been created as part of the import process, eliminating the need for reading of configuration files and `SHOW VARIABLES` output and issuing of most `set` commands needed to prepare a cluster for import.

This command also supports a `--dryrun` option (short form: `-y`) for testing purposes.

You should note that any nonstandard ports used by `ndb_mgmd` or `mysqld` processes in the existing MySQL Cluster must be configured manually (using `set`) for the corresponding processes in the target cluster before trying to use `import cluster` to import the wild cluster's data.

For more information, see [The `import config` Command](#), and [Importing MySQL Clusters into MySQL Cluster Manager](#).

- **Client:** The `--import` option for `create cluster` now enables assignment of node ID values less than 49 for `ndb_mgmd`, `mysqld`, and `ndbapi` processes. The `create cluster` command used without this option continues to enforce the rule that processes that are not data node processes must have node IDs greater than 48. (Bug #18181039)

Bugs Fixed

- **Agent:** When executing `backup cluster --waitstarted` and `abort backup` in succession, it was possible in some circumstances for the agent to use the wrong backup ID internally. (Bug #18027413)
- **Client:** After performing an initial start of a cluster, the cluster is no longer aware of any backup IDs that have previously been used. If you take a new backup of the cluster afterwards without specifying a backup ID, the cluster tries to use 1 as the ID for the first such backup, even if you restored the cluster from a backup having 1 as its ID, which results in an error. This is expected behavior, for which there are at least 2 workarounds:

1. Move or rename the backup files following the restoration.
2. Execute the `backup cluster` command using the `--backupid` option, to specify a backup ID that is not already in use.

Issues arose in such cases because the error message returned was not sufficiently descriptive, and it could be difficult to determine the true nature of the problem without reading the management server and cluster log files. Now the error message returned by the `mcm` client makes it clear that the backup failed due to collision with an existing backup ID. (Bug #18465705)

- **Client:** Executing the `create site` command using the names of one more hosts on which the MySQL Cluster Manager Agent was not running returned `ERROR 1002 (OOMGR): Agent on host <UNKNOWN>: (delivery status does not match current view) is unavailable`. Now in such cases, the name of each host lacking an agent is included as part of the error message. (Bug #18200900)
- **Client:** Attempting to set any of the `mysqld` configuration attributes relating to the thread pool plugin (see [Thread Pool Installation](#))—including `thread_pool_algorithm`, `thread_pool_high_priority_connection`, `thread_pool_max_unused_threads`, `thread_pool_prio_kickup_timer`, `thread_pool_size`, and `thread_pool_stall_limit`—failed with the error `No such configuration parameter ... for process mysqld`. (Bug #18127968)

Changes in MySQL Cluster Manager 1.3.0 (2014-01-13)

This section documents all changes and bug fixes that have been applied in MySQL Cluster Manager 1.3.0 since the final release of MySQL Cluster Manager 1.2.

- [Collect log and other files for offline/offsite analysis](#)
- [Import of standalone clusters](#)
- [Obtain next reserved node IDs](#)
- [Log Rotation for mcmd](#)
- [Functionality Added or Changed](#)
- [Bugs Fixed](#)

Collect log and other files for offline/offsite analysis

- **Client:** In the event of major problems with a MySQL Cluster, it is often necessary to collect all of the cluster's log and configuration files and to send or to copy these off-site for analysis. Formerly, this had to be done manually, or by using the `ndb_error_reporter` utility included with the MySQL Cluster distribution, but it is now possible to accomplish this task from within the `mcm` client, using the `collect_logs` command added in this release. (Bug #11757603)

Import of standalone clusters

- **Agent; Client:** MySQL Cluster Manager can now take a standalone MySQL Cluster under its own control using the `import_cluster` command implemented in this release, and manage this cluster just as if it had been created in the `mcm` client.

In addition, the `create_cluster` command has been enhanced with an `--import` option, which identifies the cluster as having been created as a target for importing a cluster; such a target cluster can be identified in the output of `show_status --process as import`; in addition, none of the commands `start_cluster`, `restart_cluster`, `start_process`, or `stop_process` can be used with this cluster until the cluster has been prepared using `import_cluster`.

For more information about these commands, see [The import_cluster Command](#), and [The create_cluster Command](#). For information about the process required for importing a new MySQL Cluster into MySQL Cluster Manager, see [Importing MySQL Clusters into MySQL Cluster Manager](#). (Bug #17480585)

Obtain next reserved node IDs

- **Client:** MySQL Cluster Manager normally assigns IDs to new node processes automatically (although this can be overridden when issuing `create_cluster` or `add_process`). The `list_nextnodeids` command added in this release prints the next node ID that has been reserved for the next new process of each type added to the cluster named `cluster_name`.

Log Rotation for mcmd

- **Agent; Client:** A new `rotate_log` command for the `mcm` client has been added in this release, to enable and configure log rotation for `mcmd`. (Bug #16982252)

Functionality Added or Changed

- **Important Change; Packaging:** The directory structure of the MySQL Cluster Manager distribution archive has changed. The top level within the archive now contains a single directory named `mcm-x.y.z`, where `x.y.z` is the version number of the current release. The former top-level directories such as `bin`, `libexec`, and `etc` are now found within this `mcm-x.y.z` directory.

For more information, see [Installing MySQL Cluster Manager on Unix Platforms](#).

Bugs Fixed

- **Important Change; Client:** The `delete cluster` command no longer removes configuration or data directories for cluster processes by default. Now, such directories are removed only when this command is invoked with the `--removedirs` option added in this release. (Bug #17455398)
- **Agent:** Using hosts with different package locations in the same cluster did not work. (Bug #17491230)
- **Client:** Setting the user or password option (or both) in a `my.cnf` file caused the MySQL Cluster Manager client to fail on startup with the error `Illegal username or password`. As part of the fix for this issue, the MySQL Cluster Manager client now reads only the `[mcm]` section of any option files, and ignores all other sections. (Bug #17540585)
- **Client:** It was possible to start an SQL node, using the `start process` command, in an otherwise stopped cluster. In addition, this node could not be stopped using `stop process` afterwards.

Now when you attempt to start a `mysqld` process in a cluster that is stopped, or in which the data nodes are otherwise unavailable, `start process` fails with an error. (Bug #17073352)

- **Client:** The `mcm` client tried to add `mysql` client options which must be specified first on the command line in the wrong order. Now the `mcm` client checks for such options and makes sure that they are passed to `mysql` first. (Bug #16598776)
