Changes in MySQL Cluster Manager 1.4.8 (2020-01-24)

- Experimental support for MySQL NDB Cluster 8.0
- Functionality Added or Changed
- Bugs Fixed

Experimental support for MySQL NDB Cluster 8.0

- MySQL Cluster Manager now supports NDB Cluster 8.0 on an experimental basis; see Supported Platforms and MySQL NDB Cluster Versions for limitations.

Functionality Added or Changed

- **Incompatible Change; Agent:** When managing NDB Cluster 8.0.19 and later, the `restore cluster` command no longer restores shared users and grants to the `mysql.ndb_sql_metadata` table by default. A new command option, `--include-stored-grants`, has been added for overriding this behavior and enabling the restore of shared user and grant data and metadata. (Bug #30375672)

- **Packaging:** MySQL Cluster Manager is now built and shipped with OpenSSL 1.1.1d. (Bug #30612140)

- **Agent:** By default, a rolling restart for a cluster is performed on the nodes in a parallel manner (that is, half of the nodes are stopped and restarted together, followed by the second half of the nodes). Now, rolling restarts can be performed in a sequential manner by using the `--sequential-restart` option with commands that perform rolling restarts, in which case the nodes are stopped and restarted one after another. The option can be used with the `restart cluster`, `change process`, `add process`, `set`, `reset`, and `autotune` commands. (Bug #30062392)

- **Agent:** Some parameters could only be set before the initial start of a node (for example, `NoOfFragmentLogparts`); it then became impossible to set them after an initial start of a cluster had failed. It is now possible to set such parameters again, as long as the node involved had not yet been assigned to any nodegroup during the failed initial start. (Bug #29718127)

- **Agent:** Following changes in NDB Cluster 8.0.18, the maximum number of data nodes supported by a NDB 8.0 cluster managed by MySQL Cluster Manager is now 145, and the maximum number of node groups supported is now 72. With that change, when a NDB 8.0 Cluster is bootstrapped by `mcmd` with the `--bootstrap` option, `ndb_mgmd`, `mysqld`, and `ndbapi` nodes are assigned node IDs of 145 and above. (Bug #29459428)

- **Client:** The `--disable-indexes` option for the `restore cluster` command has been removed, to avoid having the cluster restored into a bad state. (Bug #30728256)

- **Client:** The message for `ERROR 6020` has been expanded to include the reason why a configuration parameter cannot be set given the current process states. (Bug #30526906)

- **Client:** The log message for a failed connection to `mcmd` by an `mcm` client has been expanded, warning users to make sure the correct hostname or IP address is specified, and that no firewall is blocking connection attempts. (Bug #30288338)
Bugs Fixed

- **Agent:** The `update_process` command failed when no `ndb_mgmd` node was running. It was due to an excessive restriction asserted by `mcmd` that this patch has relieved, so that a running `ndb_mgmd` node is required now only when `update_process` is applied to a data node or `mysqld` node. (Bug #30723002)

- **Agent:** During an MySQL Cluster Manager upgrade, when `mcmd` was upgrading its repository, it was over aggressive in removing old configuration objects that did not need to be upgraded, resulting sometimes in inconsistency of the repository and `mcmd` quitting unexpectedly. With this fix, `mcmd` only deletes configuration objects that it is supposed to. (Bug #30666263)

- **Agent:** When running the `import cluster` command, there were a lot of unnecessary critical messages issued to the agent log. (Bug #30572723)

- **Agent:** A cluster restart failed after the cluster has been imported by `mcmd` if the `Arbitration` parameter was specified in the `config.ini` file of the imported cluster. It was because the `import config` command, which was always run before the `import cluster` command, imported the parameter's value wrongly, and that has been corrected by this fix. (Bug #30505003)

- **Agent:** After an `add process` command failed and the `remove process` command was used to clean up the processes that were not successfully added, a subsequent `restart cluster` command caused `mcmd` to quite unexpectedly. With this fix, `mcmd` issues a warning in the situation and then finishes the restart. (Bug #30498301)

- **Agent:** When the `stop cluster` command was run and `mcmd` had to force a `mysqld` node to stop, the node got stuck in the `stopping` state, while `mcm` reported that the cluster had been stopped successfully. (Bug #30375807)

- **Agent:** The `restore cluster` command timed out when the cluster to be backed up contained more than 2000 schemas. With this fix, the `mcmd` agents are informed of the progress of the restore on a more frequent basis, so that even if the process takes a longer time to finish, the agents would wait instead of timing out. (Bug #30360453)

- **Agent:** When running the `restore cluster` command, a schema or table name containing a comma was taken by `mcmd` as a comma-separated list of multiple schemas or tables, resulting in the schema or table being restored wrongly. With this fix, `mcmd` honors the comma as part of the schema or table name. (Bug #30360401)

- **Agent:** When managing an NDB 8.0 cluster, during the initial startup of the cluster, the `start cluster` command sometimes failed due to a failure to create the `mcmd` user on the cluster. That was because while the grants for the `mcmd` user are automatically synchronized to all `mysqld` nodes in NDB 8.0, `mcmd` still tried to create the user on individual nodes, thus creating conflicts. With this patch, the `mcmd` user is now only created on one `mysqld` node, and the grants are synchronized to other nodes by the cluster. (Bug #30015430)

- **Agent:** When running an `add process` command, if multiple new nodegroups are to be created, `mcmd` misassigned nodes already in a nodegroup to a new group, causing an error to be thrown. It was due to the way `mcmd` reported nodegroup membership information internally, which this patch corrects. (Bug #29723329)

- **Agent:** On Windows platforms, the `rotate log` command gave a wrong name to the new log file. (Bug #29478833)

- **Agent:** For MySQL NDB Cluster 8.0, after a `set skip_grant_tables:mysqld=true` command has been issued from the `mcm` client, `mcmd` lost connection to the `mysqld` node. It was because on a `mysqld` node, remote connections were disabled when `skip-grant-tables` was true. With this fix, for MySQL servers started by `mcmd`, setting or resetting `skip-grant-tables` no longer disables remote connections, as long as the setting or resetting is performed when the `mysqld` node has been stopped. (Bug #29329690)
MySQL Cluster Manager 1.4 Release Notes

- **Agent:** For a NDB Cluster without any `mysqld` nodes, a rolling restart might sometime cause some of the `mcmd` agents to quit unexpectedly. (Bug #29289945)

- **Agent:** A slow increase in memory use was observed over time for `mcmd`, which might potentially add up to a significant amount if `mcmd` was not restarted for a long time. This fix eliminates the problem by removing a task that was executed repeatedly and unnecessarily by `mcmd`. (Bug #29166492)

- **Agent:** The `import config` command took a long time to run on SPARC systems. With this fix the process for retrieving the configuration from the MySQL Server has been optimized for SPARC systems, so that the command does not run longer than on other platforms. (Bug #22673589)

- **Client:** When the `delete package` command specified with the `--hosts` option a host name that `mcmd` did not recognize as a site member, `mcmd` quit unexpectedly. With this fix, `mcmd` throws a proper error in the situation. (Bug #29584728)

### Changes in MySQL Cluster Manager 1.4.7 (2018-12-14)

- **Functionality Added or Changed**

  - **Agent:** Performance has been improved for the `add package` command by removing unnecessary queries from its execution process. (Bug #28950231)

  - **Agent:** The initialization script for `mcmd` now cleans up the temporary files it creates under the `tmp` directory while starting new `mcmd` processes. (Bug #28924059)

  - **Agent:** The `list hosts` command now returns, in addition to `Available` and `Unavailable`, two more possible statuses for the agent of a host:
    - **Recovery:** The agent is in the process of recovering itself
    - **Unresponsive:** The agent rejected an attempt to connect
    (Bug #28438155)

  - **Agent:** The option `--core-file`, when used on the command line to start a node in a wild cluster, now causes the `import cluster` and `update process` commands to give a warning (that the option “may be removed on next restart of the process”), instead of causing the commands to fail. See Creating and Configuring the Target Cluster for details. (Bug #28177366)

  - **Agent:** The `import cluster` and `update process` commands now support a new `--remove-angel` option, which kills any angel processes for the data nodes to be imported or updated and also updates the data nodes’ PID files. See descriptions for the two commands for details. (Bug #28116279)

  - **Agent:** The `backup cluster` command finishes faster now, as some unnecessary wait time has been eliminated from the backup process. (Bug #27986443)

  - **Agent:** A new option for `mcmd`, `--initial`, allows an agent that has fallen into an inconsistent state to recover its configuration from other agents. See the description for `--initial` for details. (Bug #20892397)

  - **Agent:** The `set`, `get`, and `reset` commands now support the following `command-line-only attributes`, which can only be configured on the command line when outside MySQL Cluster Manager:
    - For `ndb_mgmd`: `--core-file, --log-name, --verbose`
    - For `ndbd` and `ndbmtd`: `--core-file, --verbose`
MySQL Cluster Manager 1.4 Release Notes

• **Agent:** The internal mechanism for [agent recovery](https://dev.mysql.com/doc/mysql_cluster_client/1.4/en/mysql-cluster-agent.html) has been improved, making it more robust and less error-prone.

• **Client:** To reduce the size of the `mcmd` log, node events are no longer dumped into the log during a cluster restart. (Bug #28843656)

• **Client:** The message for ERROR 5200 (“Restore cannot be performed …”) has been expanded to include the reason for the restore's failure. (Bug #25075284)

• **Client:** The message for ERROR 5017 has been expanded to include the reason for an action being invalid for a process or cluster. (Bug #22777846)

**Bugs Fixed**

• **Agent:** A large number of unnecessary warnings and error messages have been removed from the log for the `import cluster` command. (Bug #28950370)

• **Agent:** During a rolling restart for a cluster (which takes place, for example, after a cluster reconfiguration), the node group IDs for some data nodes might become some invalid numbers transiently, and that might cause `mcmd` to throw an internal error (Error 1003). With this fix, such transient changes of node group IDs are ignored by `mcmd`, and no error is thrown. (Bug #28949173)

• **Agent:** An `update process` command on a `mysqld` node failed with a timeout if the node was in the status of `stopping`. It was because `mcmd` did not retry stopping the node, and this fix makes it do so in the situation. (Bug #28913525)

• **Agent:** After a cluster reconfiguration failed, the restart of an `mcmd` agent that had lost contact with other agents might fail with a checksum error. That was because in the process, the original configuration for the cluster was removed from the agent's repository by mistake. With this fix, the original cluster configuration was preserved and the agent restarts as expected. (Bug #28904775)

• **Agent:** When trying to shutdown a `mysqld` node, if `mcmd` failed to get the MySQL Server's version number through a query, the shutdown failed because `mcmd` could not decide on the proper shutdown method. With this fix, `mcmd` falls back on the shutdown method for the MySQL Server version bundled with the `mcmd` version in the MySQL Cluster CGE distribution. (Bug #28830884)

• **Agent:** Commands to reconfigure or stop a cluster hung when a `mysqld` node did not respond to queries. With this fix, under the situation, a query to a `mysqld` node times out after a certain period of time, after which the command for reconfiguring or stopping the cluster is aborted and an error is returned. (Bug #28813012)

• **Agent:** `mcmd` hung when it failed to stop a data node that was in an unknown status. With this fix, the `stop process` command fails with an error in the situation. (Bug #28780427)

• **Agent:** Attempts to restore an `mcmd` agent with data from other agents failed with the agent remaining in the state of recovering indefinitely, when any of the cluster log files was very long. With this fix, the agent only scans the most recent segments of the logs instead of the full logs for error information, which speeds up the restore process and allows it to be completed. (Bug #28671584)

• **Agent:** In an environment that used only IP addresses, if a site was defined using host names, an `mcmd` agent hung at startup or restart when it attempted reverse DNS lookups. (Bug #28437469)

• **Agent:** The `collect logs` command sometimes reported success before the operation was actually finished if the cluster had many hosts and a lot of log data to be collected. (Bug #2828932)

• **Agent:** `mcmd` failed to start when its `init.d` script found the previous PID for `mcmd` was in use by another process, which was taken to mean `mcmd` was already running. With this fix, the process name for the PID is also checked, so that `mcmd` is started again if the PID is no longer used by `mcmd`. (Bug #28278727)

• **Agent:** The `collect logs` command failed with an ERROR 1003 Internal error when no data was received on the TCP connection established for collecting data from another host. With this
fix, the connection is closed gracefully if no data is received, allowing other hosts to connect to the TCP port and send data. (Bug #28278410)

- **Agent:** The `restore cluster` command failed when the cluster to be restored contained databases with special characters in their names. (Bug #28220549)

- **Agent:** Memory leaks occurred when an `mcmd` process on a management node read large cluster logs during its operations. This fix makes sure `mcmd` regularly truncates the buffer for log reading, so the buffer size does not keep growing in an uncontrolled manner. (Bug #28076545)

- **Agent:** On Windows platforms, the `collect logs` command failed with an `ERROR 1003 Internal error` when the path name of a log file to be transferred was exactly 260 characters. It was because, while 260 is the maximum number of characters allowed, the internal test forgot to count the trailing zero for the path name in the internal buffer, so it failed to catch the error. With this fix, `mcmd` throws an `ERROR 106 Path max length exceeded for file` instead in the situation. (Bug #28062069)

- **Agent:** If `mcmd` was started on Windows platforms with the option `--log-syslog` being true but without specifying the `--log-file` option, running the `show settings` command would cause `mcmd` to quit with an `Error 2013 (Lost connection to MySQL server during query)`. (Bug #27981362)

- **Agent:** When, due to some reasons (for example, time jumps on virtual machines), an `mcmd` agent ended up receiving incomplete event records from an `ndb_mgmd` node, the agent quit unexpectedly. With this fix, `mcmd` can now parse and handle incomplete records properly. (Bug #25746295)

- **Agent:** Agent recovery (for example, after upgrading the agents) sometimes failed when the agent received recovery configurations both locally and from a remote host, and the recovering process was then frustrated. With the new recovery mechanism now in place, the recovery configuration is only received once. (Bug #25517245)

- **Agent:** The `create site` command failed with a timeout when the site to be created had a large number of hosts (more than 45), and the hosts were not uniform in their machine configurations. (Bug #25075284)

- **Client:** In a number of instances where an `ndb_mgmd` command or a `mysqld` query failed, the wrong error (`Error 1006` or `Error 7006`) was thrown. With this fix, the appropriate `Error 7030` is thrown instead. (Bug #28829732)

### Changes in MySQL Cluster Manager 1.4.6 (2018-05-09)

#### Functionality Added or Changed

- **Functionality Added or Changed**

#### Bugs Fixed

- **Bugs Fixed**

#### Functionality Added or Changed

- **Agent:** MySQL Cluster Manager now supports taking backups in parallel fashion on individual data nodes using multiple local data managers (LDMs) and restoring such backups. Parallel backups are performed with the `backup cluster` command as long as the data nodes satisfy the requirements specified in Taking an NDB Backup with Parallel Data Nodes, and the backups are restored with the `restore cluster` as usual. (Bug #27676066)

- **Agent:** The `list backups` command has been extended with a new `--agent` option for listing agent backups created with the `backup agents` command. See the option description for details. (Bug #27168819, Bug #27850905)

#### Bugs Fixed

- **Agent:** The `collect logs` command failed to include logs that had been rotated with the `rotate log` command. (Bug #27918231)
• Agent: A `list backups` command failed with an Error: 1159 (timeout reading communication packets) from one of the mcmd agents when it had a huge number of backups to list. With this fix, `mcmd` has been optimized to enumerate a larger number of backups. (Bug #27868499)

• Agent: The `mcmd` agent quit unexpectedly if the cluster’s global configuration file (config.ini usually) contained a `[system]` section. It was because in MySQL Cluster Manager, the handling for the `[system]` section was missing, which has now been added by this fix. The addition also allows `mcmd` to set the `name` attribute in the `[system]` section, which is required for MySQL Enterprise Monitor 4.0 to monitor the cluster. (Bug #27638138, Bug #27519205)

• Agent: The `collect logs` command hung if a host was referenced earlier with the localhost IP address `127.0.0.1` in the `create site` or `create cluster` command. (Bug #27551932)

• Agent: The `create cluster` command was successful even if the format of an IP address submitted with it as a hostname was inconsistent with the format used earlier with the `add hosts` command (for example, a host was added to a site as 127.0.0.1, and then added to a cluster as 127.0.0.1). A subsequent attempt to start the cluster failed. This fix added consistency check for the host names, so that inconsistent IP addresses are now rejected. (Bug #27551776)

• Agent: When a maintenance restart occurred for a cluster node while `mcmd` was shutting down, the node remained in the `starting` stage indefinitely. With this fix, a node restart will not be attempted when `mcmd` is shutting down. (Bug #27513481)

• Agent: An `Internal error` occurred when `mcmd` tried to set the MySQL Server system variable `audit_log_read_buffer_size` with a `set` command. It was because of the wrong data type used internally for the variable, which has now been fixed. (Bug #27413635)

• Agent: `mcmd` quit unexpectedly sometimes when running a `restore cluster` command. It was due to a race condition in which `mcmd` started executing the restore before the required `ndbapi` node was ready for the task. This fix added checks to eliminate the race condition. (Bug #27342271)

Changes in MySQL Cluster Manager 1.4.5 (2018-01-25)

• Functionality Added or Changed

• Bugs Fixed

Functionality Added or Changed

• Agent: When the `rotate log` command is run, the new file name for the old `mcmd` log now has the timestamp put right before the file extension and preceded by an underscore; for example, `mcmd.log` becomes `mcmd_2017-07-15T22-45-28.log` after log rotation. (Bug #26696293)

• Client: When an `Internal Error` (Error 1003) is returned, the error message now indicates the host on which the error occurs. (Bug #27082475)

Bugs Fixed

• Agent: The reported status of a node was sometimes ignored (for example, a node reported to have stopped was next considered running). This was because log sequence numbers (LSNs) on nodes (by which `mcmd` tells whether the status report is out-of-date) were wrongly assigned sometimes. The fix corrects the LSN mechanism, so that status reports can be properly handled. (Bug #27338269)

• Agent: A `stop cluster` command timed out while waiting for a failed management node to respond. With this fix, the command errors out immediately in the situation. (Bug #27253476)

• Agent: `mcmd` hung on a `restore cluster` command when it failed to get the process handle of a node that was newly spawned and then failed. This fix adds proper error handling for the situation. (Bug #27225001)

• Agent: After bootstrapping an NDB Cluster with the `start cluster --bootstrap` command, connecting to the cluster with a `mysql` client using the command suggested by MySQL Cluster
Manager failed, because the command referred to the local host by its host name, which could be unresolvable in some situations. With this fix, the IP address 127.0.0.1 is used instead in the command. (Bug #27169533)

- **Agent:** An mcmd agent exited unexpectedly when a ndbmtd node failed during a rolling restart, because the failure disallowed mcmd to identify the node's mirror. With this fix, mcmd throws the proper error in the situation and then continues with its operations. (Bug #27105336)

- **Agent:** A start cluster command failed when there was an unmanaged node running on one of the cluster hosts. (Bug #27060818)

- **Agent:** A stopping of a single node sometimes caused a large number of repeated exit reports to be generated to all mcmd agents. (Bug #27049206)

- **Agent:** mcmd reported success for a restore cluster command even if it had failed. (Bug #25117413)

- **Agent:** On Windows platforms, mcmd gave an excessive number of warnings to its log when it “Could not get process handle” for a cluster node. (Bug #23570996)

- **Agent:** When a stop cluster command was running, sometimes a data node was not shut down completely and the command failed with an ERROR 7006 for nodegroup failure of the data nodes. This fix stops the unnecessary error from being thrown in the situation and lets the command continue. (Bug #21508316)

- **Agent:** The import cluster command failed when the cluster to be imported used connection pooling for its mysqld nodes. (Bug #19357267)

- **Agent:** On Windows platforms, after a cluster reconfiguration, when a management node failed to be restarted, it was still reported by mcmd as starting. It was because on Windows platforms, mcmd continued its attempt to connect to the stopped ndb_mgmd node in the situation until timeout. With this fix, status of the ndb_mgmd nodes are first checked before attempts were made to connect to them. (Bug #14255038)

- **Agent:** When one of the NDB Cluster's ndb_mgmd nodes was already down, using a stop cluster --force to shut down the whole cluster was going to take a long time. It was because the stop process command's timeout, after being triggered, was not made known to all relevant processes on the cluster. With this fix, all mcmd agents are now informed of the timeout, so they will just kill processes that are still running after the timeout period. (Bug #13778840)

- **Agent:** If a data node was added but could not be started at first, nodegroup creation failed even after the node was started successfully at the end. (Bug #13261667)

- **Client:** When the show status command reported that a node had failed, if the mcmd agent that reported the failure also failed afterwards and the user then tried to restart the node, an ERROR 7007 was returned, saying wrongly that the node was already running. With this fix, a proper Error 1003 is returned with the message “Agent on host hostname is unavailable.” (Bug #27082586)

- **Client:** Using the --removedirs option with the delete cluster command did not remove a data node's file system (the ndb_nodeID_fs directory) if it was located outside of the node's data directory. (Bug #25591980)

- **Client:** While the set command cannot be used to set attributes for an unmanaged node that does not appear in the config.ini file (for example, the --port option for an unmanaged mysqld node), such attempts were not rejected by the mcm client. With this fix, mcm throws an error in the situation. (Bug #25512477)

- **Client:** In some situations, after a new process was added, the start process --added command failed. It was because the added process was misidentified with a process that had stopped earlier. With this fix, the handling of stopped and added processes has been improved to prevent such cases of misidentification. (Bug #25160942)
MySQL Cluster Manager 1.4 Release Notes

- **Client:** A `stop cluster` command failed if all data nodes of the cluster were in the `failed` status when the command was issued. (Bug #24931681)

### Changes in MySQL Cluster Manager 1.4.4 (2017-10-05)

This section documents all changes and bug fixes that have been applied in MySQL Cluster Manager 1.4.4 since the release of MySQL Cluster Manager version 1.4.3.

- **Functionality Added or Changed**
- **Bugs Fixed**

### Functionality Added or Changed

- **Agent:** On Windows platforms, when the `collect logs` command was run and the resulting file path for any of the collected files was longer than 255 characters, the command failed with `ERROR 101 (00MGR) Access denied`. A new type of error, `PATH_TOO_LONG (106) Path max length exceeded for file filename`, has been added and is now returned at the situation. (Bug #26619163)

### Bugs Fixed

- **Agent:** On Solaris platforms, the `collect logs` command created lots of zombie threads after it finished. It was because a number of thread joins were missing in the code, which have been added by this fix. (Bug #26665347)

- **Agent:** For a large NDB Cluster site, the `collect logs` command frequently failed due to errors with the network connections during file transfers. This was because some error codes related to the network connections were not properly handled, and this fix corrects that. (Bug #26642616)

- **Agent:** The `import config` command sometimes failed, as the `mcmd` agent updated its configuration store before all the values to be imported arrived. This fix makes `mcmd` wait for all the values before starting the updates. (Bug #26610874)

- **Agent:** The `collect logs` command reported success even when an agent failed and the file transfer from it was incomplete. With this fix, when connection to an agent fails, the command allows running file transfers to complete, and then throws an error. (Bug #26594948)

- **Agent:** The `collect logs` command sometimes failed with `ERROR 1003 Internal error: No clients connected`, even though clients were connecting and files were being transferred. That was due to a faulty mechanism for tracking client connections, which has been corrected by this fix. (Bug #26575768)

- **Agent:** The `mcm` client hung when running the `collect logs` command if the host names for the cluster nodes could not be resolved, even if the cluster was actually defined using IP addresses. (Bug #2654176)

- **Agent:** A `start cluster` command timed out when its timeout value, being scaled for handling a large `DataMemory` size for a cluster, was accidentally reset. This fix makes sure the timeout for the execution step of a `start cluster` command is never lowered while the data nodes are starting. (Bug #26543383)

- **Agent:** After a node had failed and an `update process` command on it also failed, a `stop cluster` or `stop process` command that followed ran into an assertion error. It was because the node, automatically restarted after its failure, had its PID file modified by the `update process` command that was still running. This fix adds a check on the status of the target process for the `update process` command to prevent the restarted node's PID file from being modified. (Bug #26388603)

- **Agent:** The `collect logs` command hung for 30 seconds after completing all file transfers before returning the success message. (Bug #26362910)
• **Agent:** When a management node's status went from *starting* to *stopped*, it was not reported by its `mcmd` agent, causing commands like `delete cluster` to fail because the management node was taken to be still running. (Bug #26288009)

### Changes in MySQL Cluster Manager 1.4.3 (2017-07-10)

This section documents all changes and bug fixes that have been applied in MySQL Cluster Manager 1.4.3 since the release of MySQL Cluster Manager version 1.4.2.

- **Functionality Added or Changed**
- **Bugs Fixed**

#### Functionality Added or Changed

- **Agent:** CPU usage during idle time for the `mcmd` agents has been significantly reduced. (Bug #26227736)
- **Agent:** A new error code, *Error 7030*, has been created for failed `ndb_mgmd` commands and `mysqld` queries. (Bug #26160968)
- **Agent:** Added support for the `skip_networking` system variable for `mysqld` nodes, allowing `mysqld` nodes of a managed cluster to communicate with client applications using named pipes or shared memory on Windows platforms, and socket files on Unix-like platforms.

  Notice that, however, communication between `mcmd` agents and `mcm` clients using named pipes, shared memory, or socket files remain unsupported. (Bug #25992390, Bug #25974499)
- **Client:** The `start cluster --initial` command now reinitializes the SQL nodes (if their data directories are empty) as well as the data nodes of an NDB Cluster. A new option, `--skip-init`, has been introduced, for specifying a comma-separated list of the SQL nodes for which reinitialization is to be skipped. (Bug #25856285, Bug #85713)
- **Client:** Checksum verification has been added for all cluster reconfiguration plans created by the `mcmd` agents. Checksums for plans created locally are shared among all agents, and when the checksums do not match, the reconfiguration is aborted. This prevents agents from executing different plans. (Bug #23225839)
- Files have been removed from the MySQL Cluster Manager + NDB Cluster bundled package, in order to reduce the package size significantly. (Bug #25916635)

#### Bugs Fixed

- **Agent:** When the `list_nextnodeids` command was run against a cluster with the maximum number of nodes allowed, the `mcmd` agent quit unexpectedly. With this fix, the situation is properly handled. (Bug #26286531)
- **Agent:** For a cluster with `NoOfReplicas=1`, trying to stop a data node with the stop process command would cause the agent to quit unexpectedly. (Bug #26295780)
- **Agent:** When a data node was killed by an arbitrator in a situation of network partitioning, an `mcmd` failed to handle the exit report from the node and quit unexpectedly. It was due to a mishandling of the nodegroup information, which this fix corrects. (Bug #26192412)
- **Agent:** A cluster could not be started if a relative path had been used for the `--manager-directory` option to set the location of the agent repository. (Bug #26172299)
- **Agent:** When executing a user command, the `mcmd` agent could hang if the expected reply from another agent never arrived. This fix improves the timeout handling to avoid such hangs. (Bug #26168339)
MySQL Cluster Manager 1.4 Release Notes

- **Agent:** While running the `import config` command, the `mcmd` agents that were present during the earlier dryrun for the import would become silent and then unavailable. This was due to some hostname resolution issues, which has been addressed by this fix. (Bug #26089906)

- **Agent:** A collect log command sometimes failed at the middle with an ERROR 1003 Internal error: No clients connected. It was because the `mcmd` agent reset the copy completion marker prematurely; the behavior has been stopped by this fix. (Bug #26086958)

- **Agent:** When the `mcmd` agents’ clocks ran out of sync due to time drifts on virtual machines running Windows operations systems and then the clocks ran in sync again, communications among the agents failed. This fix prevents the problem by making the agents use a monotonic timer for their communication. (Bug #26084090)

- **Agent:** The dropping or recreating of a node group that took place when adding data nodes could sometimes fail with an assertion error (“Polled nodegroup info is inconsistent”). This fix relaxes the assertion, which allows the node group reconfiguration to be completed. (Bug #26051753)

References: See also: Bug #20104357.

- **Agent:** During an execution of a `set` command, if no `mysqld` node is available for querying cluster information, an `mcmd` agent timed out while waiting for the “prepared” message from another agent, even after the message was already sent. This was due to the fact that the two agents had inconsistent plans of execution for the `set` command. This fix prevents the inconsistency. (Bug #26021616)

References: This issue is a regression of: Bug #14230789, Bug #23148061.

- **Agent:** A `backup cluster --waitcompleted` timed out sometimes right before the backup was completed when there were a lot of tables to be backed up. This was because the logical backup for the tables' metadata was taking too long in that case. With this fix, the `mcmd` agent is now sent progress reports of the logical backup, and the backup does not time out unless no more progress reports are received. (Bug #2600482)

- **Agent:** When a `set` command involved a restart of data nodes of a cluster but one of the data nodes had been stopped, the `set` command failed with a timeout. With this fix, the `set` command is carried out successfully with a rolling restart for the data nodes. (Bug #25869325)

- **Agent:** If a `mysqld` node was configured with the `skip_name_resolve` system variable enabled, attempts for `mcmd` to connect to the `mysqld` node would fail with the error message Host '127.0.0.1' is not allowed to connect to this MySQL server. This was because the MySQL account used by `mcmd` had 127.0.0.1 as its host name, which is not allowed when `skip_name_resolve` is enabled on the `mysqld` node. This fix corrects the account host name to `localhost`. (Bug #25831764, Bug #85620)

- **Agent:** When a host and its `mcmd` agent were restarted, `mcmd` might fail to restart a management or `mysqld` node on the host, and the `show status` command continuously returned the status of the node to be unknown. (Bug #25822822)

- **Agent:** When an `mcmd` agent was in the process of shutting down, a user command issued then might cause the agent to quit unexpectedly. With this fix, an error message “Agent is shutting down” is returned, and the agent continues with its shutdown. (Bug #25055338)

- **Agent:** When a `set` command involved a restart of data nodes of a cluster but one of the data nodes was in the `failed` state, `mcmd` restarted the data node, and then restarted it once more as part of a rolling restart, which was unnecessary. This fix eliminates the second restart. (Bug #23586651)

- **Client:** After an agent was started and a few commands had been executed from the `mcm` client, the `show settings` command started returning the wrong value for the `--log-level` option. (Bug #26189795)

- **Client:** Trying to set the `mysqld` node option `--validate-password` resulted in an error complaining that the parameter did not exist, even if the Password Validation Plugin had already
been installed on the mysqld node. It was due to some errors with the plug-in activation for mysqld nodes, which have now been corrected. (Bug #25797125)

Changes in MySQL Cluster Manager 1.4.2 (2017-03-07)

This section documents all changes and bug fixes that have been applied in MySQL Cluster Manager 1.4.2 since the release of MySQL Cluster Manager version 1.4.1.

• Functionality Added or Changed

• Bugs Fixed

Functionality Added or Changed

• Packaging: MySQL Cluster Manager is now also shipped in RPM packages for installation on Oracle Linux 7 and Red Hat Enterprise Linux 7. (Bug #25368708)

• Agent: To allow easy detection of an incomplete agent backup, an empty file named INCOMPLETE is created in the folder in which the backup is created when the backup agents command begins, and is deleted after the backup is finished. The continuous existence of the file after the backup process is over indicates that the backup is incomplete. (Bug #25126866)

• Agent: A new update process command updates a cluster process' status when it is no longer reflected correctly in the output of the show status --process. It imports the process into the control of the mcmd agent again. See description of the update process command for details. (Bug #25098588)

• Agent: MySQL Cluster Manager can now recover automatically a failed mysqld node, as long as the data directory of the node is empty when recovery is attempted; if that is not the case, after cleaning up the data directory manually, users can now manually run start process --initial to rebuild the mysqld node's data directory. (Bug #18415446)

• Agent: The show status command now reports progress when the new --progress or --progressbar option is used.

• Agent: A new command, update process, imports a process back into the control of mcmd after it has lost track of the process's status due to different reasons (for example, it has been restarted manually outside of MySQL Cluster Manager). For more details, see the description for the command.

Bugs Fixed

• Agent: mcmd sometimes quit unexpectedly when running on SLES 11.4 with ReiserFS due to sporadic occurrences of checksum errors with the MySQL Cluster Manager data repository. (Bug #25596300)

• Agent: When a custom FileSystemPath value was used for a data node, the list backups and restore cluster commands failed, as the backup directory could not be found. (Bug #25549903)

• Agent: In some situations, a certain mcmd agent took too long to process event messages that a synchronization timeout occurred among the agents. This was because the agent went into a mutex contention for file access, which this fix removes. (Bug #25462861)

• Agent: The collect logs command reported success even if file transfers were incomplete. This fix adds checks for file transfer completion and reports any errors. (Bug #25436057)

• Agent: An ndbmd node sometimes (for example, at a rolling restart of the cluster) sent out a large amount of event messages, and it might take too long for an mcmd agent to process them that the agent lagged behind on its readiness for the next command, resulting in a synchronization timeout among the mcmd agents. This fix drastically reduced the amount of event messages sent out about
MySQL Cluster Manager 1.4 Release Notes

an ndbmtd node, thus reducing the chance of a synchronization timeout under the situation. (Bug #25358050)

• **Agent:** A management node failure might trigger `mcmd` to quit unexpectedly on Windows platforms. (Bug #25336594)

• **Agent:** Multiple errors thrown by the `backup agents, rotate log, and change log-level` commands could potentially overwrite each other, causing a lost of error information. (Bug #25134452)

• **Agent:** The `collect logs` command hung when TCP connections could not be established between the agent that initiated the command and the other agents. This fix makes the command timeout after the situation persists for more than 30s. Also, a new `mcmd` option, `--copy-port`, has been added, by which users can specify the TCP port number to be used for log copying. (Bug #25064313)

• **Agent:** The `.mcm` file created by the `import config --dryrun` command sometimes have certain configuration settings missing from it. (Bug #24962848)

• **Agent:** A `restore cluster` command would fail if MySQL Cluster Manager did not have write access to the `BackupDataDir` of each data node. The unnecessary requirement has now been removed. (Bug #24763936)

• **Agent:** If a `stop cluster` or a `stop process` command had failed, a restart on some of the processes might fail with the complaint from `mcmd` that those processes were already stopped, even if they were actually running. That also made it impossible to reconfigure those processes when `StopOnError` was true. This happened because the failed `stop` command had left those processes' metadata in an incorrect state. With this fix, the process restart is allowed despite the value of `StopOnError`. (Bug #24712504)

• **Agent:** Hostnames referenced in the error messages returned by `mcmd` were always in lower case. With this fix, the hostname is always referred to as it is; moreover, `mcmd` now always refers to a hostname or the IP address used in creating the cluster. (Bug #21375132)

• **Agent:** A `restore cluster` command hung, when an `mcmd` agent failed and the other agents kept waiting to receive messages from it. With the fix, the other agents detect the failure and return an error to the user. (Bug #16907088)

• **Agent:** When a cluster was being started, if a data node failed shortly after it was started and `mcmd` was still in the process of starting an SQL node, even if the SQL node was started successfully at the end, `mcmd` might forever lose connection to the SQL node. It happened when the user `mcmd` required for the `mcmd` agent did not get created on the SQL node. With this fix, the user `mcmd` is always created on the SQL node despite a failure of the `start cluster` command. (Bug #13436550)

Changes in MySQL Cluster Manager 1.4.1 (2016-11-24)

This section documents all changes and bug fixes that have been applied in MySQL Cluster Manager 1.4.1 since the release of MySQL Cluster Manager version 1.4.0.

• **Functionality Added or Changed**

• **Bugs Fixed**

Functionality Added or Changed

• **Microsoft Windows:** A 64-bit Windows installer package for MySQL Cluster Manager is now available.

• **Agent:** Quotes used in specifying an `mcmd option` were interpreted literally as parts of the option value. With this fix, `mcmd` now handles the quotes properly for the following options by stripping the quotes before interpreting the option values:
MySQL Cluster Manager 1.4 Release Notes

- --basedir
- --pid-file
- --plugin-dir
- --log-file
- --manager-username
- --manager-password
- --manager-directory

(Bug #24529142)

Agent: When an mcmd agent failed to shutdown a mysqld node, it kept on retrying until the process timed out, at which point the error code from mysqld was returned to the client. With this fix, the error is returned immediately after the first shutdown attempt has failed. (Bug #24418005)

Agent: After a start process --added command was executed, if a show status --operational command was then run, in the Command column of the output, the ID for only one of the added nodes was shown even if multiple nodes had been added and started. With this fix, nodeids are no longer shown in the command output in that case, to avoid any possible confusions. (Bug #24372861)

Agent: The restore cluster command now supports a new option, --promote-attributes, which allows attributes to be promoted when MySQL Cluster Manager restores data from a backup. (Bug #24295481)

Agent: The collect logs command now also collects trace files, to provide more information in the event of a cluster failure. (Bug #23746394)

Agent: Information that is unrelated to debugging is no longer included into the agent log when --log-level is set to debug, but is included when --log-level is set to info. (Bug #23716969)

Agent: The capability for MySQL Cluster Manager to set the cluster parameter ndbinfo_table_prefix has been removed, as setting it might cause a timeout when mcmd tries to start a mysqld node. (Bug #23632067)

Agent: The import cluster command now supports the import of cluster nodes that have been started with options specified on the command line using underscores (_) instead of dashes (-) in the option names (for example, --ndb_connectstring instead of --ndb-connectstring). (Bug #23535372)

Agent: The --initial option can now be used with the start cluster command for starting clusters in the "created" status. (Bug #23138442)

Agent: The timer in mcmd is now monotonic, so interval measures are no longer affected by clock changes on the host. (Bug #22699245)

Agent: The version number for the mcmd agent and the name of the host it is running on are now always recorded in the agent log (mcmd.log) at startups or log rotations, irrespective of the --log-level setting. (Bug #22616530)

Agent: The backup cluster command now creates a logical backup for the metadata of the NDB tables in a MySQL Cluster, allowing more flexibility for cluster reconfiguration during a restore. See the description for backup cluster for more details. (Bug #21200829)

Agent: The --backupid option can now be used with the list backups command to specify the ID of the backup to be listed.
MySQL Cluster Manager 1.4 Release Notes

- **Client:** Execution of the `.mcm` file created by the `import config --dryrun` command failed when a relative file path was given for a file-path attribute to be imported for a `mysqld` node. The `mcm` client now accepts relative file paths for those attributes, except for the `socket` value, and for any paths for a directory value (for example, `plugin_dir`). (Bug #18650848)

- **Client:** Creating a single-host site with `localhost` as the argument for `--hosts` now results in a site that cannot be scaled up by the `add hosts` command; a warning for that is given by the `mcm` client at the creation of the site. See the description for the `create site` command for details. (Bug #18389510)

- **MySQL Cluster Manager** now supports MySQL Cluster 7.5. At the same time, support for MySQL Cluster 7.2 has been deprecated. (Bug #24940329)

**Bugs Fixed**

- **Agent:** When the `backup agents` command failed to copy some files, it finished without erroring out, but caused the subsequent `mcmd` agent restart to fail. This fix adds proper error-handling function to the `backup agents` command. (Bug #25057056)

- **Agent:** When a `start cluster` or `stop cluster` command was run, if it took more than two minutes for any data node to be started or stopped, the `mcmd` agent threw a timeout for the command, and sometimes did that more than once, even though the data node was still in a normal process of being started or stopped. It was because the timeout extension needed was never granted within two minutes. With this fix, a timeout extension is granted at a much earlier time, and the amount of the extension is calculated based on the cluster's `DataMemory` size. (Bug #24749459)

- **Agent:** When `mcmd` failed to create the users it needs on a `mysqld` node, it just kept retrying until a timeout was reached, and without notifying the `mcm` client. With this fix, a failure is declared immediately to the client in the situation, and there are no more retries. (Bug #24511041)

- **Agent:** After a failure by `mcmd` to configure a cluster, the progress message from the process caused the next attempt to configure the cluster to fail. With this fix, the progress message from the last attempt only causes a warning to be issued to the agent log, and is then ignored. (Bug #24499097)

- **Agent:** After a failed execution of the `import config` command using an older version of MySQL Cluster Manager, if MySQL Cluster Manager was then upgraded, restarting would fail afterward for some of the `mcmd` agents. (Bug #24464302)

- **Agent:** Attempts to upgrade MySQL Cluster Manager to version 1.4.0 by starting the 1.4.0 executables on pre-1.4 data failed, as the automatic upgrades for backup configurations were not successful. (Bug #24433400)

- **Agent:** `mcmd` exited unexpectedly after failing to parse correctly a message of an unexpected format from a `mysqld` node. With this fix, sanity check is performed on the received message first, in order to avoid parsing the wrong information out of it. (Bug #24430610)

- **Agent:** When attempting to set a global system variable on a `mysqld` node, the `mcmd` agent always returned a success message, even if it failed to contact the `mysqld` node actually. (Bug #24417856)

- **Agent:** When running the `list backups` command, if one of the `mcmd` agents ran into permission errors on some of the backups' file paths, the returned results for the command became incomplete. With this fix, complete results are returned in those situations. (Bug #24414682)

- **Agent:** When the `mcm` client and the `mcmd` agent it connected to were on the same host whose loopback address was not 127.0.0.1, if the host's name or loopback address was not explicitly contained in the host list in the `create site` command, attempts to restart the cluster later would fail with the complaint that the host name for the agent could not be resolved in the host list. With this fix, a warning is given in the situation when the `create site` command is issued, asking the user to include the proper host name. (Bug #24411504)

- **Agent:** `mcmd` sometimes failed to report errors for its executions of SQL statements to the `mcmd` log. This fix tries to ensures that those errors are captured. (Bug #24375344)
• **Agent:** When an `add package` command failed due to an error in loading the cluster configuration, `mcmd` exited unexpectedly on Windows platforms, and falsely reported that the package was added successfully on Unix-like platforms. (Bug #24361901)

• **Agent:** On Windows platforms, the value for the system variable `wait_timeout` for `mysqld` nodes cannot be made larger than “2147483” using the `set` command. (Bug #24332880)

• **Agent:** When `mcmd` failed to write to the configuration file `config.ini` or `my.cnf`, `mcmd` either quit unexpectedly (for most Unix-like platforms), or returned a success message without actually writing to the file (on Solaris). (Bug #23632067)

• **Agent:** When a configuration parameter was imported from a `mysqld` node using the `import config` command, the value got truncated when it was a quoted value containing a hash sign and was followed by a comment when listed inside the configuration file. (Bug #23591849)

• **Agent:** On Windows platforms, the `import cluster` command failed when a 32-bit `mcmd` was working a 64-bit MySQL Cluster, or vice versa. (Bug #23503256)

• **Agent:** The `import config --dryrun` command produced `set` commands of wrong syntax for instance-level TCP configuration settings specified inside the `config.ini` file. (Bug #23341146)

• **Agent:** When `NoOfReplicas` was “4” for a cluster and only one forth of all the data nodes were available, `mcmd` reported that the cluster was “non-operational” when the `show status --cluster` command was run. (Bug #23330032)

• **Agent:** `mcmd` ignored status update from an `ndbapi` (or unmanaged `mysqld`) node when it reported an LSN lower than one already reported by some other agent. This was due to an unnecessary check on the reported LSNS, which has been removed by this fix. (Bug #23320387)

• **Agent:** When working with MySQL Cluster 7.5, resetting the Datadir parameter for a `mysqld` node using a `reset` command caused an error when the default data directory had contents inside. (Bug #23283577)

• **Agent:** If distributed privileges for `mysqld` nodes were used and the `root` password has been set on the cluster's `mysqld` nodes, after a new `mysqld` process was added, MySQL Cluster Manager failed to connect to it, as `mcmd` tried in vain to log on to the new `mysqld` node as `root` with an empty password. With this fix, `mcmd` then attempts in that situation to log on to the node as the user `mcmd`. Also, even if the `root` account is not secured, when distributed privileges are used, `mcmd` now attempts first to connect to a new `mysqld` node as `mcmd` before it tries to create the `mcmd` user on the new node. (Bug #23274982, Bug #81391)

• **Agent:** The command `start process --added` failed with the error “Unable to create nodegroup ...” when the parameter `NoOfReplicas` was set to “3” or “4.” (Bug #23257723)

• **Agent:** Some `ndbmtd` processes were being excluded from rolling restarts when the parameter `NoOfReplicas` was set to “3” or “4.” (Bug #23251630)

• **Agent:** With the parameter `NoOfReplicas` set to “3” or “4,” even when there was still one mirror node left in a nodegroup for a `ndbmtd` process, the `stop process` command issued for the `ndbmtd` node was rejected by `mcmd`. (Bug #23250053)

• **Agent:** When a quorum of majority of `mcmd` agents no longer existed (due to, for example, a network failure), an `mcmd` agent reported wrong statuses of failed processes even when those processes were local to its own host and were accessible by the agent. (Bug #23222658)

• **Agent:** When network connection to a host with a data node running was lost and then reestablished, the `show status` command reported falsely that the data node was running again even though it had actually stopped. This fix makes sure the current status of the data node is properly reflected. (Bug #23220981)

• **Agent:** When there was a failure in setting the value of the parameter `LogDestination`, `mcmd` when returning an error, also issued sometimes a warning that an earlier runtime error had been
overwritten. This is now prevented by putting in proper checking and handling for any existing error as a new error is being thrown. (Bug #23211849)

- **Agent:** If a warning was returned by `mcmd` after it executed a `SET GLOBAL` statement to a `mysqld` node, the same warning was issued to the agent log (`mcmd.log`) again and again each time a new `SET GLOBAL` statement was executed. (Bug #23211783)

- **Agent:** When the parameter `ArbitrationRank` was being set for a `mysqld` node, the data nodes and management nodes were not restarted, so they had no knowledge that the arbitration rank for the `mysqld` node has been changed. (Bug #23148368)

- **Agent:** In the case where there was only one `ndb_mgmd` node in a cluster, during a rolling restart, after the `ndb_mgmd` node was just restarted and a first data node was stopped, a second data node might fail before it got restarted, complaining that there was no arbitrator for the cluster. It was because the management node was still in the process of asserting itself as an arbitrator. With this fix, the restarting of data nodes only begin after they have all seen an arbitrator established. (Bug #23148061)

- **Agent:** A new `ndbd` or `ndbmd` node could not be added to a cluster if `BackupDataDir` specified a non-default location for cluster backups, and there were backups existing at that location. (Bug #23123364)

- **Agent:** When already existing nodes were added again to a cluster without being started and the cluster was stopped, a subsequent `start cluster --initial` command failed. This was because `mcmd` attempted to recreate the already existing node groups, which this fix prevents. (Bug #23024367)

- **Agent:** While the `.my.cnf` configuration files for added `mysqld` processes generated by `mcmd` used group suffixes for group titles in the files (for example `[mysqld.50]`), the `mysqld` nodes were started without using the `--defaults-group-suffix` option, causing the generated configurations to be unread by the `mysqld` node. With this fix, the group suffixes are no longer used. (Bug #22931198)

- **Agent:** On Windows platforms, an `mcmd` agent quit unexpectedly after it was unable to open a process handler to a PID. This fix makes `mcmd` able to handle the situation and not quit. (Bug #22886512)

- **Agent:** During the time when an `upgrade cluster` command is being performed, if a `mysqld` node that had not yet been upgraded failed somehow, it was mistakenly restarted with the newer instead of the older binary package. With this fix, the node is restarted with the original binary package it was running on. (Bug #22880634)

- **Agent:** Under some conditions, setting a configuration attribute for a cluster using the `set` command made `mcmd` quit unexpectedly, as more than one thread in MySQL Cluster Manager tried to change the cluster configurations together within a very short period of time, with one thread running into a checksum error for the repository directory and causing the agent to quit. This fix adds error checks, retries, and also exponential backoffs to handle the situation, in order to allow proper execution of the `set` command. (Bug #22865068)

- **Agent:** A `restore cluster` command failed because one of the management nodes in the cluster was in the “starting” status, which should not prevent a cluster from being restored. (Bug #22755257)

- **Agent:** When the `start process --added` command was used to start data nodes that were newly added, the command failed if there was an `ndbapi` node that was in the “connected” status, with the complaint that the `ndbapi` node was “already running.” (Bug #22726592)

- **Agent:** If an earlier attempt to stop a `mysqld` node failed and left the node in a status of “stopping,” a subsequent `stop cluster` command failed with a timeout. With this fix, the `stop cluster` command actually reattempts twice the shutdown of the “stopping” process, and throws a proper error if the attempts fail. The timeout period for each attempt is also reduced to 5 seconds. (Bug #22682222, Bug #24735542)
• **Agent:** When performing a `create cluster` command for a large cluster with many processes, `mcmd` tried to resolve the host name and check the validity of the package name for every single process, which could take a long time and cause the `create cluster` command to fail with a timeout. `mcmd` now avoids repeated lookups for the same host name or package name, so the timeouts are prevented. (Bug #22671177)

• **Agent:** When a backup was actually completed after an `abort backup` command had just been issued through the `mcmd` agent, the agent failed to respond to the backup completion, resulting in a timeout for the `abort backup` command. With this fix, the `abort backup` command will error out under the situation. (Bug #22655696)

• **Agent:** When setting a value for the `log-error` attribute for a `mysqld` node using the `set` command, `mcmd` failed to, as expected, append the extension `.err` to the supplied file name when it did not have an extension. (Bug #22588267)

• **Agent:** The `mysql` client hung as a `status` command was issued through it to a `mysqld` node, due to some communication packages remaining unhandled by `mcmd`. (Bug #22539167)

• **Agent:** The `autotune --dryrun` command did not write to the `.mcm` script file the TCP connection attributes (for example, `SendBufferMemory` and `ReceiveBufferMemory`) it would set for the cluster when the `--dryrun` option was not used. (Bug #22517603)

• **Agent:** With two clusters running separately on two different hosts in the same site, the `autotune --dryrun` command for a cluster failed with an internal error, complaining that a dump file [for the other cluster running on the other host] could not be opened because it did not exist on the host—which was to be expected. (Bug #22465053, Bug #79586)

• **Agent:** If a cluster log rotation happened while MySQL Cluster Manager was starting the cluster, an `mcmd` agent failure would occur. This fix makes sure log rotation is properly detected and handled by `mcmd`. (Bug #22296243)

• **Agent:** For MySQL Cluster 7.4.8 and later, the `import config` command imported the deprecated `PortNumber` attribute under the `[tcp]` section of the cluster configuration file as “0.”. The attribute is now skipped during a configuration import. (Bug #22274785)

• **Agent:** A `create cluster` command failed with an error when one of the `mcmd` agents was down, even if that agent was not needed for the process. (Bug #22245706)

• **Agent:** When the utility `mysql_install_db` was run by the `mcmd` agent at the creation of a `mysqld` node, it was not run asynchronously, resulting sometimes in unnecessary delay for other `mcmd` processes. With this fix, the utility is now run asynchronously. (Bug #22238508)

• **Agent:** After a new host has been added to a cluster without a package being added for it, `mcmd` returned an error message to any `get` and `set` command, saying that the parameter to be get or set did not exist. With this fix, a proper error message is returned. (Bug #21894353)

• **Agent:** On Windows platform, setting the `datadir` option for a `mysqld` node in the Windows file path format caused the `mcmd` agent to stop unexpectedly after it failed to restart the `mysqld` node. It was due to a mishandling of the Windows format file path, which has now been fixed. (Bug #19209870)

• **Agent:** A rolling restart of the cluster performed by `mcmd` timed out while waiting for GCP and LCP takeover events to complete among the data nodes. With this fix, the timeout is avoided by having `mcmd` check for the status of the takeover events and wait until the involved data nodes are ready before trying to stop them. (Bug #14230789)

• **Client:** Spaces in quoted option values for MySQL Cluster Manager were lost (for example, with “--prompt='mcm1.4.1> ’,” the prompt for the `mcm` client became “mcm1.4.1>” [with no space at the end]). (Bug #24528495)
MySQL Cluster Manager 1.4 Release Notes

• **Client:** When the `mcm` client was being started with the `--debug` option, if the `mysql` client could not be found at the expected location, the `mcm` client failed with a segmentation fault. (Bug #24522244)

• **Client:** The success messages returned by the `autotune --dryrun` and `import-config --dryrun` commands referred users to the agent log file for the proposed settings to be applied to the cluster, but the settings were not actually in the file. The success messages now give the path to the `.mcm` script file that contains the settings. (Bug #22280689)

• **Client:** After the `mcmd` agent on a certain host failed, the `mcm` client continued to report the statuses of the processes on the host to “running” while the `mcmd` agent log and the `ndb_mgmd` queries already showed their statuses to be “unknown.”. (Bug #22174415)

**Changes in MySQL Cluster Manager 1.4.0 (2015-12-07)**

This section documents all changes and bug fixes that have been applied in MySQL Cluster Manager 1.4.0 since the release of MySQL Cluster Manager version 1.3.6.

• **Functionality Added or Changed**

• **Bugs Fixed**

**Functionality Added or Changed**

• **Packaging:** MySQL Cluster Manager is now built and shipped with GLib-2.44.0, OpenSSL 1.0.1p, and the MySQL 5.6 client library. (Bug #22202878)

• **Agent:** A warning is now logged (if `log-level=warning`) when a failed process is not restarted because the parameter `StopOnError` is set to `true`. (Bug #21575241)

• **Agent:** When using the `import-cluster` command, if a `mysqld` node was started on the command line with options outside of a special, pre-defined set, the import failed with the complaint that those options were unsupported. Now, the import continues, as long as those options and their values are also included in the node's configuration created by MySQL Cluster Manager for import. (Bug #21363732)

• **Agent:** Two new options have been introduced for the `upgrade-cluster` command: `--retry` and `--nodeid`. They, together with the `--force` option, allow a retry after an initial attempt to upgrade a cluster has failed. See the description for `upgrade-cluster` for details. (Bug #20469067, Bug #16932006, Bug #21200698)

• **Client:** The `get` command now returns attributes in the same order as the MySQL Cluster `ndb_mgmd` command does when the `--print-full-config` option is used, with the non-data nodes being listed first and other nodes listed in increasing order of their node IDs. (Bug #22202973)

• **Client:** A new `autotune` command has been introduced, which tunes a number of parameters of the cluster to optimize its performance. (Bug #22202855)

• **Client:** The `show settings` command has a new `--hostinfo` option, with which the command prints out information on the host the `mcm` client is connected to. (Bug #21923561)

• **Client:** You can now use the wildcard `*` (asterisk character) to match attribute names in a `get` command. See The `get` Command for examples. (Bug #18069656)

**Bugs Fixed**

• **Agent:** On Windows platform, after a cluster import, the subsequent cluster restart timed out if a non-default value of the option `--pid-file` had been imported for a `mysqld` node. (Bug #21945519)

  References: This issue is a regression of: Bug #21111944.

• **Agent:** When a data node could not be restarted after a `set` command because some attributes were set wrongly, another set command could not be used to correct the attributes, because the `set`
command required the data node to be running. With this fix, the second `set` command can now be
executed even when the data node is not running, as long as the `--force` option is used. The failed
node is then restarted, followed by a rolling restart of the cluster. (Bug #21943518)

- **Agent:** `restore cluster` timed out when the number of tables in the cluster was huge (>1000). It
  was because a timeout extension was blocked. This fix unblocks the extension. (Bug #21393857)

- **Agent:** At the initial startup of a large cluster (with memory size on the order of 10GB), the process
  might time out while waiting for a data node to start. This fix makes the transaction timeout longer for
  data node initiation. (Bug #21355383)

- **Agent:** Under some conditions, a `show status` command might report negative node group ID
  values for processes after an `add process` command was completed. That was because the agent
  reported the node group IDs before their proper values had arrived, after the creation of new node
  groups. This fix makes the agent wait for the correct node group IDs before reporting them. (Bug
  #21346804)

- **Agent:** After successful the execution of an `add process` and a subsequent `start process --
  added` command, a third command that was issued very shortly afterward might fail. This was due
  to the way the updates for the processes’ statuses were handled after the new nodes were added,
  which has now been corrected. (Bug #21138604)

References: See also: Bug #21346804.

- **Agent:** Setting a value for a “key-only” option for a MySQL node (that is, an option that does not take
  a value—for example, `skip_show_database`) with the `set` command and restarting the cluster
  afterward caused `ncmd` to attempt a cluster upgrade and back up the cluster. (Bug #21098403)

- **Agent:** The `create site` command sometimes failed with the error message “Lost connection to
  MySQL server during query.” It was due to an error in the code that handled the socket, which has
  now been fixed. (Bug #21027818)

- **Agent:** Parameters listed under the `[mysql default]` or `[tcp default]` section of the
  `config.ini` file were not imported as configuration parameters for unmanaged API nodes. (Bug
  #20889471)

- **Client:** Output of the `get` command used with the `--include-defaults (-d)` option did not
  include matching TCP attributes that had default values. (Bug #21895322)
