You may create a printed copy of this documentation solely for your own personal use. Conversion to other formats is allowed as long as the actual content is not altered or edited in any way. You shall not publish or distribute this documentation in any form or on any media, except if you distribute the documentation in a manner similar to how Oracle disseminates it (that is, electronically for download on a Web site with the software) or on a CD-ROM or similar medium, provided however that the documentation is disseminated together with the software on the same medium. Any other use, such as any dissemination of printed copies or use of this documentation, in whole or in part, in another publication, requires the prior written consent from an authorized representative of Oracle. Oracle and/or its affiliates reserve any and all rights to this documentation not expressly granted above.

**Documentation Accessibility**

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at
https://www.oracle.com/corporate/accessibility/.

**Access to Oracle Support for Accessibility**

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit
https://www.oracle.com/corporate/accessibility/learning-support.html#support-tab.
Chapter 1 Installing MySQL from Source

Building MySQL from the source code enables you to customize build parameters, compiler optimizations, and installation location. For a list of systems on which MySQL is known to run, see https://www.mysql.com/support/supportedplatforms/database.html.

Before you proceed with an installation from source, check whether Oracle produces a precompiled binary distribution for your platform and whether it works for you. We put a great deal of effort into ensuring that our binaries are built with the best possible options for optimal performance. Instructions for installing binary distributions are available in Installing MySQL on Unix/Linux Using Generic Binaries.

If you are interested in building MySQL from a source distribution using build options the same as or similar to those use by Oracle to produce binary distributions on your platform, obtain a binary distribution, unpack it, and look in the docs/INFO_BIN file, which contains information about how that MySQL distribution was configured and compiled.

**Warning**

Building MySQL with nonstandard options may lead to reduced functionality, performance, or security.

The MySQL source code contains internal documentation written using Doxygen. The generated Doxygen content is available at https://dev.mysql.com/doc/index-other.html. It is also possible to generate this content locally from a MySQL source distribution using the instructions at Generating MySQL Doxygen Documentation Content.
Chapter 2 Installing MySQL Using a Standard Source Distribution

To install MySQL from a standard source distribution:

1. Verify that your system satisfies the tool requirements listed at Source Installation Prerequisites.
2. Obtain a distribution file using the instructions in How to Get MySQL.
3. Configure, build, and install the distribution using the instructions in this section.
4. Perform postinstallation procedures using the instructions in Postinstallation Setup and Testing.

MySQL uses CMake as the build framework on all platforms. The instructions given here should enable you to produce a working installation. For additional information on using CMake to build MySQL, see How to Build MySQL Server with CMake.

If you start from a source RPM, use the following command to make a binary RPM that you can install. If you do not have rpmbuild, use rpm instead.

```
$> rpmbuild --rebuild --clean MySQL-VERSION.src.rpm
```

The result is one or more binary RPM packages that you install as indicated in Installing MySQL on Linux Using RPM Packages from Oracle.

The sequence for installation from a compressed tar file or Zip archive source distribution is similar to the process for installing from a generic binary distribution (see Installing MySQL on Unix/Linux Using Generic Binaries), except that it is used on all platforms and includes steps to configure and compile the distribution. For example, with a compressed tar file source distribution on Unix, the basic installation command sequence looks like this:

```
# Preconfiguration setup
$> groupadd mysql
$> useradd -r -g mysql -s /bin/false mysql
# Beginning of source-build specific instructions
$> tar zxf mysql-VERSION.tar.gz
$> cd mysql-VERSION
$> mkdir bld
$> cd bld
$> cmake ..
$> make
$> make install
# End of source-build specific instructions
# Postinstallation setup
$> cd /usr/local/mysql
$> mkdir mysql-files
$> chown mysql:mysql mysql-files
$> chmod 750 mysql-files
$> bin/mysqld --initialize --user=mysql
$> bin/mysql_ssl_rsa_setup
$> bin/mysqld_safe --user=mysql &
# Next command is optional
$> cp support-files/mysql.server /etc/init.d/mysql.server
```

A more detailed version of the source-build specific instructions is shown following.

---

**Note**

The procedure shown here does not set up any passwords for MySQL accounts. After following the procedure, proceed to Postinstallation Setup and Testing, for postinstallation setup and testing.
Perform Preconfiguration Setup

On Unix, set up the `mysql` user and group that should be used to run and execute the MySQL server, and own the database directory. For details, see Create a mysql User and Group. Then perform the following steps as the `mysql` user, except as noted.

Obtain and Unpack the Distribution

Pick the directory under which you want to unpack the distribution and change location into it.

Obtain a distribution file using the instructions in How to Get MySQL.

Unpack the distribution into the current directory:

- To unpack a compressed `tar` file, `tar` can uncompress and unpack the distribution if it has `z` option support:

  ```
  $> tar zzxf mysql-VERSION.tar.gz
  ```

  If your `tar` does not have `z` option support, use `gunzip` to unpack the distribution and `tar` to unpack it:

  ```
  $> gunzip < mysql-VERSION.tar.gz | tar xvf -
  ```

  Alternatively, `CMake` can uncompress and unpack the distribution:

  ```
  $> cmake -E tar zzxf mysql-VERSION.tar.gz
  ```

- To unpack a Zip archive, use `WinZip` or another tool that can read `.zip` files.

  Unpacking the distribution file creates a directory named `mysql-VERSION`.

Configure the Distribution

Change location into the top-level directory of the unpacked distribution:

```
$> cd mysql-VERSION
```

Build outside of the source tree to keep the tree clean. If the top-level source directory is named `mysql-src` under your current working directory, you can build in a directory named `bld` at the same level. Create the directory and go there:

```
$> mkdir bld
$> cd bld
```

Configure the build directory. The minimum configuration command includes no options to override configuration defaults:
The build directory needs not be outside the source tree. For example, you can build in a directory named `bld` under the top-level source tree. To do this, starting with `mysql-src` as your current working directory, create the directory `bld` and then go there:

```bash
mkdir bld
cd bld
```

Configure the build directory. The minimum configuration command includes no options to override configuration defaults:

```bash
cmake ..
```

If you have multiple source trees at the same level (for example, to build multiple versions of MySQL), the second strategy can be advantageous. The first strategy places all build directories at the same level, which requires that you choose a unique name for each. With the second strategy, you can use the same name for the build directory within each source tree. The following instructions assume this second strategy.

On Windows, specify the development environment. For example, the following commands configure MySQL for 32-bit or 64-bit builds, respectively:

```bash
$> cmake .. -G "Visual Studio 12 2013"
$> cmake .. -G "Visual Studio 12 2013 Win64"
```

On macOS, to use the Xcode IDE:

```bash
$> cmake .. -G Xcode
```

When you run `cmake`, you might want to add options to the command line. Here are some examples:

- `-DBUILD_CONFIG=mysql_release`: Configure the source with the same build options used by Oracle to produce binary distributions for official MySQL releases.

- `-DCMAKE_INSTALL_PREFIX=dir_name`: Configure the distribution for installation under a particular location.

- `-DCPACK_MONOLITHIC_INSTALL=1`: Cause `make package` to generate a single installation file rather than multiple files.

- `-DWITH_DEBUG=1`: Build the distribution with debugging support.

For a more extensive list of options, see Chapter 4, *MySQL Source-Configuration Options*.

To list the configuration options, use one of the following commands:

```bash
$> cmake .. -L # overview
$> cmake .. -LH # overview with help text
$> cmake .. -LAH # all params with help text
$> ccmake .. # interactive display
```

If `CMake` fails, you might need to reconfigure by running it again with different options. If you do reconfigure, take note of the following:

- If `CMake` is run after it has previously been run, it may use information that was gathered during its previous invocation. This information is stored in `CMakeCache.txt`. When `CMake` starts, it looks for that file and reads its contents if it exists, on the assumption that the information is still correct. That assumption is invalid when you reconfigure.
Build the Distribution

- Each time you run CMake, you must run make again to recompile. However, you may want to remove old object files from previous builds first because they were compiled using different configuration options.

To prevent old object files or configuration information from being used, run these commands in the build directory on Unix before re-running CMake:

```bash
$> make clean
$> rm CMakeCache.txt
```

Or, on Windows:

```bash
$> devenv MySQL.sln /clean
$> del CMakeCache.txt
```

Before asking on the MySQL Community Slack, check the files in the CMakeFiles directory for useful information about the failure. To file a bug report, please use the instructions in How to Report Bugs or Problems.

### Build the Distribution

**On Unix:**

```bash
$> make
$> make VERBOSE=1
```

The second command sets VERBOSE to show the commands for each compiled source.

Use gmake instead on systems where you are using GNU make and it has been installed as gmake.

**On Windows:**

```bash
$> devenv MySQL.sln /build RelWithDebInfo
```

If you have gotten to the compilation stage, but the distribution does not build, see Chapter 5, Dealing with Problems Compiling MySQL, for help. If that does not solve the problem, please enter it into our bugs database using the instructions given in How to Report Bugs or Problems. If you have installed the latest versions of the required tools, and they crash trying to process our configuration files, please report that also. However, if you get a command not found error or a similar problem for required tools, do not report it. Instead, make sure that all the required tools are installed and that your PATH variable is set correctly so that your shell can find them.

### Install the Distribution

**On Unix:**

```bash
$> make install
```

This installs the files under the configured installation directory (by default, /usr/local/mysql). You might need to run the command as root.

To install in a specific directory, add a DESTDIR parameter to the command line:

```bash
$> make install DESTDIR="/opt/mysql"
```

Alternatively, generate installation package files that you can install where you like:

```bash
$> make package
```
Perform Postinstallation Setup

This operation produces one or more .tar.gz files that can be installed like generic binary distribution packages. See Installing MySQL on Unix/Linux Using Generic Binaries. If you run CMake with -DCPACK_MONOLITHIC_INSTALL=1, the operation produces a single file. Otherwise, it produces multiple files.

On Windows, generate the data directory, then create a .zip archive installation package:

```
$ devenv MySQL.sln /build RelWithDebInfo /project initial_database
$ devenv MySQL.sln /build RelWithDebInfo /project package
```

You can install the resulting .zip archive where you like. See Installing MySQL on Microsoft Windows Using a noinstall ZIP Archive.

Perform Postinstallation Setup

The remainder of the installation process involves setting up the configuration file, creating the core databases, and starting the MySQL server. For instructions, see Postinstallation Setup and Testing.

---

Note

The accounts that are listed in the MySQL grant tables initially have no passwords. After starting the server, you should set up passwords for them using the instructions in Postinstallation Setup and Testing.
Chapter 3 Installing MySQL Using a Development Source Tree

This section describes how to install MySQL from the latest development source code, which is hosted on GitHub. To obtain the MySQL Server source code from this repository hosting service, you can set up a local MySQL Git repository.

On GitHub, MySQL Server and other MySQL projects are found on the MySQL page. The MySQL Server project is a single repository that contains branches for several MySQL series.

MySQL officially joined GitHub in September, 2014. For more information about MySQL’s move to GitHub, refer to the announcement on the MySQL Release Engineering blog: MySQL on GitHub

- Prerequisites for Installing from Development Source
- Setting Up a MySQL Git Repository

Prerequisites for Installing from Development Source

To install MySQL from a development source tree, your system must satisfy the tool requirements listed at Source Installation Prerequisites.

Setting Up a MySQL Git Repository

To set up a MySQL Git repository on your machine:

1. Clone the MySQL Git repository to your machine. The following command clones the MySQL Git repository to a directory named `mysql-server`. The initial download may take some time to complete, depending on the speed of your connection.

   ```
   ~$ git clone https://github.com/mysql/mysql-server.git
   Cloning into 'mysql-server'...
   remote: Counting objects: 1198513, done.
   remote: Total 1198513 (delta 0), reused 0 (delta 0), pack-reused 1198513
   Receiving objects: 100% (1198513/1198513), 1.01 GiB | 7.44 MiB/s, done.
   Resolving deltas: 100% (993200/993200), done.
   Checking connectivity... done.
   Checking out files: 100% (25510/25510), done.
   ```

2. When the clone operation completes, the contents of your local MySQL Git repository appear similar to the following:

   ```
   ~$ cd mysql-server
   ~/mysql-server$ ls
   client         extra        mysys       storage
   cmake          include      packaging   strings
   CMakeLists.txt INSTALL      plugin      support-files
   components     libbinlogevents README     testclients
   config.cmake   libbinlogstandalone router     unittest
   configure.cmake libmysql     run_doxygen.cmake utilities
   Docs           libservices   scripts     VERSION
   Doxyfile-ignored LICENSE     share       vio
   Doxyfile.in      man         sql        win
   doxygen_resources mysql-test sql-common
   ```

3. Use the `git branch -r` command to view the remote tracking branches for the MySQL repository.

   ```
   ~/mysql-server$ git branch -r
   origin/5.5
   origin/5.6
   ```
4. To view the branch that is checked out in your local repository, issue the `git branch` command. When you clone the MySQL Git repository, the latest MySQL GA branch is checked out automatically. The asterisk identifies the active branch.

```
~/mysql-server$ git branch
* 8.0
```

5. To check out an earlier MySQL branch, run the `git checkout` command, specifying the branch name. For example, to check out the MySQL 5.7 branch:

```
~/mysql-server$ git checkout 5.7
Checking out files: 100% (9600/9600), done.
Branch 5.7 set up to track remote branch 5.7 from origin.
Switched to a new branch '5.7'
```

6. To obtain changes made after your initial setup of the MySQL Git repository, switch to the branch you want to update and issue the `git pull` command:

```
~/mysql-server$ git checkout 8.0
~/mysql-server$ git pull
```

To examine the commit history, use the `git log` option:

```
~/mysql-server$ git log
```

You can also browse commit history and source code on the GitHub MySQL site.

If you see changes or code that you have a question about, ask on the MySQL Community Slack. For information about contributing a patch, see Contributing to MySQL Server.

7. After you have cloned the MySQL Git repository and have checked out the branch you want to build, you can build MySQL Server from the source code. Instructions are provided in Chapter 2, Installing MySQL Using a Standard Source Distribution, except that you skip the part about obtaining and unpacking the distribution.

Be careful about installing a build from a distribution source tree on a production machine. The installation command may overwrite your live release installation. If you already have MySQL installed and do not want to overwrite it, run CMake with values for the `CMAKE_INSTALL_PREFIX`, `MYSQL_TCP_PORT`, and `MYSQL_UNIX_ADDR` options different from those used by your production server. For additional information about preventing multiple servers from interfering with each other, see Running Multiple MySQL Instances on One Machine.

Play hard with your new installation. For example, try to make new features crash. Start by running `make test`. See The MySQL Test Suite.
Chapter 4 MySQL Source-Configuration Options

The CMake program provides a great deal of control over how you configure a MySQL source distribution. Typically, you do this using options on the CMake command line. For information about options supported by CMake, run either of these commands in the top-level source directory:

```
cmake . -LH
ccmake .
```

You can also affect CMake using certain environment variables. See Environment Variables.

For boolean options, the value may be specified as 1 or ON to enable the option, or as 0 or OFF to disable the option.

Many options configure compile-time defaults that can be overridden at server startup. For example, the CMAKE_INSTALL_PREFIX, MYSQL_TCP_PORT, and MYSQL_UNIX_ADDR options that configure the default installation base directory location, TCP/IP port number, and Unix socket file can be changed at server startup with the --basedir, --port, and --socket options for mysqld. Where applicable, configuration option descriptions indicate the corresponding mysqld startup option.

The following sections provide more information about CMake options.

- CMake Option Reference
- General Options
- Installation Layout Options
- Storage Engine Options
- Feature Options
- Compiler Flags
- CMake Options for Compiling NDB Cluster

CMake Option Reference

The following table shows the available CMake options. In the Default column, PREFIX stands for the value of the CMAKE_INSTALL_PREFIX option, which specifies the installation base directory. This value is used as the parent location for several of the installation subdirectories.

**General Options**

- `-DBUILD_CONFIG=mysql_release`

  This option configures a source distribution with the same build options used by Oracle to produce binary distributions for official MySQL releases.

- `-DBUNDLE_RUNTIME_LIBRARIES=bool`

  Whether to bundle runtime libraries with server MSI and Zip packages for Windows.

- `-DCMAKE_BUILD_TYPE=type`

  The type of build to produce:

  - `RelWithDebInfo`: Enable optimizations and generate debugging information. This is the default MySQL build type.

  - `Release`: Enable optimizations but omit debugging information to reduce the build size. This build type was added in MySQL 8.0.13.
### Installation Layout Options

- **Debug**: Disable optimizations and generate debugging information. This build type is also used if the `WITH_DEBUG` option is enabled. That is, `-DWITH_DEBUG=1` has the same effect as `-DCMAKE_BUILD_TYPE=Debug`.

- **-DCPACK_MONOLITHIC_INSTALL=bool**
  
  This option affects whether the `make package` operation produces multiple installation package files or a single file. If disabled, the operation produces multiple installation package files, which may be useful if you want to install only a subset of a full MySQL installation. If enabled, it produces a single file for installing everything.

- **-DFORCE_INSOURCE_BUILD=bool**
  
  Defines whether to force an in-source build. Out-of-source builds are recommended, as they permit multiple builds from the same source, and cleanup can be performed quickly by removing the build directory. To force an in-source build, invoke CMake with `-DFORCE_INSOURCE_BUILD=ON`.

### Installation Layout Options

The `CMAKE_INSTALL_PREFIX` option indicates the base installation directory. Other options with names of the form `INSTALL_XXX` that indicate component locations are interpreted relative to the prefix and their values are relative pathnames. Their values should not include the prefix.

- **-DCMAKE_INSTALL_PREFIX=dir_name**
  
  The installation base directory.

  This value can be set at server startup with the `--basedir` option.

- **-DINSTALL_BINDIR=dir_name**

  Where to install user programs.

- **-DINSTALL_DOCDIR=dir_name**

  Where to install documentation.

- **-DINSTALL_DOCREADMEDIR=dir_name**

  Where to install `README` files.

- **-DINSTALL_INCLUDEDIR=dir_name**

  Where to install header files.

- **-DINSTALL_INFODIR=dir_name**

  Where to install Info files.

- **-DINSTALL_LAYOUT=name**

  Select a predefined installation layout:

  - **STANDALONE**: Same layout as used for `.tar.gz` and `.zip` packages. This is the default.
  - **RPM**: Layout similar to RPM packages.
  - **SVR4**: Solaris package layout.
Installation Layout Options

• **DEB**: DEB package layout (experimental).

You can select a predefined layout but modify individual component installation locations by specifying other options. For example:

```cmake -DINSTALL_LAYOUT=SVR4 -DMYSQL_DATADIR=/var/mysql/data```

The `INSTALL_LAYOUT` value determines the default value of the `secure_file_priv`, `keyring_encrypted_file_data`, and `keyring_file_data` system variables. See the descriptions of those variables in Server System Variables, and Keyring System Variables.

• `-DINSTALL_LIBDIR=dir_name`

Where to install library files.

• `-DINSTALL_MANDIR=dir_name`

Where to install manual pages.

• `-DINSTALL_MYSQLKEYRINGDIR=dir_path`

The default directory to use as the location of the `keyring_file` plugin data file. The default value is platform specific and depends on the value of the `INSTALL_LAYOUT` CMake option; see the description of the `keyring_file_data` system variable in Server System Variables.

• `-DINSTALL_MYSQLSHAREDIR=dir_name`

Where to install shared data files.

• `-DINSTALL_MYSQLTESTDIR=dir_name`

Where to install the `mysql-test` directory. To suppress installation of this directory, explicitly set the option to the empty value (`-DINSTALL_MYSQLTESTDIR=`).

• `-DINSTALL_PKGCONFIGDIR=dir_name`

The directory in which to install the `mysqlclient.pc` file for use by `pkg-config`. The default value is `INSTALL_LIBDIR/pkgconfig`, unless `INSTALL_LIBDIR` ends with `/mysql`, in which case that is removed first.

• `-DINSTALL_PLUGINDIR=dir_name`

The location of the plugin directory.

This value can be set at server startup with the `--plugin_dir` option.

• `-DINSTALL_PRIV_LIBDIR=dir_name`

The location of the dynamic library directory.

Default locations: RPM = `/usr/lib64/mysql/private/`, DEB = `/usr/lib/mysql/private/`, and TAR = `lib/private/`.

This option was added in MySQL 8.0.18.

For Protobuf: Because this is a private location, loader (such as ld-linux.so on Linux) may not find the `libprotobuf.so` files without help. To guide loader, `RPATH` with value `$ORIGIN/./$INSTALL_PRIV_LIBDIR` is added to mysqld and mysqlxtest. This works for most cases but when using
Installation Layout Options

the Resource Group feature, mysqld is setsuid and then loader ignores RPATH which contains $ORIGIN. To overcome this, an explicit full path to the directory is set in DEB and RPM variants of mysqld, as the target destination is known. For tarball installs, patching of mysqld with a tool like patchelf is required.

• `-DINSTALL_SBINDIR=dir_name`
Where to install the mysqld server.

• `-DINSTALL_SECURE_FILE_PRIVDIR=dir_name`
The default value for the secure_file_priv system variable. The default value is platform specific and depends on the value of the INSTALL_LAYOUT CMake option; see the description of the secure_file_priv system variable in Server System Variables.

• `-DINSTALL_SHAREDIR=dir_name`
Where to install aclocal/mysql.m4.

• `-DINSTALL_STATIC_LIBRARIES=bool`
Whether to install static libraries. The default is ON. If set to OFF, these libraries are not installed: libmysqlclient.a, libmysqlservices.a.

• `-DINSTALL_SUPPORTFILES_DIR=dir_name`
Where to install extra support files.

• `-DLINK_RANDOMIZE=bool`
Whether to randomize the order of symbols in the mysqld binary. The default is OFF. This option should be enabled only for debugging purposes.

• `-DLINK_RANDOMIZE_SEED=val`
Seed value for the LINK_RANDOMIZE option. The value is a string. The default is mysql, an arbitrary choice.

• `-DMYSQL_DATADIR=dir_name`
The location of the MySQL data directory.
This value can be set at server startup with the --datadir option.

• `-DODBC_INCLUDES=dir_name`
The location of the ODBC includes directory, and may be used while configuring Connector/ODBC.

• `-DODBC_LIB_DIR=dir_name`
The location of the ODBC library directory, and may be used while configuring Connector/ODBC.

• `-DSYSCONFDIR=dir_name`
The default my.cnf option file directory.
This location cannot be set at server startup, but you can start the server with a given option file using the --defaults-file=file_name option, where file_name is the full path name to the file.

• `-DSYSTEMD_PID_DIR=dir_name`
Storage Engine Options

The name of the directory in which to create the PID file when MySQL is managed by systemd. The default is /var/run/mysqld; this might be changed implicitly according to the INSTALL_LAYOUT value.

This option is ignored unless WITH_SYSTEMD is enabled.

-DSYSTEMD_SERVICE_NAME=name

The name of the MySQL service to use when MySQL is managed by systemd. The default is mysqld; this might be changed implicitly according to the INSTALL_LAYOUT value.

This option is ignored unless WITH_SYSTEMD is enabled.

-DTMPDIR=dir_name

The default location to use for the tmpdir system variable. If unspecified, the value defaults to P_tmpdir in <stdio.h>.

Storage Engine Options

Storage engines are built as plugins. You can build a plugin as a static module (compiled into the server) or a dynamic module (built as a dynamic library that must be installed into the server using the INSTALL PLUGIN statement or the --plugin-load option before it can be used). Some plugins might not support static or dynamic building.

The InnoDB, MyISAM, MERGE, MEMORY, and CSV engines are mandatory (always compiled into the server) and need not be installed explicitly.

To compile a storage engine statically into the server, use -DWITH_engine_STORAGE_ENGINE=1. Some permissible engine values are ARCHIVE, BLACKHOLE, EXAMPLE, FEDERATED, and NDB or NDBCLUSTER (NDB support). Examples:

-DWITH_ARCHIVE_STORAGE_ENGINE=1
-DWITH_BLACKHOLE_STORAGE_ENGINE=1

Note

It is not possible to compile without Performance Schema support. If it is desired to compile without particular types of instrumentation, that can be done with the following CMake options:

DISABLE_PSI_COND
DISABLE_PSI_DATA_LOCK
DISABLE_PSI_ERROR
DISABLE_PSI_FILE
DISABLE_PSI_IDLE
DISABLE_PSI_MEMORY
DISABLE_PSI_METADATA
DISABLE_PSI_MUTEX
DISABLE_PSI_PS
DISABLE_PSI_RWLOCK
DISABLE_PSI_SOCKET
DISABLE_PSI_SP
DISABLE_PSI_STAGE
DISABLE_PSI_STATEMENT
DISABLE_PSI_STATEMENT_DIGEST
DISABLE_PSI_TABLE
DISABLE_PSI_THREAD
DISABLE_PSI_TRANSACTION
Feature Options

For example, to compile without mutex instrumentation, configure MySQL using the
-DDISABLE_PSI_MUTEX=1 option.

To exclude a storage engine from the build, use -DWITH_engine_STORAGEENGINE=0. Examples:

- DWITH_ARCHIVE_STORAGE_ENGINE=0
- DWITHByExample_STORAGE_ENGINE=0
- DWITH_FEDERATED_STORAGE_ENGINE=0

It is also possible to exclude a storage engine from the build using -
DWITHOUT_engine_STORAGE_ENGINE=1 (but -DWITH_engine_STORAGE_ENGINE=0 is preferred). Examples:

- DWITHOUT_ARCHIVE_STORAGE_ENGINE=1
- DWITHOUTByExample_STORAGE_ENGINE=1
- DWITHOUT_FEDERATED_STORAGE_ENGINE=1

If neither -DWITH_engine_STORAGE_ENGINE nor -DWITHOUT_engine_STORAGE_ENGINE are
specified for a given storage engine, the engine is built as a shared module, or excluded if it cannot be built
as a shared module.

Feature Options

- DADD_GDB_INDEX=bool

This option determines whether to enable generation of a .gdb_index section in binaries, which makes
loading them in a debugger faster. The option is disabled by default. ld linker is used, and is disabled by
It has no effect if a linker other than ld or GNU gold is used.

This option was added in MySQL 8.0.18.

- DCOMPILATION_COMMENT=string

A descriptive comment about the compilation environment. As of MySQL 8.0.14, mysqld uses
COMPILATION_COMMENT_SERVER. Other programs continue to use COMPILATION_COMMENT.

- DCOMPRESS_DEBUG_SECTIONS=bool

Whether to compress the debug sections of binary executables (Linux only). Compressing executable
deploy debug sections saves space at the cost of extra CPU time during the build process.

The default is OFF. If this option is not set explicitly but the COMPRESSION_DEBUG_SECTIONS environment
variable is set, the option takes its value from that variable.

This option was added in MySQL 8.0.22.

- DCOMPILATION_COMMENT_SERVER=string

A descriptive comment about the compilation environment for use by mysqld (for example, to set the
version_comment system variable). This option was added in MySQL 8.0.14. Prior to 8.0.14, the
server uses COMPILATION_COMMENT.

- DDEFAULT_CHARSET=charset_name

The server character set. By default, MySQL uses the utf8mb4 character set.

Charset_name may be one of binary, armSCII8, ascii, big5, cp1250, cp1251, cp1256,
cp1257, cp850, cp852, cp866, cp932, dec8, eucjpms, euckr, gb2312, gbk, geostd8,
Feature Options

greek, hebrew, hp8, keybcs2, koi8r, koi8u, latin1, latin2, latin5, latin7, macce, macroman, sjis, swe7, tis620, ucs2, ujis, utf8, utf8mb4, utf16, utf16le, utf32. The permissible character sets are listed in the cmake/character_sets.cmake file as the value of CHARSETS_AVAILABLE.

This value can be set at server startup with the --character_set_server option.

- \$\text{-DDEFAULT_COLLATION=collation\_name}\$

The server collation. By default, MySQL uses utf8mb4_0900_ai_ci. Use the SHOW COLLATION statement to determine which collations are available for each character set.

This value can be set at server startup with the --collation_server option.

- \$\text{-DDISABLE_PSI\_COND=bool}\$

Whether to exclude the Performance Schema condition instrumentation. The default is OFF (include).

- \$\text{-DDISABLE_PSI\_FILE=bool}\$

Whether to exclude the Performance Schema file instrumentation. The default is OFF (include).

- \$\text{-DDISABLE_PSI\_IDLE=bool}\$

Whether to exclude the Performance Schema idle instrumentation. The default is OFF (include).

- \$\text{-DDISABLE_PSI\_MEMORY=bool}\$

Whether to exclude the Performance Schema memory instrumentation. The default is OFF (include).

- \$\text{-DDISABLE_PSI\_METADATA=bool}\$

Whether to exclude the Performance Schema metadata instrumentation. The default is OFF (include).

- \$\text{-DDISABLE_PSI\_MUTEX=bool}\$

Whether to exclude the Performance Schema mutex instrumentation. The default is OFF (include).

- \$\text{-DDISABLE_PSI\_RWLOCK=bool}\$

Whether to exclude the Performance Schema rwlock instrumentation. The default is OFF (include).

- \$\text{-DDISABLE_PSI\_SOCKET=bool}\$

Whether to exclude the Performance Schema socket instrumentation. The default is OFF (include).

- \$\text{-DDISABLE_PSI\_SP=bool}\$

Whether to exclude the Performance Schema stored program instrumentation. The default is OFF (include).

- \$\text{-DDISABLE_PSI\_STAGE=bool}\$

Whether to exclude the Performance Schema stage instrumentation. The default is OFF (include).

- \$\text{-DDISABLE_PSI\_STATEMENT=bool}\$

Whether to exclude the Performance Schema statement instrumentation. The default is OFF (include).

- \$\text{-DDISABLE_PSI\_STATEMENT\_DIGEST=bool}\$
Feature Options

Whether to exclude the Performance Schema statement_digest instrumentation. The default is OFF (include).

- DDISABLE_PSI_TABLE=bool

Whether to exclude the Performance Schema table instrumentation. The default is OFF (include).

- DDISABLE_SHARED=bool

Whether to disable building build shared libraries and compile position-dependent code. The default is OFF (compile position-independent code).

This option is unused and was removed in MySQL 8.0.18.

- DDISABLE_PSI_PS=bool

Exclude the performance schema prepared statements instances instrumentation. The default is OFF (include).

- DDISABLE_PSI_THREAD=bool

Exclude the performance schema thread instrumentation. The default is OFF (include).

Only disable threads when building without any instrumentation, because other instrumentations have a dependency on threads.

- DDISABLE_PSI_TRANSACTION=bool

Exclude the performance schema transaction instrumentation. The default is OFF (include).

- DDISABLE_PSI_DATA_LOCK=bool

Exclude the performance schema data lock instrumentation. The default is OFF (include).

- DDISABLE_PSI_ERROR=bool

Exclude the performance schema server error instrumentation. The default is OFF (include).

- DDOWNLOAD_BOOST=bool

Whether to download the Boost library. The default is OFF.

See the WITH_BOOST option for additional discussion about using Boost.

- DDOWNLOAD_BOOST_TIMEOUT=seconds

The timeout in seconds for downloading the Boost library. The default is 600 seconds.

See the WITH_BOOST option for additional discussion about using Boost.

- DENABLE_DOWNLOADS=bool

Whether to download optional files. For example, with this option enabled, CMake downloads the Google Test distribution that is used by the test suite to run unit tests, or Ant and JUnit required for building GCS Java wrapper.

As of MySQL 8.0.26, MySQL source distributions bundle the Google Test source code, used to run Google Test-based unit tests. Consequently, as of that version the WITH_GMOCK and ENABLE_DOWNLOADS CMake options are removed and are ignored if specified.
Feature Options

• `-DENABLE_EXPERIMENTAL_SYSVARS=bool`

Whether to enable experimental InnoDB system variables. Experimental system variables are intended for those engaged in MySQL development, should only be used in a development or test environment, and may be removed without notice in a future MySQL release. For information about experimental system variables, refer to `/storage/innobase/handler/ha_innodb.cc` in the MySQL source tree. Experimental system variables can be identified by searching for “PLUGIN_VAR_EXPERIMENTAL”.

• `-DENABLE_GCOV=bool`

Whether to include gcov support (Linux only).

• `-DENABLE_GPROF=bool`

Whether to enable gprof (optimized Linux builds only).

• `-DENABLED_LOCAL_INFILE=bool`

This option controls the compiled-in default LOCAL capability for the MySQL client library. Clients that make no explicit arrangements therefore have LOCAL capability disabled or enabled according to the ENABLED_LOCAL_INFILE setting specified at MySQL build time.

By default, the client library in MySQL binary distributions is compiled with ENABLED_LOCAL_INFILE disabled. If you compile MySQL from source, configure it with ENABLED_LOCAL_INFILE disabled or enabled based on whether clients that make no explicit arrangements should have LOCAL capability disabled or enabled, respectively.

`ENABLED_LOCAL_INFILE` controls the default for client-side LOCAL capability. For the server, the `local_infile` system variable controls server-side LOCAL capability. To explicitly cause the server to refuse or permit LOAD DATA LOCAL statements (regardless of how client programs and libraries are configured at build time or runtime), start mysqld with `local_infile` disabled or enabled, respectively. `local_infile` can also be set at runtime. See Security Considerations for LOAD DATA LOCAL.

• `-DENABLED_PROFILING=bool`

Whether to enable query profiling code (for the SHOW PROFILE and SHOW PROFILES statements).

• `-DFORCE_UNSUPPORTED_COMPILER=bool`

By default, CMake checks for minimum versions of supported compilers: Visual Studio 2015 (Windows); GCC 4.8 or Clang 3.4 (Linux); Developer Studio 12.5 (Solaris server); Developer Studio 12.4 or GCC 4.8 (Solaris client library); Clang 3.6 (macOS), Clang 3.4 (FreeBSD). To disable this check, use `-DFORCE_UNSUPPORTED_COMPILER=ON`.

• `-DFPROFILE_GENERATE=bool`

Whether to generate profile guided optimization (PGO) data. This option is available for experimenting with PGO with GCC. See the `cmake/fprofile.cmake` file in a MySQL source distribution for information about using FPROFILE_GENERATE and FPROFILE_USE. These options have been tested with GCC 8 and 9.

This option was added in MySQL 8.0.19.
Feature Options

- **-DFPROFILE_USE=bool**
  Whether to use profile guided optimization (PGO) data. This option is available for experimenting with PGO with GCC. See the `cmake/fprofile.cmake` file in a MySQL source distribution for information about using `FPROFILE_GENERATE` and `FPROFILE_USE`. These options have been tested with GCC 8 and 9.

  Enabling `FPROFILE_USE` also enables `WITH_LTO`.

  This option was added in MySQL 8.0.19.

- **-DHAVE_PSI_MEMORY_INTERFACE=bool**
  Whether to enable the performance schema memory tracing module for memory allocation functions (`ut::aligned_name` library functions) used in dynamic storage of over-aligned types.

- **-DIGNORE_AIO_CHECK=bool**
  If the `-DBUILD_CONFIG=mysql_release` option is given on Linux, the `libaio` library must be linked in by default. If you do not have `libaio` or do not want to install it, you can suppress the check for it by specifying `-DIGNORE_AIO_CHECK=1`.

- **-DMAX_INDEXES=num**
  The maximum number of indexes per table. The default is 64. The maximum is 255. Values smaller than 64 are ignored and the default of 64 is used.

- **-DMYSQL_MAINTAINER_MODE=bool**
  Whether to enable a MySQL maintainer-specific development environment. If enabled, this option causes compiler warnings to become errors.

- **-DMUTEX_TYPE=type**
  The mutex type used by InnoDB. Options include:
  - `event`: Use event mutexes. This is the default value and the original InnoDB mutex implementation.
  - `sys`: Use POSIX mutexes on UNIX systems. Use `CRITICAL_SECTION` objects on Windows, if available.
  - `futex`: Use Linux futexes instead of condition variables to schedule waiting threads.

- **-DMYSQL_TCP_PORT=port_num**
  The port number on which X Plugin listens for TCP/IP connections. The default is 33060.

  This value can be set at server startup with the `mysqlx_port` system variable.

- **-DMYSQL_UNIX_ADDR=file_name**
  The Unix socket file path on which the server listens for X Plugin socket connections. This must be an absolute path name. The default is `/tmp/mysqlx.sock`.

  This value can be set at server startup with the `mysqlx_port` system variable.

- **-DMYSQL_PROJECT_NAME=name**
  For Windows or macOS, the project name to incorporate into the project file name.
Feature Options

• `-DMYSQL_TCP_PORT=port_num`

  The port number on which the server listens for TCP/IP connections. The default is 3306.

  This value can be set at server startup with the `--port` option.

• `-DMYSQL_UNIX_ADDR=file_name`

  The Unix socket file path on which the server listens for socket connections. This must be an absolute path name. The default is `/tmp/mysql.sock`.

  This value can be set at server startup with the `--socket` option.

• `-DOPTIMIZER_TRACE=bool`

  Whether to support optimizer tracing. See MySQL Internals: Tracing the Optimizer.

• `-DREPRODUCIBLE_BUILD=bool`

  For builds on Linux systems, this option controls whether to take extra care to create a build result independent of build location and time.

  This option was added in MySQL 8.0.11. As of MySQL 8.0.12, it defaults to `ON` for `RelWithDebInfo` builds.

• `-DUSE_LD_GOLD=bool`

  CMake causes the build process to link with the GNU gold linker if it is available and not explicitly disabled. To disable use of this linker, specify the `-DUSE_LD_GOLD=OFF` option.

• `-DUSE_LD_LLD=bool`

  CMake causes the build process to link with the llvm lld linker for Clang if it is available and not explicitly disabled. To disable use of this linker, specify the `-DUSE_LD_LLD=OFF` option.

  This option was added in MySQL 8.0.16.

• `-DWIN_DEBUG_NO_INLINE=bool`

  Whether to disable function inlining on Windows. The default is off (inlining enabled).

• `-DWITH_ANT=path_name`

  Set the path to Ant, required when building GCS Java wrapper. Works in a similar way to the existing `WITH_BOOST` CMake option. Set `WITH_ANT` to the path of a directory where the Ant tarball, or an already unpacked archive, is saved. When `WITH_ANT` is not set, or is set with the special value `system`, the build assumes a binary `ant` exists in `$PATH`.

• `-DWITH_ASAN=bool`

  Whether to enable the AddressSanitizer, for compilers that support it. The default is off.

• `-DWITH_ASAN_SCOPE=bool`

  Whether to enable the AddressSanitizer `-fsanitize-address-use-after-scope` Clang flag for use-after-scope detection. The default is off. To use this option, `-DWITH_ASAN` must also be enabled.

• `-DWITH_AUTHENTICATION_CLIENT_PLUGINS=bool`

  Whether to enable the Authentication Client Plugins.
Feature Options

This option is enabled automatically if any corresponding server authentication plugins are built. Its value thus depends on other CMake options and it should not be set explicitly.

This option was added in MySQL 8.0.26.

- **-DWITH_AUTHENTICATION_LDAP=bool**

Whether to report an error if the LDAP authentication plugins cannot be built:

- If this option is disabled (the default), the LDAP plugins are built if the required header files and libraries are found. If they are not, CMake displays a note about it.

- If this option is enabled, a failure to find the required header file and libraries causes CMake to produce an error, preventing the server from being built.

- **-DWITH_AUTHENTICATION_PAM=bool**

Whether to build the PAM authentication plugin, for source trees that include this plugin. (See PAM Pluggable Authentication.) If this option is specified and the plugin cannot be compiled, the build fails.

- **-DWITH_AWS_SDK=path_name**

The location of the Amazon Web Services software development kit.

- **-DWITH_BOOST=path_name**

The Boost library is required to build MySQL. These CMake options enable control over the library source location, and whether to download it automatically:

  - **-DWITH_BOOST=path_name** specifies the Boost library directory location. It is also possible to specify the Boost location by setting the BOOST_ROOT or WITH_BOOST environment variable.

  - **-DWITH_BOOST=system** is also permitted and indicates that the correct version of Boost is installed on the compilation host in the standard location. In this case, the installed version of Boost is used rather than any version included with a MySQL source distribution.

  - **-DDOWNLOAD_BOOST=bool** specifies whether to download the Boost source if it is not present in the specified location. The default is OFF.

  - **-DDOWNLOAD_BOOST_TIMEOUT=seconds** the timeout in seconds for downloading the Boost library. The default is 600 seconds.

For example, if you normally build MySQL placing the object output in the bld subdirectory of your MySQL source tree, you can build with Boost like this:

```bash
mkdir bld
cd bld
cmake .. -DDOWNLOAD_BOOST=ON -DWITH_BOOST=$HOME/my_boost
```

This causes Boost to be downloaded into the my_boost directory under your home directory. If the required Boost version is already there, no download is done. If the required Boost version changes, the newer version is downloaded.

If Boost is already installed locally and your compiler finds the Boost header files on its own, it may not be necessary to specify the preceding CMake options. However, if the version of Boost required by MySQL changes and the locally installed version has not been upgraded, you may have build problems. Using the CMake options should give you a successful build.
With the above settings that allow Boost download into a specified location, when the required Boost version changes, you need to remove the `bld` folder, recreate it, and perform the `cmake` step again. Otherwise, the new Boost version might not get downloaded, and compilation might fail.

- **-DWITH_CLIENT_PROTOCOL_TRACING=bool**

  Whether to build the client-side protocol tracing framework into the client library. By default, this option is enabled.

  For information about writing protocol trace client plugins, see Writing Protocol Trace Plugins.

  See also the `WITH_TEST_TRACE_PLUGIN` option.

- **-DWITH_CURL=curl_type**

  The location of the `curl` library. `curl_type` can be `system` (use the system `curl` library) or a path name to the `curl` library.

- **-DWITH_DEBUG=bool**

  Whether to include debugging support.

  Configuring MySQL with debugging support enables you to use the `--debug="d,parser_debug"` option when you start the server. This causes the Bison parser that is used to process SQL statements to dump a parser trace to the server's standard error output. Typically, this output is written to the error log.

  Sync debug checking for the InnoDB storage engine is defined under `UNIV_DEBUG` and is available when debugging support is compiled in using the `WITH_DEBUG` option. When debugging support is compiled in, the `innodb_sync_debug` configuration option can be used to enable or disable InnoDB sync debug checking.

  Enabling `WITH_DEBUG` also enables Debug Sync. This facility is used for testing and debugging. When compiled in, Debug Sync is disabled by default at runtime. To enable it, start `mysqld` with the `--debug-sync-timeout=N` option, where `N` is a timeout value greater than 0. (The default value is 0, which disables Debug Sync.) `N` becomes the default timeout for individual synchronization points.

  Sync debug checking for the InnoDB storage engine is available when debugging support is compiled in using the `WITH_DEBUG` option.

  For a description of the Debug Sync facility and how to use synchronization points, see MySQL Internals: Test Synchronization.

- **-DWITH_DEFAULT_FEATURE_SET=bool**

  Whether to use the flags from `cmake/build_configurations/feature_set.cmake`. This option was removed in MySQL 8.0.22.

- **-DWITH_EDITLINE=value**

  Which `libedit/editline` library to use. The permitted values are `bundled` (the default) and `system`.
Feature Options

- **-DWITH_FIDO=fido_type**

The `authentication_fido` authentication plugin is implemented using a FIDO library (see FIDO Pluggable Authentication). The `WITH_FIDO` option indicates the source of FIDO support:

- **bundled**: Use the FIDO library bundled with the distribution. This is the default.
- **system**: Use the system FIDO library.

This option was added in MySQL 8.0.27.

- **-DWITH_GMOCK=path_name**

The path to the googlemock distribution, for use with Google Test-based unit tests. The option value is the path to the distribution Zip file. Alternatively, set the `WITH_GMOCK` environment variable to the path name. It is also possible to use `-DENABLE_DOWNLOADS=1`, so that CMake downloads the distribution from GitHub.

If you build MySQL without the Google Test-based unit tests (by configuring without `WITH_GMOCK`), CMake displays a message indicating how to download it.

As of MySQL 8.0.26, MySQL source distributions bundle the Google Test source code, used to run Google Test-based unit tests. Consequently, as of that version the `WITH_GMOCK` and `ENABLE_DOWNLOADS` CMake options are removed and are ignored if specified.

- **-DWITH_ICU={icu_type|path_name}**

MySQL uses International Components for Unicode (ICU) to support regular expression operations. The `WITH_ICU` option indicates the type of ICU support to include or the path name to the ICU installation to use.

- **icu_type** can be one of the following values:
  - **bundled**: Use the ICU library bundled with the distribution. This is the default, and is the only supported option for Windows.
  - **system**: Use the system ICU library.

- **path_name** is the path name to the ICU installation to use. This can be preferable to using the `icu_type` value of `system` because it can prevent CMake from detecting and using an older or incorrect ICU version installed on the system. (Another permitted way to do the same thing is to set `WITH_ICU` to `system` and set the `CMAKE_PREFIX_PATH` option to `path_name`.)

- **-DWITH_INNODB_EXTRA_DEBUG=bool**

Whether to include extra InnoDB debugging support.

Enabling `WITH_INNODB_EXTRA_DEBUG` turns on extra InnoDB debug checks. This option can only be enabled when `WITH_DEBUG` is enabled.

- **-DWITH_INNODB_MEMCACHED=bool**

Whether to generate memcached shared libraries (`libmemcached.so` and `innodb_engine.so`).

- **-DWITH_JEMALLOC=bool**

Whether to link with `-ljemalloc`. If enabled, built-in `malloc()`, `calloc()`, `realloc()`, and `free()` routines are disabled. The default is OFF.
WITH_JEMALLOC and WITH_TCMALLOC are mutually exclusive.

This option was added in MySQL 8.0.16.

- \texttt{-DWITH\_WIN\_JEMALLOC=string}

On Windows, pass in a path to a directory containing \texttt{jemalloc.dll} to enable jemalloc functionality. The build system copies \texttt{jemalloc.dll} to the same directory as \texttt{mysqld.exe} and/or \texttt{mysqld-debug.exe} and utilizes it for memory management operations. Standard memory functions are used if \texttt{jemalloc.dll} is not found or does not export the required functions. An INFORMATION level log message records whether or not jemalloc is found and used.

This option is enabled for official MySQL binaries for Windows.

This option was added in MySQL 8.0.29.

- \texttt{-DWITH\_KEYRING\_TEST=bool}

Whether to build the test program that accompanies the \texttt{keyring\_file} plugin. The default is \texttt{OFF}. Test file source code is located in the \texttt{plugin/keyring/keyring-test} directory.

- \texttt{-DWITH\_LIBEVENT=string}

Which \texttt{libevent} library to use. Permitted values are \texttt{bundled} (default) and \texttt{system}. Prior to MySQL 8.0.21, if you specify \texttt{system}, the system \texttt{libevent} library is used if present, and an error occurs otherwise. In MySQL 8.0.21 and later, if \texttt{system} is specified and no system \texttt{libevent} library can be found, an error occurs regardless, and the bundled \texttt{libevent} is not used.

The \texttt{libevent} library is required by InnoDB memcached, X Plugin, and MySQL Router.

- \texttt{-DWITH\_LIBWRAP=bool}

Whether to include \texttt{libwrap} (TCP wrappers) support.

- \texttt{-DWITH\_LOCK\_ORDER=bool}

Whether to enable LOCK\_ORDER tooling. By default, this option is disabled and server builds contain no tooling. If tooling is enabled, the LOCK\_ORDER tool is available and can be used as described in The LOCK\_ORDER Tool.

\begin{itemize}
  \item Note
  
  With the \texttt{WITH\_LOCK\_ORDER} option enabled, MySQL builds require the \texttt{flex} program.
\end{itemize}

This option was added in MySQL 8.0.17.

- \texttt{-DWITH\_LSAN=bool}

Whether to run LeakSanitizer, without AddressSanitizer. The default is \texttt{OFF}.

This option was added in MySQL 8.0.16.

- \texttt{-DWITH\_LTO=bool}

Whether to enable the link-time optimizer, if the compiler supports it. The default is \texttt{OFF} unless \texttt{FPROFILE\_USE} is enabled.
This option was added in MySQL 8.0.13.

- **-DWITH_LZ4=** *lz4_type*

The `WITH_LZ4` option indicates the source of `zlib` support:

- **bundled**: Use the `lz4` library bundled with the distribution. This is the default.
- **system**: Use the system `lz4` library. If `WITH_LZ4` is set to this value, the `lz4_decompress` utility is not built. In this case, the system `lz4` command can be used instead.

- **-DWITH_LZMA=** *lzma_type*

The type of LZMA library support to include. `lzma_type` can be one of the following values:

- **bundled**: Use the LZMA library bundled with the distribution. This is the default.
- **system**: Use the system LZMA library.

This option was removed in MySQL 8.0.16.

- **-DWITH_MECAB={disabled|system|path_name}**

Use this option to compile the MeCab parser. If you have installed MeCab to its default installation directory, set `-DWITH_MECAB=system`. The `system` option applies to MeCab installations performed from source or from binaries using a native package management utility. If you installed MeCab to a custom installation directory, specify the path to the MeCab installation. For example, `-DWITH_MECAB=/opt/mecab`. If the `system` option does not work, specifying the MeCab installation path should work in all cases.

For related information, see MeCab Full-Text Parser Plugin.

- **-DWITH_MSAN=bool**

Whether to enable MemorySanitizer, for compilers that support it. The default is off.

For this option to have an effect if enabled, all libraries linked to MySQL must also have been compiled with the option enabled.

- **-DWITH_MSCRT_DEBUG=bool**

Whether to enable Visual Studio CRT memory leak tracing. The default is OFF.

- **-DWITH_MYSQLX=bool**

Whether to build with support for X Plugin. Default ON. See Using MySQL as a Document Store.

- **-DWITH_NUMA=bool**

Explicitly set the NUMA memory allocation policy. CMake sets the default `WITH_NUMA` value based on whether the current platform has NUMA support. For platforms without NUMA support, CMake behaves as follows:

- With no NUMA option (the normal case), CMake continues normally, producing only this warning: NUMA library missing or required version not available
- With `-DWITH_NUMA=ON`, CMake aborts with this error: NUMA library missing or required version not available
• **-DWITH_PACKAGE_FLAGS=bool**

For flags typically used for RPM and Debian packages, whether to add them to standalone builds on those platforms. The default is **ON** for nondebug builds.

This option was added in MySQL 8.0.26.

• **-DWITH_PROTOBUF=protobuf_type**

Which Protocol Buffers package to use. **protobuf_type** can be one of the following values:

- **bundled**: Use the package bundled with the distribution. This is the default. Optionally use INSTALL_PRIV_LIBDIR to modify the dynamic Protobuf library directory.

- **system**: Use the package installed on the system.

Other values are ignored, with a fallback to bundled.

• **-DWITH_RAPID=bool**

Whether to build the rapid development cycle plugins. When enabled, a **rapid** directory is created in the build tree containing these plugins. When disabled, no **rapid** directory is created in the build tree. The default is **ON**, unless the **rapid** directory is removed from the source tree, in which case the default becomes **OFF**.

• **-DWITH_RAPIDJSON=rapidjson_type**

The type of RapidJSON library support to include. **rapidjson_type** can be one of the following values:

- **bundled**: Use the RapidJSON library bundled with the distribution. This is the default.

- **system**: Use the system RapidJSON library. Version 1.1.0 or higher is required.

This option was added in MySQL 8.0.13.

• **-DWITH_RE2=re2_type**

The type of RE2 library support to include. **re2_type** can be one of the following values:

- **bundled**: Use the RE2 library bundled with the distribution. This is the default.

- **system**: Use the system RE2 library.

As of MySQL 8.0.18, MySQL no longer uses the RE2 library and this option was removed.

• **-DWITH_ROUTER=bool**

Whether to build MySQL Router. The default is **ON**.

This option was added in MySQL 8.0.16.
• **-DWITH_SSL=** `{ssl_type|path_name}`

For support of encrypted connections, entropy for random number generation, and other encryption-related operations, MySQL must be built using an SSL library. This option specifies which SSL library to use.

• **ssl_type** can be one of the following values:
  
  • **system**: Use the system OpenSSL library. This is the default.

    On macOS and Windows, using **system** configures MySQL to build as if CMake was invoked with **path_name** points to a manually installed OpenSSL library. This is because they do not have system SSL libraries. On macOS, `brew install openssl` installs to `/usr/local/opt/openssl` so that **system** can find it. On Windows, it checks `%ProgramFiles%/OpenSSL, %ProgramFiles%/OpenSSL-Win32, %ProgramFiles%/OpenSSL-Win64, C:/OpenSSL, C:/OpenSSL-Win32, and C:/OpenSSL-Win64`.

  • **yes**: This is a synonym for **system**.

    • **path_name** is the path name to the OpenSSL installation to use. This can be preferable to using the **ssl_type** value of **system** because it can prevent CMake from detecting and using an older or incorrect OpenSSL version installed on the system. (Another permitted way to do the same thing is to set `WITH_SSL` to **system** and set the `CMAKE_PREFIX_PATH` option to **path_name**.)

For additional information about configuring the SSL library, see Configuring SSL Library Support.

• **-DWITH_SYSTEMD=bool**

Whether to enable installation of systemd support files. By default, this option is disabled. When enabled, systemd support files are installed, and scripts such as `mysqld_safe` and the System V initialization script are not installed. On platforms where systemd is not available, enabling **WITH_SYSTEMD** results in an error from CMake.

For more information about using systemd, see Managing MySQL Server with systemd. That section also includes information about specifying options previously specified in `[mysqld_safe]` option groups. Because `mysqld_safe` is not installed when systemd is used, such options must be specified another way.

• **-DWITH_SYSTEMD_LIBS=bool**

This option serves as an "umbrella" option to set the **system** value of any of the following CMake options that are not set explicitly: `WITH CURL, WITH_EDITLINE, WITH FIDO, WITH ICU, WITH LibEvent, WITH LZ4, WITH LZMA, WITH ProtoBuf, WITH Re2, WITH SSL, WITH ZLIB, WITH ZSTD`.

• **-DWITH_SYSTEMD_DEBUG=bool**

Whether to produce additional systemd debugging information, for platforms on which systemd is used to run MySQL. The default is **OFF**.

This option was added in MySQL 8.0.22.

• **-DWITH_TCMALLOC=bool**

Whether to link with `-ltcmalloc`. If enabled, built-in `malloc()`, `calloc()`, `realloc()`, and `free()` routines are disabled. The default is **OFF**.

**WITH_TCMALLOC** and **WITH_JEMALLOC** are mutually exclusive.
This option was added in MySQL 8.0.22.

- `-DWITH_TEST_TRACE_PLUGIN=bool`

Whether to build the test protocol trace client plugin (see Using the Test Protocol Trace Plugin). By default, this option is disabled. Enabling this option has no effect unless the WITH_CLIENT_PROTOCOL_TRACING option is enabled. If MySQL is configured with both options enabled, the libmysqlclient client library is built with the test protocol trace plugin built in, and all the standard MySQL clients load the plugin. However, even when the test plugin is enabled, it has no effect by default. Control over the plugin is afforded using environment variables; see Using the Test Protocol Trace Plugin.

**Note**

Do not enable the `WITH_TEST_TRACE_PLUGIN` option if you want to use your own protocol trace plugins because only one such plugin can be loaded at a time and an error occurs for attempts to load a second one. If you have already built MySQL with the test protocol trace plugin enabled to see how it works, you must rebuild MySQL without it before you can use your own plugins.

For information about writing trace plugins, see Writing Protocol Trace Plugins.

- `-DWITH_TSAN=bool`

Whether to enable the ThreadSanitizer, for compilers that support it. The default is off.

- `-DWITH_UBSAN=bool`

Whether to enable the Undefined Behavior Sanitizer, for compilers that support it. The default is off.

- `-DWITH_UNIT_TESTS={ON|OFF}`

If enabled, compile MySQL with unit tests. The default is ON unless the server is not being compiled.

- `-DWITH_UNIXODBC=1`

Enables unixODBC support, for Connector/ODBC.

- `-DWITH_VALGRIND=bool`

Whether to compile in the Valgrind header files, which exposes the Valgrind API to MySQL code. The default is OFF.

To generate a Valgrind-aware debug build, `-DWITH_VALGRIND=1` normally is combined with `-DWITH_DEBUG=1`. See Building Debug Configurations.

- `-DWITH_ZLIB=zlib_type`

Some features require that the server be built with compression library support, such as the `COMPRESS()` and `UNCOMPRESS()` functions, and compression of the client/server protocol. The `WITH_ZLIB` option indicates the source of zlib support:

- `bundled`: Use the `zlib` library bundled with the distribution. This is the default.

- `system`: Use the system `zlib` library. If `WITH_ZLIB` is set to this value, the `zlib_decompress` utility is not built. In this case, the system `openssl zlib` command can be used instead.

- `-DWITH_ZSTD=zstd_type`
Connection compression using the `zstd` algorithm (see Connection Compression Control) requires that the server be built with `zstd` library support. The `WITH_ZSTD` option indicates the source of `zstd` support:

- **bundled**: Use the `zstd` library bundled with the distribution. This is the default.
- **system**: Use the system `zstd` library.

This option was added in MySQL 8.0.18.

## Compiler Flags

- **-DCMAKE_C_FLAGS="flags"**
  Flags for the C Compiler.

- **-DCMAKE_CXX_FLAGS="flags"**
  Flags for the C++ Compiler.

- **-DWITH_DEFAULT_COMPILER_OPTIONS=bool**
  Whether to use the flags from `cmake/build_configurations/compiler_options.cmake`.

### Note

All optimization flags were carefully chosen and tested by the MySQL build team. Overriding them can lead to unexpected results and is done at your own risk.

To specify your own C and C++ compiler flags, for flags that do not affect optimization, use the `CMAKE_C_FLAGS` and `CMAKE_CXX_FLAGS` CMake options.

When providing your own compiler flags, you might want to specify `CMAKE_BUILD_TYPE` as well.

For example, to create a 32-bit release build on a 64-bit Linux machine, do this:

```bash
cd bld
make .. -DCMAKE_C_FLAGS=-m32 \
-DCMAKE_CXX_FLAGS=-m32 \
-DCMAKE_BUILD_TYPE=RelWithDebInfo
```

If you set flags that affect optimization (\texttt{-O\textit{number}}), you must set the `CMAKE_C_FLAGS\_build\_type` and/or `CMAKE_CXX_FLAGS\_build\_type` options, where \textit{build\_type} corresponds to the `CMAKE\_BUILD\_TYPE` value. To specify a different optimization for the default build type (RelWithDebInfo) set the `CMAKE\_C\_FLAGS\_RELWITHDEBINFO` and `CMAKE\_CXX\_FLAGS\_RELWITHDEBINFO` options. For example, to compile on Linux with `\texttt{-O3}` and with debug symbols, do this:

```bash
cmake .. -DCMAKE_C_FLAGS\_RELWITHDEBINFO="-O3 -g" \
-DCMAKE_CXX_FLAGS\_RELWITHDEBINFO="-O3 -g"
```

## CMake Options for Compiling NDB Cluster

The following options are for use when building MySQL 8.0 sources with NDB Cluster support.

- **-DMEMCACHED\_HOME=\textit{dir\_name}**
CMake Options for Compiling NDB Cluster

Perform the build using the memcached (version 1.6 or later) installed in the system directory indicated by `dir_name`. Files from this installation that are used in the build include the memcached binary, header files, and libraries, as well as the `memcached_utilities` library and the header file `engine_testapp.h`.

You must leave this option unset when building `ndbmemcache` using the bundled memcached sources (with `-DWITH_BUNDLED_MEMCACHED` option); in other words, the bundled sources are used by default).

While additional CMake options—such as for SASL authorization and for providing dtrace support—are available for use when compiling `memcached` from external sources, these options are currently not enabled for the `memcached` sources bundled with NDB Cluster.

- `-NDB_UTILS_LINK_DYNAMIC={ON|OFF}`

Controls whether NDB utilities such as `ndb_drop_table` are linked with `ndbclient` statically (`OFF`) or dynamically (`ON`); `OFF` (static linking) is the default. Normally static linking is used when building these to avoid problems with `LD_LIBRARY_PATH`, or when multiple versions of `ndbclient` are installed. This option is intended for creating Docker images and possibly other cases in which the target environment is subject to precise control and it is desirable to reduce image size.

Added in NDB 8.0.22.

- `-DWITH_BUNDLED_LIBEVENT={ON|OFF}`

Use the `libevent` included in the NDB Cluster sources when building NDB Cluster with `ndbmemcached` support. Enabled by default. `OFF` causes the system's `libevent` to be used instead.

- `-DWITH_BUNDLED_MEMCACHED={ON|OFF}`

Build the memcached sources included in the NDB Cluster source tree, then use the resulting memcached server when building the `ndbmemcache` engine. In this case, `make install` places the memcached binary in the installation `bin` directory, and the `ndbmemcache` engine shared library file `ndb_engine.so` in the installation `lib` directory.

This option is ON by default.

- `-DWITH_CLASSPATH=path`

Sets the classpath for building NDB Cluster Connector for Java. The default is empty. This option is ignored if `-DWITH_NDB_JAVA=OFF` is used.

- `-DWITH_ERROR_INSERT={ON|OFF}`

Enables error injection in the `NDB` kernel. For testing only; not intended for use in building production binaries. The default is `OFF`.

- `-DWITH_NDBAPI_EXAMPLES={ON|OFF}`

Build API example programs in `storage/ndb/ndbapi-examples/`.

- `-DWITH_NDBCLUSTER_STORAGE_ENGINE={ON|OFF}`

This is an alias for `-DWITH_NDBCLUSTER`.

- `-DWITH_NDBCLUSTER={ON|OFF}`

Build and link in support for the `NDB` (`NDBCLUSTER`) storage engine in `mysql`. The default is `ON`.
CMake Options for Compiling NDB Cluster

- **-DWITH_NDBMTD={ON|OFF}**
  Build the multithreaded data node executable `ndbmtd`. The default is ON.

- **-DWITH_NDB_DEBUG={ON|OFF}**
  Enable building the debug versions of the NDB Cluster binaries. OFF by default.

- **-DWITH_NDB_JAVA={ON|OFF}**
  Enable building NDB Cluster with Java support, including `ClusterJ`.
  This option is ON by default. If you do not wish to compile NDB Cluster with Java support, you must disable it explicitly by specifying `-DWITH_NDB_JAVA=OFF` when running `CMake`. Otherwise, if Java cannot be found, configuration of the build fails.

- **-DWITH_NDB_PORT=port**
  Causes the NDB Cluster management server (`ndb_mgmd`) that is built to use this `port` by default. If this option is unset, the resulting management server tries to use port 1186 by default.

- **-DWITH_NDB_TEST={ON|OFF}**
  If enabled, include a set of NDB API test programs. The default is OFF.

- **-DWITH_PLUGIN_NDBCLUSTER={ON|OFF}**
  Alias for `WITH_NDBCLUSTER`. 

Chapter 5 Dealing with Problems Compiling MySQL

The solution to many problems involves reconfiguring. If you do reconfigure, take note of the following:

- If CMake is run after it has previously been run, it may use information that was gathered during its previous invocation. This information is stored in CMakeCache.txt. When CMake starts, it looks for that file and reads its contents if it exists, on the assumption that the information is still correct. That assumption is invalid when you reconfigure.

- Each time you run CMake, you must run make again to recompile. However, you may want to remove old object files from previous builds first because they were compiled using different configuration options.

To prevent old object files or configuration information from being used, run the following commands before re-running CMake:

On Unix:

```bash
$> make clean
$> rm CMakeCache.txt
```

On Windows:

```bash
$> devenv MySQL.sln /clean
$> del CMakeCache.txt
```

If you build outside of the source tree, remove and recreate your build directory before re-running CMake. For instructions on building outside of the source tree, see How to Build MySQL Server with CMake.

On some systems, warnings may occur due to differences in system include files. The following list describes other problems that have been found to occur most often when compiling MySQL:

- To define which C and C++ compilers to use, you can define the CC and CXX environment variables. For example:

```bash
$> CC=gcc
$> CXX=g++
$> export CC CXX
```

To specify your own C and C++ compiler flags, use the CMAKE_C_FLAGS and CMAKE_CXX_FLAGS CMake options. See Compiler Flags.

To see what flags you might need to specify, invoke mysql_config with the --cflags and --cxxflags options.

- To see what commands are executed during the compile stage, after using CMake to configure MySQL, run make VERBOSE=1 rather than just make.

- If compilation fails, check whether the MYSQL_MAINTAINER_MODE option is enabled. This mode causes compiler warnings to become errors, so disabling it may enable compilation to proceed.

- If your compile fails with errors such as any of the following, you must upgrade your version of make to GNU make:

```bash
make: Fatal error in reader: Makefile, line 18:
Badly formed macro assignment
```

Or:

```bash
make: file `Makefile' line 18: Must be a separator (:)
```
Or:

(pthread.h: No such file or directory)

Solaris and FreeBSD are known to have troublesome `make` programs.

GNU `make` 3.75 is known to work.

- The `sql_yacc.cc` file is generated from `sql_yacc.yy`. Normally, the build process does not need to create `sql_yacc.cc` because MySQL comes with a pregenerated copy. However, if you do need to re-create it, you might encounter this error:

  "sql_yacc.yy", line xxx fatal: default action causes potential...

This is a sign that your version of `yacc` is deficient. You probably need to install a recent version of `bison` (the GNU version of `yacc`) and use that instead.

Versions of `bison` older than 1.75 may report this error:

`sql_yacc.yy:#####: fatal error: maximum table size (32767) exceeded`

The maximum table size is not actually exceeded; the error is caused by bugs in older versions of `bison`.

For information about acquiring or updating tools, see the system requirements in Chapter 1, *Installing MySQL from Source*.
