int mysql_stmt_execute(MYSQL_STMT *stmt)

Description

`mysql_stmt_execute()` executes the prepared query associated with the statement handle. The currently bound parameter marker values are sent to server during this call, and the server replaces the markers with this newly supplied data.

Statement processing following `mysql_stmt_execute()` depends on the type of statement:

- For an UPDATE, DELETE, or INSERT, the number of changed, deleted, or inserted rows can be found by calling `mysql_stmt_affected_rows()`.
- For a statement such as SELECT that generates a result set, you must call `mysql_stmt_fetch()` to fetch the data prior to calling any other functions that result in query processing. For more information on how to fetch the results, refer to Section 17.6.10.11, "mysql_stmt_fetch()".

Do not following invocation of `mysql_stmt_execute()` with a call to `mysql_store_result()` or `mysql_use_result()`. Those functions are not intended for processing results from prepared statements.

For statements that generate a result set, you can request that `mysql_stmt_execute()` open a cursor for the statement by calling `mysql_stmt_attr_set()` before executing the statement. If you execute a statement multiple times, `mysql_stmt_execute()` closes any open cursor before opening a new one.

This function was added in MySQL 4.1.2.

Return Values

Zero if execution was successful. Nonzero if an error occurred.

Errors

- **CR_COMMANDS_OUT_OF_SYNC**
  
  Commands were executed in an improper order.
- **CR_OUT_OF_MEMORY**
  
  Out of memory.
- **CR_SERVER_GONE_ERROR**
  
  The MySQL server has gone away.
- **CR_SERVER_LOST**
  
  The connection to the server was lost during the query.
- **CR_UNKNOWN_ERROR**
  
  An unknown error occurred.

Example

The following example demonstrates how to create and populate a table using `mysql_stmt_init()`, `mysql_stmt_prepare()`, `mysql_stmt_param_count()`, `mysql_stmt_bind_param()`, `mysql_stmt_execute()`, and `mysql_stmt_affected_rows()`. The `mysql` variable is assumed to
be a valid connection handle. For an example that shows how to retrieve data, see Section 17.6.10.11, "mysql_stmt_fetch()".

```c
#define STRING_SIZE 50
#define DROP_SAMPLE_TABLE "DROP TABLE IF EXISTS test_table"
#define CREATE_SAMPLE_TABLE "CREATE TABLE test_table(col1 INT,\n    col2 VARCHAR(40),\n    col3 SMALLINT,\n    col4 TIMESTAMP)"
#define INSERT_SAMPLE "INSERT INTO \n    test_table(col1,col2,col3) \n    VALUES(?,?,?)"

MYSQL_STMT *stmt;
MYSQL_BIND bind[3];
my_ulonglong affected_rows;
int param_count;
short small_data;
int int_data;
char str_data[STRING_SIZE];
unsigned long str_length;
my_bool is_null;

if (mysql_query(mysql, DROP_SAMPLE_TABLE))
{
    fprintf(stderr, " DROP TABLE failed\n");
    fprintf(stderr, "%s\n", mysql_error(mysql));
    exit(0);
}

if (mysql_query(mysql, CREATE_SAMPLE_TABLE))
{
    fprintf(stderr, " CREATE TABLE failed\n");
    fprintf(stderr, "%s\n", mysql_error(mysql));
    exit(0);
}

/* Prepare an INSERT query with 3 parameters */
/* (the TIMESTAMP column is not named; the server */
/*  sets it to the current date and time) */
stmt = mysql_stmt_init(mysql);
if (!stmt)
{
    fprintf(stderr, " mysql_stmt_init(), out of memory\n");
    exit(0);
}

if (mysql_stmt_prepare(stmt, INSERT_SAMPLE, strlen(INSERT_SAMPLE)))
{
    fprintf(stderr, " mysql_stmt_prepare(), INSERT failed\n");
    fprintf(stderr, "%s\n", mysql_stmt_error(stmt));
    exit(0);
}

fprintf(stdout, " prepare, INSERT successful\n");

/* Get the parameter count from the statement */
param_count= mysql_stmt_param_count(stmt);
if (param_count != 3) /* validate parameter count */
{
    fprintf(stderr, " invalid parameter count returned by MySQL\n");
    exit(0);
}

/* Bind the data for all 3 parameters */
```
memset(bind, 0, sizeof(bind));

/* INTEGER PARAM */
/* This is a number type, so there is no need
to specify buffer_length */
bind[0].buffer_type= MYSQL_TYPE_LONG;
bind[0].buffer= (char *)&int_data;
bind[0].is_null= 0;
bind[0].length= 0;

/* STRING PARAM */
bind[1].buffer_type= MYSQL_TYPE_STRING;
bind[1].buffer= (char *)str_data;
bind[1].buffer_length= STRING_SIZE;
bind[1].is_null= 0;
bind[1].length= &str_length;

/* SMALLINT PARAM */
bind[2].buffer_type= MYSQL_TYPE_SHORT;
bind[2].buffer= (char *)&small_data;
bind[2].is_null= &is_null;
bind[2].length= 0;

/* Bind the buffers */
if (mysql_stmt_bind_param(stmt, bind))
{
  fprintf(stderr, " mysql_stmt_bind_param() failed\n");
  fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
  exit(0);
}

/* Specify the data values for the first row */
int_data= 10;   /* integer */
strcpy(str_data, "MySQL", STRING_SIZE);   /* string */
str_length= strlen(str_data);

/* INSERT SMALLINT data as NULL */
is_null= 1;

/* Execute the INSERT statement - 1*/
if (mysql_stmt_execute(stmt))
{
  fprintf(stderr, " mysql_stmt_execute(), 1 failed\n");
  fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
  exit(0);
}

/* Get the number of affected rows */
affected_rows= mysql_stmt_affected_rows(stmt);
fprintf(stdout, " total affected rows(insert 1): %lu\n",
        (unsigned long) affected_rows);
if (affected_rows != 1) /* validate affected rows */
{
  fprintf(stderr, " invalid affected rows by MySQL\n");
  exit(0);
}

/* Specify data values for second row,
then re-execute the statement */
int_data= 1000;
strcpy(str_data, "The most popular Open Source database",
      STRING_SIZE);
str_length= strlen(str_data);
small_data= 1000;   /* smallint */
is_null= 0;               /* reset */
/* Execute the INSERT statement - 2*/
if (mysql_stmt_execute(stmt))
{
    fprintf(stderr, " mysql_stmt_execute, 2 failed"
    );
    fprintf(stderr, " %s", mysql_stmt_error(stmt));
    exit(0);
}
/* Get the total rows affected */
affected_rows= mysql_stmt_affected_rows(stmt);
fprintf(stdout, " total affected rows(insert 2): %lu\n",
    (unsigned long) affected_rows);
if (affected_rows != 1) /* validate affected rows */
{
    fprintf(stderr, " invalid affected rows by MySQL\n");
    exit(0);
}
/* Close the statement */
if (mysql_stmt_close(stmt))
{
    fprintf(stderr, " failed while closing the statement\n"
    );
    fprintf(stderr, " %s", mysql_stmt_error(stmt));
    exit(0);
}

Note
For complete examples on the use of prepared statement functions, refer to the file
tests/mysql_client_test.c. This file can be obtained from a MySQL source
distribution or from the Bazaar source repository.

### 17.6.10.11 mysql_stmt_fetch()

```c
int mysql_stmt_fetch(MYSQL_STMT *stmt)
```

**Description**

`mysql_stmt_fetch()` returns the next row in the result set. It can be called only while the result set
exists; that is, after a call to `mysql_stmt_execute()` for a statement such as `SELECT` that produces a
result set.

`mysql_stmt_fetch()` returns row data using the buffers bound by `mysql_stmt_bind_result()`. It
returns the data in those buffers for all the columns in the current row set and the lengths are returned to
the `length` pointer. All columns must be bound by the application before it calls `mysql_stmt_fetch()`.

By default, result sets are fetched unbuffered a row at a time from the server. To buffer the entire result
set on the client, call `mysql_stmt_store_result()` after binding the data buffers and before calling
`mysql_stmt_fetch()`.

If a fetched data value is a `NULL` value, the `*is_null` value of the corresponding `MYSQL_BIND` structure
contains TRUE (1). Otherwise, the data and its length are returned in the `*buffer` and `*length` elements
based on the buffer type specified by the application. Each numeric and temporal type has a fixed length,
as listed in the following table. The length of the string types depends on the length of the actual data
value, as indicated by `data_length`.

<table>
<thead>
<tr>
<th>Type</th>
<th>Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>MYSQL_TYPE_TINY</td>
<td>1</td>
</tr>
</tbody>
</table>
This function was added in MySQL 4.1.2.

In some cases you might want to determine the length of a column value before fetching it with `mysql_stmt_fetch()`. For example, the value might be a long string or `BLOB` value for which you want to know how much space must be allocated. To accomplish this, you can use these strategies:

- **Before invoking `mysql_stmt_fetch()` to retrieve individual rows, pass `STMT_ATTR_UPDATE_MAX_LENGTH` to `mysql_stmt_attr_set()`, then invoke `mysql_stmt_store_result()` to buffer the entire result on the client side. Setting the `STMT_ATTR_UPDATE_MAX_LENGTH` attribute causes the maximal length of column values to be indicated by the `max_length` member of the result set metadata returned by `mysql_stmt_result_metadata()`.

- **Invoke `mysql_stmt_fetch()` with a zero-length buffer for the column in question and a pointer in which the real length can be stored. Then use the real length with `mysql_stmt_fetch_column()`.

```c
real_length= 0;
bind[0].buffer= 0;
bind[0].buffer_length= 0;
bind[0].length= &real_length
mysql_stmt_bind_result(stmt, bind);
mysql_stmt_fetch(stmt);
if (real_length > 0)
{
    data= malloc(real_length);
    bind[0].buffer= data;
    bind[0].buffer_length= real_length;
    mysql_stmt_fetch_column(stmt, bind, 0, 0);
}
```

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Successful, the data has been fetched to application data buffers.</td>
</tr>
</tbody>
</table>
| 1                | Error occurred. Error code and message can be obtained by calling `mysql_stmt_errno()` and `mysql_stmt_error()`.
| MYSQL_NO_DATA    | No more rows/data exists                                                   |
| MYSQL_DATA_TRUNCATED | Data truncation occurred                                                    |
MySQL_DATA_TRUNCATED is not returned unless truncation reporting is enabled with mysql_options(). To determine which parameters were truncated when this value is returned, check the error members of the MYSQL_BIND parameter structures.

Errors

- CR_COMMANDS_OUT_OF_SYNC
  Commands were executed in an improper order.

- CR_OUT_OF_MEMORY
  Out of memory.

- CR_SERVER_GONE_ERROR
  The MySQL server has gone away.

- CR_SERVER_LOST
  The connection to the server was lost during the query.

- CR_UNKNOWN_ERROR
  An unknown error occurred.

- CR_UNSUPPORTED_PARAM_TYPE
  The buffer type is MYSQL_TYPE_DATE, MYSQL_TYPE_TIME, MYSQL_TYPE_DATETIME, or MYSQL_TYPE_TIMESTAMP, but the data type is not DATE, TIME, DATETIME, or TIMESTAMP.

- All other unsupported conversion errors are returned from mysql_stmt_bind_result().

Example

The following example demonstrates how to fetch data from a table using mysql_stmt_result_metadata(), mysql_stmt_bind_result(), and mysql_stmt_fetch(). (This example expects to retrieve the two rows inserted by the example shown in Section 17.6.10.10, "mysql_stmt_execute().") The mysql variable is assumed to be a valid connection handle.

```c
#define STRING_SIZE 50
#define SELECT_SAMPLE "SELECT col1, col2, col3, col4 \n FROM test_table"

MYSQL_STMT *stmt;
MYSQL_BIND bind[4];
MYSQL_RES *prepare_meta_result;
MYSQL_TIME ts;
unsigned long length[4];
int param_count, column_count, row_count;
short small_data;
int int_data;
char str_data[STRING_SIZE];
my_bool is_null[4];

/* Prepare a SELECT query to fetch data from test_table */
stmt = mysql_stmt_init(mysql);
if (!stmt)
{
    fprintf(stderr, " mysql_stmt_init(), out of memory\n");
    exit(0);
```
if (mysql_stmt_prepare(stmt, SELECT_SAMPLE, strlen(SELECT_SAMPLE)))
{
    fprintf(stderr, " mysql_stmt_prepare(), SELECT failed\n" );
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

fprintf(stdout, " prepare, SELECT successful\n" );

/* Get the parameter count from the statement */
param_count= mysql_stmt_param_count(stmt);
fprintf(stdout, " total parameters in SELECT: %d\n", param_count);

if (param_count != 0) /* validate parameter count */
{
    fprintf(stderr, " invalid parameter count returned by MySQL\n" );
    exit(0);
}

/* Fetch result set meta information */
prepare_meta_result = mysql_stmt_result_metadata(stmt);
if (!prepare_meta_result)
{
    fprintf(stderr,
            " mysql_stmt_result_metadata(), \n            returned no meta information\n" );
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

/* Get total columns in the query */
column_count= mysql_num_fields(prepare_meta_result);
fprintf(stdout,
        " total columns in SELECT statement: %d\n",
        column_count);

if (column_count != 4) /* validate column count */
{
    fprintf(stderr, " invalid column count returned by MySQL\n" );
    exit(0);
}

/* Execute the SELECT query */
if (mysql_stmt_execute(stmt))
{
    fprintf(stderr, " mysql_stmt_execute(), failed\n" );
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

/* Bind the result buffers for all 4 columns before fetching them */
memset(bind, 0, sizeof(bind));

/* INTEGER COLUMN */
bind[0].buffer_type= MYSQL_TYPE_LONG;
bind[0].buffer= (char *)&int_data;
bind[0].is_null= &is_null[0];
bind[0].length= &length[0];

/* STRING COLUMN */
bind[1].buffer_type= MYSQL_TYPE_STRING;
bind[1].buffer= (char *)str_data;
bind[1].buffer_length= STRING_SIZE;
bind[1].is_null= &is_null[1];
bind[1].length= &length[1];
/* SMALLINT COLUMN */
bind[2].buffer_type= MYSQL_TYPE_SHORT;
bind[2].buffer= (char *)&small_data;
bind[2].is_null= &is_null[2];
bind[2].length= &length[2];

/* TIMESTAMP COLUMN */
bind[3].buffer_type= MYSQL_TYPE_TIMESTAMP;
bind[3].buffer= (char *)&ts;
bind[3].is_null= &is_null[3];
bind[3].length= &length[3];

/* Bind the result buffers */
if (mysql_stmt_bind_result(stmt, bind))
{
    fprintf(stderr, " mysql_stmt_bind_result() failed\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

/* Now buffer all results to client (optional step) */
if (mysql_stmt_store_result(stmt))
{
    fprintf(stderr, " mysql_stmt_store_result() failed\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

/* Fetch all rows */
row_count= 0;
fprintf(stdout, "Fetching results ...
");
while (!mysql_stmt_fetch(stmt))
{
    row_count++;
    fprintf(stdout, " row %d
", row_count);

    /* column 1 */
    fprintf(stdout, "   column1 (integer)  : ");
    if (is_null[0])
        fprintf(stdout, " NULL\n");
    else
        fprintf(stdout, " %d(%ld)\n", int_data, length[0]);

    /* column 2 */
    fprintf(stdout, "   column2 (string)   : ");
    if (is_null[1])
        fprintf(stdout, " NULL\n");
    else
        fprintf(stdout, " %s(%ld)\n", str_data, length[1]);

    /* column 3 */
    fprintf(stdout, "   column3 (smallint) : ");
    if (is_null[2])
        fprintf(stdout, " NULL\n");
    else
        fprintf(stdout, " %d(%ld)\n", small_data, length[2]);

    /* column 4 */
    fprintf(stdout, "   column4 (timestamp): ");
    if (is_null[3])
        fprintf(stdout, " NULL\n");
    else
        fprintf(stdout, " %04d-%02d-%02d %02d:%02d:%02d (%ld)
",
            ts.year, ts.month, ts.day,
            ts.hour, ts.minute, ts.second,
            length[3]);
    fprintf(stdout, "\n");
/* Validate rows fetched */
fprintf(stdout, " total rows fetched: %d\n", row_count);
if (row_count != 2)
{
    fprintf(stderr, " MySQL failed to return all rows\n");
    exit(0);
}

/* Free the prepared result metadata */
mysql_free_result(prepare_meta_result);

/* Close the statement */
if (mysql_stmt_close(stmt))
{
    fprintf(stderr, " failed while closing the statement\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

17.6.10.12 mysql_stmt_fetch_column()

int mysql_stmt_fetch_column(MYSQL_STMT *stmt, MYSQL_BIND *bind, unsigned int column, unsigned long offset)

Description

Fetch one column from the current result set row. bind provides the buffer where data should be placed. It should be set up the same way as for mysql_stmt_bind_result(). column indicates which column to fetch. The first column is numbered 0. offset is the offset within the data value at which to begin retrieving data. This can be used for fetching the data value in pieces. The beginning of the value is offset 0.

This function was added in MySQL 4.1.2.

Return Values

Zero if the value was fetched successfully. Nonzero if an error occurred.

Errors

• CR_INVALID_PARAMETER_NO

Invalid column number.

• CR_NO_DATA

The end of the result set has already been reached.

17.6.10.13 mysql_stmt_field_count()

unsigned int mysql_stmt_field_count(MYSQL_STMT *stmt)

Description

Returns the number of columns for the most recent statement for the statement handler. This value is zero for statements such as INSERT or DELETE that do not produce result sets.
**mysql_stmt_field_count()** can be called after you have prepared a statement by invoking **mysql_stmt_prepare()**.

This function was added in MySQL 4.1.3.

**Return Values**

An unsigned integer representing the number of columns in a result set.

**Errors**

None.

### 17.6.10.14 mysql_stmt_free_result()

```c
my_bool mysql_stmt_free_result(MYSQL_STMT *stmt)
```

**Description**

Releases memory associated with the result set produced by execution of the prepared statement. If there is a cursor open for the statement, **mysql_stmt_free_result()** closes it.

This function was added in MySQL 4.1.1.

**Return Values**

Zero if the result set was freed successfully. Nonzero if an error occurred.

**Errors**

### 17.6.10.15 mysql_stmt_init()

```c
MYSQL_STMT *mysql_stmt_init(MYSQL *mysql)
```

**Description**

Create a **MYSQL_STMT** handle. The handle should be freed with **mysql_stmt_close(MYSQL_STMT *)**.

This function was added in MySQL 4.1.2.

See also Section 17.6.8, "C API Prepared Statement Data Structures", for more information.

**Return Values**

A pointer to a **MYSQL_STMT** structure in case of success. **NULL** if out of memory.

**Errors**

- **CR_OUT_OF_MEMORY**
  
  Out of memory.

### 17.6.10.16 mysql_stmt_insert_id()

```c
my_ulonglong mysql_stmt_insert_id(MYSQL_STMT *stmt)
```
Description

Returns the value generated for an AUTO_INCREMENT column by the prepared INSERT or UPDATE statement. Use this function after you have executed prepared INSERT statement into a table which contains an AUTO_INCREMENT field.

See Section 17.6.6.35, “mysql_insert_id()”, for more information.

This function was added in MySQL 4.1.2.

Return Values

Value for AUTO_INCREMENT column which was automatically generated or explicitly set during execution of prepared statement, or value generated by LAST_INSERT_ID(expr) [866] function. Return value is undefined if statement does not set AUTO_INCREMENT value.

Errors

None.

17.6.10.17 mysql_stmt_num_rows()

my_ulonglong mysql_stmt_num_rows(MYSQL_STMT *stmt)

Description

Returns the number of rows in the result set.

The use of mysql_stmt_num_rows() depends on whether you used mysql_stmt_store_result() to buffer the entire result set in the statement handle. If you use mysql_stmt_store_result(), mysql_stmt_num_rows() may be called immediately. Otherwise, the row count is unavailable unless you count the rows as you fetch them.

mysql_stmt_num_rows() is intended for use with statements that return a result set, such as SELECT. For statements such as INSERT, UPDATE, or DELETE, the number of affected rows can be obtained with mysql_stmt_affected_rows().

This function was added in MySQL 4.1.1.

Return Values

The number of rows in the result set.

Errors

None.

17.6.10.18 mysql_stmt_param_count()

unsigned long mysql_stmt_param_count(MYSQL_STMT *stmt)

Description

Returns the number of parameter markers present in the prepared statement.

This function was added in MySQL 4.1.2.
Return Values

An unsigned long integer representing the number of parameters in a statement.

Errors

None.

Example

See the Example in Section 17.6.10, "mysql_stmt_execute()".

17.6.10.19 mysql_stmt_param_metadata()

MYSQL_RES *mysql_stmt_param_metadata(MYSQL_STMT *stmt)

This function currently does nothing.

This function was added in MySQL 4.1.2.

Description

Return Values

Errors

17.6.10.20 mysql_stmt_prepare()

int mysql_stmt_prepare(MYSQL_STMT *stmt, const char *stmt_str, unsigned long length)

Description

Given the statement handle returned by mysql_stmt_init(), prepares the SQL statement pointed to by the string stmt_str and returns a status value. The string length should be given by the length argument. The string must consist of a single SQL statement. You should not add a terminating semicolon (";") or \g to the statement.

The application can include one or more parameter markers in the SQL statement by embedding question mark (?) characters into the SQL string at the appropriate positions.

The markers are legal only in certain places in SQL statements. For example, they are permitted in the VALUES() list of an INSERT statement (to specify column values for a row), or in a comparison with a column in a WHERE clause to specify a comparison value. However, they are not permitted for identifiers (such as table or column names), or to specify both operands of a binary operator such as the = equal sign. The latter restriction is necessary because it would be impossible to determine the parameter type. In general, parameters are legal only in Data Manipulation Language (DML) statements, and not in Data Definition Language (DDL) statements.

The parameter markers must be bound to application variables using mysql_stmt_bind_param() before executing the statement.

This function was added in MySQL 4.1.2.

Return Values

Zero if the statement was prepared successfully. Nonzero if an error occurred.
Errors

- **CR_COMMANDS_OUT_OF_SYNC**
  Commands were executed in an improper order.

- **CR_OUT_OF_MEMORY**
  Out of memory.

- **CR_SERVER_GONE_ERROR**
  The MySQL server has gone away.

- **CR_SERVER_LOST**
  The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  An unknown error occurred.

If the prepare operation was unsuccessful (that is, `mysql_stmt_prepare()` returns nonzero), the error message can be obtained by calling `mysql_stmt_error()`.

Example
See the Example in Section 17.6.10.10, "mysql_stmt_execute()".

### 17.6.10.21 `mysql_stmt_reset()`
```
my_bool mysql_stmt_reset(MYSQL_STMT *stmt)
```

**Description**

Resets a prepared statement on client and server to state after prepare. It resets the statement on the server, data sent using `mysql_stmt_send_long_data()`, unbuffered result sets and current errors. It does not clear bindings or stored result sets. Stored result sets will be cleared when executing the prepared statement (or closing it).

To re-prepare the statement with another query, use `mysql_stmt_prepare()`.

This function was added in MySQL 4.1.1.

**Return Values**

Zero if the statement was reset successfully. Nonzero if an error occurred.

**Errors**

- **CR_COMMANDS_OUT_OF_SYNC**
  Commands were executed in an improper order.

- **CR_SERVER_GONE_ERROR**
  The MySQL server has gone away.

- **CR_SERVER_LOST**
The connection to the server was lost during the query

- CR_UNKNOWN_ERROR

An unknown error occurred.

17.6.10.22 mysql_stmt_result_metadata()

MYSQL_RES *mysql_stmt_result_metadata(MYSQL_STMT *stmt)

Description

If a statement passed to `mysql_stmt_prepare()` is one that produces a result set, `mysql_stmt_result_metadata()` returns the result set metadata in the form of a pointer to a `MYSQL_RES` structure that can be used to process the meta information such as number of fields and individual field information. This result set pointer can be passed as an argument to any of the field-based API functions that process result set metadata, such as:

- `mysql_num_fields()`
- `mysql_fetch_field()`
- `mysql_fetch_field_direct()`
- `mysql_fetch_fields()`
- `mysql_field_count()`
- `mysql_field_seek()`
- `mysql_field_tell()`
- `mysql_free_result()`

The result set structure should be freed when you are done with it, which you can do by passing it to `mysql_free_result()`. This is similar to the way you free a result set obtained from a call to `mysql_store_result()`.

The result set returned by `mysql_stmt_result_metadata()` contains only metadata. It does not contain any row results. The rows are obtained by using the statement handle with `mysql_stmt_fetch()`.

This function was added in MySQL 4.1.2.

Return Values

A `MYSQL_RES` result structure. `NULL` if no meta information exists for the prepared query.

Errors

- CR_OUT_OF_MEMORY

  Out of memory.

- CR_UNKNOWN_ERROR

  An unknown error occurred.
Example

See the Example in Section 17.6.10.11, “mysql_stmt_fetch()”.

17.6.10.23 mysql_stmt_row_seek()

MYSQL_ROW_OFFSET mysql_stmt_row_seek(MYSQL_STMT *stmt, MYSQL_ROW_OFFSET offset)

Description

Sets the row cursor to an arbitrary row in a statement result set. The offset value is a row offset that should be a value returned from mysql_stmt_row_tell() or from mysql_stmt_row_seek(). This value is not a row number; if you want to seek to a row within a result set by number, use mysql_stmt_data_seek() instead.

This function requires that the result set structure contains the entire result of the query, so mysql_stmt_row_seek() may be used only in conjunction with mysql_stmt_store_result().

This function was added in MySQL 4.1.1.

Return Values

The previous value of the row cursor. This value may be passed to a subsequent call to mysql_stmt_row_seek().

Errors

None.

17.6.10.24 mysql_stmt_row_tell()

MYSQL_ROW_OFFSET mysql_stmt_row_tell(MYSQL_STMT *stmt)

Description

Returns the current position of the row cursor for the last mysql_stmt_fetch(). This value can be used as an argument to mysql_stmt_row_seek().

You should use mysql_stmt_row_tell() only after mysql_stmt_store_result().

This function was added in MySQL 4.1.1.

Return Values

The current offset of the row cursor.

Errors

None.

17.6.10.25 mysql_stmt_send_long_data()

my_bool mysql_stmt_send_long_data(MYSQL_STMT *stmt, unsigned int parameter_number, const char *data, unsigned long length)

Description

Enables an application to send parameter data to the server in pieces (or “chunks”). Call this function after mysql_stmt_bind_param() and before mysql_stmt_execute(). It can be called multiple times to
send the parts of a character or binary data value for a column, which must be one of the `TEXT` or `BLOB` data types.

`parameter_number` indicates which parameter to associate the data with. Parameters are numbered beginning with 0. `data` is a pointer to a buffer containing data to be sent, and `length` indicates the number of bytes in the buffer.

**Note**
The next `mysql_stmt_execute()` call ignores the bind buffer for all parameters that have been used with `mysql_stmt_send_long_data()` since last `mysql_stmt_execute()` or `mysql_stmt_reset()`.

If you want to reset/forget the sent data, you can do it with `mysql_stmt_reset()`. See Section 17.6.10.21, "mysql_stmt_reset()".

This function was added in MySQL 4.1.2.

**Return Values**
Zero if the data is sent successfully to server. Nonzero if an error occurred.

**Errors**

- **CR_COMMANDS_OUT_OF_SYNC**
  Commands were executed in an improper order.

- **CR_SERVER_GONE_ERROR**
  The MySQL server has gone away.

- **CR_OUT_OF_MEMORY**
  Out of memory.

- **CR_UNKNOWN_ERROR**
  An unknown error occurred.

**Example**
The following example demonstrates how to send the data for a `TEXT` column in chunks. It inserts the data value 'MySQL - The most popular Open Source database' into the `text_column` column. The `mysql` variable is assumed to be a valid connection handle.

```
#define INSERT_QUERY "INSERT INTO test_long_data(text_column) VALUES(?)"

MYSQL_BIND bind[1];
long length;

stmt = mysql_stmt_init(mysql);
if (!stmt)
{
    fprintf(stderr, " mysql_stmt_init(), out of memory\n");
    exit(0);
}
if (mysql_stmt_prepare(stmt, INSERT_QUERY, strlen(INSERT_QUERY)))
```
```c
{  fprintf(stderr, "\n mysql_stmt_prepare(), INSERT failed\n  mysql_stmt_error(stmt));
  exit(0);
}
memset(bind, 0, sizeof(bind));
bind[0].buffer_type= MYSQL_TYPE_STRING;
bind[0].length= &length;
bind[0].is_null= 0;

/* Bind the buffers */
if (mysql_stmt_bind_param(stmt, bind))
{  fprintf(stderr, "\n param bind failed\n  mysql_stmt_error(stmt));
    exit(0);
}

/* Supply data in chunks to server */
if (mysql_stmt_send_long_data(stmt,0,"MySQL",5))
{  fprintf(stderr, "\n send_long_data failed\n  mysql_stmt_error(stmt));
    exit(0);
}

/* Supply the next piece of data */
if (mysql_stmt_send_long_data(stmt,0,
    " - The most popular Open Source database",40))
{  fprintf(stderr, "\n send_long_data failed\n  mysql_stmt_error(stmt));
    exit(0);
}

/* Now, execute the query */
if (mysql_stmt_execute(stmt))
{  fprintf(stderr, "\n mysql_stmt_execute failed\n  mysql_stmt_error(stmt));
    exit(0);
}
```

### 17.6.10.26 mysql_stmt_sqlstate()

```c
const char *mysql_stmt_sqlstate(MYSQL_STMT *stmt)
```

#### Description

For the statement specified by `stmt`, `mysql_stmt_sqlstate()` returns a null-terminated string containing the SQLSTATE error code for the most recently invoked prepared statement API function that can succeed or fail. The error code consists of five characters. "00000" means “no error.” The values are specified by ANSI SQL and ODBC. For a list of possible values, see Appendix B, Errors, Error Codes, and Common Problems.

Note that not all MySQL errors are yet mapped to SQLSTATE codes. The value "HY000" (general error) is used for unmapped errors.

This function was added to MySQL 4.1.1.

#### Return Values

A null-terminated character string containing the SQLSTATE error code.
17.6.10.27 `mysql_stmt_store_result()`

```c
int mysql_stmt_store_result(MYSQL_STMT *stmt)
```

**Description**

Result sets are produced by calling `mysql_stmt_execute()` to executed prepared statements for SQL statements such as `SELECT`, `SHOW`, `DESCRIBE`, and `EXPLAIN`. By default, result sets for successfully executed prepared statements are not buffered on the client and `mysql_stmt_fetch()` fetches them one at a time from the server. To cause the complete result set to be buffered on the client, call `mysql_stmt_store_result()` after binding data buffers with `mysql_stmt_bind_result()` and before calling `mysql_stmt_fetch()` to fetch rows. (For an example, see Section 17.6.10.11, “mysql_stmt_fetch()”.)

`mysql_stmt_store_result()` is optional for result set processing, unless you will call `mysql_stmt_data_seek()`, `mysql_stmt_row_seek()`, or `mysql_stmt_row_tell()`. Those functions require a seekable result set.

It is unnecessary to call `mysql_stmt_store_result()` after executing an SQL statement that does not produce a result set, but if you do, it does not harm or cause any notable performance problem. You can detect whether the statement produced a result set by checking if `mysql_stmt_result_metadata()` returns `NULL`. For more information, refer to Section 17.6.10.22, “mysql_stmt_result_metadata()”.

**Note**

MySQL does not by default calculate `MYSQL_FIELD->max_length` for all columns in `mysql_stmt_store_result()` because calculating this would slow down `mysql_stmt_store_result()` considerably and most applications do not need `max_length`. If you want `max_length` to be updated, you can call `mysql_stmt_attr_set(MYSQL_STMT, STM Consort.UPDATE_MAX_LENGTH, &flag)` to enable this. See Section 17.6.10.3, “mysql_stmt_attr_set()”.

This function was added in MySQL 4.1.0.

**Return Values**

Zero if the results are buffered successfully. Nonzero if an error occurred.

**Errors**

- **CR_INVALID_BUFFER_USE**

  The parameter does not have a string or binary type.

- **CR_COMMANDS_OUT_OF_SYNC**

  Commands were executed in an improper order.

- **CR_OUT_OF_MEMORY**

  Out of memory.

- **CR_SERVER_GONE_ERROR**

  The MySQL server has gone away.

- **CR_SERVER_LOST**
The connection to the server was lost during the query.

- **CR_UNKNOWN_ERROR**
  An unknown error occurred.

If the application is linked to the embedded server library, runtime error messages will indicate the `libmysqld` rather than `libmysqlclient` library, but the solution to the problem is the same as just described.

### 17.6.11 C API Threaded Function Descriptions

To create a threaded client, use the functions described in the following sections. See also Section 17.6.3.2, "Writing C API Threaded Client Programs".

#### 17.6.11.1 `my_init()`

```c
void my_init(void)
```

**Description**

`my_init()` initializes some global variables that MySQL needs. If you are using a thread-safe client library, it also calls `mysql_thread_init()` for this thread.

It is necessary for `my_init()` to be called early in the initialization phase of a program's use of the MySQL library. However, `my_init()` is automatically called by `mysql_init()`, `mysql_library_init()`, `mysql_server_init()`, and `mysql_connect()`. If you ensure that your program invokes one of those functions before any other MySQL calls, there is no need to invoke `my_init()` explicitly.

To access the prototype for `my_init()`, your program should include these header files:

```c
#include <my_global.h>
#include <my_sys.h>
```

**Return Values**

None.

#### 17.6.11.2 `mysql_thread_end()`

```c
void mysql_thread_end(void)
```

**Description**

This function needs to be called before calling `pthread_exit()` to free memory allocated by `mysql_thread_init()`.

`mysql_thread_end()` is not invoked automatically by the client library. It must be called explicitly to avoid a memory leak.

**Return Values**

None.

#### 17.6.11.3 `mysql_thread_init()`
my_bool mysql_thread_init(void)

Description
This function must be called early within each created thread to initialize thread-specific variables. However, you may not necessarily need to invoke it explicitly: mysql_thread_init() is automatically called by my_init(), which itself is automatically called by mysql_init(), mysql_library_init(), mysql_server_init(), and mysql_connect(). If you invoke any of those functions, mysql_thread_init() will be called for you.

Return Values
Zero for success. Nonzero if an error occurred.

17.6.11.4 mysql_thread_safe()

unsigned int mysql_thread_safe(void)

Description
This function indicates whether the client library is compiled as thread-safe.

Return Values
1 if the client library is thread-safe, 0 otherwise.

17.6.12 C API Embedded Server Function Descriptions

MySQL applications can be written to use an embedded server. See Section 17.5, “libmysqld, the Embedded MySQL Server Library”. To write such an application, you must link it against the libmysqld library by using the -lmysqld flag rather than linking it against the libmysqlclient client library by using the -lmysqlclient flag. However, the calls to initialize and finalize the library are the same whether you write a client application or one that uses the embedded server: Call mysql_library_init() to initialize the library and mysql_library_end() when you are done with it. See Section 17.6.5, “C API Function Overview”.

mysql_library_init() and mysql_library_end() are available as of MySQL 4.1.10. For earlier versions of MySQL 4.1, call mysql_server_init() and mysql_server_end() instead, which are equivalent. mysql_library_init() and mysql_library_end() actually are #define symbols that make them equivalent to mysql_server_init() and mysql_server_end(), but the names more clearly indicate that they should be called when beginning and ending use of a MySQL C API library no matter whether the application uses libmysqlclient or libmysqld.

17.6.12.1 mysql_server_init()

int mysql_server_init(int argc, char **argv, char **groups)

Description
This function initializes the MySQL library, which must be done before you call any other MySQL function.

As of MySQL 4.1.10, mysql_server_init() is deprecated and you should call mysql_library_init() instead. See Section 17.6.38, “mysql_library_init()”.

Return Values
Zero for success. Nonzero if an error occurred.
17.6.12.2 mysql_server_end()

```c
void mysql_server_end(void)
```

**Description**

This function finalizes the MySQL library. You should call it when you are done using the library.

As of MySQL 4.1.10, `mysql_server_end()` is deprecated and you should call `mysql_library_end()` instead. See Section 17.6.6.37, “mysql_library_end()”.

**Return Values**

None.

17.6.13 Common Questions and Problems When Using the C API

17.6.13.1 Why mysql_store_result() Sometimes Returns NULL After mysql_query() Returns Success

It is possible for `mysql_store_result()` to return `NULL` following a successful call to `mysql_query()`. When this happens, it means one of the following conditions occurred:

- There was a `malloc()` failure (for example, if the result set was too large).
- The data couldn't be read (an error occurred on the connection).
- The query returned no data (for example, it was an `INSERT`, `UPDATE`, or `DELETE`).

You can always check whether the statement should have produced a nonempty result by calling `mysql_field_count()`. If `mysql_field_count()` returns zero, the result is empty and the last query was a statement that does not return values (for example, an `INSERT` or a `DELETE`). If `mysql_field_count()` returns a nonzero value, the statement should have produced a nonempty result. See the description of the `mysql_field_count()` function for an example.

You can test for an error by calling `mysql_error()` or `mysql_errno()`.

17.6.13.2 What Results You Can Get from a Query

In addition to the result set returned by a query, you can also get the following information:

- `mysql_affected_rows()` returns the number of rows affected by the last query when doing an `INSERT`, `UPDATE`, or `DELETE`.

  In MySQL 3.23, there is an exception when `DELETE` is used without a `WHERE` clause. In this case, the table is re-created as an empty table and `mysql_affected_rows()` returns zero for the number of records affected. In MySQL 4.0 and later, `DELETE` always returns the correct number of rows deleted. For a fast re-create, use `TRUNCATE TABLE`.

- `mysql_num_rows()` returns the number of rows in a result set. With `mysql_store_result()`, `mysql_num_rows()` may be called as soon as `mysql_store_result()` returns. With `mysql_use_result()`, `mysql_num_rows()` may be called only after you have fetched all the rows with `mysql_fetch_row()`.

- `mysql_insert_id()` returns the ID generated by the last query that inserted a row into a table with an `AUTO_INCREMENT` index. See Section 17.6.6.35, “mysql_insert_id()”.

• Some queries (LOAD DATA INFILE ..., INSERT INTO ... SELECT ..., UPDATE) return additional information. The result is returned by mysql_info(). See the description for mysql_info() for the format of the string that it returns. mysql_info() returns a NULL pointer if there is no additional information.

17.6.13.3 How to Get the Unique ID for the Last Inserted Row

If you insert a record into a table that contains an AUTO_INCREMENT column, you can obtain the value stored into that column by calling the mysql_insert_id() function.

You can check from your C applications whether a value was stored in an AUTO_INCREMENT column by executing the following code (which assumes that you’ve checked that the statement succeeded). It determines whether the query was an INSERT with an AUTO_INCREMENT index:

```c
if ((result = mysql_store_result(&mysql)) == 0 &&
    mysql_field_count(&mysql) == 0 &&
    mysql_insert_id(&mysql) != 0)
{
    used_id = mysql_insert_id(&mysql);
}
```

When a new AUTO_INCREMENT value has been generated, you can also obtain it by executing a SELECT LAST_INSERT_ID() statement with mysql_query() and retrieving the value from the result set returned by the statement.

For LAST_INSERT_ID() [866], the most recently generated ID is maintained in the server on a per-connection basis. It is not changed by another client. It is not even changed if you update another AUTO_INCREMENT column with a nonmagic value (that is, a value that is not NULL and not 0). Using LAST_INSERT_ID() [866] and AUTO_INCREMENT columns simultaneously from multiple clients is perfectly valid. Each client will receive the last inserted ID for the last statement that client executed.

If you want to use the ID that was generated for one table and insert it into a second table, you can use SQL statements like this:

```sql
INSERT INTO foo (auto,text)
VALUES(NULL,'text');         # generate ID by inserting NULL
INSERT INTO foo2 (id,text)
VALUES(LAST_INSERT_ID(),'text');  # use ID in second table
```

Note that mysql_insert_id() returns the value stored into an AUTO_INCREMENT column, whether that value is automatically generated by storing NULL or 0 or was specified as an explicit value. LAST_INSERT_ID() [866] returns only automatically generated AUTO_INCREMENT values. If you store an explicit value other than NULL or 0, it does not affect the value returned by LAST_INSERT_ID() [866].

For more information on obtaining the last ID in an AUTO_INCREMENT column:

• For information on LAST_INSERT_ID() [866], which can be used within an SQL statement, see Section 11.13, “Information Functions”.

• For information on mysql_insert_id(), the function you use from within the C API, see Section 17.6.6.35, “mysql_insert_id()”.

• For information on obtaining the auto-incremented value when using Connector/J see MySQL Connector/J Developer Guide.

• For information on obtaining the auto-incremented value when using Connector/ODBC see Obtaining Auto-Increment Values.
17.6.14 Controlling Automatic Reconnection Behavior

The MySQL client library can perform an automatic reconnection to the server if it finds that the connection is down when you attempt to send a statement to the server to be executed. If auto-reconnect is enabled, the library tries once to reconnect to the server and send the statement again.

If the connection has gone down, the `mysql_ping()` function performs a reconnect if auto-reconnect is enabled. If auto-reconnect is disabled, `mysql_ping()` returns an error instead.

Some client programs might provide the capability of controlling automatic reconnection. For example, `mysql` reconnects by default, but the `--skip-reconnect` option can be used to suppress this behavior.

If an automatic reconnection does occur (for example, as a result of calling `mysql_ping()`), there is no explicit indication of it. To check for reconnection, call `mysql_thread_id()` to get the original connection identifier before calling `mysql_ping()`, then call `mysql_thread_id()` again to see whether the identifier changed.

Automatic reconnection can be convenient because you need not implement your own reconnect code, but if a reconnection does occur, several aspects of the connection state are reset and your application will not know about it. The connection-related state is affected as follows:

- Any active transactions are rolled back and autocommit mode is reset.
- All table locks are released.
- All `TEMPORARY` tables are closed (and dropped).
- Session system variables are reinitialized to the values of the corresponding global system variables, including system variables that are set implicitly by statements such as `SET NAMES`.
- User variable settings are lost.
- Prepared statements are released.
- `HANDLER` variables are closed.
- The value of `LAST_INSERT_ID()` [866] is reset to 0.
- Locks acquired with `GET_LOCK()` [869] are released.

If the connection drops, it is possible that the session associated with the connection on the server side will still be running if the server has not yet detected that the client is no longer connected. In this case, any locks held by the original connection still belong to that session, so you may want to kill it by calling `mysql_kill()`.

17.6.15 C API Support for Multiple Statement Execution

By default, `mysql_query()` and `mysql_real_query()` interpret their statement string argument as a single statement to be executed, and you process the result according to whether the statement produces a result set (a set of rows, as for `SELECT`) or an affected-rows count (as for `INSERT`, `UPDATE`, and so forth).

MySQL 4.1 also supports the execution of a string containing multiple statements separated by semicolon (";") characters. This capability is enabled by special options that are specified either when you connect to the server with `mysql_real_connect()` or after connecting by calling `mysql_set_server_option()`.
Executing a multiple-statement string can produce multiple result sets or row-count indicators. Processing these results involves a different approach than for the single-statement case: After handling the result from the first statement, it is necessary to check whether more results exist and process them in turn if so. To support multiple-result processing, the C API includes the mysql_more_results() and mysql_next_result() functions. These functions are used at the end of a loop that iterates as long as more results are available. Failure to process the result this way may result in a dropped connection to the server.

The multiple statement and result capabilities can be used only with mysql_query() or mysql_real_query(). They cannot be used with the prepared statement interface. Prepared statement handles are defined to work only with strings that contain a single statement. See Section 17.6.7, “C API Prepared Statements”.

To enable multiple-statement execution and result processing, the following options may be used:

- The mysql_real_connect() function has a flags argument for which two option values are relevant:
  - CLIENT_MULTI_RESULTS enables the client program to process multiple results.
  - CLIENT_MULTI_STATEMENTS enables mysql_query() and mysql_real_query() to execute statement strings containing multiple statements separated by semicolons. This option also enables CLIENT_MULTI_RESULTS implicitly, so a flags argument of CLIENT_MULTI_STATEMENTS to mysql_real_connect() is equivalent to an argument of CLIENT_MULTI_STATEMENTS | CLIENT_MULTI_RESULTS. That is, CLIENT_MULTI_STATEMENTS is sufficient to enable multiple-statement execution and all multiple-result processing.

- After the connection to the server has been established, you can use the mysql_set_server_option() function to enable or disable multiple-statement execution by passing it an argument of MYSQL_OPTION_MULTI_STATEMENTS_ON or MYSQL_OPTION_MULTI_STATEMENTS_OFF.

The following procedure outlines a suggested strategy for handling multiple statements:

1. Pass CLIENT_MULTI_STATEMENTS to mysql_real_connect(), to fully enable multiple-statement execution and multiple-result processing.
2. After calling mysql_query() or mysql_real_query() and verifying that it succeeds, enter a loop within which you process statement results.
3. For each iteration of the loop, handle the current statement result, retrieving either a result set or an affected-rows count. If an error occurs, exit the loop.
4. At the end of the loop, call mysql_next_result() to check whether another result exists and initiate retrieval for it if so. If no more results are available, exit the loop.

One possible implementation of the preceding strategy is shown following. The final part of the loop can be reduced to a simple test of whether mysql_next_result() returns nonzero. The code as written distinguishes between no more results and an error, which enables a message to be printed for the latter occurrence.

```c
/* connect to server with the CLIENT_MULTI_STATEMENTS option */
if (mysql_real_connect (mysql, host_name, user_name, password,
            db_name, port_num, socket_name, CLIENT_MULTI_STATEMENTS) == NULL)
{
    printf("mysql_real_connect() failed\n");
    mysql_close(mysql);
```
exit(1);
}

/* execute multiple statements */
status = mysql_query(mysql,
    "DROP TABLE IF EXISTS test_table;
    CREATE TABLE test_table(id INT);
    INSERT INTO test_table VALUES(10);
    UPDATE test_table SET id=20 WHERE id=10;
    SELECT * FROM test_table;
    DROP TABLE test_table");
if (status)
{
    printf("Could not execute statement(s)\n");
    mysql_close(mysql);
    exit(0);
}

/* process each statement result */
do {
    /* did current statement return data? */
    result = mysql_store_result(mysql);
    if (result)
    {
        /* yes; process rows and free the result set */
        process_result_set(mysql, result);
        mysql_free_result(result);
    } else /* no result set or error */
    {
        if (mysql_field_count(mysql) == 0)
        {
            printf("%lld rows affected\n", mysql_affected_rows(mysql));
        } else /* some error occurred */
        {
            printf("Could not retrieve result set\n");
            break;
        }
    }
    /* more results? -1 = no, >0 = error, 0 = yes (keep looping) */
    if ((status = mysql_next_result(mysql)) > 0)
    {
        printf("Could not execute statement\n");
    } while (status == 0);
mysql_close(mysql);

17.6.16 C API Prepared Statement Problems

Here follows a list of the currently known problems with prepared statements:

- **TIME, TIMESTAMP, and DATETIME** do not support parts of seconds (for example, from DATE_FORMAT() [824]).

- When converting an integer to string, **ZEROFILL** is honored with prepared statements in some cases where the MySQL server does not print the leading zeros. (For example, with MIN(number-with-zerofill) [876]).

- When converting a floating-point number to a string in the client, the rightmost digits of the converted value may differ slightly from those of the original value.

- **Prepared statements do not use the query cache, even in cases where a query does not contain any placeholders.** See Section 7.5.3.1, “How the Query Cache Operates”. 
17.6.17 C API Prepared Statement Handling of Date and Time Values

The binary (prepared statement) protocol available in MySQL 4.1 and above enables you to send and receive date and time values (DATE, TIME, DATETIME, and TIMESTAMP), using the MYSQL_TIME structure. The members of this structure are described in Section 17.6.8, “C API Prepared Statement Data Structures”.

To send temporal data values, create a prepared statement using mysql_stmt_prepare(). Then, before calling mysql_stmt_execute() to execute the statement, use the following procedure to set up each temporal parameter:

1. In the MYSQL_BIND structure associated with the data value, set the buffer_type member to the type that indicates what kind of temporal value you're sending. For DATE, TIME, DATETIME, or TIMESTAMP values, set buffer_type to MYSQL_TYPE_DATE, MYSQL_TYPE_TIME, MYSQL_TYPE_DATETIME, or MYSQL_TYPE_TIMESTAMP, respectively.

2. Set the buffer member of the MYSQL_BIND structure to the address of the MYSQL_TIME structure in which you pass the temporal value.

3. Fill in the members of the MYSQL_TIME structure that are appropriate for the type of temporal value to be passed.

Use mysql_stmt_bind_param() to bind the parameter data to the statement. Then you can call mysql_stmt_execute().

To retrieve temporal values, the procedure is similar, except that you set the buffer_type member to the type of value you expect to receive, and the buffer member to the address of a MYSQL_TIME structure into which the returned value should be placed. Use mysql_stmt_bind_result() to bind the buffers to the statement after calling mysql_stmt_execute() and before fetching the results.

Here is a simple example that inserts DATE, TIME, and TIMESTAMP data. The mysql variable is assumed to be a valid connection handle.

```c
MYSQL_TIME  ts;
MYSQL_BIND  bind[3];
MYSQL_STMT  *stmt;

strncpy(query, "INSERT INTO test_table(date_field, time_field, \
    timestamp_field) VALUES(?,?,?);", 128);

stmt = mysql_stmt_init(mysql);
if (!stmt)
    {fprintf(stderr, " mysql_stmt_init(), out of memory\n");
     exit(0);
    }
if (mysql_stmt_prepare(mysql, query, strlen(query)))
    {fprintf(stderr, " mysql_stmt_prepare(), INSERT failed\n");
      fprintf(stderr, "%s", mysql_stmt_error(stmt));
      exit(0);
    }

    /* set up input buffers for all 3 parameters */
    bind[0].buffer_type= MYSQL_TYPE_DATE;
    bind[0].buffer= (char *)&ts;
    bind[0].is_null= 0;
    bind[0].length= 0;
```
bind[1]= bind[2]= bind[0];
...
mysql_stmt_bind_param(stmt, bind);

/* supply the data to be sent in the ts structure */
ts.year= 2002;
ts.month= 02;
ts.day= 03;

  ts.hour= 10;
ts.minute= 45;
ts.second= 20;

mysql_stmt_execute(stmt);
..

17.7 MySQL PHP API

The MySQL PHP API manual is now published in standalone form, not as part of the MySQL Reference Manual. See MySQL and PHP.

17.8 MySQL Perl API

The Perl DBI module provides a generic interface for database access. You can write a DBI script that works with many different database engines without change. To use DBI with MySQL, install the following:

1. The DBI module.
2. The DBD::mysql module. This is the DataBase Driver (DBD) module for Perl.
3. Optionally, the DBD module for any other type of database server you want to access.

Perl DBI is the recommended Perl interface. It replaces an older interface called mysqlperl, which should be considered obsolete.

These sections contain information about using Perl with MySQL and writing MySQL applications in Perl:

- For installation instructions for Perl DBI support, see Section 2.14, "Perl Installation Notes".
- For an example of reading options from option files, see Section 5.7.3, “Using Client Programs in a Multiple-Server Environment”.
- For secure coding tips, see Section 5.4.1, “General Security Guidelines”.
- For debugging tips, see Section 18.4.1.3, “Debugging mysqld under gdb”.
- For some Perl-specific environment variables, see Section 2.13, “Environment Variables”.
- For considerations for running on Mac OS X, see Using the Bundled MySQL on Mac OS X Server.
- For ways to quote string literals, see Section 8.1.1, “String Literals”.

DBI information is available at the command line, online, or in printed form:

- Once you have the DBI and DBD::mysql modules installed, you can get information about them at the command line with the perldoc command:
You can also use pod2man, pod2html, and so on to translate this information into other formats.

- For online information about Perl DBI, visit the DBI Web site, http://dbi.perl.org/. That site hosts a general DBI mailing list. Oracle Corporation hosts a list specifically about DBD::mysql; see Section 1.7.1, “MySQL Mailing Lists”.

17.9 MySQL Python API

MySQLdb is a third-party driver that provides MySQL support for Python, compliant with the Python DB API version 2.0. It can be found at http://sourceforge.net/projects/mysql-python/.

The new MySQL Connector/Python component provides an interface to the same Python API, and is built into the MySQL Server and supported by Oracle. See MySQL Connector/Python Developer Guide for details on the Connector, as well as coding guidelines for Python applications and sample Python code.

17.10 MySQL Ruby APIs

Two APIs are available for Ruby programmers developing MySQL applications:

- The MySQL/Ruby API is based on the libmysqlclient API library. For information on installing and using the MySQL/Ruby API, see Section 17.10.1, “The MySQL/Ruby API”.

- The Ruby/MySQL API is written to use the native MySQL network protocol (a native driver). For information on installing and using the Ruby/MySQL API, see Section 17.10.2, “The Ruby/MySQL API”.

For background and syntax information about the Ruby language, see Ruby Programming Language.

17.10.1 The MySQL/Ruby API

The MySQL/Ruby module provides access to MySQL databases using Ruby through libmysqlclient.

For information on installing the module, and the functions exposed, see MySQL/Ruby.

17.10.2 The Ruby/MySQL API

The Ruby/MySQL module provides access to MySQL databases using Ruby through a native driver interface using the MySQL network protocol.

For information on installing the module, and the functions exposed, see Ruby/MySQL.

17.11 MySQL Tcl API

MySQLtcl is a simple API for accessing a MySQL database server from the Tcl programming language. It can be found at http://www.xdobry.de/mysqltcl/.
17.12 MySQL Eiffel Wrapper

Eiffel MySQL is an interface to the MySQL database server using the Eiffel programming language, written by Michael Ravits. It can be found at http://efsa.sourceforge.net/archive/ravits/mysql.htm.

18.1 MySQL Internals

This chapter describes a lot of things that you need to know when working on the MySQL code. To track or contribute to MySQL development, follow the instructions in Section 2.9.2, “Installing MySQL from a Development Source Tree”. If you are interested in MySQL internals, you should also subscribe to our internals mailing list. This list has relatively low traffic. For details on how to subscribe, please see Section 1.7.1, “MySQL Mailing Lists”. Many MySQL developers at Oracle Corporation are on the internals list and we help other people who are working on the MySQL code. Feel free to use this list both to ask questions about the code and to send patches that you would like to contribute to the MySQL project!

18.1.1 MySQL Threads

The MySQL server creates the following threads:

- Connection manager threads handle client connection requests on the network interfaces that the server listens to. On all platforms, one manager thread handles TCP/IP connection requests. On Unix, this manager thread also handles Unix socket file connection requests. On Windows, a manager thread handles shared-memory connection requests, and another handles named-pipe connection requests. The server does not create threads to handle interfaces that it does not listen to. For example, a Windows server that does not have support for named-pipe connections enabled does not create a thread to handle them.

- Connection manager threads associate each client connection with a thread dedicated to it that handles authentication and request processing for that connection. Manager threads create a new thread when necessary but try to avoid doing so by consulting the thread cache first to see whether it contains a thread that can be used for the connection. When a connection ends, its thread is returned to the thread cache if the cache is not full.

For information about tuning the parameters that control thread resources, see Section 7.8.3, “How MySQL Uses Threads for Client Connections”.

- On a master replication server, connections from slave servers are handled like client connections: There is one thread per connected slave.
• On a slave replication server, an I/O thread is started to connect to the master server and read updates from it. An SQL thread is started to apply updates read from the master. These two threads run independently and can be started and stopped independently.

• A signal thread handles all signals. This thread also normally handles alarms and calls process_alarm() to force timeouts on connections that have been idle too long.

• If InnoDB is used, there will be 4 additional threads by default. Those are file I/O threads, controlled by the innodb_file_io_threads parameter. See Section 13.2.4, “InnoDB Startup Options and System Variables”.

• If mysqld is compiled with -DUSE_ALARM_THREAD, a dedicated thread that handles alarms is created. This is only used on some systems where there are problems with sigwait() or if you want to use the thr_alarm() code in your application without a dedicated signal handling thread.

• If the server is started with the --flush_time=val option, a dedicated thread is created to flush all tables every val seconds.

• Each table for which INSERT DELAYED statements are issued gets its own thread. See Section 12.2.4.2, “INSERT DELAYED Syntax”.

mysqladmin processlist only shows the connection, INSERT DELAYED, and replication threads.

18.1.2 The MySQL Test Suite

The test system that is included in Unix source and binary distributions makes it possible for users and developers to perform regression tests on the MySQL code. These tests can be run on Unix.

You can also write your own test cases. For information about the MySQL Test Framework, including system requirements, see the manual available at http://dev.mysql.com/doc/mysqltest/2.0/en/.

The current set of test cases doesn't test everything in MySQL, but it should catch most obvious bugs in the SQL processing code, operating system or library issues, and is quite thorough in testing replication. Our goal is to have the tests cover 100% of the code. We welcome contributions to our test suite. You may especially want to contribute tests that examine the functionality critical to your system because this ensures that all future MySQL releases work well with your applications.

The test system consists of a test language interpreter (mysqltest), a Perl script to run all tests (mysql-test-run.pl), the actual test cases written in a special test language, and their expected results. To run the test suite on your system after a build, type make test from the source root directory, or change location to the mysql-test directory and type ../mysql-test-run.pl. If you have installed a binary distribution, change location to the mysql-test directory under the installation root directory (for example, /usr/local/mysql/mysql-test), and run ../mysql-test-run.pl. All tests should succeed. If any do not, feel free to try to find out why and report the problem if it indicates a bug in MySQL. See Section 1.8, “How to Report Bugs or Problems”.

If one test fails, you should run mysql-test-run.pl with the --force option to check whether any other tests fail.

If you have a copy of mysqld running on the machine where you want to run the test suite, you do not have to stop it, as long as it is not using ports 9306 or 9307. If either of those ports is taken, you should set the MTR_BUILD_THREAD environment variable to an appropriate value, and the test suite will use a different set of ports for master, slave, NDB, and Instance Manager). For example:

shell> export MTR_BUILD_THREAD=31
Adding New Functions to MySQL

In the `mysql-test` directory, you can run an individual test case with `./mysql-test-run.pl test_name`.

If you have a question about the test suite, or have a test case to contribute, send an email message to the MySQL internals mailing list. See Section 1.7.1, “MySQL Mailing Lists”.

Before MySQL 4.1, the `mysql-test-run` shell script is used instead of the `mysql-test-run.pl` Perl script. `mysql-test-run` does not try to run its own server by default but tries to use your currently running server. To override this and cause `mysql-test-run` to start its own server, run it with the `--local` option.

### 18.2 Adding New Functions to MySQL

There are two ways to add new functions to MySQL:

- You can add functions through the user-defined function (UDF) interface. User-defined functions are compiled as object files and then added to and removed from the server dynamically using the `CREATE FUNCTION` and `DROP FUNCTION` statements. See Section 12.4.3.1, “CREATE FUNCTION Syntax for User-Defined Functions”.
- You can add functions as native (built-in) MySQL functions. Native functions are compiled into the `mysqld` server and become available on a permanent basis.

Each method of creating compiled functions has advantages and disadvantages:

- If you write user-defined functions, you must install object files in addition to the server itself. If you compile your function into the server, you don't need to do that.
- Native functions require you to modify a source distribution. UDFs do not. You can add UDFs to a binary MySQL distribution. No access to MySQL source is necessary.
- If you upgrade your MySQL distribution, you can continue to use your previously installed UDFs, unless you upgrade to a newer version for which the UDF interface changes. (An incompatible change occurred in MySQL 4.1.1 for aggregate functions. A function named `xxx_clear()` must be defined rather than `xxx_reset()`.) For native functions, you must repeat your modifications each time you upgrade.

Whichever method you use to add new functions, they can be invoked in SQL statements just like native functions such as `ABS()` [809] or `SOUNDEX()` [793].

See Section 8.2.3, “Function Name Parsing and Resolution”, for the rules describing how the server interprets references to different kinds of functions.

The following sections describe features of the UDF interface, provide instructions for writing UDFs, discuss security precautions that MySQL takes to prevent UDF misuse, and describe how to add native MySQL functions.

For example source code that illustrates how to write UDFs, take a look at the `sql/udf_example.cc` file that is provided in MySQL source distributions.

### 18.2.1 Features of the User-Defined Function Interface

The MySQL interface for user-defined functions provides the following features and capabilities:

- Functions can return string, integer, or real values and can accept arguments of those same types.
Adding a New User-Defined Function

- You can define simple functions that operate on a single row at a time, or aggregate functions that operate on groups of rows.
- Information is provided to functions that enables them to check the number and types of the arguments passed to them.
- You can tell MySQL to coerce arguments to a given type before passing them to a function.
- You can indicate that a function returns NULL or that an error occurred.

18.2.2 Adding a New User-Defined Function

For the UDF mechanism to work, functions must be written in C or C++ and your operating system must support dynamic loading. MySQL source distributions include a file `sql/udf_example.cc` that defines five UDF functions. Consult this file to see how UDF calling conventions work. The `include/mysql_com.h` header file defines UDF-related symbols and data structures, although you need not include this header file directly; it is included by `mysql.h`.

A UDF contains code that becomes part of the running server, so when you write a UDF, you are bound by any and all constraints that apply to writing server code. For example, you may have problems if you attempt to use functions from the `libstdc++` library. Note that these constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to UDFs that were originally written for older servers. For information about these constraints, see Section 2.9.3, “MySQL Source-Configuration Options”, and Section 2.9.4, “Dealing with Problems Compiling MySQL”.

To be able to use UDFs, you must link `mysqld` dynamically. Don't configure MySQL using `--with-mysqld-ldflags=-all-static`. If you want to use a UDF that needs to access symbols from `mysqld` (for example, the `metaphone` function in `sql/udf_example.cc` uses `default_charset_info`), you must link the program with `-rdynamic` (see `man dlopen`). If you plan to use UDFs, the rule of thumb is to configure MySQL with `--with-mysqld-ldflags=-rdynamic` unless you have a very good reason not to.

If you must use a precompiled distribution of MySQL, use MySQL-Max, which contains a dynamically linked server that supports dynamic loading.

For each function that you want to use in SQL statements, you should define corresponding C (or C++) functions. In the following discussion, the name “xxx” is used for an example function name. To distinguish between SQL and C/C++ usage, `XXX()` (uppercase) indicates an SQL function call, and `xxx()` (lowercase) indicates a C/C++ function call.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>When using C++ you can encapsulate your C functions within:</td>
</tr>
</tbody>
</table>
| ```
extern "C" {
  ...
}
``` |
| This ensures that your C++ function names remain readable in the completed UDF. |

The following list describes the C/C++ functions that you write to implement the interface for a function named `XXX()`. The main function, `xxx()`, is required. In addition, a UDF requires at least one of the other functions described here, for reasons discussed in Section 18.2.6.2, “User-Defined Function Security Precautions”.

- `xxx()`
  - The main function. This is where the function result is computed. The correspondence between the SQL function data type and the return type of your C/C++ function is shown here.
Adding a New User-Defined Function

<table>
<thead>
<tr>
<th>SQL Type</th>
<th>C/C++ Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>STRING</td>
<td>char *</td>
</tr>
<tr>
<td>INTEGER</td>
<td>long long</td>
</tr>
<tr>
<td>REAL</td>
<td>double</td>
</tr>
</tbody>
</table>

• **xxx_init()**

The initialization function for `xxx()`. If present, it can be used for the following purposes:

- To check the number of arguments to `XXX()`.
- To verify that the arguments are of a required type or, alternatively, to tell MySQL to coerce arguments to the required types when the main function is called.
- To allocate any memory required by the main function.
- To specify the maximum length of the result.
- To specify (for REAL functions) the maximum number of decimal places in the result.
- To specify whether the result can be NULL.

• **xxx_deinit()**

The deinitialization function for `xxx()`. If present, it should deallocate any memory allocated by the initialization function.

When an SQL statement invokes `XXX()`, MySQL calls the initialization function `xxx_init()` to let it perform any required setup, such as argument checking or memory allocation. If `xxx_init()` returns an error, MySQL aborts the SQL statement with an error message and does not call the main or deinitialization functions. Otherwise, MySQL calls the main function `xxx()` once for each row. After all rows have been processed, MySQL calls the deinitialization function `xxx_deinit()` so that it can perform any required cleanup.

For aggregate functions that work like `SUM()` [876], you must also provide the following functions:

• **xxx_reset()** (required before 4.1.1)

  Reset the current aggregate value and insert the argument as the initial aggregate value for a new group.

• **xxx_clear()** (required starting from 4.1.1)

  Reset the current aggregate value but do not insert the argument as the initial aggregate value for a new group.

• **xxx_add()**

  Add the argument to the current aggregate value.

MySQL handles aggregate UDFs as follows:

1. **Call xxx_init()** to let the aggregate function allocate any memory it needs for storing results.
2. **Sort the table according to the GROUP BY expression.**
3. Before MySQL 4.1.1, call `xxx_clear()` for the first row in each new group. As of 4.1.1, call `xxx_clear()` for the first row in each new group.

4. Before MySQL 4.1.1, call `xxx_add()` for each new row that belongs in the same group, except for the first row. As of 4.1.1, call `xxx_add()` for each new row that belongs in the same group, including the first row.

5. Call `xxx()` to get the result for the aggregate when the group changes or after the last row has been processed.

6. Repeat steps 3 to 5 until all rows have been processed.

7. Call `xxx_deinit()` to let the UDF free any memory it has allocated.

All functions must be thread-safe. This includes not just the main function, but the initialization and deinitialization functions as well, and also the additional functions required by aggregate functions. A consequence of this requirement is that you are not permitted to allocate any global or static variables that change! If you need memory, you should allocate it in `xxx_init()` and free it in `xxx_deinit()`.

### 18.2.2.1 UDF Calling Sequences for Simple Functions

This section describes the different functions that you need to define when you create a simple UDF. Section 18.2.2, “Adding a New User-Defined Function”, describes the order in which MySQL calls these functions.

The main `xxx()` function should be declared as shown in this section. Note that the return type and parameters differ, depending on whether you declare the SQL function `XXX()` to return `STRING`, `INTEGER`, or `REAL` in the `CREATE FUNCTION` statement:

For `STRING` functions:

```c
char *xxx(UDF_INIT *initid, UDF_ARGS *args,
          char *result, unsigned long *length,
          char *is_null, char *error);
```

For `INTEGER` functions:

```c
long long xxx(UDF_INIT *initid, UDF_ARGS *args,
              char *is_null, char *error);
```

For `REAL` functions:

```c
double xxx(UDF_INIT *initid, UDF_ARGS *args,
           char *is_null, char *error);
```

The initialization and deinitialization functions are declared like this:

```c
my_bool xxx_init(UDF_INIT *initid, UDF_ARGS *args, char *message);
void xxx_deinit(UDF_INIT *initid);
```

The `initid` parameter is passed to all three functions. It points to a `UDF_INIT` structure that is used to communicate information between functions. The `UDF_INIT` structure members follow. The initialization function should fill in any members that it wishes to change. (To use the default for a member, leave it unchanged.)
Adding a New User-Defined Function

- **my_bool maybe_null**
  
  `xxx_init()` should set `maybe_null` to `1` if `xxx()` can return `NULL`. The default value is `1` if any of the arguments are declared `maybe_null`.

- **unsigned int decimals**
  
  The number of decimal digits to the right of the decimal point. The default value is the maximum number of decimal digits in the arguments passed to the main function. For example, if the function is passed `1.34, 1.345, and 1.3`, the default would be `3`, because `1.345` has `3` decimal digits.

  For arguments that have no fixed number of decimals, the `decimals` value is set to `31`, which is `1` more than the maximum number of decimals permitted for the `DECIMAL, FLOAT, and DOUBLE` data types.

  A `decimals` value of `31` is used for arguments in cases such as a `FLOAT` or `DOUBLE` column declared without an explicit number of decimals (for example, `FLOAT` rather than `FLOAT(10,3)`) and for floating-point constants such as `1345E-3`. It is also used for string and other nonnumber arguments that might be converted within the function to numeric form.

  The value to which the `decimals` member is initialized is only a default. It can be changed within the function to reflect the actual calculation performed. The default is determined such that the largest number of decimals of the arguments is used. If the number of decimals is `31` for even one of the arguments, that is the value used for `decimals`.

- **unsigned int max_length**
  
  The maximum length of the result. The default `max_length` value differs depending on the result type of the function. For string functions, the default is the length of the longest argument. For integer functions, the default is `21` digits. For real functions, the default is `13` plus the number of decimal digits indicated by `initid->decimals`. (For numeric functions, the length includes any sign or decimal point characters.)

  If you want to return a blob value, you can set `max_length` to `65KB` or `16MB`. This memory is not allocated, but the value is used to decide which data type to use if there is a need to temporarily store the data.

- **char *ptr**
  
  A pointer that the function can use for its own purposes. For example, functions can use `initid->ptr` to communicate allocated memory among themselves. `xxx_init()` should allocate the memory and assign it to this pointer:

  ```
  initid->ptr = allocated_memory;
  ```

  In `xxx()` and `xxx_deinit()`, refer to `initid->ptr` to use or deallocate the memory.

### 18.2.2.2 UDF Calling Sequences for Aggregate Functions

This section describes the different functions that you need to define when you create an aggregate UDF. Section 18.2.2, "Adding a New User-Defined Function", describes the order in which MySQL calls these functions.

- **xxx_reset()**

  This function is called when MySQL finds the first row in a new group. It should reset any internal summary variables and then use the given `UDF_ARGS` argument as the first value in your internal summary value for the group. Declare `xxx_reset()` as follows:
void xxx_reset(UDF_INIT *initid, UDF_ARGS *args,  
    char *is_null, char *error);

xxx_reset() is needed only before MySQL 4.1.1. It is not needed or used as of MySQL 4.1.1, when the UDF interface changed to use xxx_clear() instead. However, you can define both xxx_reset() and xxx_clear() if you want to have your UDF work both before and after the interface change. (If you do include both functions, the xxx_reset() function in many cases can be implemented internally by calling xxx_clear() to reset all variables, and then calling xxx_add() to add the UDF_ARGS argument as the first value in the group.)

• xxx_clear()

This function is called when MySQL needs to reset the summary results. It is called at the beginning for each new group but can also be called to reset the values for a query where there were no matching rows. Declare xxx_clear() as follows:

void xxx_clear(UDF_INIT *initid, char *is_null, char *error);

is_null is set to point to CHAR(0) before calling xxx_clear().

If something went wrong, you can store a value in the variable to which the error argument points. error points to a single-byte variable, not to a string buffer.

xxx_clear() is required only by MySQL 4.1.1 and above. Before MySQL 4.1.1, use xxx_reset() instead.

• xxx_add()

This function is called for all rows that belong to the same group, with the exception that it is not called for the first row before MySQL 4.1.1 (see the preceding descriptions for the xxx_clear() and xxx_reset() functions). You should use it to add the value in the UDF_ARGS argument to your internal summary variable.

void xxx_add(UDF_INIT *initid, UDF_ARGS *args,  
    char *is_null, char *error);

The xxx() function for an aggregate UDF should be declared the same way as for a nonaggregate UDF. See Section 18.2.2.1, “UDF Calling Sequences for Simple Functions”.

For an aggregate UDF, MySQL calls the xxx() function after all rows in the group have been processed. You should normally never access its UDF_ARGS argument here but instead return a value based on your internal summary variables.

Return value handling in xxx() should be done the same way as for a nonaggregate UDF. See Section 18.2.2.4, “UDF Return Values and Error Handling”.

The xxx_reset() and xxx_add() functions handle their UDF_ARGS argument the same way as functions for nonaggregate UDFs. See Section 18.2.2.3, “UDF Argument Processing”.

The pointer arguments to is_null and error are the same for all calls to xxx_reset(), xxx_clear(), xxx_add() and xxx(). You can use this to remember that you got an error or whether the xxx() function should return NULL. You should not store a string into *error! error points to a single-byte variable, not to a string buffer.

*is_null is reset for each group (before calling xxx_clear()). *error is never reset.
18.2.2.3 UDF Argument Processing

The args parameter points to a UDF_ARGS structure that has the members listed here:

* unsigned int arg_count

The number of arguments. Check this value in the initialization function if you require your function to be called with a particular number of arguments. For example:

```c
if (args->arg_count != 2)
{
    strcpy(message,"XXX() requires two arguments");
    return 1;
}
```

For other UDF_ARGS member values that are arrays, array references are zero-based. That is, refer to array members using index values from 0 to args->arg_count – 1.

* enum Item_result *arg_type

A pointer to an array containing the types for each argument. The possible type values are STRING_RESULT, INT_RESULT, and REAL_RESULT.

To make sure that arguments are of a given type and return an error if they are not, check the arg_type array in the initialization function. For example:

```c
if (args->arg_type[0] != STRING_RESULT ||
    args->arg_type[1] != INT_RESULT)
{
    strcpy(message,"XXX() requires a string and an integer");
    return 1;
}
```

As an alternative to requiring your function's arguments to be of particular types, you can use the initialization function to set the arg_type elements to the types you want. This causes MySQL to coerce arguments to those types for each call to xxx(). For example, to specify that the first two arguments should be coerced to string and integer, respectively, do this in xxx_init():

```c
args->arg_type[0] = STRING_RESULT;
args->arg_type[1] = INT_RESULT;
```

* char **args

args->args communicates information to the initialization function about the general nature of the arguments passed to your function. For a constant argument i, args->args[i] points to the argument value. (See below for instructions on how to access the value properly.) For a nonconstant argument, args->args[i] is 0. A constant argument is an expression that uses only constants, such as 3 or 4*7-2 or SIN(3.14) [816]. A nonconstant argument is an expression that refers to values that may change from row to row, such as column names or functions that are called with nonconstant arguments.

For each invocation of the main function, args->args contains the actual arguments that are passed for the row currently being processed.
Adding a New User-Defined Function

If argument \( i \) represents \texttt{NULL}, \texttt{args->args[i]} is a null pointer (0). If the argument is not \texttt{NULL}, functions can refer to it as follows:

- An argument of type \texttt{STRING\_RESULT} is given as a string pointer plus a length, to enable handling of binary data or data of arbitrary length. The string contents are available as \texttt{args->args[i]} and the string length is \texttt{args->lengths[i]}. Do not assume that the string is null-terminated.

- For an argument of type \texttt{INT\_RESULT}, you must cast \texttt{args->args[i]} to a \texttt{long\ long} value:

  ```
  long long int_val;
  int_val = *((long long*) args->args[i]);
  ```

- For an argument of type \texttt{REAL\_RESULT}, you must cast \texttt{args->args[i]} to a \texttt{double} value:

  ```
  double real_val;
  real_val = *((double*) args->args[i]);
  ```

- \texttt{unsigned long \*lengths}

  For the initialization function, the \texttt{lengths} array indicates the maximum string length for each argument. You should not change these. For each invocation of the main function, \texttt{lengths} contains the actual lengths of any string arguments that are passed for the row currently being processed. For arguments of types \texttt{INT\_RESULT} or \texttt{REAL\_RESULT}, \texttt{lengths} still contains the maximum length of the argument (as for the initialization function).

- \texttt{char \*maybe\_null}

  For the initialization function, the \texttt{maybe\_null} array indicates for each argument whether the argument value might be null (0 if no, 1 if yes).

### 18.2.2.4 UDF Return Values and Error Handling

The initialization function should return \texttt{0} if no error occurred and \texttt{1} otherwise. If an error occurs, \texttt{xxx\_init()} should store a null-terminated error message in the \texttt{message} parameter. The message is returned to the client. The message buffer is \texttt{MYSQL\_ERRMSG\_SIZE} characters long, but you should try to keep the message to less than 80 characters so that it fits the width of a standard terminal screen.

The return value of the main function \texttt{xxx()} is the function value, for \texttt{long\ long} and \texttt{double} functions. A string function should return a pointer to the result and set \*\texttt{length} to the length (in bytes) of the return value. For example:

```
memcpy(result, "result string", 13);
*length = 13;
```
To indicate a return value of `NULL` in the main function, set `*is_null` to 1:

```
*is_null = 1;
```

To indicate an error return in the main function, set `*error` to 1:

```
*error = 1;
```

If `xxx()` sets `*error` to 1 for any row, the function value is `NULL` for the current row and for any subsequent rows processed by the statement in which `XXX()` was invoked. (`xxx()` is not even called for subsequent rows.)

**Note**

Before MySQL 3.22.10, you should set both `*error` and `*is_null`:

```
*error = 1;
*is_null = 1;
```

### 18.2.2.5 Compiling and Installing User-Defined Functions

Files implementing UDFs must be compiled and installed on the host where the server runs. This process is described below for the example UDF file `sql/udf_example.cc` that is included in the MySQL source distribution.

If a UDF will be referred to in statements that will be replicated to slave servers, you must ensure that every slave also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

The immediately following instructions are for Unix. Instructions for Windows are given later in this section.

The `udf_example.cc` file contains the following functions:

- `metaphon()` returns a metaphon string of the string argument. This is something like a soundex string, but it is more tuned for English.
- `myfunc_double()` returns the sum of the ASCII values of the characters in its arguments, divided by the sum of the length of its arguments.
- `myfunc_int()` returns the sum of the length of its arguments.
- `sequence([const int])` returns a sequence starting from the given number or 1 if no number has been given.
- `lookup()` returns the IP address for a host name.
- `reverse_lookup()` returns the host name for an IP address. The function may be called either with a single string argument of the form `'xxx.xxx.xxx.xxx'` or with four numbers.
- `avgcost()` returns an average cost. This is an aggregate function.

A dynamically loadable file should be compiled as a sharable object file, using a command something like this:

```
shell> gcc -shared -o udf_example.so udf_example.cc
```

If you are using `gcc`, you should be able to create `udf_example.so` with a simpler command:
Adding a New User-Defined Function

You can easily determine the correct compiler options for your system by running this command in the `sql` directory of your MySQL source tree:

```
shell> make udf_example.o
```

You should run a compile command similar to the one that `make` displays, except that you should remove the `-c` option near the end of the line and add `-o udf_example.so` to the end of the line. (On some systems, you may need to leave the `-c` on the command.)

After you compile a shared object containing UDFs, you must install it and tell MySQL about it. Compiling a shared object from `udf_example.cc` produces a file named something like `udf_example.so` (the exact name may vary from platform to platform).

As of MySQL 4.1.25, copy the shared object to server's plugin directory and name it `udf_example.so`. This directory is given by the value of the `plugin_dir` system variable.

Prior to MySQL 4.1.25, or if the value of `plugin_dir` is empty, the shared object should be placed in a directory such as `/usr/lib` that is searched by your system's dynamic (runtime) linker, or you can add the directory in which you place the shared object to the linker configuration file (for example, `/etc/ld.so.conf`).

On many systems, you can also set the `LD_LIBRARY` or `LD_LIBRARY_PATH` environment variable to point at the directory where you have the files for your UDF. You should set the variable in `mysql.server` or `mysqld_safe` startup scripts and restart `mysqld`. You might do this if you want to place the object file in a directory accessible only to the server and not in a public directory. The `dlopen` manual page tells you which variable to use on your system.

The dynamic linker name is system-specific (for example, `ld-elf.so.1` on FreeBSD, `ld.so` on Linux, or `dyld` on Mac OS X). Consult your system documentation for information about the linker name and how to configure it.

On some systems, the `ldconfig` program that configures the dynamic linker does not recognize a shared object unless its name begins with `lib`. In this case you should rename a file such as `udf_example.so` to `libudf_example.so`.

On Windows, you can compile user-defined functions by using the following procedure:

1. Obtain the development source for MySQL 4.1. See Section 2.1.3, “How to Get MySQL”.
2. In the source repository, look in the `VC++Files/examples/udf_example` directory. There are files named `udf_example.def`, `udf_example.dsp`, and `udf_example.dsw` there.
3. In the source tree, look in the `sql` directory. Copy the `udf_example.cc` from this directory to the `VC++Files/examples/udf_example` directory and rename the file to `udf_example.cpp`.
4. Open the `udf_example.dsw` file with Visual Studio VC++ and use it to compile the UDFs as a normal project.

After the shared object file has been installed, notify `mysqld` about the new functions with the following statements. If object files have a suffix different from `.so` on your system, substitute the correct suffix throughout (for example, `.dll` on Windows).

```
mysql> CREATE FUNCTION metaphon RETURNS STRING SONAME 'udf_example.so';
mysql> CREATE FUNCTION myfunc_double RETURNS REAL SONAME 'udf_example.so';
```
Adding a New Native Function

mysql> CREATE FUNCTION myfunc_int RETURNS INTEGER SONAME 'udf_example.so';
mysql> CREATE FUNCTION sequence RETURNS INTEGER SONAME 'udf_example.so';
mysql> CREATE FUNCTION lookup RETURNS STRING SONAME 'udf_example.so';
mysql> CREATE FUNCTION reverse_lookup RETURNS STRING SONAME 'udf_example.so';
mysql> CREATE AGGREGATE FUNCTION avgcost RETURNS REAL SONAME 'udf_example.so';

To delete functions, use DROP FUNCTION:

mysql> DROP FUNCTION metaphon;
mysql> DROP FUNCTION myfunc_double;
mysql> DROP FUNCTION myfunc_int;
mysql> DROP FUNCTION sequence;
mysql> DROP FUNCTION lookup;
mysql> DROP FUNCTION reverse_lookup;
mysql> DROP FUNCTION avgcost;

The CREATE FUNCTION and DROP FUNCTION statements update the func system table in the mysql database. The function's name, type and shared library name are saved in the table. You must have the INSERT or DELETE privilege for the mysql database to create or drop functions, respectively.

You should not use CREATE FUNCTION to add a function that has previously been created. If you need to reinstall a function, you should remove it with DROP FUNCTION and then reinstall it with CREATE FUNCTION. You would need to do this, for example, if you recompile a new version of your function, so that mysqld gets the new version. Otherwise, the server continues to use the old version.

An active function is one that has been loaded with CREATE FUNCTION and not removed with DROP FUNCTION. All active functions are reloaded each time the server starts, unless you start mysqld with the --skip-grant-tables option. In this case, UDF initialization is skipped and UDFs are unavailable.

18.2.2.6 User-Defined Function Security Precautions

MySQL takes several measures to prevent misuse of user-defined functions.

UDF object files cannot be placed in arbitrary directories. They must be located in some system directory that the dynamic linker is configured to search. To enforce this restriction and prevent attempts at specifying path names outside of directories searched by the dynamic linker, MySQL checks the shared object file name specified in CREATE FUNCTION statements for path name delimiter characters. As of MySQL 4.0.24 and 4.1.10a, MySQL also checks for path name delimiters in file names stored in the mysql.func table when it loads functions. This prevents attempts at specifying illegitimate path names through direct manipulation of the mysql.func table. For information about UDFs and the runtime linker, see Section 18.2.2.5, “Compiling and Installing User-Defined Functions”.

To use CREATE FUNCTION or DROP FUNCTION, you must have the INSERT or DELETE privilege, respectively, for the mysql database. This is necessary because those statements add and delete rows from the mysql.func table.

UDFs should have at least one symbol defined in addition to the xxx symbol that corresponds to the main xxx() function. These auxiliary symbols correspond to the xxx_init(), xxx_deinit(), xxx_reset(), xxx_clear(), and xxx_add() functions. As of MySQL 4.0.24 and 4.1.10a, mysqld supports an --allow-suspicious-udfs option that controls whether UDFs that have only an xxx symbol can be loaded. By default, the option is off, to prevent attempts at loading functions from shared object files other than those containing legitimate UDFs. If you have older UDFs that contain only the xxx symbol and that cannot be recompiled to include an auxiliary symbol, it may be necessary to specify the --allow-suspicious-udfs option. Otherwise, you should avoid enabling this capability.

18.2.3 Adding a New Native Function
Adding a New Native Function

To add a new native MySQL function, use the procedure described here, which requires that you use a source distribution. You cannot add native functions to a binary distribution because it is necessary to modify MySQL source code and compile MySQL from the modified source. If you migrate to another version of MySQL (for example, when a new version is released), you must repeat the procedure with the new version.

If the new native function will be referred to in statements that will be replicated to slave servers, you must ensure that every slave server also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

To add a new native function, follow these steps to modify source files in the sql directory:

1. Add one line to lex.h that defines the function name in the sql_functions[] array.

2. If the function prototype is simple (just takes zero, one, two, or three arguments), add a line to the sql_functions[] array in lex.h that specifies SYM(FUNC_ARGN) as the second argument (where N is the number of arguments the function takes). Also, add a function in item_create.cc that creates a function object. Look at "ABS" and create_funcs_abs() for an example of this.

   If the function prototype is not simple (for example, if it takes a variable number of arguments), you should make two changes to sql_yacc.yy. One is a line that indicates the preprocessor symbol that yacc should define; this should be added at the beginning of the file. The other is an “item” to be added to the simple_expr parsing rule that defines the function parameters. You will need an item for each syntax with which the function can be called. For an example that shows how this is done, check all occurrences of ATAN in sql_yacc.yy.

3. In item_func.h, declare a class inheriting from Item_num_func or Item_str_func, depending on whether your function returns a number or a string.

4. In item_func.cc, add one of the following declarations, depending on whether you are defining a numeric or string function:

   ```
   double Item_func_newname::val()
   longlong Item_func_newname::val_int()
   String *Item_func_newname::Str(String *str)
   ```

   If you inherit your object from any of the standard items (like Item_num_func), you probably only have to define one of these functions and let the parent object take care of the other functions. For example, the Item_str_func class defines a val() function that executes atof() on the value returned by ::str().

5. If the function is nondeterministic, include the following statement in the item constructor to indicate that function results should not be cached:

   ```
   current_thd->lex->safe_to_cache_query=0;
   ```

   A function is nondeterministic if, given fixed values for its arguments, it can return different results for different invocations.

6. You should probably also define the following object function:

   ```
   void Item_func_newname::fix_length_and_dec()
   ```

   This function should at least calculate max_length based on the given arguments. max_length is the maximum number of characters the function may return. This function should also set maybe_null
= 0 if the main function can't return a NULL value. The function can check whether any of the function arguments can return NULL by checking the arguments' maybe_null variable. Look at Item_func_mod::fix_length_and_dec for a typical example of how to do this.

All functions must be thread-safe. In other words, do not use any global or static variables in the functions without protecting them with mutexes.

If you want to return NULL from ::val(), ::val_int(), or ::str(), you should set null_value to 1 and return 0.

For ::str() object functions, there are additional considerations to be aware of:

• The String *str argument provides a string buffer that may be used to hold the result. (For more information about the String type, take a look at the sql_string.h file.)

• The ::str() function should return the string that holds the result, or (char*) 0 if the result is NULL.

• All current string functions try to avoid allocating any memory unless absolutely necessary!

18.3 Adding New Procedures to MySQL

In MySQL, you can define a procedure in C++ that can access and modify the data in a query before it is sent to the client. The modification can be done on a row-by-row or GROUP BY level.

We have created an example procedure in MySQL 3.23 to show you what can be done.

18.3.1 PROCEDURE ANALYSE

ANALYSE([max_elements[, max_memory]])

ANALYSE() is defined in the sql/sql_analyse.cc source file, which serves as an example of how to create a procedure for use with the PROCEDURE clause of SELECT statements. ANALYSE() is built in and is available by default; other procedures can be created using the format demonstrated in the source file.

ANALYSE() examines the result from a query and returns an analysis of the results that suggests optimal data types for each column that may help reduce table sizes. To obtain this analysis, append PROCEDURE ANALYSE to the end of a SELECT statement:

```
SELECT ... FROM ... WHERE ... PROCEDURE ANALYSE([max_elements, [max_memory]])
```

For example:

```
SELECT col1, col2 FROM table1 PROCEDURE ANALYSE(10, 2000);
```

The results show some statistics for the values returned by the query, and propose an optimal data type for the columns. This can be helpful for checking your existing tables, or after importing new data. You may need to try different settings for the arguments so that PROCEDURE ANALYSE() does not suggest the ENUM data type when it is not appropriate.

The arguments are optional and are used as follows:

• **max_elements** (default 256) is the maximum number of distinct values that ANALYSE() notices per column. This is used by ANALYSE() to check whether the optimal data type should be of type ENUM; if there are more than max_elements distinct values, then ENUM is not a suggested type.

• **max_memory** (default 8192) is the maximum amount of memory that ANALYSE() should allocate per column while trying to find all distinct values.
18.3.2 Writing a Procedure

You can find information about procedures by examining the following source files:

- sql/sql_analyse.cc
- sql/procedure.h
- sql/procedure.cc
- sql/sql_select.cc

See also MySQL Internals: Writing a Procedure.

18.4 Porting to Other Systems

This appendix helps you port MySQL to other operating systems. Do check the list of currently supported operating systems first. See Section 2.1.1, “Operating Systems On Which MySQL Is Known To Run”. If you have created a new port of MySQL, please let us know so that we can list it here and on our Web site (http://www.mysql.com/), recommending it to other users.

Note

If you create a new port of MySQL, you are free to copy and distribute it under the GPL license, but it does not make you a copyright holder of MySQL.

A working POSIX thread library is needed for the server. On Solaris 2.5 we use Sun PThreads (the native thread support in 2.4 and earlier versions is not good enough), on Linux we use LinuxThreads by Xavier Leroy, <Xavier.Leroy@inria.fr>.

The hard part of porting to a new Unix variant without good native thread support is probably to port MIT-pthreads. See mit-pthreads/README and Programming POSIX Threads (http://www.humanfactor.com/pthreads/).

Up to MySQL 4.0.2, the MySQL distribution included a patched version of Chris Provenzano’s Pthreads from MIT (see the MIT Pthreads Web page at http://www.mit.edu/afs/sipb/project/pthreads/ and a programming introduction at http://www.mit.edu:8001/people/proven/IAP_2000/). These can be used for some operating systems that do not have POSIX threads. See Section 2.9.6, “MIT-pthreads Notes”.

It is also possible to use another user level thread package named FSU Pthreads (see http://moss.csc.ncsu.edu/~mueller/pthreads/). This implementation is being used for the SCO port.

See the thr_lock.c and thr_alarm.c programs in the msys directory for some tests/examples of these problems.

Both the server and the client need a working C++ compiler. We use gcc on many platforms. Other compilers that are known to work are Sun Studio, HP-UX aCC, IBM AIX xlC_r, Intel ecc/icc. With previous versions on the respective platforms, we also used Irix cc and Compaq cxx.

Important

If you are trying to build MySQL 5.1 with icc on the IA64 platform, and need support for MySQL Cluster, you should first ensure that you are using icc version 9.1.043 or later. (For details, see Bug #21875.)

To compile only the client, use ./configure --without-server.
Debugging a MySQL Server

If you want or need to change any `Makefile` or the `configure` script, you also need GNU Automake and Autoconf. See Section 2.9.2, “Installing MySQL from a Development Source Tree”.

All steps needed to remake everything from the most basic files.

```
/bin/rm */.deps/*.P
/bin/rm -f config.cache
aclocal
autoheader
aclocal
automake
autoconf
./configure --with-debug=full --prefix='your installation directory'

# The makefiles generated above need GNU make 3.75 or newer.
# (called qmake below)
gmake clean all install init-db
```

If you run into problems with a new port, you may have to do some debugging of MySQL! See Section 18.4.1, “Debugging a MySQL Server”.

**Note**

Before you start debugging `mysqld`, first get the test programs `mysys/thr_alarm` and `mysys/thr_lock` to work. This ensures that your thread installation has even a remote chance to work!

18.4.1 Debugging a MySQL Server

If you are using some functionality that is very new in MySQL, you can try to run `mysqld` with the `--skip-new` (which disables all new, potentially unsafe functionality) or with `--safe-mode` which disables a lot of optimization that may cause problems. See Section B.5.4.2, “What to Do If MySQL Keeps Crashing”.

If `mysqld` doesn't want to start, you should verify that you don't have any `my.cnf` files that interfere with your setup! You can check your `my.cnf` arguments with `mysqld --print-defaults` and avoid using them by starting with `mysqld --no-defaults` .

If `mysqld` starts to eat up CPU or memory or if it “hangs,” you can use `mysqladmin processlist status` to find out if someone is executing a query that takes a long time. It may be a good idea to run `mysqladmin -i10 processlist status` in some window if you are experiencing performance problems or problems when new clients can't connect.

The command `mysqladmin debug` dumps some information about locks in use, used memory and query usage to the MySQL log file. This may help solve some problems. This command also provides some useful information even if you haven't compiled MySQL for debugging!

If the problem is that some tables are getting slower and slower you should try to optimize the table with `OPTIMIZE TABLE` or `myisamchk`. See Chapter 5, *MySQL Server Administration*. You should also check the slow queries with `EXPLAIN`.

You should also read the OS-specific section in this manual for problems that may be unique to your environment. See Section 2.12, “Operating System-Specific Notes”.

18.4.1.1 Compiling MySQL for Debugging

If you have some very specific problem, you can always try to debug MySQL. To do this you must configure MySQL with the `--with-debug` or the `--with-debug=full` option. You can check whether MySQL was compiled with debugging by doing: `mysqld --help`. If the `--debug` flag is listed with
the options then you have debugging enabled. `mysqladmin ver` also lists the `mysqld` version as `mysql ... --debug` in this case.

If you are using `gcc`, the recommended `configure` line is:

```
CC=gcc CFLAGS="-O2" CXX=gcc CXXFLAGS="-O2 -felide-constructors -fno-exceptions -fno-rtti" ./configure --prefix=/usr/local/mysql --with-debug --with-extra-charsets=complex
```

This avoids problems with the `libstdc++` library and with C++ exceptions (many compilers have problems with C++ exceptions in threaded code) and compile a MySQL version with support for all character sets.

If you suspect a memory overrun error, you can configure MySQL with `--with-debug=full`, which installs a memory allocation (SAFEMALLOC) checker. However, running with SAFEMALLOC is quite slow, so if you get performance problems you should start `mysqld` with the `--skip-safemalloc` option. This disables the memory overrun checks for each call to `malloc()` and `free()`.

If `mysqld` stops crashing when you compile it with `--with-debug`, you probably have found a compiler bug or a timing bug within MySQL. In this case, you can try to add `-g` to the `CFLAGS` and `CXXFLAGS` variables above and not use `--with-debug`. If `mysqld` dies, you can at least attach to it with `gdb` or use `gdb` on the core file to find out what happened.

When you configure MySQL for debugging you automatically enable a lot of extra safety check functions that monitor the health of `mysqld`. If they find something "unexpected," an entry is written to `stderr`, which `mysqld_safe` directs to the error log! This also means that if you are having some unexpected problems with MySQL and are using a source distribution, the first thing you should do is to configure MySQL for debugging! (The second thing is to send mail to a MySQL mailing list and ask for help. See Section 1.7.1, "MySQL Mailing Lists". If you believe that you have found a bug, please use the instructions at Section 1.8, "How to Report Bugs or Problems".

In the Windows MySQL distribution, `mysqld.exe` is by default compiled with support for trace files.

### 18.4.1.2 Creating Trace Files

If the `mysqld` server doesn't start or if you can cause it to crash quickly, you can try to create a trace file to find the problem.

To do this, you must have a `mysqld` that has been compiled with debugging support. You can check this by executing `mysqld -V`. If the version number ends with `-debug`, it is compiled with support for trace files. (On Windows, the debugging server is named `mysqld-debug` rather than `mysqld` as of MySQL 4.1.)

Start the `mysqld` server with a trace log in `/tmp/mysqld.trace` on Unix or `C:\mysqld.trace` on Windows:

```
shell> mysqld --debug
```

On Windows, you should also use the `--standalone` flag to not start `mysqld` as a service. In a console window, use this command:

```
C:> mysqld-debug --debug --standalone
```

After this, you can use the `mysql.exe` command-line tool in a second console window to reproduce the problem. You can stop the `mysqld` server with `mysqladmin shutdown`. 1546
The trace file can become very large! To generate a smaller trace file, you can use debugging options something like this:

```bash
mysqld --debug=d,info,error,query,general,where:O,/tmp/mysqld.trace
```

This only prints information with the most interesting tags to the trace file.

If you make a bug report about this, please only send the lines from the trace file to the appropriate mailing list where something seems to go wrong! If you can't locate the wrong place, you can open a bug report and upload the trace file to the report, so that a MySQL developer can take a look at it. For instructions, see Section 1.8, “How to Report Bugs or Problems”.

The trace file is made with the DBUG package by Fred Fish. See Section 18.4.3, “The DBUG Package”.

### 18.4.1.3 Debugging mysqld under gdb

On most systems you can also start `mysqld` from `gdb` to get more information if `mysqld` crashes.

With some older `gdb` versions on Linux you must use `run --one-thread` if you want to be able to debug `mysqld` threads. In this case, you can only have one thread active at a time. It is best to upgrade to `gdb 5.1` because thread debugging works much better with this version!

NPTL threads (the new thread library on Linux) may cause problems while running `mysqld` under `gdb`. Some symptoms are:

- `mysqld` hangs during startup (before it writes `ready for connections`).
- `mysqld` crashes during a `pthread_mutex_lock()` or `pthread_mutex_unlock()` call.

In this case, you should set the following environment variable in the shell before starting `gdb`:

```bash
LD_ASSUME_KERNEL=2.4.1
export LD_ASSUME_KERNEL
```

When running `mysqld` under `gdb`, you should disable the stack trace with `--skip-stack-trace` to be able to catch segfaults within `gdb`.

In MySQL 4.0.14 and above you should use the `--gdb` option to `mysqld`. This installs an interrupt handler for `SIGINT` (needed to stop `mysqld` with `^C` to set breakpoints) and disable stack tracing and core file handling.

It is very hard to debug MySQL under `gdb` if you do a lot of new connections the whole time as `gdb` doesn't free the memory for old threads. You can avoid this problem by starting `mysqld` with `thread_cache_size` set to a value equal to `max_connections + 1`. In most cases just using `--thread_cache_size=5` helps a lot!

If you want to get a core dump on Linux if `mysqld` dies with a SIGSEGV signal, you can start `mysqld` with the `--core-file` option. This core file can be used to make a backtrace that may help you find out why `mysqld` died:

```bash
shell> gdb mysqld core
gdb> backtrace full
gdb> quit
```

See Section B.5.4.2, “What to Do If MySQL Keeps Crashing”.
Debugging a MySQL Server

If you are using gdb 4.17.x or above on Linux, you should install a .gdb file, with the following information, in your current directory:

```
set print sevenbit off
handle SIGUSR1 nostop noprnt
handle SIGUSR2 nostop noprnt
handle SIGWAITING nostop noprnt
handle SIGLWP nostop noprnt
handle SIGPIPE nostop
handle SIGALRM nostop
handle SIGHUP nostop
handle SIGTERM nostop noprnt
```

If you have problems debugging threads with gdb, you should download gdb 5.x and try this instead. The new gdb version has very improved thread handling!

Here is an example how to debug mysqld:

```
shell> gdb /usr/local/libexec/mysqld
gdb> run
...
backtrace full # Do this when mysqld crashes
```

Include the above output in a bug report, which you can file using the instructions in Section 1.8, “How to Report Bugs or Problems”.

If mysqld hangs you can try to use some system tools like strace or /usr/proc/bin/pstack to examine where mysqld has hung.

```
strace /tmp/log libexec/mysqld
```

If you are using the Perl DBI interface, you can turn on debugging information by using the trace method or by setting the DBI_TRACE environment variable.

### 18.4.1.4 Using a Stack Trace

On some operating systems, the error log contains a stack trace if mysqld dies unexpectedly. You can use this to find out where (and maybe why) mysqld died. See Section 5.3.1, “The Error Log”. To get a stack trace, you must not compile mysqld with the -fomit-frame-pointer option to gcc. See Section 18.4.1.1, “Compiling MySQL for Debugging”.

A stack trace in the error log looks something like this:

```
mysqld got signal 11;
Attempting backtrace. You can use the following information
to find out where mysqld died. If you see no messages after
this, something went terribly wrong...

    stack range sanity check, ok, backtrace follows
0x40077552
0x81281a0
0x8128f47
0x8127be0
0x8127995
0x8104947
0x80ff28f
0x810131b
0x80ee4bc
0x80c3c91
```

1548
You can use the `resolve_stack_dump` utility to determine where `mysqld` died by using the following procedure:

1. Copy the preceding numbers to a file, for example `mysqld.stack`:

   0x9da402
   0x6648e9
   0x7f1a5af000f0
   0x7f1a5a10f0f2
   0x7412cb
   0x68835d
   0x688494
   0x671a70
   0x67f0ad
   0x67f88f
   0x6811b6
   0x66e05e

2. Make a symbol file for the `mysqld` server:

   ```shell
   shell> nm -n libexec/mysqld > /tmp/mysqld.sym
   ```

   If `mysqld` is not linked statically, use the following command instead:

   ```shell
   shell> nm -D -n libexec/mysqld > /tmp/mysqld.sym
   ```

   If you want to decode C++ symbols, use the `--demangle`, if available, to `nm`. If your version of `nm` does not have this option, you will need to use the `c++filt` command after the stack dump has been produced to demangle the C++ names.

   Note that most MySQL binary distributions (except for the "debug" packages, where this information is included inside of the binaries themselves) ship with the above file, named `mysqld.sym.gz`. In this case, you can simply unpack it like this:

   ```shell
   shell> gunzip < bin/mysqld.sym.gz > /tmp/mysqld.sym
   ```

3. Execute the following command:

   ```shell
   shell> resolve_stack_dump -s /tmp/mysqld.sym -n mysqld.stack
   ```

   If you were not able to include demangled C++ names in your symbol file, process the `resolve_stack_dump` output using `c++filt`:

   ```shell
   shell> resolve_stack_dump -s /tmp/mysqld.sym -n mysqld.stack | c++filt
   ```

   This prints out where `mysqld` died. If that does not help you find out why `mysqld` died, you should create a bug report and include the output from the preceding command with the bug report.

   However, in most cases it does not help us to have just a stack trace to find the reason for the problem. To be able to locate the bug or provide a workaround, in most cases we need to know the statement that killed `mysqld` and preferably a test case so that we can repeat the problem! See Section 1.8, "How to Report Bugs or Problems".
18.4.1.5 Using Server Logs to Find Causes of Errors in mysqld

Note that before starting `mysqld` with `--log` you should check all your tables with `myisamchk`. See Chapter 5, MySQL Server Administration.

If `mysqld` dies or hangs, you should start `mysqld` with `--log`. When `mysqld` dies again, you can examine the end of the log file for the query that killed `mysqld`.

If you are using `--log` without a file name, the log is stored in the database directory as `host_name.log`.

In most cases it is the last query in the log file that killed `mysqld`, but if possible you should verify this by restarting `mysqld` and executing the found query from the MySQL command-line tools. If this works, you should also test all complicated queries that didn't complete.

You can also try the command `EXPLAIN` on all `SELECT` statements that takes a long time to ensure that `mysqld` is using indexes properly. See Section 12.7.2, “EXPLAIN Syntax”.

You can find the queries that take a long time to execute by starting `mysqld` with `--log-slow-queries`. See Section 5.3.5, “The Slow Query Log”.

If you find the text `mysqld restarted` in the error log file (normally named `hostname.err`) you probably have found a query that causes `mysqld` to fail. If this happens, you should check all your tables with `myisamchk` (see Chapter 5, MySQL Server Administration), and test the queries in the MySQL log files to see whether one fails. If you find such a query, try first upgrading to the newest MySQL version. If this doesn't help and you can't find anything in the `mysql` mail archive, you should report the bug to a MySQL mailing list. The mailing lists are described at http://lists.mysql.com/, which also has links to online list archives.

If you have started `mysqld` with `--myisam-recover`, MySQL automatically checks and tries to repair MyISAM tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the `hostname.err` file 'Warning: Checking table ...' which is followed by Warning: Repairing table if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further. See Section 5.1.2, “Server Command Options”.

It is not a good sign if `mysqld` did die unexpectedly, but in this case, you should not investigate the Checking table... messages, but instead try to find out why `mysqld` died.

18.4.1.6 Making a Test Case If You Experience Table Corruption

If you get corrupted tables or if `mysqld` always fails after some update commands, you can test whether this bug is reproducible by doing the following:

- Take down the MySQL daemon (with `mysqladmin shutdown`).

- Make a backup of the tables (to guard against the very unlikely case that the repair does something bad).

- Check all tables with `myisamchk -s database/* .MYI`. Repair any wrong tables with `myisamchk -r database/table.MYI`.

- Make a second backup of the tables.

- Remove (or move away) any old log files from the MySQL data directory if you need more space.

- Start `mysqld` with `--log-bin`. See Section 5.3.4, “The Binary Log”. If you want to find a query that crashes `mysqld`, you should use `--log --log-bin`. 

1550
• When you have gotten a crashed table, stop the `mysqld` server.
• Restore the backup.
• Restart the `mysqld` server **without** `--log-bin`
• Re-execute the commands with `mysqlbinlog binary-log-file | mysql`. The binary log is saved in the MySQL database directory with the name `hostname-bin.##`.
• If the tables are corrupted again or you can get `mysqld` to die with the above command, you have found reproducible bug that should be easy to fix! FTP the tables and the binary log to our bugs database using the instructions given in Section 1.8, “How to Report Bugs or Problems”. If you are a support customer, you can use the MySQL Customer Support Center [https://support.mysql.com/](https://support.mysql.com/) to alert the MySQL team about the problem and have it fixed as soon as possible.

You can also use the script `mysql_find_rows` to just execute some of the update statements if you want to narrow down the problem.

### 18.4.2 Debugging a MySQL Client

To be able to debug a MySQL client with the integrated debug package, you should configure MySQL with `--with-debug` or `--with-debug=full`. See Section 2.9.3, “MySQL Source-Configuration Options”.

Before running a client, you should set the `MYSQL_DEBUG` environment variable:

```
shell> MYSQL_DEBUG=d:t:O,/tmp/client.trace
shell> export MYSQL_DEBUG
```

This causes clients to generate a trace file in `/tmp/client.trace`.

If you have problems with your own client code, you should attempt to connect to the server and run your query using a client that is known to work. Do this by running `mysql` in debugging mode (assuming that you have compiled MySQL with debugging on):

```
shell> mysql --debug=d:t:O,/tmp/client.trace
```

This provides useful information in case you mail a bug report. See Section 1.8, “How to Report Bugs or Problems”.

If your client crashes at some ‘legal’ looking code, you should check that your `mysql.h` include file matches your MySQL library file. A very common mistake is to use an old `mysql.h` file from an old MySQL installation with new MySQL library.

### 18.4.3 The DEBUG Package

The MySQL server and most MySQL clients are compiled with the DEBUG package originally created by Fred Fish. When you have configured MySQL for debugging, this package makes it possible to get a trace file of what the program is debugging. See Section 18.4.1.2, “Creating Trace Files”.

This section summarizes the argument values that you can specify in debug options on the command line for MySQL programs that have been built with debugging support. For more information about programming with the DEBUG package, see the DEBUG manual in the `dbug` directory of MySQL source distributions. It is best to use a recent distribution to get the most updated DEBUG manual.

You use the debug package by invoking a program with the `--debug="..."` or the `--#...` option.
Most MySQL programs have a default debug string that is used if you don't specify an option to --debug. The default trace file is usually /tmp/program_name.trace on Unix and \program_name.trace on Windows.

The debug control string is a sequence of colon-separated fields as follows:

<field_1>:<field_2>:...:<field_N>

Each field consists of a mandatory flag character followed by an optional ",," and comma-separated list of modifiers:

flag[,modifier,modifier,...,modifier]

The following table shows the currently recognized flag characters.

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>d</td>
<td>Enable output from DBUG_&lt;N&gt; macros for the current state. May be followed by a list of keywords which selects output only for the DBUG macros with that keyword. An empty list of keywords implies output for all macros.</td>
</tr>
<tr>
<td>D</td>
<td>Delay after each debugger output line. The argument is the number of tenths of seconds to delay, subject to machine capabilities. For example, -#D,20 specifies a delay of two seconds.</td>
</tr>
<tr>
<td>f</td>
<td>Limit debugging, tracing, and profiling to the list of named functions. Note that a null list disables all functions. The appropriate d or t flags must still be given; this flag only limits their actions if they are enabled.</td>
</tr>
<tr>
<td>P</td>
<td>Identify the source file name for each line of debug or trace output.</td>
</tr>
<tr>
<td>i</td>
<td>Identify the process with the PID or thread ID for each line of debug or trace output.</td>
</tr>
<tr>
<td>g</td>
<td>Enable profiling. Create a file called dbugmon.out containing information that can be used to profile the program. May be followed by a list of keywords that select profiling only for the functions in that list. A null list implies that all functions are considered.</td>
</tr>
<tr>
<td>L</td>
<td>Identify the source file line number for each line of debug or trace output.</td>
</tr>
<tr>
<td>n</td>
<td>Print the current function nesting depth for each line of debug or trace output.</td>
</tr>
<tr>
<td>N</td>
<td>Number each line of debug output.</td>
</tr>
<tr>
<td>o</td>
<td>Redirect the debugger output stream to the specified file. The default output is stderr.</td>
</tr>
<tr>
<td>O</td>
<td>Like o, but the file is really flushed between each write. When needed, the file is closed and reopened between each write.</td>
</tr>
<tr>
<td>P</td>
<td>Limit debugger actions to specified processes. A process must be identified with the DBUG_PROCESS macro and match one in the list for debugger actions to occur.</td>
</tr>
<tr>
<td>P</td>
<td>Print the current process name for each line of debug or trace output.</td>
</tr>
<tr>
<td>r</td>
<td>When pushing a new state, do not inherit the previous state's function nesting level. Useful when the output is to start at the left margin.</td>
</tr>
<tr>
<td>S</td>
<td>Do function _sanity(<em>file</em>,<em>line</em>) at each debugged function until _sanity() returns something that differs from 0. (Mostly used with safemalloc to find memory leaks)</td>
</tr>
<tr>
<td>t</td>
<td>Enable function call/exit trace lines. May be followed by a list (containing only one modifier) giving a numeric maximum trace level, beyond which no output occurs for either debugging or tracing macros. The default is a compile time option.</td>
</tr>
</tbody>
</table>

Some examples of debug control strings that might appear on a shell command line (the -# is typically used to introduce a control string to an application program) are:
In MySQL, common tags to print (with the `d` option) are `enter`, `exit`, `error`, `warning`, `info`, and `loop`. 
Appendix A Licenses for Third-Party Components

Table of Contents

A.1 RegEX-Spencer Library License ................................................................. 1555
A.2 RSA MD5 Algorithm License ................................................................. 1556
A.3 Editline Library (libedit) License ......................................................... 1556

The following is a list of the creators of the libraries we have included with the MySQL server source to make it easy to compile and install MySQL. We are thankful to all individuals that have created these. Some of these libraries require that their licensing terms be included in the documentation of products that include them. Cross references to these licensing terms are given with the applicable items in the list.

• Fred Fish
  For his excellent C debugging and trace library. Monty has made a number of smaller improvements to the library (speed and additional options).

• Richard A. O'Keefe
  For his public domain string library.

• Jean-loup Gailly and Mark Adler
  For the zlib library, used on MySQL on Windows and on platforms where the host zlib is too old.

• Bjorn Benson
  For his safe_malloc (memory checker) package which is used in when you build MySQL using one of the BUILD/compile-*-debug scripts or by manually setting the -DSAFEMALLOC flag.

• Free Software Foundation
  The readline library, used by the mysql command-line client.

• The NetBSD Foundation
  The libedit library, optionally used by the mysql command-line client. libedit is used for commercial builds because readline is covered under the GPL. License: Section A.3, “Editline Library (libedit) License”

A.1 RegEX-Spencer Library License

The following software may be included in this product: Henry Spencer's Regular-Expression Library (RegEX-Spencer)

  B.5.8 Known Issues in MySQL ............................................................

This appendix lists common problems and errors that may occur and potential resolutions, in addition to listing the errors that may appear when you call MySQL from any host language. The first section covers problems and resolutions. Detailed information on errors is provided: One list displays server error messages. Another list displays client program messages.

B.1 Sources of Error Information

There are several sources of error information in MySQL:

- Each SQL statement executed results in an error code, an SQLSTATE value, and an error message, as described in Section B.2, “Types of Error Values”. These errors are returned from the server side; see Section B.3, “Server Error Codes and Messages”.

- Errors can occur on the client side, usually involving problems communicating with the server; see Section B.4, “Client Error Codes and Messages”.

- SQL statement warning and error information is available through the `SHOW WARNINGS` and `SHOW ERRORS` statements. The `warning_count` system variable indicates the number of errors, warnings, and notes. The `error_count` system variable indicates the number of errors. Its value excludes warnings and notes.

- `SHOW SLAVE STATUS` statement output includes information about replication errors occurring on the slave side.

- `SHOW ENGINE INNODB STATUS` statement output includes information about the most recent foreign key error if a `CREATE TABLE` statement for an InnoDB table fails.

- The `perror` program provides information from the command line about error numbers. See Section 4.8.1, “perror — Explain Error Codes”.

Descriptions of server and client errors are provided later in this Appendix. For information about errors related to InnoDB, see Section 13.2.13, “InnoDB Error Handling”.

B.2 Types of Error Values

When an error occurs in MySQL, the server returns two types of error values:
Server Error Codes and Messages

• A MySQL-specific error code. This value is numeric. It is not portable to other database systems.

• An SQLSTATE value. The value is a five-character string (for example, '42S02'). The values are taken from ANSI SQL and ODBC and are more standardized.

A message string that provides a textual description of the error is also available.

When an error occurs, the MySQL error code, SQLSTATE value, and message string are available using C API functions:

• MySQL error code: Call `mysql_errno()`
• SQLSTATE value: Call `mysql_sqlstate()`
• Error message: Call `mysql_error()`

For prepared statements, the corresponding error functions are `mysql_stmt_errno()`, `mysql_stmt_sqlstate()`, and `mysql_stmt_error()`. All error functions are described in Section 17.6, “MySQL C API”.

The number of errors, warnings, and notes for the previous statement can be obtained by calling `mysql_warning_count()`. See Section 17.6.6.70, “mysql_warning_count()”.

The first two characters of an SQLSTATE value indicate the error class:

• Class = '00' indicates success.
• Class = '01' indicates a warning.
• Class = '02' indicates “not found.” This is relevant within the context of cursors and is used to control what happens when a cursor reaches the end of a data set. This condition also occurs for `SELECT ... INTO var_list` statements that retrieve no rows.
• Class > '02' indicates an exception.

B.3 Server Error Codes and Messages

MySQL programs have access to several types of error information when the server returns an error. For example, the `mysql` client program displays errors using the following format:

```
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

The message displayed contains three types of information:

• A numeric error code (1146). This number is MySQL-specific and is not portable to other database systems.

• A five-character SQLSTATE value ('42S02'). The values are taken from ANSI SQL and ODBC and are more standardized. Not all MySQL error numbers have corresponding SQLSTATE values. In these cases, ' HY000' (general error) is used.

• A message string that provides a textual description of the error.

Server error information comes from the following source files. For details about the way that error information is defined, see the MySQL Internals manual, available at http://dev.mysql.com/doc/.

• The Error values and the symbols in parentheses correspond to definitions in the `include/mysqlld_error.h` MySQL source file.
Server Error Codes and Messages

- The SQLSTATE values correspond to definitions in the include/sql_state.h MySQL source file. SQLSTATE error codes are displayed only if you use MySQL version 4.1 and up. SQLSTATE codes were added for compatibility with X/Open, ANSI, and ODBC behavior.

- The Message values correspond to the error messages that are listed in the sql/share/errmsg.txt file. %d and %s represent numbers and strings, respectively, that are substituted into the messages when they are displayed.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: **1000** SQLSTATE: **HY000** (ER_HASHCHK)
  Message: hashchk

- Error: **1001** SQLSTATE: **HY000** (ER_NISAMCHK)
  Message: isamchk

- Error: **1002** SQLSTATE: **HY000** (ER_NO)
  Message: NO

- Error: **1003** SQLSTATE: **HY000** (ER_YES)
  Message: YES

- Error: **1004** SQLSTATE: **HY000** (ER_CANT_CREATE_FILE)
  Message: Can't create file '%s' (errno: %d)

- Error: **1005** SQLSTATE: **HY000** (ER_CANT_CREATE_TABLE)
  Message: Can't create table '%s' (errno: %d)

- Error: **1006** SQLSTATE: **HY000** (ER_CANT_CREATE_DB)
  Message: Can't create database '%s' (errno: %d)

- Error: **1007** SQLSTATE: **HY000** (ER_DB_CREATE_EXISTS)
  Message: Can't create database '%s'; database exists

- Error: **1008** SQLSTATE: **HY000** (ER_DB_DROP_EXISTS)
  Message: Can't drop database '%s'; database doesn't exist

- Error: **1009** SQLSTATE: **HY000** (ER_DB_DROP_DELETE)
  Message: Error dropping database (can't delete '%s', errno: %d)

- Error: **1010** SQLSTATE: **HY000** (ER_DB_DROP_RMDIR)
  Message: Error dropping database (can't rmdir '%s', errno: %d)

- Error: **1011** SQLSTATE: **HY000** (ER_CANT_DELETE_FILE)
  Message: Error on delete of '%s' (errno: %d)
Server Error Codes and Messages

- **Error:** 1012  **SQLSTATE:** HY000  (**ER_CANT_FIND_SYSTEM_REC**)
  Message: Can't read record in system table

- **Error:** 1013  **SQLSTATE:** HY000  (**ER_CANT_GET_STAT**)
  Message: Can't get status of '%s' (errno: %d)

- **Error:** 1014  **SQLSTATE:** HY000  (**ER_CANT_GET_WD**)
  Message: Can't get working directory (errno: %d)

- **Error:** 1015  **SQLSTATE:** HY000  (**ER_CANT_LOCK**)
  Message: Can't lock file (errno: %d)

- **Error:** 1016  **SQLSTATE:** HY000  (**ER_CANT_OPEN_FILE**)
  Message: Can't open file: '%s' (errno: %d)

- **Error:** 1017  **SQLSTATE:** HY000  (**ER_FILE_NOT_FOUND**)
  Message: Can't find file: '%s' (errno: %d)

- **Error:** 1018  **SQLSTATE:** HY000  (**ER_CANT_READ_DIR**)
  Message: Can't read dir of '%s' (errno: %d)

- **Error:** 1019  **SQLSTATE:** HY000  (**ER_CANT_SET_WD**)
  Message: Can't change dir to '%s' (errno: %d)

- **Error:** 1020  **SQLSTATE:** HY000  (**ER_CHECKREAD**)
  Message: Record has changed since last read in table '%s'

- **Error:** 1021  **SQLSTATE:** HY000  (**ER_DISK_FULL**)
  Message: Disk full (%s); waiting for someone to free some space...

- **Error:** 1022  **SQLSTATE:** 23000  (**ER_DUP_KEY**)
  Message: Can't write; duplicate key in table '%s'

- **Error:** 1023  **SQLSTATE:** HY000  (**ER_ERROR_ON_CLOSE**)
  Message: Error on close of '%s' (errno: %d)

- **Error:** 1024  **SQLSTATE:** HY000  (**ER_ERROR_ON_READ**)
  Message: Error reading file '%s' (errno: %d)

- **Error:** 1025  **SQLSTATE:** HY000  (**ER_ERROR_ON_RENAME**)
  Message: Error on rename of '%s' to '%s' (errno: %d)

- **Error:** 1026  **SQLSTATE:** HY000  (**ER_ERROR_ON_WRITE**)
  Message: Error writing file '%s' (errno: %d)
Server Error Codes and Messages

• Error: 1027 SQLSTATE: HY000 (ER_FILE_USED)
  Message: '%s' is locked against change

• Error: 1028 SQLSTATE: HY000 (ER_FILESORT_ABORT)
  Message: Sort aborted

• Error: 1029 SQLSTATE: HY000 (ER_FORM_NOT_FOUND)
  Message: View '%s' doesn't exist for '%s'

• Error: 1030 SQLSTATE: HY000 (ER_GET_ERRNO)
  Message: Got error %d from storage engine

• Error: 1031 SQLSTATE: HY000 (ER_ILLEGAL_HA)
  Message: Table storage engine for '%s' doesn't have this option

• Error: 1032 SQLSTATE: HY000 (ER_KEY_NOT_FOUND)
  Message: Can't find record in '%s'

• Error: 1033 SQLSTATE: HY000 (ER_NOT_FORM_FILE)
  Message: Incorrect information in file: '%s'

• Error: 1034 SQLSTATE: HY000 (ER_NOT_KEYFILE)
  Message: Incorrect key file for table '%s'; try to repair it

• Error: 1035 SQLSTATE: HY000 (ER_OLD_KEYFILE)
  Message: Old key file for table '%s'; repair it!

• Error: 1036 SQLSTATE: HY000 (ER_OPEN_AS_READONLY)
  Message: Table '%s' is read only

• Error: 1037 SQLSTATE: HY001 (ER_OUTOFMEMORY)
  Message: Out of memory; restart server and try again (needed %d bytes)

• Error: 1038 SQLSTATE: HY001 (ER_OUT_OF_SORTMEMORY)
  Message: Out of sort memory; increase server sort buffer size

• Error: 1039 SQLSTATE: HY000 (ER_UNEXPECTED_EOF)
  Message: Unexpected EOF found when reading file '%s' (errno: %d)

• Error: 1040 SQLSTATE: 08004 (ER_CON_COUNT_ERROR)
  Message: Too many connections

• Error: 1041 SQLSTATE: HY000 (ER_OUT_OF_RESOURCES)
  Message: Out of memory; check if mysqld or some other process uses all available memory; if not, you may have to use 'ulimit' to allow mysqld to use more memory or you can add more swap space
Server Error Codes and Messages

- Error: 1042 SQLSTATE: 08S01 (ER_BAD_HOST_ERROR)
  Message: Can't get hostname for your address

- **Error: 1078** SQLSTATE: HY000 (**ER_GOT_SIGNAL**)
  Message: %s: Got signal %d. Aborting!

- **Error: 1079** SQLSTATE: HY000 (**ER_SHUTDOWN_COMPLETE**)
  Message: %s: Shutdown complete

- **Error: 1080** SQLSTATE: 08S01 (**ER_FORCING_CLOSE**)
  Message: %s: Forcing close of thread %ld user: '%s'

- **Error: 1081** SQLSTATE: 08S01 (**ER_IPSOCK_ERROR**)
  Message: Can't create IP socket

- **Error: 1082** SQLSTATE: 42S12 (**ER_NO_SUCH_INDEX**)
  Message: Table '%s' has no index like the one used in CREATE INDEX; recreate the table

- **Error: 1083** SQLSTATE: 42000 (**ER_WRONG_FIELD_TERMINATORS**)
  Message: Field separator argument is not what is expected; check the manual

- **Error: 1084** SQLSTATE: 42000 (**ER_BLOBS_AND_NO_TERMINATED**)
  Message: You can't use fixed rowlength with BLOBs; please use 'fields terminated by'

- **Error: 1085** SQLSTATE: HY000 (**ER_TEXTFILE_NOT_READABLE**)
  Message: The file '%s' must be in the database directory or be readable by all

- **Error: 1086** SQLSTATE: HY000 (**ER_FILE_EXISTS_ERROR**)
  Message: File '%s' already exists
• Error: 1087 SQLSTATE: HY000 (ER_LOAD_INFO)
  Message: Records: %ld Deleted: %ld Skipped: %ld Warnings: %ld
• Error: 1088 SQLSTATE: HY000 (ER_ALTER_INFO)
  Message: Records: %ld Duplicates: %ld
• Error: 1089 SQLSTATE: HY000 (ER_WRONG_SUB_KEY)
  Message: Incorrect sub part key; the used key part isn't a string, the used length is longer than the key part, or the storage engine doesn't support unique sub keys
• Error: 1090 SQLSTATE: 42000 (ER_CANT_REMOVE_ALL_FIELDS)
  Message: You can't delete all columns with ALTER TABLE; use DROP TABLE instead
• Error: 1091 SQLSTATE: 42000 (ER_CANT_DROP_FIELD_OR_KEY)
  Message: Can't DROP '%s'; check that column/key exists
• Error: 1092 SQLSTATE: HY000 (ER_INSERT_INFO)
  Message: Records: %ld Duplicates: %ld Warnings: %ld
• Error: 1093 SQLSTATE: HY000 (ER_UPDATE_TABLE_USED)
  Message: You can't specify target table '%s' for update in FROM clause
• Error: 1094 SQLSTATE: HY000 (ER_NO_SUCH_THREAD)
  Message: Unknown thread id: %lu
• Error: 1095 SQLSTATE: HY000 (ER_KILL_DENIED_ERROR)
  Message: You are not owner of thread %lu
• Error: 1096 SQLSTATE: HY000 (ER_NO_TABLES_USED)
  Message: No tables used
• Error: 1097 SQLSTATE: HY000 (ER_TOO_BIG_SET)
  Message: Too many strings for column %s and SET
• Error: 1098 SQLSTATE: HY000 (ER_NO_UNIQUE_LOGFILE)
  Message: Can't generate a unique log-filename %s.(1-999)
• Error: 1099 SQLSTATE: HY000 (ER_TABLE_NOT_LOCKED_FOR_WRITE)
  Message: Table '%s' was locked with a READ lock and can't be updated
• Error: 1100 SQLSTATE: HY000 (ER_TABLE_NOT_LOCKED)
  Message: Table '%s' was not locked with LOCK TABLES
• Error: 1101 SQLSTATE: 42000 (ER_BLOB_CANT_HAVE_DEFAULT)
  Message: BLOB/TEXT column '%s' can't have a default value
Server Error Codes and Messages

- Error: 1102 SQLSTATE: 42000 (ER_WRONG_DB_NAME)
  Message: Incorrect database name '%s'

- Error: 1103 SQLSTATE: 42000 (ER_WRONG_TABLE_NAME)
  Message: Incorrect table name '%s'

- Error: 1104 SQLSTATE: 42000 (ER_TOO_BIG_SELECT)
  Message: The SELECT would examine more than MAX_JOIN_SIZE rows; check your WHERE and use SET SQL_BIG_SELECTS=1 or SET SQL_MAX_JOIN_SIZE=# if the SELECT is okay

- Error: 1105 SQLSTATE: HY000 (ER_UNKNOWN_ERROR)
  Message: Unknown error

- Error: 1106 SQLSTATE: 42000 (ER_UNKNOWN_PROCEDURE)
  Message: Unknown procedure '%s'

- Error: 1107 SQLSTATE: 42000 (ER_WRONG_PARAMCOUNT_TO_PROCEDURE)
  Message: Incorrect parameter count to procedure '%s'

- Error: 1108 SQLSTATE: HY000 (ER_WRONG_PARAMETERS_TO_PROCEDURE)
  Message: Incorrect parameters to procedure '%s'

- Error: 1109 SQLSTATE: 42S02 (ER_UNKNOWN_TABLE)
  Message: Unknown table '%s' in %s

- Error: 1110 SQLSTATE: 42000 (ER_FIELD_SPECIFIED_TWICE)
  Message: Column '%s' specified twice

- Error: 1111 SQLSTATE: HY000 (ER_INVALID_GROUP_FUNC_USE)
  Message: Invalid use of group function

- Error: 1112 SQLSTATE: 42000 (ER_UNSUPPORTED_EXTENSION)
  Message: Table '%s' uses an extension that doesn't exist in this MySQL version

- Error: 1113 SQLSTATE: 42000 (ER_TABLE_MUST_HAVE_COLUMNS)
  Message: A table must have at least 1 column

- Error: 1114 SQLSTATE: HY000 (ER_RECORD_FILE_FULL)
  Message: The table '%s' is full

- Error: 1115 SQLSTATE: 42000 (ER_UNKNOWN_CHARACTER_SET)
  Message: Unknown character set: '%s'

- Error: 1116 SQLSTATE: HY000 (ER_TOO_MANY_TABLES)
  Message: Too many tables; MySQL can only use %d tables in a join
Server Error Codes and Messages

- Error: 1117 SQLSTATE: HY000 (ER_TOO_MANY_FIELDS)
  Message: Too many columns

- Error: 1118 SQLSTATE: 42000 (ER_TOO_BIG_ROWSIZE)
  Message: Row size too large. The maximum row size for the used table type, not counting BLOBs, is %ld. You have to change some columns to TEXT or BLOBs

- Error: 1119 SQLSTATE: HY000 (ER_STACK_OVERFLOW)
  Message: Thread stack overrun: Used: %ld of a %ld stack. Use 'mysqld -O thread_stack=#' to specify a bigger stack if needed

- Error: 1120 SQLSTATE: 42000 (ER_Wrong_OUTER_JOIN)
  Message: Cross dependency found in OUTER JOIN; examine your ON conditions

- Error: 1121 SQLSTATE: 42000 (ER_Null_COLUMN_IN_INDEX)
  Message: Column '%s' is used with UNIQUE or INDEX but is not defined as NOT NULL

- Error: 1122 SQLSTATE: HY000 (ER_CANT_FIND_UDF)
  Message: Can't load function '%s'

- Error: 1123 SQLSTATE: HY000 (ER_CANT_INITIALIZE_UDF)
  Message: Can't initialize function '%s'; %s

- Error: 1124 SQLSTATE: HY000 (ER_UDF_NO_PATHS)
  Message: No paths allowed for shared library

- Error: 1125 SQLSTATE: HY000 (ER_UDF_EXISTS)
  Message: Function '%s' already exists

- Error: 1126 SQLSTATE: HY000 (ER_CANT_OPEN_LIBRARY)
  Message: Can't open shared library '%s' (errno: %d %s)

- Error: 1127 SQLSTATE: HY000 (ER_CANT_FIND_DL_ENTRY)
  Message: Can't find function '%s' in library

- Error: 1128 SQLSTATE: HY000 (ER_FUNCTION_NOT_DEFINED)
  Message: Function '%s' is not defined

- Error: 1129 SQLSTATE: HY000 (ER_HOST_IS_BLOCKED)
  Message: Host '%s' is blocked because of many connection errors; unblock with 'mysqladmin flush-hosts'

- Error: 1130 SQLSTATE: HY000 (ER_HOST_NOT_PRIVILEGED)
  Message: Host '%s' is not allowed to connect to this MySQL server

- Error: 1131 SQLSTATE: 42000 (ER_PASSWORD_ANONYMOUS_USER)
Message: You are using MySQL as an anonymous user and anonymous users are not allowed to change passwords

- Error: 1132 SQLSTATE: 42000 (ER_PASSWORD_NOT_ALLOWED)

Message: You must have privileges to update tables in the mysql database to be able to change passwords for others

- Error: 1133 SQLSTATE: 42000 (ER_PASSWORD_NO_MATCH)

Message: Can't find any matching row in the user table

- Error: 1134 SQLSTATE: HY000 (ER_UPDATE_INFO)

Message: Rows matched: %ld Changed: %ld Warnings: %ld

- Error: 1135 SQLSTATE: HY000 (ER_CANT_CREATE_THREAD)

Message: Can't create a new thread (errno %d); if you are not out of available memory, you can consult the manual for a possible OS-dependent bug

- Error: 1136 SQLSTATE: 21S01 (ER_WRONG_VALUE_COUNT_ON_ROW)

Message: Column count doesn't match value count at row %ld

- Error: 1137 SQLSTATE: HY000 (ER_CANT_REOPEN_TABLE)

Message: Can't reopen table: '%s'

- Error: 1138 SQLSTATE: 42000 (ER_INVALID_USE_OF_NULL)

Message: Invalid use of NULL value

- Error: 1139 SQLSTATE: 42000 (ER_REGEXP_ERROR)

Message: Got error '%s' from regexp

- Error: 1140 SQLSTATE: 42000 (ER_MIX_OF_GROUP_FUNC_AND_FIELDS)

Message: Mixing of GROUP columns (MIN(),MAX(),COUNT(),...) with no GROUP columns is illegal if there is no GROUP BY clause

- Error: 1141 SQLSTATE: 42000 (ER_NONEXISTING_GRANT)

Message: There is no such grant defined for user '%s' on host '%s'

- Error: 1142 SQLSTATE: 42000 (ER_TABLEACCESS_DENIED_ERROR)

Message: %s command denied to user '%s'@'%s' for table '%s'

- Error: 1143 SQLSTATE: 42000 (ER_COLUMNACCESS_DENIED_ERROR)

Message: %s command denied to user '%s'@'%s' for column '%s' in table '%s'

- Error: 1144 SQLSTATE: 42000 (ER_ILLEGAL_GRANT_FOR_TABLE)

Message: Illegal GRANT/REVOKE command; please consult the manual to see which privileges can be used
Server Error Codes and Messages

- **Error: 1145 SQLSTATE: 42000 (ER_GRANT_WRONG_HOST_OR_USER)**
  Message: The host or user argument to GRANT is too long

- **Error: 1146 SQLSTATE: 42S02 (ER_NO_SUCH_TABLE)**
  Message: Table '%s.%s' doesn't exist

- **Error: 1147 SQLSTATE: 42000 (ER_NONEXISTING_TABLE_GRANT)**
  Message: There is no such grant defined for user '%s' on host '%s' on table '%s'

- **Error: 1148 SQLSTATE: 42000 (ER_NOT_ALLOWED_COMMAND)**
  Message: The used command is not allowed with this MySQL version

- **Error: 1149 SQLSTATE: 42000 (ER_SYNTAX_ERROR)**
  Message: You have an error in your SQL syntax; check the manual that corresponds to your MySQL server version for the right syntax to use

- **Error: 1150 SQLSTATE: HY000 (ER_DELAYED_CANT_CHANGE_LOCK)**
  Message: Delayed insert thread couldn't get requested lock for table %s

- **Error: 1151 SQLSTATE: HY000 (ER_TOO_MANY_DELAYED_THREADS)**
  Message: Too many delayed threads in use

- **Error: 1152 SQLSTATE: 08S01 (ER_ABORTING_CONNECTION)**
  Message: Aborted connection %ld to db: '%s' user: '%s' (%s)

- **Error: 1153 SQLSTATE: 08S01 (ER_NET_PACKET_TOO_LARGE)**
  Message: Got a packet bigger than 'max_allowed_packet' bytes

- **Error: 1154 SQLSTATE: 08S01 (ER_NET_READ_ERROR_FROM_PIPE)**
  Message: Got a read error from the connection pipe

- **Error: 1155 SQLSTATE: 08S01 (ER_NET_FCNTL_ERROR)**
  Message: Got an error from fcntl()

- **Error: 1156 SQLSTATE: 08S01 (ER_NET_PACKETS_OUT_OF_ORDER)**
  Message: Got packets out of order

- **Error: 1157 SQLSTATE: 08S01 (ER_NET_UNCOMPRESS_ERROR)**
  Message: Couldn't uncompress communication packet

- **Error: 1158 SQLSTATE: 08S01 (ER_NET_READ_ERROR)**
  Message: Got an error reading communication packets

- **Error: 1159 SQLSTATE: 08S01 (ER_NET_READ_INTERRUPTED)**
  Message: Got timeout reading communication packets
Server Error Codes and Messages

- Error: 1160 SQLSTATE: 08S01 (ER_NET_ERROR_ON_WRITE)
  Message: Got an error writing communication packets
- Error: 1161 SQLSTATE: 08S01 (ER_NET_WRITE_INTERRUPTED)
  Message: Got timeout writing communication packets
- Error: 1162 SQLSTATE: 42000 (ER_TOO_LONG_STRING)
  Message: Result string is longer than 'max_allowed_packet' bytes
- Error: 1163 SQLSTATE: 42000 (ER_TABLE_CANT_HANDLE_BLOB)
  Message: The used table type doesn't support BLOB/TEXT columns
- Error: 1164 SQLSTATE: 42000 (ER_TABLE_CANT_HANDLE_AUTO_INCREMENT)
  Message: The used table type doesn't support AUTO_INCREMENT columns
- Error: 1165 SQLSTATE: HY000 (ER_DELAYED_INSERT_TABLE_LOCKED)
  Message: INSERT DELAYED can't be used with table '%s' because it is locked with LOCK TABLES
- Error: 1166 SQLSTATE: 42000 (ER_WRONG_COLUMN_NAME)
  Message: Incorrect column name '%s'
- Error: 1167 SQLSTATE: 42000 (ER_WRONG_KEY_COLUMN)
  Message: The used storage engine can't index column '%s'
- Error: 1168 SQLSTATE: HY000 (ER_WRONG_MRG_TABLE)
  Message: Unable to open underlying table which is differently defined or of non-MyISAM type or doesn't exist
- Error: 1169 SQLSTATE: 23000 (ER_DUP_UNIQUE)
  Message: Can't write, because of unique constraint, to table '%s'
- Error: 1170 SQLSTATE: 42000 (ER_BLOB_KEY_WITHOUT_LENGTH)
  Message: BLOB/TEXT column '%s' used in key specification without a key length
- Error: 1171 SQLSTATE: 42000 (ER_PRIMARY_CANT_HAVE_NULL)
  Message: All parts of a PRIMARY KEY must be NOT NULL; if you need NULL in a key, use UNIQUE instead
- Error: 1172 SQLSTATE: 42000 (ER_TOO_MANY_ROWS)
  Message: Result consisted of more than one row
- Error: 1173 SQLSTATE: 42000 (ERQUIRES_PRIMARY_KEY)
  Message: This table type requires a primary key
- Error: 1174 SQLSTATE: HY000 (ER_NO_RAID_COMPILED)
  Message: This version of MySQL is not compiled with RAID support
Server Error Codes and Messages

- Error: **1175 SQLSTATE: HY000 (ER_UPDATE_WITHOUT_KEY_IN_SAFE_MODE)**

Server Error Codes and Messages

Message: Error running query on master: %s

• Error: 1220 SQLSTATE: HY000 (ER_ERROR_WHEN_EXECUTING_COMMAND)
  Message: Error when executing command %s: %s

• Error: 1221 SQLSTATE: HY000 (ER_WRONG_USAGE)
  Message: Incorrect usage of %s and %s

• Error: 1222 SQLSTATE: 21000 (ER_WRONG_NUMBER_OF_COLUMNS_IN_SELECT)
  Message: The used SELECT statements have a different number of columns

• Error: 1223 SQLSTATE: HY000 (ER_CANT_UPDATE_WITH_READLOCK)
  Message: Can't execute the query because you have a conflicting read lock

• Error: 1224 SQLSTATE: HY000 (ER_MIXING_NOT_ALLOWED)
  Message: Mixing of transactional and non-transactional tables is disabled

• Error: 1225 SQLSTATE: HY000 (ER_DUP_ARGUMENT)
  Message: Option '%s' used twice in statement

• Error: 1226 SQLSTATE: 42000 (ER_USER_LIMIT_REACHED)
  Message: User '%s' has exceeded the '%s' resource (current value: %ld)

• Error: 1227 SQLSTATE: HY000 (ER_SPECIFIC_ACCESS_DENIED_ERROR)
  Message: Access denied; you need the %s privilege for this operation

• Error: 1228 SQLSTATE: HY000 (ER_LOCAL_VARIABLE)
  Message: Variable '%s' is a SESSION variable and can't be used with SET GLOBAL

• Error: 1229 SQLSTATE: HY000 (ER_GLOBAL_VARIABLE)
  Message: Variable '%s' is a GLOBAL variable and should be set with SET GLOBAL

• Error: 1230 SQLSTATE: 42000 (ER_NO_DEFAULT)
  Message: Variable '%s' doesn't have a default value

• Error: 1231 SQLSTATE: 42000 (ER_WRONG_VALUE_FOR_VAR)
  Message: Variable '%s' can't be set to the value of '%s'

• Error: 1232 SQLSTATE: 42000 (ER_WRONG_TYPE_FOR_VAR)
  Message: Incorrect argument type to variable '%s'

• Error: 1233 SQLSTATE: HY000 (ER_VAR_CANT_BE_READ)
  Message: Variable '%s' can only be set, not read

• Error: 1234 SQLSTATE: 42000 (ER_CANT_USE_OPTION_HERE)
Message: Incorrect usage/placement of '%s'
- Error: **1235** SQLSTATE: **42000** (*ER_NOT_SUPPORTED_YET*)
  Message: This version of MySQL doesn't yet support '%s'
- Error: **1236** SQLSTATE: **HY000** (*ER_MASTER_FATAL_ERROR_READING_BINLOG*)
  Message: Got fatal error %d: '%s' from master when reading data from binary log
- Error: **1237** SQLSTATE: **HY000** (*ER_SLAVE_IGNORED_TABLE*)
  Message: Slave SQL thread ignored the query because of replicate-*table rules
- Error: **1238** SQLSTATE: **HY000** (*ER_INCORRECT_GLOBAL_LOCAL_VAR*)
  Message: Variable '%s' is a %s variable
- Error: **1239** SQLSTATE: **42000** (*ER_WRONG_FK_DEF*)
  Message: Incorrect foreign key definition for '%s': %s
- Error: **1240** SQLSTATE: **HY000** (*ER_KEY_REF_DO_NOT_MATCH_TABLE_REF*)
  Message: Key reference and table reference don't match
- Error: **1241** SQLSTATE: **21000** (*ER_OPERAND_COLUMNS*)
  Message: Operand should contain %d column(s)
- Error: **1242** SQLSTATE: **21000** (*ER_SUBQUERY_NO_1_ROW*)
  Message: Subquery returns more than 1 row
- Error: **1243** SQLSTATE: **HY000** (*ER_UNKNOWN_STMT_HANDLER*)
  Message: Unknown prepared statement handler (%.*s) given to %s
- Error: **1244** SQLSTATE: **HY000** (*ER_CORRUPT_HELP_DB*)
  Message: Help database is corrupt or does not exist
- Error: **1245** SQLSTATE: **HY000** (*ER_CYCLIC_REFERENCE*)
  Message: Cyclic reference on subqueries
- Error: **1246** SQLSTATE: **HY000** (*ER_AUTO_CONVERT*)
  Message: Converting column '%s' from %s to %s
- Error: **1247** SQLSTATE: **42S22** (*ER_ILLEGAL_REFERENCE*)
  Message: Reference '%s' not supported (%s)
- Error: **1248** SQLSTATE: **42000** (*ER_DERIVED_MUST_HAVE_ALIAS*)
  Message: Every derived table must have its own alias
- Error: **1249** SQLSTATE: **01000** (*ER_SELECT_REDUCED*)
Message: Select %u was reduced during optimization
• Error: 1250 SQLSTATE: 42000 (ER_TABLENAME_NOT_ALLOWED_HERE)
Message: Table '%s' from one of the SELECTs cannot be used in %s
• Error: 1251 SQLSTATE: 08004 (ER_NOT_SUPPORTED_AUTH_MODE)
Message: Client does not support authentication protocol requested by server; consider upgrading MySQL client
• Error: 1252 SQLSTATE: 42000 (ER_SPATIAL_CANT_HAVE_NULL)
Message: All parts of a SPATIAL index must be NOT NULL
• Error: 1253 SQLSTATE: 42000 (ER_COLLATION_CHARSET_MISMATCH)
Message: COLLATION '%s' is not valid for CHARACTER SET '%s'
• Error: 1254 SQLSTATE: HY000 (ER_SLAVE_WAS_RUNNING)
Message: Slave is already running
• Error: 1255 SQLSTATE: HY000 (ER_SLAVE_WAS_NOT_RUNNING)
Message: Slave has already been stopped
• Error: 1256 SQLSTATE: HY000 (ER_TOO_BIG_FOR_UNCOMPRESS)
Message: Uncompressed data size too large; the maximum size is %d (probably, length of uncompressed data was corrupted)
• Error: 1257 SQLSTATE: HY000 (ER_ZLIB_Z_MEM_ERROR)
Message: ZLIB: Not enough memory
• Error: 1258 SQLSTATE: HY000 (ER_ZLIB_Z_BUF_ERROR)
Message: ZLIB: Not enough room in the output buffer (probably, length of uncompressed data was corrupted)
• Error: 1259 SQLSTATE: HY000 (ER_ZLIB_Z_DATA_ERROR)
Message: ZLIB: Input data corrupted
• Error: 1260 SQLSTATE: HY000 (ER_CUT_VALUE_GROUP_CONCAT)
Message: %d line(s) were cut by GROUP_CONCAT()
• Error: 1261 SQLSTATE: 01000 (ER_WARN_TOO_FEW_RECORDS)
Message: Row %ld doesn't contain data for all columns
• Error: 1262 SQLSTATE: 01000 (ER_WARN_TOO_MANY_RECORDS)
Message: Row %ld was truncated; it contained more data than there were input columns
• Error: 1263 SQLSTATE: 01000 (ER_WARN_NULL_TO_NOTNULL)
Message: Data truncated; NULL supplied to NOT NULL column '%s' at row %ld
• Error: **1264 SQLSTATE: 01000 (ER_WARN_DATA_OUT_OF_RANGE)**
Message: Data truncated; out of range for column '%s' at row %ld

• Error: **1265 SQLSTATE: 01000 (ER_WARN_DATA_TRUNCATED)**
Message: Data truncated for column '%s' at row %ld

• Error: **1266 SQLSTATE: HY000 (ER_WARN_USING_OTHER_Handler)**
Message: Using storage engine %s for table '%s'

• Error: **1267 SQLSTATE: HY000 (ER_CANT_AGGREGATE_2COLLATIONS)**
Message: Illegal mix of collations (%s,%s) and (%s,%s) for operation '%s'

• Error: **1268 SQLSTATE: HY000 (ER_DROP_USER)**
Message: Can't drop one or more of the requested users

• Error: **1269 SQLSTATE: HY000 (ER_REVOKE_GRANTS)**
Message: Can't revoke all privileges, grant for one or more of the requested users

• Error: **1270 SQLSTATE: HY000 (ER_CANT_AGGREGATE_3COLLATIONS)**
Message: Illegal mix of collations (%s,%s), (%s,%s), (%s,%s) for operation '%s'

• Error: **1271 SQLSTATE: HY000 (ER_CANT_AGGREGATE_NCOLLATIONS)**
Message: Illegal mix of collations for operation '%s'

• Error: **1272 SQLSTATE: HY000 (ER_VARIABLE_IS_NOT_STRUCT)**
Message: Variable '%s' is not a variable component (can't be used as XXXX.variable_name)

• Error: **1273 SQLSTATE: HY000 (ER_UNKNOWN_COLLATION)**
Message: Unknown collation: '%s'

• Error: **1274 SQLSTATE: HY000 (ER_SLAVE_IGNORED_SSL_PARAMS)**
Message: SSL parameters in CHANGE MASTER are ignored because this MySQL slave was compiled without SSL support; they can be used later if MySQL slave with SSL is started

• Error: **1275 SQLSTATE: HY000 (ER_SERVER_IS_IN_SECURE_AUTH_MODE)**
Message: Server is running in --secure-auth mode, but '%s'@'%s' has a password in the old format; please change the password to the new format

• Error: **1276 SQLSTATE: HY000 (ER_WARN_FIELD_RESOLVED)**
Message: Field or reference '%s%s%s%s%s%s' of SELECT #%d was resolved in SELECT #%d

• Error: **1277 SQLSTATE: HY000 (ER_BAD_SLAVE_UNTIL_COND)**
Message: Incorrect parameter or combination of parameters for START SLAVE UNTIL

• Error: **1278 SQLSTATE: HY000 (ER_MISSING_SKIP_SLAVE)**
Message: It is recommended to use --skip-slave-start when doing step-by-step replication with START SLAVE UNTIL; otherwise, you will get problems if you get an unexpected slave's mysqld restart

- Error: 1279 SQLSTATE: HY000 (ER_UNTIL_COND_IGNORED)
  Message: SQL thread is not to be started so UNTIL options are ignored

- Error: 1280 SQLSTATE: 42000 (ER_WRONG_NAME_FOR_INDEX)
  Message: Incorrect index name '%s'

- Error: 1281 SQLSTATE: 42000 (ER_WRONG_NAME_FOR_CATALOG)
  Message: Incorrect catalog name '%s'

- Error: 1282 SQLSTATE: HY000 (ER_WARN_QC_RESIZE)
  Message: Query cache failed to set size %lu; new query cache size is %lu

- Error: 1283 SQLSTATE: HY000 (ER_BAD_FT_COLUMN)
  Message: Column '%s' cannot be part of FULLTEXT index

- Error: 1284 SQLSTATE: HY000 (ER_UNKNOWN_KEY_CACHE)
  Message: Unknown key cache '%s'

- Error: 1285 SQLSTATE: HY000 (ER_WARN_HOSTNAME_WONT_WORK)
  Message: MySQL is started in --skip-name-resolve mode; you must restart it without this switch for this grant to work

- Error: 1286 SQLSTATE: 42000 (ER_UNKNOWN_STORAGE_ENGINE)
  Message: Unknown table engine '%s'

- Error: 1287 SQLSTATE: HY000 (ER_WARN_DEPRECATED_SYNTAX)
  Message: '%s' is deprecated; use '%s' instead

- Error: 1288 SQLSTATE: HY000 (ER_NON_UPDATABLE_TABLE)
  Message: The target table %s of the %s is not updatable

- Error: 1289 SQLSTATE: HY000 (ER_FEATURE_DISABLED)
  Message: The '%s' feature is disabled; you need MySQL built with '%s' to have it working

- Error: 1290 SQLSTATE: HY000 (ER_OPTION_PREVENTS_STATEMENT)
  Message: The MySQL server is running with the %s option so it cannot execute this statement

- Error: 1291 SQLSTATE: HY000 (ER_DUPLICATED_VALUE_IN_TYPE)
  Message: Column '%s' has duplicated value '%s' in %s

- Error: 1292 SQLSTATE: HY000 (ER_TRUNCATED_WRONG_VALUE)
  Message: Truncated incorrect %s value: '%s'
Client Error Codes and Messages

• Error: **1293** SQLSTATE: **HY000** (*ER_TOO_MUCH_AUTO_TIMESTAMP_COLS*)
  Message: Incorrect table definition; there can be only one TIMESTAMP column with CURRENT_TIMESTAMP in DEFAULT or ON UPDATE clause

• Error: **1294** SQLSTATE: **HY000** (*ER_INVALID_ON_UPDATE*)
  Message: Invalid ON UPDATE clause for '%%s' column

• Error: **1295** SQLSTATE: **HY000** (*ER_UNSUPPORTED_PS*)
  Message: This command is not supported in the prepared statement protocol yet

• Error: **1296** SQLSTATE: **HY000** (*ER_GET_ERRMSG*)
  Message: Got error %d='%s' from %s

• Error: **1297** SQLSTATE: **HY000** (*ER_GET_TEMPORARY_ERRMSG*)
  Message: Got temporary error %d='%s' from %s

• Error: **1298** SQLSTATE: **HY000** (*ER_UNKNOWN_TIME_ZONE*)
  Message: Unknown or incorrect time zone: '%s'

• Error: **1299** SQLSTATE: **HY000** (*ER_WARN_INVALID_TIMESTAMP*)
  Message: Invalid TIMESTAMP value in column '%s' at row %ld

• Error: **1300** SQLSTATE: **HY000** (*ER_INVALID_CHARACTER_STRING*)
  Message: Invalid %s character string: '%s'

• Error: **1301** SQLSTATE: **HY000** (*ER_WARN_ALLOWED_PACKET_OVERFLOWED*)
  Message: Result of %s() was larger than max_allowed_packet (%ld) - truncated

• Error: **1302** SQLSTATE: **HY000** (*ER_CONFLICTING_DECLARATIONS*)
  Message: Conflicting declarations: '%s%s' and '%s%s'

### B.4 Client Error Codes and Messages

Client error information comes from the following source files:

• The Error values and the symbols in parentheses correspond to definitions in the include/errmsg.h MySQL source file.

• The Message values correspond to the error messages that are listed in the libmysql/errmsg.c file. %d and %s represent numbers and strings, respectively, that are substituted into the messages when they are displayed.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

• Error: **2000** (*CR_UNKNOWN_ERROR*)
  Message: Unknown MySQL error

• Error: **2001** (*CR_SOCKET_CREATE_ERROR*)
Client Error Codes and Messages

Message: Can't create UNIX socket (%d)
• Error: 2002 (CR_CONNECTION_ERROR)

Message: Can't connect to local MySQL server through socket '%s' (%d)
• Error: 2003 (CR_CONN_HOST_ERROR)

Message: Can't connect to MySQL server on '%s' (%d)
• Error: 2004 (CR_IPSOCK_ERROR)

Message: Can't create TCP/IP socket (%d)
• Error: 2005 (CR_UNKNOWN_HOST)

Message: Unknown MySQL server host '%s' (%d)
• Error: 2006 (CR_SERVER_GONE_ERROR)

Message: MySQL server has gone away
• Error: 2007 (CR_VERSION_ERROR)

Message: Protocol mismatch; server version = %d, client version = %d
• Error: 2008 (CR_OUT_OF_MEMORY)

Message: MySQL client ran out of memory
• Error: 2009 (CR_WRONG_HOST_INFO)

Message: Wrong host info
• Error: 2010 (CR_LOCALHOST_CONNECTION)

Message: Localhost via UNIX socket
• Error: 2011 (CR_TCP_CONNECTION)

Message: %s via TCP/IP
• Error: 2012 (CR_SERVER_HANDSHAKE_ERR)

Message: Error in server handshake
• Error: 2013 (CR_SERVER_LOST)

Message: Lost connection to MySQL server during query
• Error: 2014 (CR_COMMANDS_OUT_OF_SYNC)

Message: Commands out of sync; you can't run this command now
• Error: 2015 (CR_NAMEDPIPE_CONNECTION)

Message: Named pipe: %s
• Error: 2016 (CR_NAMEDPIPEWAIT_ERROR)
Message: Can't wait for named pipe to host: %s pipe: %s (%lu)
• Error: 2017 (CR_NAMEDPIPEOPEN_ERROR)
Message: Can't open named pipe to host: %s pipe: %s (%lu)
• Error: 2018 (CR_NAMEDPIPESETSTATE_ERROR)
Message: Can't set state of named pipe to host: %s pipe: %s (%lu)
• Error: 2019 (CR_CANT_READ_CHARSET)
Message: Can't initialize character set %s (path: %s)
• Error: 2020 (CR_NET_PACKET_TOO_LARGE)
Message: Got packet bigger than 'max_allowed_packet' bytes
• Error: 2021 (CR_EMBEDDED_CONNECTION)
Message: Embedded server
• Error: 2022 (CR_PROBE_SLAVE_STATUS)
Message: Error on SHOW SLAVE STATUS:
• Error: 2023 (CR_PROBE_SLAVE_HOSTS)
Message: Error on SHOW SLAVE HOSTS:
• Error: 2024 (CR_PROBE_SLAVE_CONNECT)
Message: Error connecting to slave:
• Error: 2025 (CR_PROBE_MASTER_CONNECT)
Message: Error connecting to master:
• Error: 2026 (CR_SSL_CONNECTION_ERROR)
Message: SSL connection error
• Error: 2027 (CR_MALFORMED_PACKET)
Message: Malformed packet
• Error: 2028 (CR_WRONG_LICENSE)
Message: This client library is licensed only for use with MySQL servers having '%s' license
• Error: 2029 (CR_NULL_POINTER)
Message: Invalid use of null pointer
• Error: 2030 (CR_NO_PREPARE_STMT)
Message: Statement not prepared
• Error: 2031 (CR_PARAMS_NOT_BOUND)
Client Error Codes and Messages

Message: No data supplied for parameters in prepared statement
• Error: **2032** (**CR_DATA_TRUNCATED**)  
  Message: Data truncated
• Error: **2033** (**CR_NO_PARAMETERS_EXISTS**)  
  Message: No parameters exist in the statement
• Error: **2034** (**CR_INVALID_PARAMETER_NO**)  
  Message: Invalid parameter number
• Error: **2035** (**CR_INVALID_BUFFER_USE**)  
  Message: Can't send long data for non-string/non-binary data types (parameter: %d)
• Error: **2036** (**CR_UNSUPPORTED_PARAM_TYPE**)  
  Message: Using unsupported buffer type: %d (parameter: %d)
• Error: **2037** (**CR_SHARED_MEMORY_CONNECTION**)  
  Message: Shared memory: %s
• Error: **2038** (**CR_SHARED_MEMORY_CONNECT_REQUEST_ERROR**)  
  Message: Can't open shared memory; client could not create request event (%lu)
• Error: **2039** (**CR_SHARED_MEMORY_CONNECT_ANSWER_ERROR**)  
  Message: Can't open shared memory; no answer event received from server (%lu)
• Error: **2040** (**CR_SHARED_MEMORY_CONNECT_FILE_MAP_ERROR**)  
  Message: Can't open shared memory; server could not allocate file mapping (%lu)
• Error: **2041** (**CR_SHARED_MEMORY_CONNECT_MAP_ERROR**)  
  Message: Can't open shared memory; server could not get pointer to file mapping (%lu)
• Error: **2042** (**CR_SHARED_MEMORY_FILE_MAP_ERROR**)  
  Message: Can't open shared memory; client could not allocate file mapping (%lu)
• Error: **2043** (**CR_SHARED_MEMORY_MAP_ERROR**)  
  Message: Can't open shared memory; client could not get pointer to file mapping (%lu)
• Error: **2044** (**CR_SHARED_MEMORY_EVENT_ERROR**)  
  Message: Can't open shared memory; client could not create %s event (%lu)
• Error: **2045** (**CR_SHARED_MEMORY_CONNECT_ABANDONED_ERROR**)  
  Message: Can't open shared memory; no answer from server (%lu)
• Error: **2046** (**CR_SHARED_MEMORY_CONNECT_SET_ERROR**)
Problems and Common Errors

Message: Can't open shared memory; cannot send request event to server (%lu)
• Error: 2047 (CR_CONN_UNKNOWN_PROTOCOL)
  Message: Wrong or unknown protocol
• Error: 2048 (CR_INVALID_CONN_HANDLE)
  Message: Invalid connection handle
• Error: 2049 (CR_SECURE_AUTH)
  Message: Connection using old (pre-4.1.1) authentication protocol refused (client option 'secure_auth' enabled)
• Error: 2050 (CR_FETCH_CANCELED)
  Message: Row retrieval was canceled by mysql_stmt_close() call
• Error: 2051 (CR_NO_DATA)
  Message: Attempt to read column without prior row fetch
• Error: 2052 (CR_NO_STMT_METADATA)
  Message: Prepared statement contains no metadata

B.5 Problems and Common Errors

This section lists some common problems and error messages that you may encounter. It describes how to determine the causes of the problems and what to do to solve them.

B.5.1 How to Determine What Is Causing a Problem

When you run into a problem, the first thing you should do is to find out which program or piece of equipment is causing it:

• If you have one of the following symptoms, then it is probably a hardware problems (such as memory, motherboard, CPU, or hard disk) or kernel problem:
  • The keyboard does not work. This can normally be checked by pressing the Caps Lock key. If the Caps Lock light does not change, you have to replace your keyboard. (Before doing this, you should try to restart your computer and check all cables to the keyboard.)
  • The mouse pointer does not move.
  • The machine does not answer to a remote machine's pings.
  • Other programs that are not related to MySQL do not behave correctly.
  • Your system restarted unexpectedly. (A faulty user-level program should never be able to take down your system.)

In this case, you should start by checking all your cables and run some diagnostic tool to check your hardware! You should also check whether there are any patches, updates, or service packs for your operating system that could likely solve your problem. Check also that all your libraries (such as glibc) are up to date.
It is always good to use a machine with ECC memory to discover memory problems early.

- If your keyboard is locked up, you may be able to recover by logging in to your machine from another machine and executing `kbd_mode -a`.

- Please examine your system log file (`/var/log/messages` or similar) for reasons for your problem. If you think the problem is in MySQL, you should also examine MySQL’s log files. See Section 5.3, “MySQL Server Logs”.

- If you do not think you have hardware problems, you should try to find out which program is causing problems. Try using `top`, `ps`, Task Manager, or some similar program, to check which program is taking all CPU or is locking the machine.

- Use `top`, `df`, or a similar program to check whether you are out of memory, disk space, file descriptors, or some other critical resource.

- If the problem is some runaway process, you can always try to kill it. If it does not want to die, there is probably a bug in the operating system.

If after you have examined all other possibilities and you have concluded that the MySQL server or a MySQL client is causing the problem, it is time to create a bug report for our mailing list or our support team. In the bug report, try to give a very detailed description of how the system is behaving and what you think is happening. You should also state why you think that MySQL is causing the problem. Take into consideration all the situations in this chapter. State any problems exactly how they appear when you examine your system. Use the “copy and paste” method for any output and error messages from programs and log files.

Try to describe in detail which program is not working and all symptoms you see. We have in the past received many bug reports that state only “the system does not work.” This provides us with no information about what could be the problem.

If a program fails, it is always useful to know the following information:

- Has the program in question made a segmentation fault (did it dump core)?

- Is the program taking up all available CPU time? Check with `top`. Let the program run for a while, it may simply be evaluating something computationally intensive.

- If the `mysqld` server is causing problems, can you get any response from it with `mysqladmin -u root ping` or `mysqladmin -u root processlist`?

- What does a client program say when you try to connect to the MySQL server? (Try with `mysql`, for example.) Does the client jam? Do you get any output from the program?

When sending a bug report, you should follow the outline described in Section 1.8, “How to Report Bugs or Problems”.

**B.5.2 Common Errors When Using MySQL Programs**

This section lists some errors that users frequently encounter when running MySQL programs. Although the problems show up when you try to run client programs, the solutions to many of the problems involves changing the configuration of the MySQL server.

**B.5.2.1 Access denied**

An Access denied error can have many causes. Often the problem is related to the MySQL accounts that the server permits client programs to use when connecting. See Section 5.5, “The MySQL Access Privilege System”, and Section 5.5.7, “Causes of Access-Denied Errors”.

1586
B.5.2.2 Can't connect to [local] MySQL server

A MySQL client on Unix can connect to the \texttt{mysqld} server in two different ways: By using a Unix socket file to connect through a file in the file system (default /tmp/mysql.sock), or by using TCP/IP, which connects through a port number. A Unix socket file connection is faster than TCP/IP, but can be used only when connecting to a server on the same computer. A Unix socket file is used if you don't specify a host name or if you specify the special host name \texttt{localhost}.

If the MySQL server is running on Windows 9x or Me, you can connect only using TCP/IP. If the server is running on Windows NT, 2000, XP, or 2003 and is started with the \texttt{--enable-named-pipe} option, you can also connect with named pipes if you run the client on the host where the server is running. The name of the named pipe is \texttt{MySQL} by default. If you don't give a host name when connecting to \texttt{mysqld}, a MySQL client first tries to connect to the named pipe. If that doesn't work, it connects to the TCP/IP port. You can force the use of named pipes on Windows by using . as the host name.

The error (2002) \texttt{Can't connect to} ... normally means that there is no MySQL server running on the system or that you are using an incorrect Unix socket file name or TCP/IP port number when trying to connect to the server. You should also check that the TCP/IP port you are using has not been blocked by a firewall or port blocking service.

The error (2003) \texttt{Can't connect to MySQL server on 'server' (10061)} indicates that the network connection has been refused. You should check that there is a MySQL server running, that it has network connections enabled, and that the network port you specified is the one configured on the server.

Start by checking whether there is a process named \texttt{mysqld} running on your server host. (Use \texttt{ps xa | grep mysqld} on Unix or the Task Manager on Windows.) If there is no such process, you should start the server. See Section 2.10.2.3, "Starting and Troubleshooting the MySQL Server".

If a \texttt{mysqld} process is running, you can check it by trying the following commands. The port number or Unix socket file name might be different in your setup. \texttt{host_ip} represents the IP address of the machine where the server is running.

\begin{verbatim}
shell> mysqladmin version
shell> mysqladmin variables
shell> mysqladmin -h `hostname` version variables
shell> mysqladmin -h `hostname` --port=3306 version
shell> mysqladmin -h host_ip version
shell> mysqladmin --protocol=SOCKET --socket=/tmp/mysql.sock version
\end{verbatim}

Note the use of backticks rather than forward quotation marks with the \texttt{hostname} command; these cause the output of \texttt{hostname} (that is, the current host name) to be substituted into the \texttt{mysqladmin} command. If you have no \texttt{hostname} command or are running on Windows, you can manually type the host name of your machine (without backticks) following the \texttt{-h} option. You can also try \texttt{-h 127.0.0.1} to connect with TCP/IP to the local host.

Make sure that the server has not been configured to ignore network connections or (if you are attempting to connect remotely) that it has not been configured to listen only locally on its network interfaces. If the server was started with \texttt{--skip-networking}, it will not accept TCP/IP connections at all. If the server was started with \texttt{--bind-address=127.0.0.1}, it will listen for TCP/IP connections only locally on the loopback interface and will not accept remote connections.

Check to make sure that there is no firewall blocking access to MySQL. Your firewall may be configured on the basis of the application being executed, or the port number used by MySQL for communication (3306 by default). Under Linux or Unix, check your IP tables (or similar) configuration to ensure that the port has not been blocked. Under Windows, applications such as ZoneAlarm or the Windows XP personal firewall may need to be configured not to block the MySQL port.
Here are some reasons the *Can't connect to local MySQL server* error might occur:

- **mysqld** is not running on the local host. Check your operating system’s process list to ensure the **mysqld** process is present.

- You’re running a MySQL server on Windows with many TCP/IP connections to it. If you’re experiencing that quite often your clients get that error, you can find a workaround here: [Connection to MySQL Server Failing on Windows](#).

- You are running on a system that uses MIT-pthreads. If you are running on a system that doesn’t have native threads, **mysqld** uses the MIT-pthreads package. See Section 2.1.1, “Operating Systems On Which MySQL Is Known To Run”. However, not all MIT-pthreads versions support Unix socket files. On a system without socket file support, you must always specify the host name explicitly when connecting to the server. Try using this command to check the connection to the server:

  ```shell
  mysqladmin -h `hostname` version
  ```

  Someone has removed the Unix socket file that **mysqld** uses (/tmp/mysql.sock by default). For example, you might have a **cron** job that removes old files from the /tmp directory. You can always run **mysqladmin version** to check whether the Unix socket file that **mysqladmin** is trying to use really exists. The fix in this case is to change the **cron** job to not remove mysql.sock or to place the socket file somewhere else. See Section B.5.4.5, “How to Protect or Change the MySQL Unix Socket File”.

- You have started the **mysqld** server with the --socket=/path/to/socket option, but forgotten to tell client programs the new name of the socket file. If you change the socket path name for the server, you must also notify the MySQL clients. You can do this by providing the same --socket option when you run client programs. You also need to ensure that clients have permission to access the mysql.sock file. To find out where the socket file is, you can do:

  ```shell
  netstat -ln | grep mysql
  ```

  See Section B.5.4.5, “How to Protect or Change the MySQL Unix Socket File”.

- You are using Linux and one server thread has died (dumped core). In this case, you must kill the other **mysqld** threads (for example, with **kill** or with the **mysql_zap** script) before you can restart the MySQL server. See Section B.5.4.2, “What to Do If MySQL Keeps Crashing”.

- The server or client program might not have the proper access privileges for the directory that holds the Unix socket file or the socket file itself. In this case, you must either change the access privileges for the directory or socket file so that the server and clients can access them, or restart **mysqld** with a --socket option that specifies a socket file name in a directory where the server can create it and where client programs can access it.

If you get the error message *Can't connect to MySQL server on some_host*, you can try the following things to find out what the problem is:

- Check whether the server is running on that host by executing **telnet some_host 3306** and pressing the Enter key a couple of times. (3306 is the default MySQL port number. Change the value if your server is listening to a different port.) If there is a MySQL server running and listening to the port, you should get a response that includes the server’s version number. If you get an error such as **telnet: Unable to connect to remote host: Connection refused**, then there is no server running on the given port.

- If the server is running on the local host, try using **mysqladmin -h localhost variables** to connect using the Unix socket file. Verify the TCP/IP port number that the server is configured to listen to (it is the value of the **port** variable.)
• If you are running under Linux and Security-Enhanced Linux (SELinux) is enabled, make sure you have disabled SELinux protection for the `mysqld` process.

**Connection to MySQL Server Failing on Windows**

When you’re running a MySQL server on Windows with many TCP/IP connections to it, and you’re experiencing that quite often your clients get a *Can't connect to MySQL server* error, the reason might be that Windows does not allow for enough ephemeral (short-lived) ports to serve those connections.

The purpose of `TIME_WAIT` is to keep a connection accepting packets even after the connection has been closed. This is because Internet routing can cause a packet to take a slow route to its destination and it may arrive after both sides have agreed to close. If the port is in use for a new connection, that packet from the old connection could break the protocol or compromise personal information from the original connection. The `TIME_WAIT` delay prevents this by ensuring that the port cannot be reused until after some time has been permitted for those delayed packets to arrive.

It is safe to reduce `TIME_WAIT` greatly on LAN connections because there is little chance of packets arriving at very long delays, as they could through the Internet with its comparatively large distances and latencies.

By default, Windows allows 5000 ephemeral (short-lived) TCP ports to the user. After any port is closed it will remain in a `TIME_WAIT` status for 120 seconds. The port will not be available again until this time expires.

With a small stack of available TCP ports (5000) and a high number of TCP ports being open and closed over a short period of time along with the `TIME_WAIT` status you have a good chance for running out of ports. There are two ways to address this problem:

• Reduce the number of TCP ports consumed quickly by investigating connection pooling or persistent connections where possible

• Tune some settings in the Windows registry (see below)

**IMPORTANT:** The following procedure involves modifying the Windows registry. Before you modify the registry, make sure to back it up and make sure that you understand how to restore the registry if a problem occurs. For information about how to back up, restore, and edit the registry, view the following article in the Microsoft Knowledge Base: [http://support.microsoft.com/kb/256986/EN-US/](http://support.microsoft.com/kb/256986/EN-US/).

1. Start Registry Editor (`Regedt32.exe`).

2. Locate the following key in the registry:

   HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters

3. On the **Edit** menu, click **Add Value**, and then add the following registry value:

   Value Name: MaxUserPort
   Data Type: REG_DWORD
   Value: 65534

   This sets the number of ephemeral ports available to any user. The valid range is between 5000 and 65534 (decimal). The default value is 0x1388 (5000 decimal).

4. On the **Edit** menu, click **Add Value**, and then add the following registry value:

   Value Name: TcpTimedWaitDelay
   Data Type: REG_DWORD
Value: 30

This sets the number of seconds to hold a TCP port connection in TIME_WAIT state before closing. The valid range is between 0 (zero) and 300 (decimal). The default value is 0x78 (120 decimal).

5. Quit Registry Editor.
6. Reboot the machine.

Note: Undoing the above should be as simple as deleting the registry entries you've created.

**B.5.2.3 Lost connection to MySQL server**

There are three likely causes for this error message.

Usually it indicates network connectivity trouble and you should check the condition of your network if this error occurs frequently. If the error message includes “during query,” this is probably the case you are experiencing.

Sometimes the “during query” form happens when millions of rows are being sent as part of one or more queries. If you know that this is happening, you should try increasing net_read_timeout from its default of 30 seconds to 60 seconds or longer, sufficient for the data transfer to complete.

More rarely, it can happen when the client is attempting the initial connection to the server. In this case, if your connect_timeout value is set to only a few seconds, you may be able to resolve the problem by increasing it to ten seconds, perhaps more if you have a very long distance or slow connection. You can determine whether you are experiencing this more uncommon cause by using SHOW STATUS LIKE 'Aborted_connects'. It will increase by one for each initial connection attempt that the server aborts.

You may see “reading authorization packet” as part of the error message; if so, that also suggests that this is the solution that you need.

If the cause is none of those just described, you may be experiencing a problem with BLOB values that are larger than max_allowed_packet, which can cause this error with some clients. Sometimes you may see an ER_NET_PACKET_TOO_LARGE error, and that confirms that you need to increase max_allowed_packet.

**B.5.2.4 Client does not support authentication protocol**

MySQL 4.1 and up uses an authentication protocol based on a password hashing algorithm that is incompatible with that used by older clients. If you upgrade the server from 4.0, attempts to connect to it with an older client may fail with the following message:

```
shell> mysql
Client does not support authentication protocol requested by server; consider upgrading MySQL client
```

To solve this problem, you should use one of the following approaches:

- Upgrade all client programs to use a 4.1.1 or newer client library.
- When connecting to the server with a pre-4.1 client program, use an account that still has a pre-4.1-style password.
- Reset the password to pre-4.1 style for each user that needs to use a pre-4.1 client program. This can be done using the SET PASSWORD statement and the OLD_PASSWORD() [860] function:

```
mysql> SET PASSWORD FOR
```

Common Errors When Using MySQL Programs

```
-> 'some_user'@'some_host' = OLD_PASSWORD('newpwd');
```

Alternatively, use **UPDATE** and **FLUSH PRIVILEGES**:

```
mysql> UPDATE mysql.user SET Password = OLD_PASSWORD('newpwd')
  -> WHERE Host = 'some_host' AND User = 'some_user';
mysql> FLUSH PRIVILEGES;
```

Substitute the password you want to use for "newpwd" in the preceding examples. MySQL cannot tell you what the original password was, so you'll need to pick a new one.

- Tell the server to use the older password hashing algorithm:
  1. Start **mysqld** with the **--old-passwords** option.
  2. Assign an old-format password to each account that has had its password updated to the longer 4.1 format. You can identify these accounts with the following query:

```
mysql> SELECT Host, User, Password FROM mysql.user
  -> WHERE LENGTH(Password) > 16;
```

For each account record displayed by the query, use the **Host** and **User** values and assign a password using the **OLD_PASSWORD()** function and either **SET PASSWORD** or **UPDATE**, as described earlier.

**Note**

In PHP, the standard **mysql** extension does not support the new authentication protocol in MySQL 4.1.1 and higher. This is true regardless of the PHP version being used. If you wish to use the **mysql** extension with MySQL 4.1 or newer, you will need to follow one of the options discussed above for configuring MySQL to work with old clients. The **mysqli** extension (stands for "MySQL, Improved"; new in PHP 5) is compatible with the improved password hashing employed in MySQL 4.1 and higher, and no special configuration of MySQL need be done to use this newer MySQL client library for PHP. For more information about the **mysqli** extension, see [http://php.net/mysqli](http://php.net/mysqli).

It may also be possible to compile the older **mysql** extension against the new MySQL client library. This is beyond the scope of this Manual; consult the PHP documentation for more information. You also be able to obtain assistance with these issues in our MySQL with PHP forum.

For additional background on password hashing and authentication, see Section 5.4.2.3, "Password Hashing in MySQL".

**B.5.2.5 Password Fails When Entered Interactively**

MySQL client programs prompt for a password when invoked with a **--password** or **-p** option that has no following password value:

```
shell> mysql -u user_name -p
Enter password:
```

On some systems, you may find that your password works when specified in an option file or on the command line, but not when you enter it interactively at the **Enter password** prompt. This occurs when the library provided by the system to read passwords limits password values to a small number of characters (typically eight). That is a problem with the system library, not with MySQL. To work around it,
change your MySQL password to a value that is eight or fewer characters long, or put your password in an option file.

B.5.2.6 Host 'host_name' is blocked

If the following error occurs, it means that mysqld has received many connection requests from the given host that were interrupted in the middle:

```
Host 'host_name' is blocked because of many connection errors.
Unblock with 'mysqladmin flush-hosts'
```

The number of interrupted connect requests permitted is determined by the value of the max_connect_errors system variable. After max_connect_errors failed requests, mysqld assumes that something is wrong (for example, that someone is trying to break in), and blocks the host from further connections until you execute a mysqladmin flush-hosts command or issue a FLUSH HOSTS statement. See Section 5.1.3, “Server System Variables”.

By default, mysqld blocks a host after 10 connection errors. You can adjust the value by starting the server like this:

```
shell> mysqld_safe --max_connect_errors=10000 &
```

If you get this error message for a given host, you should first verify that there isn't anything wrong with TCP/IP connections from that host. If you are having network problems, it does you no good to increase the value of the max_connect_errors variable.

B.5.2.7 Too many connections

If you get a Too many connections error when you try to connect to the mysqld server, this means that all available connections are in use by other clients.

The number of connections permitted is controlled by the max_connections system variable. Its default value is 100. If you need to support more connections, you should set a larger value for this variable.

mysqld actually permits max_connections+1 clients to connect. The extra connection is reserved for use by accounts that have the SUPER privilege. By granting the SUPER privilege to administrators and not to normal users (who should not need it), an administrator can connect to the server and use SHOW PROCESSLIST to diagnose problems even if the maximum number of unprivileged clients are connected. See Section 12.4.5.19, “SHOW PROCESSLIST Syntax”.

The maximum number of connections MySQL can support depends on the quality of the thread library on a given platform, the amount of RAM available, how much RAM is used for each connection, the workload from each connection, and the desired response time. Linux or Solaris should be able to support at 500 to 1000 simultaneous connections routinely and as many as 10,000 connections if you have many gigabytes of RAM available and the workload from each is low or the response time target undemanding. Windows is limited to (open tables × 2 + open connections) < 2048 due to the Posix compatibility layer used on that platform.

Increasing open-files-limit may be necessary. Also see Section 2.12.1.4, “Linux Postinstallation Notes”, for how to raise the operating system limit on how many handles can be used by MySQL.

B.5.2.8 Out of memory

If you issue a query using the mysql client program and receive an error like the following one, it means that mysql does not have enough memory to store the entire query result:

```
mysql: Out of memory at line 42, 'malloc.c'
```
mysql: needed 8136 byte (8k), memory in use: 12481367 bytes (12189k)
ERROR 2008: MySQL client ran out of memory

To remedy the problem, first check whether your query is correct. Is it reasonable that it should return so many rows? If not, correct the query and try again. Otherwise, you can invoke `mysql` with the `--quick` option. This causes it to use the `mysql_use_result()` C API function to retrieve the result set, which places less of a load on the client (but more on the server).

## B.5.2.9 MySQL server has gone away

This section also covers the related _Lost connection to server during query_ error.

The most common reason for the **MySQL server has gone away** error is that the server timed out and closed the connection. In this case, you normally get one of the following error codes (which one you get is operating system-dependent).

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CR_SERVER_GONE_ERROR</td>
<td>The client couldn't send a question to the server.</td>
</tr>
<tr>
<td>CR_SERVER_LOST</td>
<td>The client didn't get an error when writing to the server, but it didn't get a full answer (or any answer) to the question.</td>
</tr>
</tbody>
</table>

By default, the server closes the connection after eight hours if nothing has happened. You can change the time limit by setting the `wait_timeout` variable when you start `mysqld`. See Section 5.1.3, “Server System Variables”.

If you have a script, you just have to issue the query again for the client to do an automatic reconnection. This assumes that you have automatic reconnection in the client enabled (which is the default for the `mysql` command-line client).

Some other common reasons for the **MySQL server has gone away** error are:

- You (or the db administrator) has killed the running thread with a `KILL` statement or a `mysqladmin kill` command.
- You tried to run a query after closing the connection to the server. This indicates a logic error in the application that should be corrected.
- A client application running on a different host does not have the necessary privileges to connect to the MySQL server from that host.
- You got a timeout from the TCP/IP connection on the client side. This may happen if you have been using the commands: `mysql_options(..., MYSQL_OPT_READ_TIMEOUT,...)` or `mysql_options(..., MYSQL_OPT_WRITE_TIMEOUT,...)`. In this case increasing the timeout may help solve the problem.
- You have encountered a timeout on the server side and the automatic reconnection in the client is disabled (the `reconnect` flag in the `MYSQL` structure is equal to 0).
- You are using a Windows client and the server had dropped the connection (probably because `wait_timeout expired`) before the command was issued.

The problem on Windows is that in some cases MySQL doesn't get an error from the OS when writing to the TCP/IP connection to the server, but instead gets the error when trying to read the answer from the connection.

In this case, even if the `reconnect` flag in the `MYSQL` structure is equal to 1, MySQL does not automatically reconnect and re-issue the query as it doesn't know if the server did get the original query or not.
The solution to this is to either do a `mysql_ping()` on the connection if there has been a long time since the last query (this is what MyODBC does) or set `wait_timeout` on the `mysqld` server so high that it in practice never times out.

- You can also get these errors if you send a query to the server that is incorrect or too large. If `mysqld` receives a packet that is too large or out of order, it assumes that something has gone wrong with the client and closes the connection. If you need big queries (for example, if you are working with big BLOB columns), you can increase the query limit by setting the server’s `max_allowed_packet` variable, which has a default value of 1MB. You may also need to increase the maximum packet size on the client end. More information on setting the packet size is given in Section B.5.2.10, “Packet Too Large”.

An `INSERT` or `REPLACE` statement that inserts a great many rows can also cause these sorts of errors. Either one of these statements sends a single request to the server irrespective of the number of rows to be inserted; thus, you can often avoid the error by reducing the number of rows sent per `INSERT` or `REPLACE`.

- You also get a lost connection if you are sending a packet 16MB or larger if your client is older than 4.0.8 and your server is 4.0.8 and above, or the other way around.

- It is also possible to see this error if host name lookups fail (for example, if the DNS server on which your server or network relies goes down). This is because MySQL is dependent on the host system for name resolution, but has no way of knowing whether it is working—from MySQL’s point of view the problem is indistinguishable from any other network timeout.

You may also see the MySQL server has gone away error if MySQL is started with the `--skip-networking` option.

Another networking issue that can cause this error occurs if the MySQL port (default 3306) is blocked by your firewall, thus preventing any connections at all to the MySQL server.

- You can also encounter this error with applications that fork child processes, all of which try to use the same connection to the MySQL server. This can be avoided by using a separate connection for each child process.

- You have encountered a bug where the server died while executing the query.

You can check whether the MySQL server died and restarted by executing `mysqladmin version` and examining the server’s uptime. If the client connection was broken because `mysqld` crashed and restarted, you should concentrate on finding the reason for the crash. Start by checking whether issuing the query again kills the server again. See Section B.5.4.2, “What to Do If MySQL Keeps Crashing”.

You can get more information about the lost connections by starting `mysqld` with the `--log-warnings=2` option. This logs some of the disconnected errors in the `hostname.err` file. See Section 5.3.1, “The Error Log”.

If you want to create a bug report regarding this problem, be sure that you include the following information:

- Indicate whether the MySQL server died. You can find information about this in the server error log. See Section B.5.4.2, “What to Do If MySQL Keeps Crashing”.

- If a specific query kills `mysqld` and the tables involved were checked with `CHECK TABLE` before you ran the query, can you provide a reproducible test case? See Section 18.4, “Porting to Other Systems”.

- What is the value of the `wait_timeout` system variable in the MySQL server? (`mysqladmin variables` gives you the value of this variable.)
Common Errors When Using MySQL Programs

• Have you tried to run `mysqld` with the general query log enabled to determine whether the problem query appears in the log? (See Section 5.3.2, “The General Query Log”.)

See also Section B.5.2.11, “Communication Errors and Aborted Connections”, and Section 1.8, “How to Report Bugs or Problems”.

B.5.2.10 Packet Too Large

A communication packet is a single SQL statement sent to the MySQL server, a single row that is sent to the client, or a binary log event sent from a master replication server to a slave.

In MySQL 3.23, the largest possible packet is 16MB, due to limits in the client/server protocol. In MySQL 4.0.1 and up, the limit is 1GB.

When a MySQL client or the `mysqld` server receives a packet bigger than `max_allowed_packet` bytes, it issues an `ER_NET_PACKET_TOO_LARGE` error and closes the connection. With some clients, you may also get a `Lost connection to MySQL server during query` error if the communication packet is too large.

Both the client and the server have their own `max_allowed_packet` variable, so if you want to handle big packets, you must increase this variable both in the client and in the server.

If you are using the `mysql` client program, its default `max_allowed_packet` variable is 16MB. That is also the maximum value before MySQL 4.0. To set a larger value from 4.0 on, start `mysql` like this:

```
shell> mysql --max_allowed_packet=32M
```

That sets the packet size to 32MB.

The server's default `max_allowed_packet` value is 1MB. You can increase this if the server needs to handle big queries (for example, if you are working with big `BLOB` columns). For example, to set the variable to 16MB, start the server like this:

```
shell> mysqld --max_allowed_packet=16M
```

Before MySQL 4.0, use this syntax instead:

```
shell> mysqld --set-variable=max_allowed_packet=16M
```

You can also use an option file to set `max_allowed_packet`. For example, to set the size for the server to 16MB, add the following lines in an option file:

```
[mysqld]
max_allowed_packet=16M
```

Before MySQL 4.0, use this syntax instead:

```
[mysqld]
set-variable = max_allowed_packet=16M
```

It's safe to increase the value of this variable because the extra memory is allocated only when needed. For example, `mysqld` allocates more memory only when you issue a long query or when `mysqld` must return a large result row. The small default value of the variable is a precaution to catch incorrect packets between the client and server and also to ensure that you don't run out of memory by using large packets accidentally.
You can also get strange problems with large packets if you are using large BLOB values but have not given mysqld access to enough memory to handle the query. If you suspect this is the case, try adding ulimit -d 256000 to the beginning of the mysqld_safe script and restarting mysqld.

**B.5.2.11 Communication Errors and Aborted Connections**

The server error log can be a useful source of information about connection problems. See Section 5.3.1, "The Error Log". Starting with MySQL 3.23.40, if you start the server with the --warnings option (or --log-warnings from MySQL 4.0.3 on), you might find messages like this in your error log:

```
010301 14:38:23 Aborted connection 854 to db: 'users' user: 'josh'
```

If a client successfully connects but later disconnects improperly or is terminated, the server increments the Aborted_clients status variable, and logs an Aborted connection message to the error log. The cause can be any of the following:

- The client program did not call mysql_close() before exiting.
- The client had been sleeping more than wait_timeout or interactive_timeout seconds without issuing any requests to the server. See Section 5.1.3, “Server System Variables”.
- The client program ended abruptly in the middle of a data transfer.

If a client is unable even to connect, the server increments the Aborted_connects status variable. Unsuccessful connection attempts can occur for the following reasons:

- A client does not have privileges to connect to a database.
- A client uses an incorrect password.
- A connection packet does not contain the right information.
- It takes more than connect_timeout seconds to get a connect packet. See Section 5.1.3, “Server System Variables”.

If these kinds of things happen, it might indicate that someone is trying to break into your server! Messages for these types of problems are logged to the general query log if it is enabled.

Other reasons for problems with aborted clients or aborted connections:

- The max_allowed_packet variable value is too small or queries require more memory than you have allocated for mysqld. See Section B.5.2.10, “Packet Too Large”.
- Use of Ethernet protocol with Linux, both half and full duplex. Many Linux Ethernet drivers have this bug. You should test for this bug by transferring a huge file using FTP between the client and server machines. If a transfer goes in burst-pause-burst-pause mode, you are experiencing a Linux duplex syndrome. Switch the duplex mode for both your network card and hub/switch to either full duplex or to half duplex and test the results to determine the best setting.
- A problem with the thread library that causes interrupts on reads.
- Badly configured TCP/IP.
- Faulty Ethernets, hubs, switches, cables, and so forth. This can be diagnosed properly only by replacing hardware.

See also Section B.5.2.9, “MySQL server has gone away”.

**B.5.2.12 The table is full**
The effective maximum table size for MySQL databases is usually determined by operating system constraints on file sizes, not by MySQL internal limits. The following table lists some examples of operating system file-size limits. This is only a rough guide and is not intended to be definitive. For the most up-to-date information, be sure to check the documentation specific to your operating system.

<table>
<thead>
<tr>
<th>Operating System</th>
<th>File-size Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Win32 w/ FAT/FAT32</td>
<td>2GB/4GB</td>
</tr>
<tr>
<td>Win32 w/ NTFS</td>
<td>2TB (possibly larger)</td>
</tr>
<tr>
<td>Linux 2.2-Intel 32-bit</td>
<td>2GB (LFS: 4GB)</td>
</tr>
<tr>
<td>Linux 2.4+</td>
<td>(using ext3 file system) 4TB</td>
</tr>
<tr>
<td>Solaris 9/10</td>
<td>16TB</td>
</tr>
<tr>
<td>MacOS X w/ HFS+</td>
<td>2TB</td>
</tr>
<tr>
<td>NetWare w/NSS file system</td>
<td>8TB</td>
</tr>
</tbody>
</table>

Windows users, please note that FAT and VFAT (FAT32) are not considered suitable for production use with MySQL. Use NTFS instead.

On Linux 2.2, you can get MyISAM tables larger than 2GB in size by using the Large File Support (LFS) patch for the ext2 file system. Most current Linux distributions are based on kernel 2.4 or higher and include all the required LFS patches. On Linux 2.4, patches also exist for ReiserFS to get support for big files (up to 2TB). With JFS and XFS, petabyte and larger files are possible on Linux.

For a detailed overview about LFS in Linux, have a look at Andreas Jaeger's Large File Support in Linux page at http://www.suse.de/~aj/linux_lfs.html.

If you do encounter a full-table error, there are several reasons why it might have occurred:

- You are using a MySQL server older than 3.23 and an in-memory temporary table becomes larger than `tmp_table_size` bytes. To avoid this problem, you can use the `--tmp_table_size=val` option to make `mysqld` increase the temporary table size or use the SQL option `sql_big_tables` before you issue the problematic query. See Section 12.4.4, “SET Syntax”.

  Under Windows you may get an error OS error code 22: Invalid argument if you are using NTFS file system compression and the size od your data or temporary table files exceedes 30GB. This is due to a limitation in the NTFS file system that it is unable to compress files of this size. See http://msdn2.microsoft.com/en-us/library/aa364219.aspx.

  You can also start `mysqld` with the `--big-tables` option. This is exactly the same as using `sql_big_tables` for all queries.

As of MySQL 3.23, this problem should not occur. If an in-memory temporary table becomes larger than `tmp_table_size`, the server automatically converts it to a disk-based MyISAM table.

- The InnoDB storage engine maintains InnoDB tables within a tablespace that can be created from several files. This enables a table to exceed the maximum individual file size. The tablespace can include raw disk partitions, which permits extremely large tables. The maximum tablespace size is 64TB.

  If you are using InnoDB tables and run out of room in the InnoDB tablespace. In this case, the solution is to extend the InnoDB tablespace. See Section 13.2.6, “Adding, Removing, or Resizing InnoDB Data and Log Files”.

- You are using ISAM or MyISAM tables on an operating system that supports files only up to 2GB in size and you have hit this limit for the data file or index file.
• You are using a MyISAM table and the space required for the table exceeds what is permitted by the internal pointer size. MyISAM creates tables to permit up to 4GB by default, but this limit can be changed up to the maximum permissible size of 65,536TB (256^7 – 1 bytes).

If you need a MyISAM table that is larger than the default limit and your operating system supports large files, the CREATE TABLE statement supports AVG_ROW_LENGTH and MAX_ROWS options. See Section 12.1.5, “CREATE TABLE Syntax”. The server uses these options to determine how large a table to permit.

If the pointer size is too small for an existing table, you can change the options with ALTER TABLE to increase a table’s maximum permissible size. See Section 12.1.2, “ALTER TABLE Syntax”.

```
ALTER TABLE tbl_name MAX_ROWS=1000000000 AVG_ROW_LENGTH=nnn;
```

You have to specify AVG_ROW_LENGTH only for tables with BLOB or TEXT columns; in this case, MySQL can’t optimize the space required based only on the number of rows.

To change the default size limit for MyISAM data and index table files, set the myisam_data_pointer_size, which sets the number of bytes used for internal row pointers. The value is used to set the pointer size for new tables if you do not specify the MAX_ROWS option. The value of myisam_data_pointer_size can be from 2 to 7. A value of 4 permits table files up to 4GB; a value of 6 permits table files up to 256TB.

You can check the maximum data and index sizes by using this statement:

```
SHOW TABLE STATUS FROM db_name LIKE 'tbl_name';
```

You also can use myisamchk -dv /path/to/table-index-file. See Section 12.4.5, “SHOW Syntax”, or Section 4.6.2, "myisamchk — MyISAM Table-Maintenance Utility".

Other ways to work around file-size limits for MyISAM tables are as follows:

• If your large table is read only, you can use myisampack to compress it. myisampack usually compresses a table by at least 50%, so you can have, in effect, much bigger tables. myisampack also can merge multiple tables into a single table. See Section 4.6.4, "myisampack — Generate Compressed, Read-Only MyISAM Tables".

You can also get around the operating system file limit for MyISAM data files by using the RAID options for CREATE TABLE. See Section 12.1.5, “CREATE TABLE Syntax”.

• MySQL includes a MERGE library that enables you to handle a collection of MyISAM tables that have identical structure as a single MERGE table. See Section 13.3, “The MERGE Storage Engine”.

• You are using the NDB storage engine, in which case you need to increase the values for the DataMemory and IndexMemory configuration parameters in your config.ini file. See Section 15.3.3.1, “MySQL Cluster Data Node Configuration Parameters”.

• You are using the MEMORY (HEAP) storage engine; in this case you need to increase the value of the max_heap_table_size system variable. See Section 5.1.3, “Server System Variables”.

B.5.2.13 Can’t create/write to file

If you get an error of the following type for some queries, it means that MySQL cannot create a temporary file for the result set in the temporary directory:
Common Errors When Using MySQL Programs

Can't create/write to file '\sqla3fe_0.ism'.

The preceding error is a typical message for Windows; the Unix message is similar.

One fix is to start `mysqld` with the `--tmpdir` option or to add the option to the `[mysqld]` section of your option file. For example, to specify a directory of `C:\temp`, use these lines:

```
[mysqld]
tmpdir=C:/temp
```

The `C:\temp` directory must exist and have sufficient space for the MySQL server to write to. See Section 4.2.3.3, "Using Option Files".

Another cause of this error can be permissions issues. Make sure that the MySQL server can write to the `tmpdir` directory.

Check also the error code that you get with `perror`. One reason the server cannot write to a table is that the file system is full:

```
shell> perror 28
OS error code  28:  No space left on device
```

If you get an error of the following type during startup, it indicates that the file system or directory used for storing data files is write protected. Providing the write error is to a test file, this error is not serious and can be safely ignored.

Can't create test file /usr/local/mysql/data/master.lower-test

B.5.2.14 Commands out of sync

If you get `Commands out of sync; you can't run this command now` in your client code, you are calling client functions in the wrong order.

This can happen, for example, if you are using `mysql_use_result()` and try to execute a new query before you have called `mysql_free_result()`. It can also happen if you try to execute two queries that return data without calling `mysql_use_result()` or `mysql_store_result()` in between.

B.5.2.15 Ignoring user

If you get the following error, it means that when `mysqld` was started or when it reloaded the grant tables, it found an account in the `user` table that had an invalid password.

```
Found wrong password for user 'some_user'@'some_host'; ignoring user
```

As a result, the account is simply ignored by the permission system.

The following list indicates possible causes of and fixes for this problem:

- You may be running a new version of `mysqld` with an old `user` table. You can check this by executing `mysqlshow mysql user` to see whether the `Password` column is shorter than 16 characters. If so, you can correct this condition by running the `scripts/add_long_password` script.
- The account has an old password (eight characters long) and you didn't start `mysqld` with the `--old-protocol` option. Update the account in the `user` table to have a new password or restart `mysqld` with the `--old-protocol` option.
- You have specified a password in the `user` table without using the `PASSWORD() [860]` function. Use `mysql` to update the account in the `user` table with a new password, making sure to use the `PASSWORD() [860]` function:
B.5.2.16 Table 'tbl_name' doesn't exist

If you get either of the following errors, it usually means that no table exists in the default database with the given name:

Table 'tbl_name' doesn't exist
Can't find file: 'tbl_name' (errno: 2)

In some cases, it may be that the table does exist but that you are referring to it incorrectly:

• Because MySQL uses directories and files to store databases and tables, database and table names are case sensitive if they are located on a file system that has case-sensitive file names.

• Even for file systems that are not case sensitive, such as on Windows, all references to a given table within a query must use the same lettercase.

You can check which tables are in the default database with `SHOW TABLES`. See Section 12.4.5, “SHOW Syntax”.

B.5.2.17 Can't initialize character set

You might see an error like this if you have character set problems:

MySQL Connection Failed: Can't initialize character set charset_name

This error can have any of the following causes:

• The character set is a multi-byte character set and you have no support for the character set in the client. In this case, you need to recompile the client by running `configure` with the `--with-charset=charset_name` or `--with-extra-charsets=charset_name` option. See Section 2.9.3, “MySQL Source-Configuration Options”.

All standard MySQL binaries are compiled with `--with-extra-charset=complex`, which enables support for all multi-byte character sets. See Section 2.9.3, “MySQL Source-Configuration Options”.

• The character set is a simple character set that is not compiled into `mysqld`, and the character set definition files are not in the place where the client expects to find them.

In this case, you need to use one of the following methods to solve the problem:

• Recompile the client with support for the character set. See Section 2.9.3, “MySQL Source-Configuration Options”.

• Specify to the client the directory where the character set definition files are located. For many clients, you can do this with the `--character-sets-dir` option.

• Copy the character definition files to the path where the client expects them to be.

B.5.2.18 'File' Not Found and Similar Errors

If you get `ERROR '...' not found (errno: 23), Can't open file: ... (errno: 24), or any other error with `errno 23` or `errno 24` from MySQL, it means that you haven't allocated enough
Installation-Related Issues

file descriptors for the MySQL server. You can use the `perror` utility to get a description of what the error number means:

```sh
shell> perror 23
OS error code  23:  File table overflow
shell> perror 24
OS error code  24:  Too many open files
shell> perror 11
OS error code  11:  Resource temporarily unavailable
```

The problem here is that `mysqld` is trying to keep open too many files simultaneously. You can either tell `mysqld` not to open so many files at once or increase the number of file descriptors available to `mysqld`.

To tell `mysqld` to keep open fewer files at a time, you can make the table cache smaller by reducing the value of the `table_cache` system variable (the default value is 64). This may not entirely prevent running out of file descriptors because in some circumstances the server may attempt to extend the cache size temporarily, as described in Section 7.7.2, “How MySQL Opens and Closes Tables”. Reducing the value of `max_connections` also reduces the number of open files (the default value is 100).

To change the number of file descriptors available to `mysqld`, you can use the `--open-files-limit` option to `mysqld_safe` or (as of MySQL 3.23.30) set the `open_files_limit` system variable. See Section 5.1.3, “Server System Variables”. The easiest way to set these values is to add an option to your option file. See Section 4.2.3.3, “Using Option Files”. If you have an old version of `mysqld` that doesn't support setting the open files limit, you can edit the `mysqld_safe` script. There is a commented-out line `ulimit -n 256` in the script. You can remove the `#` character to uncomment this line, and change the number 256 to set the number of file descriptors to be made available to `mysqld`.

`--open-files-limit` and `ulimit` can increase the number of file descriptors, but only up to the limit imposed by the operating system. There is also a “hard” limit that can be overridden only if you start `mysqld_safe` or `mysqld` as root (just remember that you also need to start the server with the `--user` option in this case so that it does not continue to run as root after it starts up). If you need to increase the operating system limit on the number of file descriptors available to each process, consult the documentation for your system.

**Note**

If you run the `tcsh` shell, `ulimit` does not work! `tcsh` also reports incorrect values when you ask for the current limits. In this case, you should start `mysqld_safe` using `sh`.

### B.5.2.19 Table-Corruption Issues

If you have started `mysqld` with `--myisam-recover`, MySQL automatically checks and tries to repair MyISAM tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the `hostname.err` file 'Warning: Checking table ...' which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further.

See also Section 5.1.2, “Server Command Options”, and Section 18.4.1.6, “Making a Test Case If You Experience Table Corruption”.

### B.5.3 Installation-Related Issues

#### B.5.3.1 Problems with File Permissions

If you have problems with file permissions, the `UMASK` environment variable might be set incorrectly when `mysqld` starts. For example, MySQL might issue the following error message when you create a table:
The default **UMASK** value is **0660**. You can change this behavior by starting `mysqld_safe` as follows:

```
shell> UMASK=384  # = 600 in octal
shell> export UMASK
shell> mysqld_safe &
```

By default, MySQL creates database and **RAID** directories with an access permission value of **0700**. You can modify this behavior by setting the **UMASK_DIR** variable. If you set its value, new directories are created with the combined **UMASK** and **UMASK_DIR** values. For example, if you want to give group access to all new directories, you can do this:

```
shell> UMASK_DIR=504  # = 770 in octal
shell> export UMASK_DIR
shell> mysqld_safe &
```

In MySQL 3.23.25 and above, MySQL assumes that the value for **UMASK** or **UMASK_DIR** is in octal if it starts with a zero.

See Section 2.13, “Environment Variables”.

### B.5.4 Administration-Related Issues

#### B.5.4.1 How to Reset the Root Password

If you have never set a **root** password for MySQL, the server does not require a password at all for connecting as **root**. However, this is insecure. For instructions on assigning passwords, see Section 2.10.3, “Securing the Initial MySQL Accounts”.

If you know the **root** password, but want to change it, see Section 12.4.1.4, “SET PASSWORD Syntax”.

If you set a **root** password previously, but have forgotten it, you can set a new password. The following sections provide instructions for Windows and Unix systems, as well as generic instructions that apply to any system.

**Resetting the Root Password: Windows Systems**

On Windows, use the following procedure to reset the password for all MySQL **root** accounts:

1. Log on to your system as Administrator.

2. Stop the MySQL server if it is running. For a server that is running as a Windows service, go to the Services manager: From the **Start** menu, select Control Panel, then Administrative Tools, then Services. Find the MySQL service in the list and stop it.

   If your server is not running as a service, you may need to use the Task Manager to force it to stop.

3. Create a text file containing the following statements. Replace the password with the password that you want to use.

   ```sql
   UPDATE mysql.user SET Password=PASSWORD('MyNewPass') WHERE User='root';
   FLUSH PRIVILEGES;
   ```
Write the `UPDATE` and `FLUSH` statements each on a single line. The `UPDATE` statement resets the password for all `root` accounts, and the `FLUSH` statement tells the server to reload the grant tables into memory so that it notices the password change.

4. Save the file. For this example, the file will be named `C:\mysql-init.txt`.

5. Open a console window to get to the command prompt: From the Start menu, select Run, then enter `cmd` as the command to be run.

6. Start the MySQL server with the special `--init-file` option (notice that the backslash in the option value is doubled):

   ```
   C:\> C:\mysql\bin\mysqld-nt --init-file=C:\\mysql-init.txt
   ```

   If you installed MySQL to a location other than `C:\mysql`, adjust the command accordingly.

   The server executes the contents of the file named by the `--init-file` option at startup, changing each `root` account password.

   You can also add the `--console` option to the command if you want server output to appear in the console window rather than in a log file.

   Users of MySQL 4.1 and higher who installed MySQL using the MySQL Installation Wizard may need to specify a `--defaults-file` option:

   ```
   C:\> "C:\Program Files\MySQL\MySQL Server 4.1\bin\mysqld-nt.exe"
   --defaults-file="C:\Program Files\MySQL\MySQL Server 4.1\my.ini"
   --init-file=C:\\\mysql-init.txt
   ```

   The appropriate `--defaults-file` setting can be found using the Services Manager: From the Start menu, select Control Panel, then Administrative Tools, then Services. Find the MySQL service in the list, right-click it, and choose the Properties option. The Path to executable field contains the `--defaults-file` setting.

7. After the server has started successfully, delete `C:\mysql-init.txt`.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the MySQL server, then restart it in normal mode again. If you run the server as a service, start it from the Windows Services window. If you start the server manually, use whatever command you normally use.

**Resetting the Root Password: Unix Systems**

On Unix, use the following procedure to reset the password for all MySQL `root` accounts. The instructions assume that you will start the server so that it runs using the Unix login account that you normally use for running the server. For example, if you run the server using the `mysql` login account, you should log in as `mysql` before using the instructions. Alternatively, you can log in as `root`, but in this case you must start `mysqld` with the `--user=mysql` option. If you start the server as `root` without using `--user=mysql`, the server may create `root`-owned files in the data directory, such as log files, and these may cause permission-related problems for future server startups. If that happens, you will need to either change the ownership of the files to `mysql` or remove them.

1. Log on to your system as the Unix user that the `mysqld` server runs as (for example, `mysql`).

2. Locate the `.pid` file that contains the server's process ID. The exact location and name of this file depend on your distribution, host name, and configuration. Common locations are `/var/lib/mysql/`,...
Administration-Related Issues

/var/run/mysqld/, and /usr/local/mysql/data/. Generally, the file name has an extension of .pid and begins with either mysqld or your system’s host name.

You can stop the MySQL server by sending a normal kill (not kill -9) to the mysqld process, using the path name of the .pid file in the following command:

```shell
shell> kill `cat /mysql-data-directory/host_name.pid`
```

Use backticks (not forward quotation marks) with the cat command. These cause the output of cat to be substituted into the kill command.

3. Create a text file containing the following statements. Replace the password with the password that you want to use.

```sql
UPDATE mysql.user SET Password=PASSWORD('MyNewPass') WHERE User='root';
FLUSH PRIVILEGES;
```

Write the UPDATE and FLUSH statements each on a single line. The UPDATE statement resets the password for all root accounts, and the FLUSH statement tells the server to reload the grant tables into memory so that it notices the password change.

4. Save the file. For this example, the file will be named /home/me/mysql-init. The file contains the password, so it should not be saved where it can be read by other users.

5. Start the MySQL server with the special --init-file option:

```shell
shell> mysqld_safe --init-file=/home/me/mysql-init &
```

The server executes the contents of the file named by the --init-file option at startup, changing each root account password.

6. After the server has started successfully, delete /home/me/mysql-init.

You should now be able to connect to the MySQL server as root using the new password. Stop the server and restart it normally.

**Resetting the Root Password: Generic Instructions**

The preceding sections provide password-resetting instructions for Windows and Unix systems. Alternatively, on any platform, you can set the new password using the mysql client (but this approach is less secure):

1. Stop mysqld and restart it with the --skip-grant-tables option. This enables anyone to connect without a password and with all privileges. If you normally start the server with the --old-passwords option, include that option as well.

2. Connect to the mysqld server with this command:

```shell
shell> mysql
```

3. Issue the following statements in the mysql client. Replace the password with the password that you want to use.

```sql
mysql> UPDATE mysql.user SET Password=PASSWORD('MyNewPass')
   -> WHERE User='root';
mysql> FLUSH PRIVILEGES;
```
The **FLUSH** statement tells the server to reload the grant tables into memory so that it notices the password change.

You should now be able to connect to the MySQL server as root using the new password. Stop the server and restart it normally (without the **--skip-grant-tables** option).

### B.5.4.2 What to Do If MySQL Keeps Crashing

Each MySQL version is tested on many platforms before it is released. This does not mean that there are no bugs in MySQL, but if there are bugs, they should be very few and can be hard to find. If you have a problem, it always helps if you try to find out exactly what crashes your system, because you have a much better chance of getting the problem fixed quickly.

First, you should try to find out whether the problem is that the **mysqld** server dies or whether your problem has to do with your client. You can check how long your **mysqld** server has been up by executing **mysqldadmin version**. If **mysqld** has died and restarted, you may find the reason by looking in the server's error log. See Section 5.3.1, “The Error Log”.

On some systems, you can find in the error log a stack trace of where **mysqld** died that you can resolve with the **resolve_stack_dump** program. See Section 18.4, “Porting to Other Systems”. Note that the variable values written in the error log may not always be 100% correct.

Many server crashes are caused by corrupted data files or index files. MySQL updates the files on disk with the **write()** system call after every SQL statement and before the client is notified about the result. (This is not true if you are running with **--delay-key-write**, in which case data files are written but not index files.) This means that data file contents are safe even if **mysqld** crashes, because the operating system ensures that the unflushed data is written to disk. You can force MySQL to flush everything to disk after every SQL statement by starting **mysqld** with the **--flush** option.

The preceding means that normally you should not get corrupted tables unless one of the following happens:

- The MySQL server or the server host was killed in the middle of an update.
- You have found a bug in **mysqld** that caused it to die in the middle of an update.
- Some external program is manipulating data files or index files at the same time as **mysqld** without locking the table properly.
- You are running many **mysqld** servers using the same data directory on a system that does not support good file system locks (normally handled by the **lockd** lock manager), or you are running multiple servers with external locking disabled.
- You have a crashed data file or index file that contains very corrupt data that confused **mysqld**.
- You have found a bug in the data storage code. This isn't likely, but it is at least possible. In this case, you can try to change the storage engine to another engine by using **ALTER TABLE** on a repaired copy of the table.

Because it is very difficult to know why something is crashing, first try to check whether things that work for others crash for you. Please try the following things:

- Stop the **mysqld** server with **mysqldadmin shutdown**, run **mysqamchk --silent --force */*.MYI** from the data directory to check all MyISAM tables, and restart **mysqld**. This ensures that you are running from a clean state. See Chapter 5, *MySQL Server Administration*.
- Start **mysqld** with the general query log enabled (see Section 5.3.2, “The General Query Log”). Then try to determine from the information written to the log whether some specific query kills the server. About
95% of all bugs are related to a particular query. Normally, this is one of the last queries in the log file just before the server restarts. See Section 5.3.2, “The General Query Log”. If you can repeatedly kill MySQL with a specific query, even when you have checked all tables just before issuing it, then you have been able to locate the bug and should submit a bug report for it. See Section 1.8, “How to Report Bugs or Problems”.

- Try to make a test case that we can use to repeat the problem. See Section 18.4, “Porting to Other Systems”.

- Try running the tests in the mysql-test directory and the MySQL benchmarks. See Section 18.1.2, “The MySQL Test Suite”. They should test MySQL rather well. You can also add code to the benchmarks that simulates your application. The benchmarks can be found in the sql-bench directory in a source distribution or, for a binary distribution, in the sql-bench directory under your MySQL installation directory.

- Try the fork_big.pl script. (It is located in the tests directory of source distributions.)

- If you configure MySQL for debugging, it is much easier to gather information about possible errors if something goes wrong. Configuring MySQL for debugging causes a safe memory allocator to be included that can find some errors. It also provides a lot of output about what is happening. Reconfigure MySQL with the --with-debug or --with-debug=full option to configure and then recompile. See Section 18.4, “Porting to Other Systems”.

- Make sure that you have applied the latest patches for your operating system.

- Use the --skip-external-locking option to mysqld. On some systems, the lockd lock manager does not work properly; the --skip-external-locking option tells mysqld not to use external locking. (This means that you cannot run two mysqld servers on the same data directory and that you must be careful if you use myisamchk. Nevertheless, it may be instructive to try the option as a test.)

- Have you tried mysqladmin -u root processlist when mysqld appears to be running but not responding? Sometimes mysqld is not comatose even though you might think so. The problem may be that all connections are in use, or there may be some internal lock problem. mysqladmin -u root processlist usually is able to make a connection even in these cases, and can provide useful information about the current number of connections and their status.

- Run the command mysqladmin -i 5 status or mysqladmin -i 5 -r status in a separate window to produce statistics while you run your other queries.

- Try the following:
  1. Start mysqld from gdb (or another debugger). See Section 18.4, “Porting to Other Systems”.
  2. Run your test scripts.
  3. Print the backtrace and the local variables at the three lowest levels. In gdb, you can do this with the following commands when mysqld has crashed inside gdb:

```
backtrace
info local
up
info local
up
info local
```

With gdb, you can also examine which threads exist with info threads and switch to a specific thread with thread N, where N is the thread ID.
• Try to simulate your application with a Perl script to force MySQL to crash or misbehave.

• Send a normal bug report. See Section 1.8, “How to Report Bugs or Problems”. Be even more detailed than usual. Because MySQL works for many people, it may be that the crash results from something that exists only on your computer (for example, an error that is related to your particular system libraries).

• If you have a problem with tables containing dynamic-length rows and you are using only VARCHAR columns (not BLOB or TEXT columns), you can try to change all VARCHAR to CHAR with ALTER TABLE. This forces MySQL to use fixed-size rows. Fixed-size rows take a little extra space, but are much more tolerant to corruption.

The current dynamic row code has been in use for several years with very few problems, but dynamic-length rows are by nature more prone to errors, so it may be a good idea to try this strategy to see whether it helps.

• Do not rule out your server hardware when diagnosing problems. Defective hardware can be the cause of data corruption. Particular attention should be paid to your memory and disk subsystems when troubleshooting hardware.

B.5.4.3 How MySQL Handles a Full Disk

This section describes how MySQL responds to disk-full errors (such as “no space left on device”), and, as of MySQL 4.0.22, to quota-exceeded errors (such as “write failed” or “user block limit reached”).

This section is relevant for writes to MyISAM tables. As of MySQL 4.1.9, it also applies for writes to binary log files and binary log index file, except that references to “row” and “record” should be understood to mean “event.”

When a disk-full condition occurs, MySQL does the following:

• It checks once every minute to see whether there is enough space to write the current row. If there is enough space, it continues as if nothing had happened.

• Every 10 minutes it writes an entry to the log file, warning about the disk-full condition.

To alleviate the problem, you can take the following actions:

• To continue, you only have to free enough disk space to insert all records.

• To abort the thread, you must use mysqladmin kill. The thread is aborted the next time it checks the disk (in one minute).

• Other threads might be waiting for the table that caused the disk-full condition. If you have several “locked” threads, killing the one thread that is waiting on the disk-full condition enables the other threads to continue.

Exceptions to the preceding behavior are when you use REPAIR TABLE or OPTIMIZE TABLE or when the indexes are created in a batch after LOAD DATA INFILE or after an ALTER TABLE statement. All of these statements may create large temporary files that, if left to themselves, would cause big problems for the rest of the system. If the disk becomes full while MySQL is doing any of these operations, it removes the big temporary files and mark the table as crashed. The exception is that for ALTER TABLE, the old table is left unchanged.

B.5.4.4 Where MySQL Stores Temporary Files

On Unix, MySQL uses the value of the TMPDIR environment variable as the path name of the directory in which to store temporary files. If TMPDIR is not set, MySQL uses the system default, which is usually / tmp, /var/tmp, or /usr/tmp.
On Windows, Netware and OS2, MySQL checks in order the values of the `TMPDIR`, `TEMP`, and `TMP` environment variables. For the first one found to be set, MySQL uses it and does not check those remaining. If none of `TMPDIR`, `TEMP`, or `TMP` are set, MySQL uses the Windows system default, which is usually `C:\windows\temp\`.

If the file system containing your temporary file directory is too small, you can use the `--tmpdir` option to `mysqld` to specify a directory in a file system where you have enough space.

Starting from MySQL 4.1, the `--tmpdir` option can be set to a list of several paths that are used in round-robin fashion. Paths should be separated by colon characters (`:`) on Unix and semicolon characters (`;`) on Windows, NetWare, and OS/2.

**Note**

To spread the load effectively, these paths should be located on different physical disks, not different partitions of the same disk.

If the MySQL server is acting as a replication slave, you should not set `--tmpdir` to point to a directory on a memory-based file system or to a directory that is cleared when the server host restarts. A replication slave needs some of its temporary files to survive a machine restart so that it can replicate temporary tables or `LOAD DATA INFILE` operations. If files in the temporary file directory are lost when the server restarts, replication fails.

MySQL arranges that temporary files are removed if `mysqld` is terminated. On platforms that support it (such as Unix), this is done by unlinking the file after opening it. The disadvantage of this is that the name does not appear in directory listings and you do not see a big temporary file that fills up the file system in which the temporary file directory is located. (In such cases, `ls -l` may be helpful in identifying large files associated with `mysqld`.)

When sorting (`ORDER BY` or `GROUP BY`), MySQL normally uses one or two temporary files. The maximum disk space required is determined by the following expression:

\[
\text{(length of what is sorted + sizeof(row pointer))} \\
\times \text{number of matched rows} \\
\times 2
\]

The row pointer size is usually four bytes, but may grow in the future for really big tables.

For some `SELECT` queries, MySQL also creates temporary SQL tables. These are not hidden and have names of the form `SQL_*`.

`ALTER TABLE` creates a temporary table in the same directory as the original table.

**B.5.4.5 How to Protect or Change the MySQL Unix Socket File**

The default location for the Unix socket file that the server uses for communication with local clients is `/tmp/mysql.sock`. (For some distribution formats, the directory might be different, such as `/var/lib/mysql` for RPMs.)

On some versions of Unix, anyone can delete files in the `/tmp` directory or other similar directories used for temporary files. If the socket file is located in such a directory on your system, this might cause problems.

On most versions of Unix, you can protect your `/tmp` directory so that files can be deleted only by their owners or the superuser (`root`). To do this, set the `sticky` bit on the `/tmp` directory by logging in as `root` and using the following command:
Query-Related Issues

You can check whether the sticky bit is set by executing `ls -ld /tmp`. If the last permission character is `t`, the bit is set.

Another approach is to change the place where the server creates the Unix socket file. If you do this, you should also let client programs know the new location of the file. You can specify the file location in several ways:

- Specify the path in a global or local option file. For example, put the following lines in `/etc/my.cnf`:

  ```
  [mysql]
  socket=/path/to/socket
  [client]
  socket=/path/to/socket
  ```

  See Section 4.2.3.3, “Using Option Files”.

- Specify a `--socket` option on the command line to `mysqld_safe` and when you run client programs.

- Set the `MYSQL_UNIX_PORT` environment variable to the path of the Unix socket file.

- Recompile MySQL from source to use a different default Unix socket file location. Define the path to the file with the `--with-unix-socket-path` option when you run `configure`. See Section 2.9.3, “MySQL Source-Configuration Options”.

You can test whether the new socket location works by attempting to connect to the server with this command:

```
shell> mysqladmin --socket=/path/to/socket version
```

B.5.4.6 Time Zone Problems

If you have a problem with `SELECT NOW()` returning values in UTC and not your local time, you have to tell the server your current time zone. The same applies if `UNIX_TIMESTAMP()` returns the wrong value. This should be done for the environment in which the server runs; for example, in `mysqld_safe` or `mysql.server`. See Section 2.13, “Environment Variables”.

You can set the time zone for the server with the `--timezone=timezonename` option to `mysqld_safe`. You can also set it by setting the `TZ` environment variable before you start `mysqld`.

The permissible values for `--timezone` or `TZ` are system dependent. Consult your operating system documentation to see what values are acceptable.

B.5.5 Query-Related Issues

B.5.5.1 Case Sensitivity in String Searches

For nonbinary strings (`CHAR, VARCHAR, TEXT`), string searches use the collation of the comparison operands. For binary strings (`BINARY, VARBINARY, BLOB`), comparisons use the numeric values of the bytes in the operands; this means that for alphabetic characters, comparisons will be case sensitive.

A comparison between a nonbinary string and binary string is treated as a comparison of binary strings.

Simple comparison operations (`>=, >, =, <, <=, sorting, and grouping`) are based on each character's “sort value.” Characters with the same sort value are treated as the same character. For example, if “e” and “é” have the same sort value in a given collation, they compare as equal.
The default character set and collation are `latin1` and `latin1_swedish_ci`, so nonbinary string comparisons are case insensitive by default. This means that if you search with `col_name LIKE 'a %'`, you get all column values that start with A or a. To make this search case sensitive, make sure that one of the operands has a case sensitive or binary collation. For example, if you are comparing a column and a string that both have the `latin1` character set, you can use the `COLLATE` operator to cause either operand to have the `latin1_general_cs` or `latin1_bin` collation:

```
col_name COLLATE latin1_general_cs LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_general_cs
col_name COLLATE latin1_bin LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_bin
```

If you want a column always to be treated in case-sensitive fashion, declare it with a case sensitive or binary collation. See Section 12.1.5, "CREATE TABLE Syntax".

Before MySQL 4.1, `COLLATE` is unavailable. Use the `BINARY` operator in expressions to treat a string as a binary string: `BINARY col_name LIKE 'a%'` or `col_name LIKE BINARY 'a%'`. In column declarations, use the `BINARY` attribute.

To cause a case-sensitive comparison of nonbinary strings to be case insensitive, use `COLLATE` to name a case-insensitive collation. The strings in the following example normally are case sensitive, but `COLLATE` changes the comparison to be case insensitive:

```
mysql> SET @s1 = 'MySQL' COLLATE latin1_bin,
   ->     @s2 = 'mysql' COLLATE latin1_bin;
mysql> SELECT @s1 = @s2;
+-----------+
| @s1 = @s2 |
+-----------+
|         0  |
mysql> SELECT @s1 COLLATE latin1_swedish_ci = @s2;
+-------------------------------------+
| @s1 COLLATE latin1_swedish_ci = @s2 |
+-------------------------------------+
|                                   1 |
+-------------------------------------+
```

A binary string is case sensitive in comparisons. To compare the string as case insensitive, convert it to a nonbinary string and use `COLLATE` to name a case-insensitive collation:

```
mysql> SET @s = BINARY 'MySQL';
mysql> SELECT @s = 'mysql';
+--------------+
| @s = 'mysql' |
+--------------+
|            0 |
mysql> SELECT CONVERT(@s USING latin1) COLLATE latin1_swedish_ci = 'mysql';
+--------------------------------------------------------------+
| CONVERT(@s USING latin1) COLLATE latin1_swedish_ci = 'mysql' |
+--------------------------------------------------------------+
|                                                            1 |
+--------------------------------------------------------------+
```

To determine whether a value will compare as a nonbinary or binary string, use the `COLLATION()` function. This example shows that `VERSION()` returns a string that has a case-insensitive collation, so comparisons are case insensitive:
For binary strings, the collation value is `binary`, so comparisons will be case sensitive. One context in which you will see `binary` is for compression and encryption functions, which return binary strings as a general rule: string:

```
mysql> SELECT COLLATION(VERSION());
+----------------------+
| COLLATION(VERSION()) |
+----------------------+
| utf8_general_ci      |
+----------------------+
```

B.5.5.2 Problems Using DATE Columns

The format of a `DATE` value is `'YYYY-MM-DD'`. According to standard SQL, no other format is permitted. You should use this format in `UPDATE` expressions and in the `WHERE` clause of `SELECT` statements. For example:

```
SELECT * FROM t1 WHERE date >= '2003-05-05';
```

As a convenience, MySQL automatically converts a date to a number if the date is used in a numeric context and vice versa. MySQL also permits a “relaxed” string format when updating and in a `WHERE` clause that compares a date to a `DATE`, `DATETIME`, or `TIMESTAMP` column. “Relaxed” format means that any punctuation character may be used as the separator between parts. For example, `'2004-08-15'` and `'2004#08#15'` are equivalent. MySQL can also convert a string containing no separators (such as `'20040815'`), provided it makes sense as a date.

When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` to a constant string with the `<`, `<=`, `=`, `>=`, `>`, or `BETWEEN` operators, MySQL normally converts the string to an internal long integer for faster comparison (and also for a bit more “relaxed” string checking). However, this conversion is subject to the following exceptions:

- When you compare two columns
- When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` column to an expression
- When you use any comparison method other than those just listed, such as `IN` or `STRCMP()` [799].

For those exceptions, the comparison is done by converting the objects to strings and performing a string comparison.

To be on the safe side, assume that strings are compared as strings and use the appropriate string functions if you want to compare a temporal value to a string.

The special “zero” date `'0000-00-00'` can be stored and retrieved as `'0000-00-00'`. When a `'0000-00-00'` date is used through Connector/ODBC, it is automatically converted to `NULL` because ODBC cannot handle that kind of date.

Because MySQL performs the conversions just described, the following statements work (assume that `idate` is a `DATE` column):

```
mysql> SELECT COL damaged('x'), COL damaged(SHA1('x'));
+-------------------------+----------------------+
| COL damaged(ENCRYPT('x')) | COL damaged(SHA1('x')) |
+-------------------------+----------------------+
| binary                  | binary               |
+-------------------------+----------------------+
```
INSERT INTO t1 (idate) VALUES (19970505);
INSERT INTO t1 (idate) VALUES ('19970505');
INSERT INTO t1 (idate) VALUES ('1997-05-05');
INSERT INTO t1 (idate) VALUES ('1997 05 05');
INSERT INTO t1 (idate) VALUES ('0000-00-00');

SELECT idate FROM t1 WHERE idate >= '1997-05-05';
SELECT idate FROM t1 WHERE idate >= 19970505;
SELECT MOD(idate,100) FROM t1 WHERE idate >= 19970505;
SELECT idate FROM t1 WHERE idate >= '19970505';

However, the following statement does not work:

SELECT idate FROM t1 WHERE STRCMP(idate,'20030505')=0;

STRCMP() is a string function, so it converts \texttt{idate} to a string in 'YYYY-MM-DD' format and performs a string comparison. It does not convert '20030505' to the date '2003-05-05' and perform a date comparison.

If a date to be stored in a \texttt{DATE} column cannot be converted to any reasonable value, MySQL stores '0000-00-00'.

\textbf{B.5.5.3 Problems with NULL Values}

The concept of the \texttt{NULL} value is a common source of confusion for newcomers to SQL, who often think that \texttt{NULL} is the same thing as an empty string ' '. This is not the case. For example, the following statements are completely different:

\begin{verbatim}
mysql> INSERT INTO my_table (phone) VALUES (NULL);
mysql> INSERT INTO my_table (phone) VALUES ('');
\end{verbatim}

Both statements insert a value into the \texttt{phone} column, but the first inserts a \texttt{NULL} value and the second inserts an empty string. The meaning of the first can be regarded as "phone number is not known" and the meaning of the second can be regarded as "the person is known to have no phone, and thus no phone number."

To help with \texttt{NULL} handling, you can use the \texttt{IS NULL} and \texttt{IS NOT NULL} operators and the \texttt{IFNULL()} function.

In SQL, the \texttt{NULL} value is never true in comparison to any other value, even \texttt{NULL}. An expression that contains \texttt{NULL} always produces a \texttt{NULL} value unless otherwise indicated in the documentation for the operators and functions involved in the expression. All columns in the following example return \texttt{NULL}:

\begin{verbatim}
mysql> SELECT NULL, 1+NULL, CONCAT('Invisible',NULL);
\end{verbatim}

To search for column values that are \texttt{NULL}, you cannot use an \texttt{expr = NULL} test. The following statement returns no rows, because \texttt{expr = NULL} is never true for any expression:

\begin{verbatim}
mysql> SELECT * FROM my_table WHERE phone = NULL;
\end{verbatim}

To look for \texttt{NULL} values, you must use the \texttt{IS NULL} test. The following statements show how to find the \texttt{NULL} phone number and the empty phone number:

\begin{verbatim}
mysql> SELECT * FROM my_table WHERE phone IS NULL;
\end{verbatim}
Query-Related Issues

mysql> SELECT * FROM my_table WHERE phone = '';

See Section 3.3.4.6, “Working with NULL Values”, for additional information and examples.

You can add an index on a column that can have NULL values if you are using MySQL 3.23.2 or newer and are using the MyISAM, InnoDB, or BDB storage engine. As of MySQL 4.0.2, the MEMORY storage engine also supports NULL values in indexes. Otherwise, you must declare an indexed column NOT NULL and you cannot insert NULL into the column.

When reading data with LOAD DATA INFILE, empty or missing columns are updated with ''. To load a NULL value into a column, use \N in the data file. The literal word "NULL" may also be used under some circumstances. See Section 12.2.5, “LOAD DATA INFILE Syntax”.

When using DISTINCT, GROUP BY, or ORDER BY, all NULL values are regarded as equal.

When using ORDER BY, NULL values are presented first, or last if you specify DESC to sort in descending order. Exception: In MySQL 4.0.2 through 4.0.10, NULL values sort first regardless of sort order.

Aggregate (summary) functions such as COUNT() [874], MIN() [876], and SUM() [876] ignore NULL values. The exception to this is COUNT(*) [874], which counts rows and not individual column values. For example, the following statement produces two counts. The first is a count of the number of rows in the table, and the second is a count of the number of non-NULL values in the age column:

mysql> SELECT COUNT(*), COUNT(age) FROM person;

For some data types, MySQL handles NULL values specially. If you insert NULL into a TIMESTAMP column, the current date and time is inserted. If you insert NULL into an integer or floating-point column that has the AUTO_INCREMENT attribute, the next number in the sequence is inserted.

B.5.5.4 Problems with Column Aliases

An alias can be used in a query select list to give a column a different name. You can use the alias in GROUP BY, ORDER BY, or HAVING clauses to refer to the column:

SELECT SQRT(a*b) AS root FROM tbl_name
GROUP BY root HAVING root > 0;
SELECT id, COUNT(*) AS cnt FROM tbl_name
GROUP BY id HAVING cnt > 0;
SELECT id AS 'Customer identity' FROM tbl_name;

Standard SQL disallows references to column aliases in a WHERE clause. This restriction is imposed because when the WHERE clause is evaluated, the column value may not yet have been determined. For example, the following query is illegal:

SELECT id, COUNT(*) AS cnt FROM tbl_name
WHERE cnt > 0 GROUP BY id;

The WHERE clause determines which rows should be included in the GROUP BY clause, but it refers to the alias of a column value that is not known until after the rows have been selected, and grouped by the GROUP BY.

In the select list of a query, a quoted column alias can be specified using identifier or string quoting characters:

SELECT 1 AS `one`, 2 AS 'two';
Elsewhere in the statement, quoted references to the alias must use identifier quoting or the reference is treated as a string literal. For example, this statement groups by the values in column `id`, referenced using the alias `a`:

```sql
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name
GROUP BY a;
```

But this statement groups by the literal string 'a' and will not work as expected:

```sql
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name
GROUP BY 'a';
```

### B.5.5.5 Rollback Failure for Nontransactional Tables

If you receive the following message when trying to perform a `ROLLBACK`, it means that one or more of the tables you used in the transaction do not support transactions:

```
Warning: Some non-transactional changed tables couldn't be rolled back
```

These nontransactional tables are not affected by the `ROLLBACK` statement.

If you were not deliberately mixing transactional and nontransactional tables within the transaction, the most likely cause for this message is that a table you thought was transactional actually is not. This can happen if you try to create a table using a transactional storage engine that is not supported by your `mysqld` server (or that was disabled with a startup option). If `mysqld` does not support a storage engine, it instead creates the table as a `MyISAM` table, which is nontransactional.

You can check the storage engine for a table by using either of these statements:

```sql
SHOW TABLE STATUS LIKE 'tbl_name';
SHOW CREATE TABLE tbl_name;
```

See Section 12.4.5.23, “SHOW TABLE STATUS Syntax”, and Section 12.4.5.7, “SHOW CREATE TABLE Syntax”.

You can check which storage engines your `mysqld` server supports by using this statement:

```
SHOW ENGINES;
```

Before MySQL 4.1.2, `SHOW ENGINES` is unavailable. Use the following statement instead and check the value of the variable that is associated with the storage engine in which you are interested:

```
SHOW VARIABLES LIKE 'have_%';
```

For example, to determine whether the InnoDB storage engine is available, check the value of the `have_innodb` variable.

See Section 12.4.5.10, “SHOW ENGINES Syntax”, and Section 12.4.5.25, “SHOW VARIABLES Syntax”.

### B.5.5.6 Deleting Rows from Related Tables

MySQL does not support subqueries prior to version 4.1, or the use of more than one table in the `DELETE` statement prior to version 4.0. If your version of MySQL does not support subqueries or multiple-table `DELETE` statements, you can use the following approach to delete rows from two related tables:
1. **SELECT** the rows based on some **WHERE** condition in the main table.

2. **DELETE** the rows in the main table based on the same condition.

3. **DELETE FROM** related_table **WHERE** related_column IN (selected_rows).

If the total length of the **DELETE** statement for related_table is more than 1MB (the default value of the max_allowed_packet system variable), you should split it into smaller parts and execute multiple **DELETE** statements. You probably get the fastest **DELETE** by specifying only 100 to 1,000 related_column values per statement if the related_column is indexed. If the related_column isn't indexed, the speed is independent of the number of arguments in the **IN** clause.

### B.5.5.7 Solving Problems with No Matching Rows

If you have a complicated query that uses many tables but that returns no rows, you should use the following procedure to find out what is wrong:

1. Test the query with **EXPLAIN** to check whether you can find something that is obviously wrong. See Section 12.7.2, “EXPLAIN Syntax”.

2. Select only those columns that are used in the **WHERE** clause.

3. Remove one table at a time from the query until it returns some rows. If the tables are large, it is a good idea to use **LIMIT 10** with the query.

4. Issue a **SELECT** for the column that should have matched a row against the table that was last removed from the query.

5. If you are comparing **FLOAT** or **DOUBLE** columns with numbers that have decimals, you cannot use equality (\(=\)) comparisons. This problem is common in most computer languages because not all floating-point values can be stored with exact precision. In some cases, changing the **FLOAT** to a **DOUBLE** fixes this. See Section B.5.5.8, “Problems with Floating-Point Values”.

6. If you still can't figure out what is wrong, create a minimal test that can be run with `mysql test < query.sql` that shows your problems. You can create a test file by dumping the tables with `mysqldump --quick db_name tbl_name_1 ... tbl_name_n > query.sql`. Open the file in an editor, remove some insert lines (if there are more than needed to demonstrate the problem), and add your **SELECT** statement at the end of the file.

Verify that the test file demonstrates the problem by executing these commands:

```shell
shell> mysqladmin create test2
shell> mysql test2 < query.sql
```

Attach the test file to a bug report, which you can file using the instructions in Section 1.8, “How to Report Bugs or Problems”.

### B.5.5.8 Problems with Floating-Point Values

Floating-point numbers sometimes cause confusion because they are approximate and not stored as exact values. A floating-point value as written in an SQL statement may not be the same as the value represented internally. Attempts to treat floating-point values as exact in comparisons may lead to problems. They are also subject to platform or implementation dependencies. The **FLOAT** and **DOUBLE** data types are subject to these issues. **DECIMAL** columns store values with exact precision because they are represented as strings, but calculations on **DECIMAL** values are done using floating-point operations.
The following example demonstrates the problem. It shows that even for older DECIMAL columns, calculations that are done using floating-point operations are subject to floating-point error. (Were you to replace the DECIMAL columns with FLOAT, similar problems would occur.)

MySQL> CREATE TABLE t1 (i INT, d1 DECIMAL(9,2), d2 DECIMAL(9,2));
MySQL> INSERT INTO t1 VALUES (1, 101.40, 21.40), (1, -80.00, 0.00),
-> (2, 0.00, 0.00), (2, -13.20, 0.00), (2, 59.60, 46.40),
-> (3, 37.00, 7.40), (3, -29.60, 0.00),
-> (4, 60.00, 15.40), (4, -10.60, 0.00), (4, -34.00, 0.00),
-> (5, 33.00, 0.00), (5, -25.80, 0.00), (5, 0.00, 7.20),
-> (6, 0.00, 0.00), (6, -51.40, 0.00);

MySQL> SELECT i, SUM(d1) AS a, SUM(d2) AS b
-> FROM t1 GROUP BY i HAVING a <> b;
+-----+-----+-----+
<table>
<thead>
<tr>
<th>i</th>
<th>a</th>
<th>b</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>21.40</td>
<td>21.40</td>
</tr>
<tr>
<td>2</td>
<td>76.80</td>
<td>76.80</td>
</tr>
<tr>
<td>3</td>
<td>7.40</td>
<td>7.40</td>
</tr>
<tr>
<td>4</td>
<td>15.40</td>
<td>15.40</td>
</tr>
<tr>
<td>5</td>
<td>7.20</td>
<td>7.20</td>
</tr>
<tr>
<td>6</td>
<td>-51.40</td>
<td>0.00</td>
</tr>
</tbody>
</table>
+-----+-----+-----+

The result is correct. Although the first five records look like they should not satisfy the comparison (the values of a and b do not appear to be different), they may do so because the difference between the numbers shows up around the tenth decimal or so, depending on factors such as computer architecture or the compiler version or optimization level. For example, different CPUs may evaluate floating-point numbers differently.

As of MySQL 5.0.3, you will get only the last row in the above result.

The problem cannot be solved by using ROUND() or similar functions, because the result is still a floating-point number:

MySQL> SELECT i, ROUND(SUM(d1), 2) AS a, ROUND(SUM(d2), 2) AS b
-> FROM t1 GROUP BY i HAVING a <> b;
+-----+-----+-----+
<table>
<thead>
<tr>
<th>i</th>
<th>a</th>
<th>b</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>21.40</td>
<td>21.40</td>
</tr>
<tr>
<td>2</td>
<td>76.80</td>
<td>76.80</td>
</tr>
<tr>
<td>3</td>
<td>7.40</td>
<td>7.40</td>
</tr>
<tr>
<td>4</td>
<td>15.40</td>
<td>15.40</td>
</tr>
<tr>
<td>5</td>
<td>7.20</td>
<td>7.20</td>
</tr>
<tr>
<td>6</td>
<td>-51.40</td>
<td>0.00</td>
</tr>
</tbody>
</table>
+-----+-----+-----+

This is what the numbers in column a look like when displayed with more decimal places:

MySQL> SELECT i, ROUND(SUM(d1), 2)*1.0000000000000000 AS a,
-> ROUND(SUM(d2), 2) AS b FROM t1 GROUP BY i HAVING a <> b;
+-----+-----+
<table>
<thead>
<tr>
<th>i</th>
<th>a</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>21.3999999999999986</td>
</tr>
<tr>
<td>2</td>
<td>76.7999999999999972</td>
</tr>
<tr>
<td>3</td>
<td>7.4000000000000004</td>
</tr>
<tr>
<td>4</td>
<td>15.4000000000000004</td>
</tr>
<tr>
<td>5</td>
<td>7.2000000000000002</td>
</tr>
<tr>
<td>-----</td>
<td>-----</td>
</tr>
</tbody>
</table>
Query-Related Issues

|    6 | -51.3999999999999986 |  0.00 |
|-----------------+-----------------+-----|

Depending on your computer architecture, you may or may not see similar results. For example, on some machines you may get the “correct” results by multiplying both arguments by 1, as the following example shows.

**Warning**

Never use this method in your applications. It is not an example of a trustworthy method!

```
mysql> SELECT i, ROUND(SUM(d1), 2)*1 AS a, ROUND(SUM(d2), 2)*1 AS b
    
    -> FROM t1 GROUP BY i HAVING a <> b;
```

<table>
<thead>
<tr>
<th>i</th>
<th>a</th>
<th>b</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>-51.40</td>
<td>0.00</td>
</tr>
<tr>
<td>------</td>
<td>--------</td>
<td>------</td>
</tr>
</tbody>
</table>

The reason that the preceding example seems to work is that on the particular machine where the test was done, CPU floating-point arithmetic happens to round the numbers to the same value. However, there is no rule that any CPU should do so, so this method cannot be trusted.

The correct way to do floating-point number comparison is to first decide on an acceptable tolerance for differences between the numbers and then do the comparison against the tolerance value. For example, if we agree that floating-point numbers should be regarded the same if they are same within a precision of one in ten thousand (0.0001), the comparison should be written to find differences larger than the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
    
    -> GROUP BY i HAVING ABS(a - b) > 0.0001;
```

<table>
<thead>
<tr>
<th>i</th>
<th>a</th>
<th>b</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>-51.40</td>
<td>0.00</td>
</tr>
<tr>
<td>------</td>
<td>-------</td>
<td>-------</td>
</tr>
<tr>
<td>1</td>
<td>21.40</td>
<td>21.40</td>
</tr>
<tr>
<td>2</td>
<td>76.80</td>
<td>76.80</td>
</tr>
<tr>
<td>3</td>
<td>7.40</td>
<td>7.40</td>
</tr>
<tr>
<td>4</td>
<td>15.40</td>
<td>15.40</td>
</tr>
<tr>
<td>5</td>
<td>7.20</td>
<td>7.20</td>
</tr>
</tbody>
</table>
| 1 row in set (0.00 sec)
```

Conversely, to get rows where the numbers are the same, the test should find differences within the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
    
    -> GROUP BY i HAVING ABS(a - b) <= 0.0001;
```

<table>
<thead>
<tr>
<th>i</th>
<th>a</th>
<th>b</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>21.40</td>
<td>21.40</td>
</tr>
<tr>
<td>2</td>
<td>76.80</td>
<td>76.80</td>
</tr>
<tr>
<td>3</td>
<td>7.40</td>
<td>7.40</td>
</tr>
<tr>
<td>4</td>
<td>15.40</td>
<td>15.40</td>
</tr>
<tr>
<td>5</td>
<td>7.20</td>
<td>7.20</td>
</tr>
</tbody>
</table>

Floating-point values are subject to platform or implementation dependencies. Suppose that you execute the following statements:

```
CREATE TABLE t1(c1 FLOAT(53,0), c2 FLOAT(53,0));
INSERT INTO t1 VALUES('1e+52','-1e+52');
```
On some platforms, the `SELECT` statement returns `inf` and `-inf`. On others, it returns `0` and `-0`.

An implication of the preceding issues is that if you attempt to create a replication slave by dumping table contents with `mysqldump` on the master and reloading the dump file into the slave, tables containing floating-point columns might differ between the two hosts.

## B.5.6 Optimizer-Related Issues

MySQL uses a cost-based optimizer to determine the best way to resolve a query. In many cases, MySQL can calculate the best possible query plan, but sometimes MySQL does not have enough information about the data at hand and has to make "educated" guesses about the data.

For the cases when MySQL does not do the "right" thing, tools that you have available to help MySQL are:

- Use the `EXPLAIN` statement to get information about how MySQL processes a query. To use it, just add the keyword `EXPLAIN` to the front of your `SELECT` statement:

  ```sql
  mysql> EXPLAIN SELECT * FROM t1, t2 WHERE t1.i = t2.i;
  
  EXPLAIN is discussed in more detail in Section 12.7.2, "EXPLAIN Syntax".
  ```

- Use `ANALYZE TABLE tbl_name` to update the key distributions for the scanned table. See Section 12.4.2.1, "ANALYZE TABLE Syntax".

- Use `FORCE INDEX` for the scanned table to tell MySQL that table scans are very expensive compared to using the given index:

  ```sql
  SELECT * FROM t1, t2 FORCE INDEX (index_for_column)
  WHERE t1.col_name=t2.col_name;
  ```

  `USE INDEX` and `IGNORE INDEX` may also be useful. See Section 12.2.7.2, "Index Hint Syntax".

- Global and table-level `STRAIGHT_JOIN`. See Section 12.2.7, "SELECT Syntax".

- You can tune global or thread-specific system variables. For example, start `mysqld` with the `--max-seeks-for-key=1000` option or use `SET max_seeks_for_key=1000` to tell the optimizer to assume that no key scan causes more than 1,000 key seeks. See Section 5.1.3, "Server System Variables".

## B.5.7 Table Definition-Related Issues

### B.5.7.1 Problems with `ALTER TABLE`

Before MySQL 4.1, `ALTER TABLE` changes a table to the current character set. As of 4.1, `ALTER TABLE` changes character sets only if you request it explicitly. If you get a duplicate-key error when `ALTER TABLE` changes the character set or collation of a character column, the cause is either that the new column collation maps two keys to the same value or that the table is corrupted. In the latter case, you should run `REPAIR TABLE` on the table.

If `ALTER TABLE` dies with the following error, the problem may be that MySQL crashed during an earlier `ALTER TABLE` operation and there is an old table named `A-xxx` or `B-xxx` lying around:

```sql
Error on rename of './database/name.frm'
to './database/B-xxx.frm' (Errcode: 17)
```
In this case, go to the MySQL data directory and delete all files that have names starting with A- or B-.
(You may want to move them elsewhere instead of deleting them.)

`ALTER TABLE` works in the following way:

- Create a new table named `A-xxx` with the requested structural changes.
- Copy all rows from the original table to `A-xxx`.
- Rename the original table to `B-xxx`.
- Rename `A-xxx` to your original table name.
- Delete `B-xxx`.

If something goes wrong with the renaming operation, MySQL tries to undo the changes. If something goes seriously wrong (although this shouldn’t happen), MySQL may leave the old table as `B-xxx`. A simple rename of the table files at the system level should get your data back.

If you use `ALTER TABLE` on a transactional table or if you are using Windows or OS/2, `ALTER TABLE` unlocks the table if you had done a `LOCK TABLE` on it. This is done because InnoDB and these operating systems cannot drop a table that is in use.

**B.5.7.2 TEMPORARY Table Problems**

The following list indicates limitations on the use of `TEMPORARY` tables:

- A `TEMPORARY` table can only be of type `HEAP`, `ISAM`, `MyISAM`, `MERGE`, or `InnoDB`.

Temporary tables are not supported for MySQL Cluster.

- You cannot refer to a `TEMPORARY` table more than once in the same query. For example, the following does not work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

- The `SHOW TABLES` statement does not list `TEMPORARY` tables.

- You cannot use `RENAME` to rename a `TEMPORARY` table. However, you can use `ALTER TABLE` instead:

```
mysql> ALTER TABLE orig_name RENAME new_name;
```

- There are known issues in using temporary tables with replication. See Section 14.7, “Replication Features and Issues”, for more information.

**B.5.8 Known Issues in MySQL**

This section lists known issues in recent versions of MySQL.

For information about platform-specific issues, see the installation and porting instructions in Section 2.12, “Operating System-Specific Notes”, and Section 18.4, “Porting to Other Systems”.

**B.5.8.1 Issues in MySQL 3.23 Fixed in a Later MySQL Version**

The following known issues have not been fixed in MySQL 3.23 for various reasons, and are not classified as critical.
Known Issues in MySQL

- Fixed in MySQL 4.0: Avoid using spaces at the end of column names because this can cause unexpected behavior. (Bug #4196)

- Fixed in MySQL 4.0.12: You can get a deadlock (hung thread) if you use `LOCK TABLE` to lock multiple tables and then in the same connection use `DROP TABLE` to drop one of them while another thread is trying to lock it. (To break the deadlock, you can use `KILL` to terminate any of the threads involved.)

- Fixed in MySQL 4.0.11: `SELECT MAX(key_column) FROM t1,t2,t3...` where one of the tables are empty doesn't return `NULL` but instead returns the maximum value for the column.

- `DELETE FROM heap_table` without a `WHERE` clause doesn't work on a locked `HEAP` table.

B.5.8.2 Issues in MySQL 4.0 Fixed in a Later Version

The following known issues have not been fixed in MySQL 4.0 for various reasons, and are not classified as critical.

- Fixed in MySQL 4.1.10: Using `HAVING`, you can get a crash or wrong result if you use an alias to a `RAND()` [814] function. This will not be fixed in 4.0 because the fix may break compatibility with some applications.

- Fixed in MySQL 4.1.1: In a `UNION`, the first `SELECT` determines the type, `max_length`, and `NULL` properties for the resulting columns.

- Fixed in MySQL 4.1: In `DELETE` with many tables, you can't refer to tables to be deleted through an alias.

- Fixed in MySQL 4.1.2: You cannot mix `UNION ALL` and `UNION DISTINCT` in the same query. If you use `ALL` for one `UNION`, it is used for all of them.

- `FLUSH TABLES WITH READ LOCK` does not block `CREATE TABLE`, which may cause a problem with the binary log position when doing a full backup of tables and the binary log.

- Fixed in MySQL 4.1.8: `mysqldump --single-transaction --master-data` behaved like `mysqldump --master-data`, so the dump was a blocking one.

- When using the `RPAD()` [792] function (or any function adding spaces to the right) in a query that had to be resolved by using a temporary table, all resulting strings had rightmost spaces removed (that is, `RPAD()` [792] did not work).

B.5.8.3 Issues in MySQL 4.1 Fixed in a Later Version

The following known issues have not been fixed in MySQL 4.1 for various reasons, and are not classified as critical.

- Fixed in 5.0.3: `VARCHAR` and `VARBINARY` did not remember end space.

B.5.8.4 Open Issues in MySQL

The following problems are known:

- If you compare a `NULL` value to a subquery using `ALL`, `ANY`, or `SOME`, and the subquery returns an empty result, the comparison might evaluate to the nonstandard result of `NULL` rather than to `TRUE` or `FALSE`. This issue has been fixed in MySQL 5.0 and later (Bug #8804).

- Subquery optimization for `IN` is not as effective as for `=`.
Known Issues in MySQL

- Even if you use lower_case_table_names=2 (which enables MySQL to remember the case used for databases and table names), MySQL does not remember the case used for database names for the function `DATABASE()` [864] or within the various logs (on case-insensitive systems).

- Dropping a `FOREIGN KEY` constraint doesn't work in replication because the constraint may have another name on the slave.

- `REPLACE` (and `LOAD DATA` with the `REPLACE` option) does not trigger `ON DELETE CASCADE`.

- `DISTINCT` with `ORDER BY` doesn't work inside `GROUP_CONCAT()` [875] if you don't use all and only those columns that are in the `DISTINCT` list.

- If one user has a long-running transaction and another user drops a table that is updated in the transaction, there is small chance that the binary log may contain the `DROP TABLE` statement before the table is used in the transaction itself. We plan to fix this by having the `DROP TABLE` statement wait until the table is not being used in any transaction.

- When inserting a big integer value (between $2^{63}$ and $2^{64} - 1$) into a decimal or string column, it is inserted as a negative value because the number is evaluated in a signed integer context.

- `FLUSH TABLES WITH READ LOCK` does not block `COMMIT` if the server is running without binary logging, which may cause a problem (of consistency between tables) when doing a full backup.

- `ANALYZE TABLE` on a `BDB` table may in some cases make the table unusable until you restart `mysqld`. If this happens, look for errors of the following form in the MySQL error file:

```
001207 22:07:56  bdb:  log_flush: LSN past current end-of-log
```

- Don't execute `ALTER TABLE` on a `BDB` table on which you are running multiple-statement transactions until all those transactions complete. (The transaction might be ignored.)

- `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE` may cause problems on tables for which you are using `INSERT DELAYED`.

- Performing `LOCK TABLE ...` and `FLUSH TABLES ...` doesn't guarantee that there isn't a half-finished transaction in progress on the table.

- `BDB` tables are relatively slow to open. If you have many `BDB` tables in a database, it takes a long time to use the `mysql` client on the database if you are not using the `-A` option or if you are using `rehash`. This is especially noticeable when you have a large table cache.

- Replication uses query-level logging: The master writes the executed queries to the binary log. This is a very fast, compact, and efficient logging method that works perfectly in most cases. It is possible for the data on the master and slave to become different if a query is designed in such a way that the data modification is nondeterministic (generally not a recommended practice, even outside of replication).

For example:

- `CREATE TABLE ... SELECT` or `INSERT ... SELECT` statements that insert zero or `NULL` values into an `AUTO_INCREMENT` column.

- `DELETE` if you are deleting rows from a table that has foreign keys with `ON DELETE CASCADE` properties.

- `REPLACE ... SELECT, INSERT IGNORE ... SELECT` if you have duplicate key values in the inserted data.
Known Issues in MySQL

If and only if the preceding queries have no ORDER BY clause guaranteeing a deterministic order.

For example, for INSERT ... SELECT with no ORDER BY, the SELECT may return rows in a different order (which results in a row having different ranks, hence getting a different number in the AUTO_INCREMENT column), depending on the choices made by the optimizers on the master and slave.

A query is optimized differently on the master and slave only if:

• The files used by the two queries are not exactly the same; for example, OPTIMIZE TABLE was run on the master tables and not on the slave tables. (To fix this, OPTIMIZE TABLE, ANALYZE TABLE, and REPAIR TABLE are written to the binary log as of MySQL 4.1.1).

• The table is stored using a different storage engine on the master than on the slave. (It is possible to use different storage engines on the master and slave. For example, you can use InnoDB on the master, but MyISAM on the slave if the slave has less available disk space.)

• MySQL buffer sizes (key_buffer_size, and so on) are different on the master and slave.

• The master and slave run different MySQL versions, and the optimizer code differs between these versions.

This problem may also affect database restoration using mysqlbinlog | mysql.

The easiest way to avoid this problem is to add an ORDER BY clause to the aforementioned nondeterministic queries to ensure that the rows are always stored or modified in the same order.

In future MySQL versions, we will automatically add an ORDER BY clause when needed.

The following issues are known and will be fixed in due time:

• Log file names are based on the server host name (if you don't specify a file name with the startup option). You have to use options such as --log-bin=old_host_name-bin if you change your host name to something else. Another option is to rename the old files to reflect your host name change (if these are binary logs, you need to edit the binary log index file and fix the binary log file names there as well). See Section 5.1.2, “Server Command Options”.

• mysqlbinlog does not delete temporary files left after a LOAD DATA INFILE statement. See Section 4.6.6, “mysqlbinlog — Utility for Processing Binary Log Files”.

• RENAME doesn't work with TEMPORARY tables or tables used in a MERGE table.

• Due to the way table format (.frm) files are stored, you cannot use character 255 (CHAR(255)) in table names, column names, or enumerations. This is scheduled to be fixed in version 5.1 when we implement new table definition format files.

• When using SET CHARACTER SET, you can't use translated characters in database, table, and column names.

• You can't use “_” or “%” with ESCAPE in LIKE ... ESCAPE [796].

• If you have a DECIMAL column in which the same number is stored in different formats (for example, +01.00, 1.00, 01.00), GROUP BY may regard each value as a different value.

• You cannot build the server in another directory when using MIT-pthreads. Because this requires changes to MIT-pthreads, we are not likely to fix this. See Section 2.9.6, “MIT-pthreads Notes”.

• BLOB and TEXT values can't "reliably" be used in GROUP BY, ORDER BY or DISTINCT. Only the first max_sort_length bytes are used when comparing BLOB values in these cases. The default value of
`max_sort_length` value is 1024 and can be changed at server startup time. As of MySQL 4.0.3, it can be changed at runtime. For older versions, a workaround is to use a substring. For example:

```
SELECT DISTINCT LEFT(blob_col,2048) FROM tbl_name;
```

- Numeric calculations are done with `BIGINT` or `DOUBLE` (both are normally 64 bits long). Which precision you get depends on the function. The general rule is that bit functions are performed with `BIGINT` precision, `IF()` [782] and `ELT()` [787] with `BIGINT` or `DOUBLE` precision, and the rest with `DOUBLE` precision. You should try to avoid using unsigned long long values if they resolve to be larger than 63 bits (922372036854775807) for anything other than bit fields. MySQL Server 4.0 has better `BIGINT` handling than 3.23.

- You can have up to 255 `ENUM` and `SET` columns in one table.

- In `MIN()` [876], `MAX()` [876], and other aggregate functions, MySQL currently compares `ENUM` and `SET` columns by their string value rather than by the string's relative position in the set.

- `mysqld_safe` redirects all messages from `mysqld` to the `mysqld` log. One problem with this is that if you execute `mysqladmin refresh` to close and reopen the log, `stdout` and `stderr` are still redirected to the old log. If you use the general query log extensively, you should edit `mysqld_safe` to log to `host_name.err` instead of `host_name.log` so that you can easily reclaim the space for the old log by deleting it and executing `mysqladmin refresh`.

- In an `UPDATE` statement, columns are updated from left to right. If you refer to an updated column, you get the updated value instead of the original value. For example, the following statement increments `KEY` by 2, `not 1`:

```
mysql> UPDATE tbl_name SET KEY=KEY+1,KEY=KEY+1;
```

- You can refer to multiple temporary tables in the same query, but you cannot refer to any given temporary table more than once. For example, the following doesn't work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

- The optimizer may handle `DISTINCT` differently when you are using "hidden" columns in a join than when you are not. In a join, hidden columns are counted as part of the result (even if they are not shown), whereas in normal queries, hidden columns don't participate in the `DISTINCT` comparison. We will probably change this in the future to never compare the hidden columns when executing `DISTINCT`.

An example of this is:

```
SELECT DISTINCT mp3id FROM band_downloads
    WHERE userid = 9 ORDER BY id DESC;
```

and

```
SELECT DISTINCT band_downloads.mp3id
    FROM band_downloads,band_mp3
    WHERE band_downloads.userid = 9
    AND band_mp3.id = band_downloads.mp3id
    ORDER BY band_downloads.id DESC;
```

In the second case, using MySQL Server 3.23.x, you may get two identical rows in the result set (because the values in the hidden `id` column may differ).
Note that this happens only for queries where that do not have the `ORDER BY` columns in the result.

- If you execute a `PROCEDURE` on a query that returns an empty set, in some cases the `PROCEDURE` does not transform the columns.

- Creation of a table of type `MERGE` doesn't check whether the underlying tables are compatible types.

- If you use `ALTER TABLE` to add a `UNIQUE` index to a table used in a `MERGE` table and then add a normal index on the `MERGE` table, the key order is different for the tables if there was an old, non-`UNIQUE` key in the table. This is because `ALTER TABLE` puts `UNIQUE` indexes before normal indexes to be able to detect duplicate keys as early as possible.
# Appendix C MySQL Release Notes

## Table of Contents

C.1 Changes in Release 4.1.x (Lifecycle Support Ended) .................................................. 1628
  C.1.1 Changes in MySQL 4.1.25 (2008-12-01) ................................................................ 1629
  C.1.2 Changes in MySQL 4.1.24 (2008-03-01) ................................................................ 1630
  C.1.3 Changes in MySQL 4.1.23 (2007-06-12) ................................................................ 1633
  C.1.4 Changes in MySQL 4.1.22 (2006-11-02) ................................................................ 1641

Changes in Release 4.1.x (Lifecycle Support Ended)

C.1 Changes in Release 4.1.x (Lifecycle Support Ended)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Note that we tend to update the manual at the same time we make changes to MySQL. If you find a recent version of MySQL listed here that you can't find on our download page (http://dev.mysql.com/downloads/), it means that the version has not yet been released.

The date mentioned with a release version is the date of the last Bazaar commit on which the release was based, not the date when the packages were made available. The binaries are usually made available a few days after the date of the tagged ChangeSet, because building and testing all packages takes some time.

The manual included in the source and binary distributions may not be fully accurate when it comes to the release changelog entries, because the integration of the manual happens at build time. For the most up-to-date release changelog, please refer to the online version instead.

C.1 Changes in Release 4.1.x (Lifecycle Support Ended)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

The following list summarizes the features in MySQL Server 4.1 that are not present in previous versions. For a full list of changes, please refer to the changelog sections for individual 4.1 releases.

• The SUBSTRING() function can now take a negative value for the pos (position) argument. See Section 11.5, “String Functions”.

• Subqueries and derived tables (unnamed views). See Section 12.2.8, “Subquery Syntax”.

This appendix lists the changes from version to version in the MySQL source code through the latest version of MySQL 4.1.
Changes in MySQL 4.1.25 (2008-12-01)

- The **INSERT ... ON DUPLICATE KEY UPDATE ...** syntax. This enables you to **UPDATE** an existing row if the insert would cause a duplicate value in a **PRIMARY** or **UNIQUE** key. (**REPLACE** enables you to overwrite an existing row, which is something entirely different.) See Section 12.2.4, “INSERT Syntax”.

- A newly designed **GROUP_CONCAT()** [875] aggregate function. See Section 11.15, “Functions and Modifiers for Use with GROUP BY Clauses”.

- Extensive Unicode (UTF8) support.

- Table names and column names now are stored in **UTF8**. This makes MySQL more flexible, but might cause some problems upgrading if you have table or column names that use characters outside of the standard 7-bit US-ASCII range. See Section 2.11.1.1, “Upgrading from MySQL 4.0 to 4.1”.

- Character sets can be defined per column, table, and database.

- New key cache for **MyISAM** tables with many tunable parameters. You can have multiple key caches, preload index into caches for batches...

- **BTREE** index on **HEAP** tables.

- Support for OpenGIS spatial types (geographical data). See Chapter 16, Spatial Extensions.

- **SHOW WARNINGS** shows warnings for the last command. See Section 12.4.5.26, “SHOW WARNINGS Syntax”.

- Faster binary protocol with prepared statements and parameter binding. See Section 17.6.7, “C API Prepared Statements”.

- You can now issue multiple statements with a single C API call and then read the results in one go. See Section 17.6.15, “C API Support for Multiple Statement Execution”.

- Create Table: **CREATE [TEMPORARY] TABLE [IF NOT EXISTS] table2 LIKE table1**.

- Server based **HELP** statement that can be used in the **mysql** command-line client (and other clients) to get help for SQL statements.

C.1.1 Changes in MySQL 4.1.25 (2008-12-01)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

This is a bugfix release for the MySQL 4.1 release family.

**Functionality Added or Changed**

- **Security Enhancement:** To enable stricter control over the location from which user-defined functions can be loaded, the **plugin_dir** system variable has been backported from MySQL 5.1. If the value is nonempty, user-defined function object files can be loaded only from the directory named by this variable. If the value is empty, the behavior that is used prior to the inclusion of **plugin_dir** applies: The UDF object files must be located in a directory that is searched by your system’s dynamic linker.

  If the plugin directory is writable by the server, it may be possible for a user to write executable code to a file in the directory using **SELECT ... INTO DUMPFILE**. This can be prevented by making **plugin_dir** read only to the server or by setting **--secure-file-priv** to a directory where **SELECT** writes can be made safely. (Bug #37428)

**Bugs Fixed**
Changes in MySQL 4.1.24 (2008-03-01)

• **Security Fix; Important Change:** Additional corrections were made for the symlink-related privilege problem originally addressed in MySQL 4.1.24. The original fix did not correctly handle the data directory path name if it contained symlinked directories in its path, and the check was made only at table-creation time, not at table-opening time later. (Bug #32167, CVE-2008-2079)

  References: See also Bug #39277.

• On Windows, the installer attempted to use JScript to determine whether the target data directory already existed. On Windows Vista x64, this resulted in an error because the installer was attempting to run the JScript in a 32-bit engine, which wasn't registered on Vista. The installer no longer uses JScript but instead relies on a native WiX command. (Bug #36103)

• The Windows installer displayed incorrect product names in some images. (Bug #40845)

• `INSERT INTO ... SELECT` caused a crash if `innodb_locks_unsafe_for_binlog` was enabled. (Bug #27294)

• The MySQL Instance Configuration Wizard would not permit you to choose a service name, even though the criteria for the service name were valid. The code that checks the name has been updated to support the correct criteria of any string less than 256 character and not containing either a forward or backward slash character. (Bug #27013)

### C.1.2 Changes in MySQL 4.1.24 (2008-03-01)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

This is a bugfix release for the MySQL 4.1 release family.

**Functionality Added or Changed**

• The `ndbd` and `ndb_mgmd` man pages have been reclassified from volume 1 to volume 8. (Bug #34642)

**Bugs Fixed**

• **Security Fix; Important Change:** It was possible to circumvent privileges through the creation of MyISAM tables employing the `DATA DIRECTORY` and `INDEX DIRECTORY` options to overwrite existing table files in the MySQL data directory. Use of the MySQL data directory in `DATA DIRECTORY` and `INDEX DIRECTORY` path name is no longer permitted.

  **Note**

  Additional fixes were made in MySQL 4.1.25.

  (Bug #32167, CVE-2008-2079)

  References: See also Bug #39277.

• **Security Fix:** Using `RENAME TABLE` against a table with explicit `DATA DIRECTORY` and `INDEX DIRECTORY` options can be used to overwrite system table information by replacing the symbolic link points. the file to which the symlink points.

  MySQL will now return an error when the file to which the symlink points already exists. (Bug #32111, CVE-2007-5969)
Changes in MySQL 4.1.24 (2008-03-01)

- **Security Fix:** A malformed password packet in the connection protocol could cause the server to crash. Thanks for Dormando for reporting this bug, and for providing details and a proof of concept. (Bug #28984, CVE-2007-3780)

- **Security Enhancement:** It was possible to force an error message of excessive length which could lead to a buffer overflow. This has been made no longer possible as a security precaution. (Bug #32707)

- **Replication:** Connections from one `mysqld` server to another failed on Mac OS X, affecting replication and `FEDERATED` tables. (Bug #29083)

  References: See also Bug #26664.

- An internal buffer in `mysql` was too short. Overextending it could cause stack problems or segmentation violations on some architectures. (This is not a problem that could be exploited to run arbitrary code.) (Bug #33841)

- `make_binary_distribution` passed the `--print-libgcc-file` option to the C compiler, but this does not work with the ICC compiler. (Bug #33536)

- Performing a full text search on a table could cause a crash on a 64-bit platforms with certain characteristics. Searches that were known to cause a crash with certain datasets included numeric values and strings where the match string included data enclosed in single or double quotation marks. (Bug #11392)

- `PURGE MASTER LOGS BEFORE (subquery)` caused a server crash. Subqueries are forbidden in the `BEFORE` clause now. (Bug #28553)

- `mysql_setpermission` tried to grant global-only privileges at the database level. (Bug #14618)

- A field packet with `NULL` fields caused a `libmysqlclient` crash. (Bug #29494)

- On 64-bit Windows systems, the Config Wizard failed to complete the setup because 64-bit Windows does not resolve dynamic linking of the 64-bit `libmysql.dll` to a 32-bit application like the Config Wizard. (Bug #14649)

- When one thread attempts to lock two (or more) tables and another thread executes a statement that aborts these locks (such as `REPAIR TABLE`, `OPTIMIZE TABLE`, or `CHECK TABLE`), the thread might get a table object with an incorrect lock type in the table cache. The result is table corruption or a server crash. (Bug #28574)

- Issuing a `DELETE` statement having both an `ORDER BY` clause and a `LIMIT` clause could cause `mysqld` to crash. (Bug #30385)

- If an `ENUM` column contained `' ' `as one of its members (represented with numeric value greater than 0), and the column contained error values (represented as 0 and displayed as `' ' `), using `ALTER TABLE` to modify the column definition caused the 0 values to be given the numeric value of the nonzero `' ' ` member. (Bug #29251)

- The semantics of `BIGINT` depended on platform-specific characteristics. (Bug #29079)

- Using up-arrow for command-line recall in `mysql` could cause a segmentation fault. (Bug #10218)

- Dropping a user-defined function could cause a server crash if the function was still in use by another thread. (Bug #27564)

- Adding `DISTINCT` could cause incorrect rows to appear in a query result. (Bug #29911)

- In some cases, `INSERT INTO ... SELECT ... GROUP BY` could insert rows even if the `SELECT` by itself produced an empty result. (Bug #29717)
Changes in MySQL 4.1.24 (2008-03-01)

• Error returns from the `time()` system call were ignored. (Bug #27198)

• If one thread was performing concurrent inserts, other threads reading from the same table using equality key searches could see the index values for new rows before the data values had been written, leading to reports of table corruption. (Bug #29838)

• A network structure was initialized incorrectly, leading to embedded server crashes. (Bug #29117)

• `SELECT ... INTO OUTFILE` followed by `LOAD DATA` could result in garbled characters when the `FIELDS ENCLOSED BY` clause named a delimiter of '0', 'b', 'n', 'r', 't', 'N', or 'Z' due to an interaction of character encoding and doubling for data values containing the enclosed-by character. (Bug #29294)

• Format strings in English error messages were insufficiently wide for path names printed in those messages by the embedded server. (Bug #16635)

• On Mac OS X, shared-library installation path names were incorrect. (Bug #28544)

• For `MEMORY` tables, `DELETE` statements that remove rows based on an index read could fail to remove all matching rows. (Bug #30590)

• For `InnoDB` tables that use the `utf8` character set, incorrect results could occur for DML statements such as `DELETE` or `UPDATE` that use an index on character-based columns. (Bug #28878)

References: See also Bug #29449, Bug #30485, Bug #31395. This bug was introduced by Bug #13195.

• With small values of `myisam_sort_buffer_size`, `REPAIR TABLE` for `MyISAM` tables could cause a server crash. (Bug #31174)

• Internal conversion routines could fail for several multi-byte character sets (`big5`, `cp932`, `euckr`, `gb2312`, `sjis`) for empty strings or during evaluation of `SOUNDS LIKE [793]`. (Bug #31069, Bug #31070)

• Versions of `mysqldump` from MySQL 4.1 or higher tried to use `START TRANSACTION WITH CONSISTENT SNAPSHOT` if the `--single-transaction` and `--master-data` options were given, even with servers older than 4.1 that do not support consistent snapshots. (Bug #30444)

• A buffer used when setting variables was not dimensioned to accommodate the trailing '\0' byte, so a single-byte buffer overrun was possible. (Bug #31588)

• Setting certain values on a table using a spatial index could cause the server to crash. (Bug #30286)

• The `GeomFromText()` function could cause a server crash if the first argument was `NULL` or the empty string. (Bug #30955)

• The server crashed on optimizations involving a join of `INT` and `MEDIUMINT` columns and a system variable in the `WHERE` clause. (Bug #32103)

• Full-text searches on `ucs2` columns caused a server crash. (`FULLTEXT` indexes on `ucs2` columns cannot be used, but it should be possible to perform `IN BOOLEAN MODE` searches on `ucs2` columns without a crash.) (Bug #31159)

• For an almost-full `MyISAM` table, an insert that failed could leave the table in a corrupt state. (Bug #31305)

• The server could crash during `filesort` for `ORDER BY` based on expressions with `INET_NTOA()` or `OCT()` if those functions returned `NULL`. (Bug #31758)
Changes in MySQL 4.1.23 (2007-06-12)

- `myisamchk --unpack` could corrupt a table that when unpacked has static (fixed-length) row format. (Bug #31277)

- Data in BLOB or GEOMETRY columns could be cropped when performing a UNION query. (Bug #31158)

- Tables with a GEOMETRY column could be marked as corrupt if you added a non-SPATIAL index on a GEOMETRY column. (Bug #30284)

- On some 64-bit systems, inserting the largest negative value into a BIGINT column resulted in incorrect data. (Bug #30069)

- With lower_case_table_names set, CREATE TABLE LIKE was treated differently by libmysqld than by the nonembedded server. (Bug #32063)

- ucs2 does not work as a client character set, but attempts to use it as such were not rejected. Now character_set_client cannot be set to ucs2. This also affects statements such as SET NAMES and SET CHARACTER SET. (Bug #31615)

- Denormalized double-precision numbers cannot be handled properly by old MIPS processors. For IRIX, this is now handled by enabling a mode to use a software workaround. (Bug #29085)

- The MySQL preferences pane did not work to start or stop MySQL on Mac OS X 10.5 (Leopard). (Bug #28854)

- On Mac OS X, the StartupItem for MySQL did not work. (Bug #25008)

C.1.3 Changes in MySQL 4.1.23 (2007-06-12)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

This is a bugfix release for the MySQL 4.1 release family.

Functionality Added or Changed

- **Incompatible Change:** Previously, the DATE_FORMAT() [824] function returned a binary string. Now it returns a string with a character set and collation given by character_set_connection and collation_connection so that it can return month and weekday names containing non-ASCII characters. (Bug #22646)

- **Incompatible Change:** The prepared_stmt_count system variable has been converted to the Prepared_stmt_count global status variable (viewable with the SHOW GLOBAL STATUS statement). (Bug #23159)

- **Important Change:** When using a MERGE table, the definition of the table and the underlying MyISAM tables are checked each time the tables are opened for access (including any SELECT or INSERT statement). Each table is compared for column order, types, sizes, and associated indexes. If there is a difference in any one of the tables, the statement will fail.

- The --memlock option relies on system calls that are unreliable on some operating systems. If a crash occurs, the server now checks whether --memlock was specified and if so issues some information about possible workarounds. (Bug #22860)

- If the user specified the server options --max-connections=N or --table-cache=M, a warning would be given in some cases that some values were recalculated, with the result that --table-cache could be assigned greater value.
In such cases, both the warning and the increase in the `--table-cache` value were completely harmless. Note also that it is not possible for the MySQL Server to predict or to control limitations on the maximum number of open files, since this is determined by the operating system.

The value of `--table-cache` is no longer increased automatically, and a warning is now given only if some values had to be decreased due to operating system limits. (Bug #21915)

- The server now includes a timestamp in error messages that are logged as a result of unhandled signals (such as `mysqld got signal 11` messages). (Bug #24878)

- `mysqldump --single-transaction` now uses `START TRANSACTION /*!40100 WITH CONSISTENT_SNAPSHOT */` rather than `BEGIN` to start a transaction, so that a consistent snapshot will be used on those servers that support it. (Bug #19660)

- `INSERT DELAYED` statements on `BLACKHOLE` tables are now rejected, due to the fact that the `BLACKHOLE` storage engine does not support them. (Bug #27998)

- A dependency on the Intel runtime libraries existed in the `shared-xxx` RPMs for the IA-64 CPU of some versions of MySQL 4.1 (4.1.16, 4.1.20, and 4.1.22). This has been resolved. (Bug #18776)

**Bugs Fixed**

- **Security Fix:** The requirement of the `DROP` privilege for `RENAME TABLE` was not enforced. (Bug #27515, CVE-2007-2691)

- **Performance:** InnoDB showed substandard performance with multiple queries running concurrently. (Bug #15815)

- **Performance:** InnoDB exhibited thread thrashing with more than 50 concurrent connections under an update-intensive workload. (Bug #22868)

- **Incompatible Change:** `INSERT DELAYED` statements are not supported for `MERGE` tables, but the `MERGE` storage engine was not rejecting such statements, resulting in table corruption. Applications previously using `INSERT DELAYED` into `MERGE` table will break when upgrading to versions with this fix. To avoid the problem, remove `DELAYED` from such statements. (Bug #26464)

- **Incompatible Change:** For `ENUM` columns that had enumeration values containing commas, the commas were mapped to `0xff` internally. However, this rendered the commas indistinguishable from true `0xff` characters in the values. This no longer occurs. However, the fix requires that you dump and reload any tables that have `ENUM` columns containing any true `0xff` values. Dump the tables using `mysqldump` with the current server before upgrading from a version of MySQL 4.1 older than 4.1.23 to version 4.1.23 or newer. (Bug #24660)

- **MySQL Cluster:** In some circumstances, shutting down the cluster could cause connected `mysqld` processes to crash. (Bug #25668)

- **MySQL Cluster:** The management client command `node_id STATUS` displayed the message `Node node_id: not connected` when `node_id` was not the node ID of a data node.

*Note*

The `ALL_STATUS` command in the cluster management client still displays status information for data nodes only. This is by design. See Section 15.5.2, “Commands in the MySQL Cluster Management Client”, for more information. (Bug #21715)
Changes in MySQL 4.1.23 (2007-06-12)

- **MySQL Cluster:** When an API node sent more than 1024 signals in a single batch, NDB would process only the first 1024 of these, and then hang. (Bug #28443)

- **Replication:** Transient errors in replication from master to slave may trigger multiple Got fatal error 1236: 'binlog truncated in the middle of event' errors on the slave. (Bug #4053)

- **Replication:** Changes to the `lc_time_names` system variable were not replicated. (Bug #22645)

- **Replication:** SQL statements close to the size of `max_allowed_packet` could produce binary log events larger than `max_allowed_packet` that could not be read by slave servers. (Bug #19402)

- **Replication:** GRANT statements were not replicated if the server was started with the `--replicate-ignore-table` or `--replicate-wild-ignore-table` option. (Bug #25482)

- **Replication:** If a slave server closed its relay log (for example, due to an error during log rotation), the I/O thread did not recognize this and still tried to write to the log, causing a server crash. (Bug #10798)

- **Cluster Replication:** Some queries that updated multiple tables were not backed up correctly. (Bug #27748)

- **Cluster API:** `libndbclient.so` was not versioned. (Bug #13522)

- When opening a corrupted `.frm` file during a query, the server crashes. (Bug #24358)

- `ISNULL(DATE(NULL))` [777] and `ISNULL(CAST(NULL AS DATE))` [777] erroneously returned false. (Bug #23938)

- The error message for error number 137 did not report which database/table combination reported the problem. (Bug #27173)

- A return value of -1 from user-defined handlers was not handled well and could result in conflicts with server code. (Bug #24987)

- `X() IS NULL` and `Y() IS NULL` comparisons failed when `X()` [1398] and `Y()` [1398] returned NULL. (Bug #26038)

- `DOUBLE` values such as `20070202191048.000000` were being treated as illegal arguments by `WEEK()` [835]. (Bug #23616)

- The `mysqlserver.lib` library on Windows had many missing symbols. (Bug #29007)

- `LAST_DAY('0000-00-00')` [828] could cause a server crash. (Bug #23653)

- `SET lc_time_names = value` permitted only exact literal values, not expression values. (Bug #22647)

- The server could send incorrect column count information to the client for queries that produce a larger number of columns than can fit in a two-byte number. (Bug #19216)

- If there was insufficient memory to store or update a blob record in a MyISAM table then the table will marked as crashed. (Bug #23196)

- A server crash occurred when using `LOAD DATA` to load a table containing a NOT NULL spatial column, when the statement did not load the spatial column. Now a NULL supplied to NOT NULL column error occurs. (Bug #22372)

- If elements in a nontoplevel IN subquery were accessed by an index and the subquery result set included a NULL value, the quantified predicate that contained the subquery was evaluated to NULL when it should return a non-NULL value. (Bug #23478)
• `mysql_fix_privilege_tables` did not accept a password containing embedded space or apostrophe characters. (Bug #17700)

• The `BUILD/check-cpu` script did not recognize Celeron processors. (Bug #20061)

• Accessing a fixed record format table with a crashed key definition results in server/myisamchk segmentation fault. (Bug #24855)

• If a thread previously serviced a connection that was killed, excessive memory and CPU use by the thread occurred if it later serviced a connection that had to wait for a table lock. (Bug #25966)

• The `MERGE` storage engine could return incorrect results when several index values that compare equality were present in an index (for example, `'gross'` and `'gross '`, which are considered equal but have different lengths). (Bug #24342)

• If `COMPRESS()` returned `NULL`, subsequent invocations of `COMPRESS()` within a result set or within a trigger also returned `NULL`. (Bug #23254)

• When updating a table that used a `JOIN` of the table itself (for example, when building trees) and the table was modified on one side of the expression, the table would either be reported as crashed or the wrong rows in the table would be updated. (Bug #21310)

• Referencing an ambiguous column alias in an expression in the `ORDER BY` clause of a query caused the server to crash. (Bug #25427)

• No warning was issued for use of the `DATA DIRECTORY` or `INDEX DIRECTORY` table options on a platform that does not support them. (Bug #17498)

• Duplicate entries were not assessed correctly in a `MEMORY` table with a `BTREE` primary key on a `utf8` `ENUM` column. (Bug #24985)

• `mysqldump --order-by-primary` failed if the primary key name was an identifier that required quoting. (Bug #13926)

• The internal functions for table preparation, creation, and alteration were not re-execution friendly, causing problems in code that: repeatedly altered a table; repeatedly created and dropped a table; opened and closed a cursor on a table, altered the table, and then reopened the cursor; used `ALTER TABLE` to change a table's current `AUTO_INCREMENT` value; created indexes on `utf8` columns. Re-execution of `CREATE DATABASE`, `CREATE TABLE`, and `ALTER TABLE` statements as prepared statements also caused incorrect results or crashes. (Bug #4968, Bug #6895, Bug #19182, Bug #19733, Bug #22060, Bug #24879)

• `SHOW COLUMNS` reported some `NOT NULL` columns as `NULL`. (Bug #22377)

• `STR_TO_DATE()` returned `NULL` if the format string contained a space following a nonformat character. (Bug #22029)

• The arguments to the `ENCODE()` and the `DECODE()` functions were not printed correctly, causing problems in the output of `EXPLAIN EXTENDED` and in view definitions. (Bug #23409)

• Passing nested row expressions with different structures to an `IN` predicate caused a server crash. (Bug #27484)

• For `MyISAM` tables, `COUNT(*)` could return an incorrect value if the `WHERE` clause compared an indexed `TEXT` column to the empty string (`''`). This happened if the column contained empty strings and also strings starting with control characters such as tab or newline. (Bug #26231)
Changes in MySQL 4.1.23 (2007-06-12)

- If an ORDER BY or GROUP BY list included a constant expression being optimized away and, at the same time, containing single-row subselects that returned more that one row, no error was reported. If a query required sorting by expressions containing single-row subselects that returned more than one row, execution of the query could cause a server crash. (Bug #24653)

- The return value from my.Seek() was ignored. (Bug #22828)

- The second execution of a prepared statement from a UNION query with ORDER BY RAND() caused the server to crash. (Bug #27937)

- LOAD DATA INFILE sent an okay to the client before writing the binary log and committing the changes to the table had finished, thus violating ACID requirements. (Bug #26050)

- NOW() [829] returned the wrong value in statements executed at server startup with the --init-file option. (Bug #23240)

- The fix for Bug #17212 provided correct sort order for misordered output of certain queries, but caused significant overall query performance degradation. (Results were correct (good), but returned much more slowly (bad).) The fix also affected performance of queries for which results were correct. The performance degradation has been addressed. (Bug #27531)

- mysql_stmt_fetch() did an invalid memory deallocation when used with the embedded server. (Bug #25492)

- For not-yet-authenticated connections, the Time column in SHOW PROCESSLIST was a random value rather than NULL. (Bug #23379)

- The Handler_rollback status variable sometimes was incremented when no rollback had taken place. (Bug #22728)

- It was possible to use DATETIME values whose year, month, and day parts were all zeros but whose hour, minute, and second parts contained nonzero values, an example of such an illegal DATETIME being '0000-00-00 11:23:45'.

  Note
  This fix was reverted in MySQL 4.1.24. (Bug #21789)

  References: See also Bug #25301.

- The creation of MySQL system tables was not checked for by mysql-test-run.pl. (Bug #20166)

- For ODBC compatibility, MySQL supports use of WHERE col_name IS NULL for DATE or DATETIME columns that are NOT NULL, to permit column values of '0000-00-00' or '0000-00-00 00:00:00' to be selected. However, this was not working for WHERE clauses in DELETE statements. (Bug #23412)

- For MERGE tables defined on underlying tables that contained a short VARCHAR column (shorter than four characters), using ALTER_TABLE on at least one but not all of the underlying tables caused the table definitions to be considered different from that of the MERGE table, even if the ALTER_TABLE did not change the definition.

  In addition, when the underlying tables contained a TINYINT or CHAR(1) column, the MERGE storage engine incorrectly reported that they differed from the MERGE table in certain cases. (Bug #26681)

- For BOOLEAN mode full-text searches on nonindexed columns, NULL rows generated by a LEFT JOIN caused incorrect query results. (Bug #14708, Bug #25637)
Changes in MySQL 4.1.23 (2007-06-12)

• Lack of validation for input and output `TIME` values resulted in several problems: `SEC_TO_TIME()` treated `BIGINT UNSIGNED` values as signed; only truncation warnings were produced when both truncation and out-of-range `TIME` values occurred. (Bug #11655, Bug #20927)

• Using `CAST()` to convert `DATETIME` values to numeric values did not work. (Bug #23656)

• A reference to a nonexistent column in the `ORDER BY` clause of an `UPDATE ... ORDER BY` statement could cause a server crash. (Bug #25126)

• Selecting into variables sometimes returned incorrect wrong results. (Bug #20836)

• A deadlock could occur, with the server hanging on `Closing tables`, with a sufficient number of concurrent `INSERT DELAYED, FLUSH TABLES, and ALTER TABLE` operations. (Bug #23312)

• Metadata for columns calculated from scalar subqueries was limited to integer, double, or string, even if the actual type of the column was different. (Bug #11032)

• The result set of a query that used `WITH ROLLUP` and `DISTINCT` could lack some rollup rows (rows with `NULL` values for grouping attributes) if the `GROUP BY` list contained constant expressions. (Bug #24856)

• A crash of the MySQL Server could occur when unpacking a `BLOB` column from a row in a corrupted MyISAM table. This could happen when trying to repair a table using either `REPAIR TABLE` or `myisamchk`; it could also happen when trying to access such a “broken” row using statements like `SELECT` if the table was not marked as crashed. (Bug #22053)

• Added support for `--debugger=dbx` for `mysql-test-run.pl` and added support for `--debugger=devenv, --debugger=DevEnv, and --debugger=/path/to/devenv`. (Bug #26792)

• There was a race condition in the `InnoDB fil_flush_file_spaces()` function. (Bug #24089)

  References: This bug was introduced by Bug #15653.

• `EXPLAIN` for a query on an empty table immediately after its creation could result in a server crash. (Bug #28272)

• MySQL failed to build on Linux/Alpha. (Bug #23256)

  References: This bug was introduced by Bug #21250.

• Running `CHECK TABLE` concurrently with a `SELECT, INSERT or other statement on Windows could corrupt a MyISAM table. (Bug #25712)

• Some small double precision numbers (such as `1.00000001e-300`) that should have been accepted were truncated to zero. (Bug #22129)

• `mysqld_multi` and `mysqldaccess` looked for option files in `/etc` even if the `--sysconfdir` option for `configure` had been given to specify a different directory. (Bug #24780)

• A compressed MyISAM table that became corrupted could crash `myisamchk` and possibly the MySQL Server. (Bug #23139)

• The `--extern` option for `mysql-test-run.pl` did not function correctly. (Bug #24354)

• `mysql-test-run` did not work correctly for RPM-based installations. (Bug #17194)

• `mysqltest` incorrectly tried to retrieve result sets for some queries where no result set was available. (Bug #19410)
• If there was insufficient memory available to `mysqld`, this could sometimes cause the server to hang during startup. (Bug #24751)

• Trailing spaces were not removed from Unicode `CHAR` column values when used in indexes. This resulted in excessive usage of storage space, and could affect the results of some `ORDER BY` queries that made use of such indexes.

Note
When upgrading, it is necessary to re-create any existing indexes on Unicode `CHAR` columns of each affected table to take advantage of the fix. See Section 2.11.4, “Rebuilding or Repairing Tables or Indexes”. (Bug #22052)

• Incorrect results could be returned for some queries that contained a select list expression with `IN` or `BETWEEN` together with an `ORDER BY` or `GROUP BY` on the same expression using `NOT IN` or `NOT BETWEEN`. (Bug #27532)

• Index hints (`USE INDEX`, `IGNORE INDEX`, `FORCE INDEX`) cannot be used with `FULLTEXT` indexes, but were not being ignored. (Bug #25951)

• Changes to some system variables should invalidate statements in the query cache, but invalidation did not happen. (Bug #27792)

• Queries using a column alias in an expression as part of an `ORDER BY` clause failed, an example of such a query being `SELECT mycol + 1 AS mynum FROM mytable ORDER BY 30 - mynum`. (Bug #22457)

• The range optimizer could consume a combinatorial amount of memory for certain classes of `WHERE` clauses. (Bug #26624)

• Attempts to access a `MyISAM` table with a corrupt column definition caused a server crash. (Bug #24401)

• The InnoDB parser sometimes did not account for null bytes, causing spurious failure of some queries. (Bug #25596)

• Storing `NULL` values in spatial fields caused excessive memory allocation and crashes on some systems. (Bug #27164)

• Optimizations that are legal only for subqueries without tables and `WHERE` conditions were applied for any subquery without tables. (Bug #24670)

• `mysqltest` crashed with a stack overflow. (Bug #24498)

• `ALTER TABLE` statements that performed both `RENAME TO` and `{ENABLE|DISABLE} KEYS` operations caused a server crash. (Bug #24219)

• In a `MEMORY` table, using a `BTREE` index to scan for updatable rows could lead to an infinite loop. (Bug #26996)

• The range optimizer could cause the server to run out of memory. (Bug #26625)

• Storing values specified as hexadecimal values 64 or more bits long into `BIGINT` or `BIGINT UNSIGNED` columns did not raise any warning or error if the value was out of range. (Bug #22533)

• The number of `setsockopt()` calls performed for reads and writes to the network socket was reduced to decrease system call overhead. (Bug #22943)
Changes in MySQL 4.1.23 (2007-06-12)

• **mysql** did not check for errors when fetching data during result set printing. (Bug #22913)

• Changing the value of **MI_KEY_BLOCK_LENGTH** in **myisam.h** and recompiling MySQL resulted in a **myisamchk** that saw existing **MyISAM** tables as corrupt. (Bug #22119)

• **IN()** [776] and **CHAR()** [786] can return **NULL**, but did not signal that to the query processor, causing incorrect results for **IS NULL** [775] operations. (Bug #17047)

• For **ALTER TABLE**, using **ORDER BY expression** could cause a server crash. Now the **ORDER BY** clause permits only column names to be specified as sort criteria (which was the only documented syntax, anyway). (Bug #24562)

• **ORDER BY** values of the **DOUBLE** or **DECIMAL** types could change the result returned by a query. (Bug #19690)

• Hebrew-to-Unicode conversion failed for some characters. Definitions for the following Hebrew characters (as specified by the ISO/IEC 8859-8:1999) were added: LEFT-TO-RIGHT MARK (LRM), RIGHT-TO-LEFT MARK (RLM) (Bug #24037)

• User-defined variables could consume excess memory, leading to a crash caused by the exhaustion of resources available to the **MEMORY** storage engine, due to the fact that this engine is used by MySQL for variable storage and intermediate results of **GROUP BY** queries. Where **SET** had been used, such a condition could instead give rise to the misleading error message **You may only use constant expressions with SET**, rather than **Out of memory (Needed NNNNNN bytes)**. (Bug #23443)

• A table created with the **ROW_FORMAT = FIXED** table option lost that option if an index was added or dropped with **CREATE_INDEX** or **DROP_INDEX**. (Bug #23404)

• Difficult repair or optimization operations could cause an assertion failure, resulting in a server crash. (Bug #25289)

• The stack size for NetWare binaries was increased to 128KB to prevent problems caused by insufficient stack size. (Bug #23504)

• **InnoDB**: During a restart of the MySQL Server that followed the creation of a temporary table using the **InnoDB** storage engine, MySQL failed to clean up in such a way that **InnoDB** still attempted to find the files associated with such tables. (Bug #20867)

• Foreign key identifiers for **InnoDB** tables could not contain certain characters. (Bug #24299)

• Some long error messages were printed incorrectly. (Bug #20710)

• Conversion of **DATETIME** values in numeric contexts sometimes did not produce a double (**YYYYMMDDHHMMSS.uuuuuu**) value. (Bug #16546)

• Comparisons using row constructors could fail for rows containing **NULL** values. (Bug #27704)

• Through the **C API**, the member strings in **MYSQL_FIELD** for a query that contained expressions could return incorrect results. (Bug #21635)

• Range searches on columns with an index prefix could miss records. (Bug #20732)

• **perror** crashed on some platforms due to failure to handle a **NULL** pointer. (Bug #25344)

• **mysql** would lose its connection to the server if its standard output was not writable. (Bug #17583)

• **INSERT...ON DUPLICATE KEY UPDATE** could cause Error 1032: Can't find record in ... for inserts into an **InnoDB** table unique index using key column prefixes with an underlying **utf8** string column. (Bug #13191)
Changes in MySQL 4.1.22 (2006-11-02)

• In certain cases it could happen that deleting a row corrupted an RTREE index. This affected indexes on spatial columns. (Bug #25673)

• The server was built even when configure was run with the --without-server option. (Bug #23973)

References: See also Bug #32898.

• ALTER TABLE ENABLE KEYS or ALTER TABLE DISABLE KEYS combined with another ALTER
  TABLE option other than RENAME TO did nothing. In addition, if ALTER TABLE was used on a table
  having disabled keys, the keys of the resulting table were enabled. (Bug #24395)

• Certain joins using Range checked for each record in the query execution plan could cause the server to crash. (Bug #24776)

• The server might fail to use an appropriate index for DELETE when ORDER BY, LIMIT, and a
  nonrestricting WHERE are present. (Bug #17711)

• Adding a day, month, or year interval to a DATE value produced a DATE, but adding a week interval
  produced a DATETIME value. Now all produce a DATE value. (Bug #21811)

C.1.4 Changes in MySQL 4.1.22 (2006-11-02)

End of Product Lifecycle.   Active development and support for MySQL Database Server versions 3.23,
4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please
consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All
formats of this manual will continue to be available until 31 Dec 2010.

This is a bugfix release for the MySQL 4.1 release family.

This section documents all changes and bug fixes that have been applied since the last official MySQL
release. If you would like to receive more fine-grained and personalized update alerts about fixes that
are relevant to the version and features you use, please consider subscribing to MySQL Enterprise (a
commercial MySQL offering). For more details, please see (http://www.mysql.com/products/enterprise).

Functionality Added or Changed

• The LOAD DATA FROM MASTER and LOAD TABLE FROM MASTER statements are deprecated. See
  Section 12.5.2.2, "LOAD DATA FROM MASTER Syntax", for recommended alternatives. (Bug #9125,
  Bug #20596, Bug #14399, Bug #12187, Bug #15025, Bug #18822)

• The mysql man page has been reclassified from volume 1 to volume 8. (Bug #21220)

• MySQL did not properly do stack dumps on x86_64 and i386/NPTL systems. (Note that the initial fix
  for this problem was discovered not to be correct. Further work on the problem was undertaken only for
  MySQL 5.1 and up. See Bug #31891.) (Bug #21250)

• A warning now is issued if the client attempts to set the sql_log_off variable without the SUPER
  privilege. (Bug #16180)

Bugs Fixed

• Packaging; MySQL Cluster: The ndb_mgm program was included in both the MySQL-ndb-tools and
  MySQL-ndb-management RPM packages, resulting in a conflict if both were installed. Now ndb_mgm is
  included only in MySQL-ndb-tools. (Bug #21058)

• MySQL Cluster: When inserting a row into an NDB table with a duplicate value for a nonprimary unique
  key, the error issued would reference the wrong key. (Bug #21072)
Changes in MySQL 4.1.22 (2006-11-02)

- **MySQL Cluster:** In some situations with a high disk-load, writing of the redo log could hang, causing a crash with the error message `GCP STOP detected`. (Bug #20904)

- **MySQL Cluster:** Multiple node restarts in rapid succession could cause a system restart to fail, or induce a race condition. (Bug #22892, Bug #23210)

- **MySQL Cluster:** The output for the `--help` option used with `NDB` executable programs (such as `ndbd`, `ndb_mgm`, `ndb_restore`, `ndb_config`, and others mentioned in Section 15.4, "MySQL Cluster Programs") referred to the `Ndb.cfg` file, instead of to `my.cnf`. (Bug #21585)

- **MySQL Cluster:** `ndb_size.pl` and `ndb_error_reporter` were missing from RPM packages. (Bug #20426)

- **MySQL Cluster:** The failure of a unique index read due to an invalid schema version could be handled incorrectly in some cases, leading to unpredictable results. (Bug #21384)

- **MySQL Cluster:** The `ndb_mgm` management client did not set the exit status on errors, always returning 0 instead. (Bug #21530)

- **MySQL Cluster:** Under some circumstances, local checkpointing would hang, keeping any unstarted nodes from being started. (Bug #20895)

- **MySQL Cluster:** Setting `TransactionDeadlockDetectionTimeout [1261]` to a value greater than 12000 would cause scans to deadlock, time out, fail to release scan records, until the cluster ran out of scan records and stopped processing. (Bug #21800)

- **MySQL Cluster:** Some queries involving joins on very large `NDB` tables could crash the MySQL server. (Bug #21059)

- **MySQL Cluster:** A partial rollback could lead to node restart failures. (Bug #21536)

- **MySQL Cluster:** If a node restart could not be performed from the REDO log, no node takeover took place. This could cause partitions to be left empty during a system restart. (Bug #22893)

- **MySQL Cluster:** The `ndb_size.pl` script did not account for `TEXT` and `BLOB` column values correctly. (Bug #21204)

- **MySQL Cluster:** Attempting to create an `NDB` table on a MySQL with an existing non-Cluster table with the same name in the same database could result in data loss or corruption. MySQL now issues a warning when a `SHOW TABLES` or other statement causing table discovery finds such a table. (Bug #21378)

- **MySQL Cluster:** `INSERT ... ON DUPLICATE KEY UPDATE` on an `NDB` table could lead to deadlocks and memory leaks. (Bug #23200)

- **MySQL Cluster:** The server provided a nondescriptive error message when encountering a fatally corrupted REDO log. (Bug #21615)

- **MySQL Cluster:** `ndb_restore` did not always make clear that it had recovered successfully from temporary errors while restoring a cluster backup. (Bug #19651)

- **MySQL Cluster:** Cluster logs were not rotated following the first rotation cycle. (Bug #21345)

- **MySQL Cluster:** When the redo buffer ran out of space, a `Pointer too large` error was raised and the cluster could become unusable until restarted with `--initial`. (Bug #20892)

- **MySQL Cluster:** Backup of a cluster failed if there were any tables with 128 or more columns. (Bug #23502)
• MySQL Cluster: A problem with takeover during a system restart caused ordered indexes to be rebuilt incorrectly. (Bug #15303)

• MySQL Cluster: In some cases where SELECT COUNT(*) from an NDB table should have yielded an error, MAX_INT was returned instead. (Bug #19914)

• MySQL Cluster: (NDB API): Attempting to read a nonexistent tuple using Commit mode for NdbTransaction::execute() caused node failures. (Bug #22672)

• MySQL Cluster: SELECT ... FOR UPDATE failed to lock the selected rows. (Bug #18184)

• MySQL Cluster: The node recovery algorithm was missing a version check for tables in the ALTER_TABLE_COMMITTED state (as opposed to the TABLE_ADD_COMMITTED state, which has the version check). This could cause inconsistent schemas across nodes following node recovery. (Bug #21756)

• MySQL Cluster: In a cluster with more than 2 replicas, a manual restart of one of the data nodes could fail and cause the other nodes in the same node group to shut down. (Bug #21213)

• MySQL Cluster: The server failed with a nondescriptive error message when out of data memory. (Bug #18475)

• Using ALTER TABLE to add a ENUM column with an enumeration value containing 0xFF caused the name of the first table column to be lost. (Bug #20922)

• SUBSTRING() results sometimes were stored improperly into a temporary table when multi-byte character sets were used. (Bug #20204)

• mysql_install_db incorrectly had an empty first line. (Bug #20721)

• The optimizer could produce an incorrect result after AND with collations such as latin1_german2_ci, utf8_czech_ci, and utf8_lithuanian_ci. (Bug #9509)

• If a column definition contained a character set declaration, but a DEFAULT value began with an introducer, the introducer character set was used as the column character set. (Bug #20695)

• User names have a maximum length of 16 characters (even if they contain multi-byte characters), but were being truncated to 16 bytes. (Bug #20393)

• PROCEDURE ANALYSE() returned incorrect values of M_FLOAT(M, D) and DOUBLE(M, D). (Bug #20305)

• For a MyISAM table with a FULLTEXT index, compression with myisampack or a check with myisamchk after compression resulted in table corruption. (Bug #19702)

• A query using WHERE column = constant OR column IS NULL did not return consistent results on successive invocations. The column in each part of the WHERE clause could be either the same column, or two different columns, for the effect to be observed. (Bug #21019)

• mysql --flush failed to flush MyISAM table changes to disk following an UPDATE statement for which no updated column had an index. (Bug #20060)

• For TIME_FORMAT() [832], the %H and %k format specifiers can return values larger than two digits (if the hour is greater than 99), but for some query results that contained three-character hours, column values were truncated. (Bug #19844)

• A subquery that uses an index for both the WHERE and ORDER BY clauses produced an empty result. (Bug #21180)
Changes in MySQL 4.1.22 (2006-11-02)

- Some Linux-x86_64-icc packages (of previous releases) mistakenly contained 32-bit binaries. Only ICC builds are affected, not gcc builds. Solaris and FreeBSD x86_64 builds are not affected. (Bug #22238)

- Redundant binary log LAST_INSERT_ID events could be generated: LAST_INSERT_ID(expr) [866] did not return the value of expr; LAST_INSERT_ID() [866] could return the value generated by the current statement if the call occurred after value generation, as in:

  ```sql
  CREATE TABLE t1 (i INT AUTO_INCREMENT PRIMARY KEY, j INT);
  INSERT INTO t1 VALUES (NULL, 0), (NULL, LAST_INSERT_ID());
  ```

  (Bug #21726)

- A query that used GROUP BY and an ALL or ANY quantified subquery in a HAVING clause could trigger an assertion failure. (Bug #21853)

- EXPORT_SET() [787] did not accept arguments with coercible character sets. (Bug #21531)

- The source distribution failed to compile when configured with the --without-geometry option. (Bug #12991)

- For INSERT ... ON DUPLICATE KEY UPDATE, use of VALUES(col_name) [872] within the UPDATE clause sometimes was handled incorrectly. (Bug #21555)

- When using tables containing VARCHAR columns created under MySQL 4.1 with a 5.0 or later server, for some queries the metadata sent to the client could have an empty column name. (Bug #14897)

- Incorporated portability fixes into the definition of __attribute__ in my_global.h. (Bug #2717)

- Under heavy load (executing more than 1024 simultaneous complex queries), a problem in the code that handles internal temporary tables could lead to writing beyond allocated space and memory corruption. (Bug #21206)

- The --collation-server server option was being ignored. With the fix, if you choose a nondefault character set with --character-set-server, you should also use --collation-server to specify the collation. (Bug #15276)

- On Mac OS X, zero-byte read() or write() calls to an SMB-mounted file system could return a nonstandard return value, leading to data corruption. Now such calls are avoided. (Bug #12620)

- LIKE searches failed for indexed utf8 character columns. (Bug #20471)

- The MD5() [860], SHA1() [861], and ENCRYPT() [859] functions should return a binary string, but the result sometimes was converted to the character set of the argument. MAKE_SET() [791] and EXPORT_SET() [787] now use the correct character set for their default separators, resulting in consistent result strings which can be coerced according to normal character set rules. (Bug #20536)

- Certain malformed INSERT statements could crash the mysql client. (Bug #21142)

- Entries in the slow query log could have an incorrect Rows_examined value. (Bug #12240)

- The result for CAST() [851] when casting a value to UNSIGNED was limited to the maximum signed BIGINT value (9223372036854775808), rather than the maximum unsigned value (18446744073709551615). (Bug #8663)

- Using the extended syntax for TRIM() [795]—that is, TRIM(... FROM ...) [795]—in a SELECT statement defining a view caused an invalid syntax error when selecting from the view. (Bug #17526)

- OPTIMIZE TABLE with myisam_repair_threads > 1 could result in MyISAM table corruption. (Bug #8283)
• WITH ROLLUP could group unequal values. (Bug #20825)

• REPAIR TABLE ... USE_FRM could cause a server crash or hang when used for a MyISAM table in a database other than the default database. (Bug #22562)

• Insufficient memory (myisam_sort_buffer_size) could cause a server crash for several operations on MyISAM tables: repair table, create index by sort, repair by sort, parallel repair, bulk insert. (Bug #23175)

• Execution of a prepared statement that uses an IN subquery with aggregate functions in the HAVING clause could cause a server crash. (Bug #22085)

• The myisam_stats_method variable was mishandled when set from an option file or on the command line. (Bug #21054)

• Using ANY with “nontable” subqueries such as SELECT 1 yielded incorrect results under certain circumstances due to incorrect application of MIN() [876]/MAX() [876] optimization. (Bug #16302)

• For cross-database multiple-table UPDATE statements, a user with all privileges for the default database could update tables in another database for which the user did not have UPDATE privileges. (Bug #7391)

• Adding ORDER BY to a SELECT DISTINCT(expr) query could produce incorrect results. (Bug #21456)

• COUNT(*) [874] queries with ORDER BY and LIMIT could return the wrong result.

Note

This problem was introduced by the fix for Bug #9676, which limited the rows stored in a temporary table to the LIMIT clause. This optimization is not applicable to nongroup queries with aggregate functions. The current fix disables the optimization in such cases.

(Bug #21787)

• Conversion of TIMESTAMP values between UTC and the local time zone resulted in some values having the year 2069 rather than 1969. (Bug #16327)

• DELETE IGNORE could hang for foreign key parent deletes. (Bug #18819)

• A query using WHERE NOT (column < ANY (subquery)) yielded a different result from the same query using the same column and subquery with WHERE (column > ANY (subquery)). (Bug #20975)

• Creating a TEMPORARY table with the same name as an existing table that was locked by another client could result in a lock conflict for DROP TEMPORARY TABLE because the server unnecessarily tried to acquire a name lock. (Bug #21096)

• FROM_UNIXTIME() [826] did not accept arguments up to POWER(2,31)−1 [814], which it had previously. (Bug #9191)

• libmysqld returned TEXT columns to the client as number of bytes, not number of characters (which can be different for multi-byte character sets). (Bug #19983)

• A literal string in a GROUP BY clause could be interpreted as a column name. (Bug #14019)

• The --with-collation [97] option was not honored for client connections. (Bug #7192)

• A patch fixing the omission of leading zeros in dates in MySQL 4.1.21 was reverted.

References: The patch for the following bug was reverted: Bug #16377.
Changes in MySQL 4.1.22 (2006-11-02)

- Multiple invocations of the `REVERSE()` function could return different results. (Bug #18243)
- Within a prepared statement, `SELECT (COUNT(*) = 1)` (or similar use of other aggregate functions) did not return the correct result for statement re-execution. (Bug #21354)
- Running `SHOW MASTER LOGS` at the same time as binary log files were being switched would cause `mysqld` to hang. (Bug #21965)
- For multiple-table `UPDATE` statements, storage engines were not notified of duplicate-key errors. (Bug #21381)
- A subquery in the `WHERE` clause of the outer query and using `IN` and `GROUP BY` returned an incorrect result. (Bug #16255)
- A server or network failure with an open client connection would cause the client to hang even though the server was no longer available.

As a result of this change, the `MYSQL_OPT_READ_TIMEOUT` and `MYSQL_OPT_WRITE_TIMEOUT` options for `mysql_options()` now apply to TCP/IP connections on all platforms. Previously, they applied only to Windows. (Bug #9678)

- `DELETE` with `WHERE` condition on a `BTREE`-indexed column for a `MEMORY` table deleted only the first matched row. (Bug #9719)
- Using aggregate functions in subqueries yielded incorrect results under certain circumstances due to incorrect application of `MIN()`/[876]/`MAX()`/[876] optimization. (Bug #20792)
- Deleting entries from a large `MyISAM` index could cause index corruption when it needed to shrink. Deletes from an index can happen when a record is deleted, when a key changes and must be moved, and when a key must be un-inserted because of a duplicate key. This can also happen in `REPAIR TABLE` when a duplicate key is found and in `myisamchk` when sorting the records by an index. (Bug #22384)
- For an `ENUM` column that used the `ucs2` character set, using `ALTER TABLE` to modify the column definition caused the default value to be lost. (Bug #20108)
- The server returns a more informative error message when it attempts to open a `MERGE` table that has been defined to use non-`MyISAM` tables. (Bug #10974)
- `libmysqld` produced some warnings to `stderr` which could not be silenced. These warnings now are suppressed. (Bug #13717)
- Character set collation was ignored in `GROUP BY` clauses. (Bug #20709)
- Use of the join cache in favor of an index for `ORDER BY` operations could cause incorrect result sorting. (Bug #17212)
- The optimizer sometimes mishandled R-tree indexes for `GEOMETRY` data types, resulting in a server crash. (Bug #21888)
- Views could not be updated within a stored function or trigger. (Bug #17591)
- Setting `myisam_repair_threads` caused any repair operation on a `MyISAM` table to fail to update the cardinality of indexes, instead making them always equal to 1. (Bug #18874)
- Table aliases in multiple-table `DELETE` statements sometimes were not resolved. (Bug #21392)
- Parallel builds occasionally failed on Solaris. (Bug #16282)
Changes in MySQL 4.1.21 (2006-07-19)

- On 64-bit systems, use of the \texttt{cp1250} character set with a primary key column in a \texttt{LIKE} clause caused a server crash for patterns having letters in the range 128..255. (Bug \#19741)

- The use of \texttt{WHERE col\_name IS NULL} in \texttt{SELECT} statements reset the value of \texttt{LAST\_INSERT\_ID()}\texttt{[866]} to zero. (Bug \#14553)

- For table-format output, \texttt{mysql} did not always calculate columns widths correctly for columns containing multi-byte characters in the column name or contents. (Bug \#17939)

- The build process incorrectly tried to overwrite \texttt{sql/lex\_hash.h}. This caused the build to fail when using a shadow link tree pointing to original sources that were owned by another account. (Bug \#18888)

- Selecting from a \texttt{MERGE} table could result in a server crash if the underlying tables had fewer indexes than the \texttt{MERGE} table itself. (Bug \#21617, Bug \#22937)

- \texttt{character\_set\_results} can be \texttt{NULL} to signify “no conversion,” but some code did not check for \texttt{NULL}, resulting in a server crash. (Bug \#21913)

- Using \texttt{> ALL} with subqueries that return no rows yielded incorrect results under certain circumstances due to incorrect application of \texttt{MIN()}\texttt{[876]}/\texttt{MAX()}\texttt{[876]} optimization. (Bug \#18503)

- For \texttt{InnoDB} tables, the server could crash when executing \texttt{NOT IN(...) subqueries.} (Bug \#21077)

- Under certain circumstances, \texttt{AVG(key\_val)}\texttt{[873]} returned a value but \texttt{MAX(key\_val)}\texttt{[876]} returned an empty set due to incorrect application of \texttt{MIN()/MAX()}\texttt{[876]} optimization. (Bug \#20954)

- In the package of pre-built time zone tables that is available for download at \url{http://dev.mysql.com/downloads/timezones.html}, the tables now explicitly use the utf8 character set so that they work the same way regardless of the system character set value. (Bug \#21208)

- Queries containing a subquery that used aggregate functions could return incorrect results. (Bug \#16792)

C.1.5 Changes in MySQL 4.1.21 (2006-07-19)

\textbf{End of Product Lifecycle.} Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see \url{http://www.mysql.com/about/legal/lifecycle/#calendar}. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

This is a bugfix release for the MySQL 4.1 release family.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized update alerts about fixes that are relevant to the version and features you use, please consider subscribing to MySQL Enterprise (a commercial MySQL offering). For more details, please see \url{http://www.mysql.com/products/enterprise}.

\textbf{Functionality Added or Changed}

- For a table with an \texttt{AUTO\_INCREMENT} column, \texttt{SHOW CREATE TABLE} now shows the next \texttt{AUTO\_INCREMENT} value to be generated. (Bug \#19025)

- The \texttt{mysqldumpslew} script has been moved from client RPM packages to server RPM packages. This corrects a problem where \texttt{mysqldumpslew} could not be used with a client-only RPM install, because it depends on \texttt{my\_print\_defaults} which is in the server RPM. (Bug \#20216)

- Added the \texttt{--set-charset} option to \texttt{mysqlbinlog} to enable the character set to be specified for processing binary log files. (Bug \#18351)
Changes in MySQL 4.1.21 (2006-07-19)

- For spatial data types, the server formerly returned these as `VARSTRING` values with a binary collation. Now the server returns spatial values as `BLOB` values. (Bug #10166)

- A new system variable, `lc_time_names`, specifies the locale that controls the language used to display day and month names and abbreviations. This variable affects the output from the `DATE_FORMAT()` [824], `DAYNAME()` [825] and `MONTHNAME()` [829] functions. See Section 9.8, "MySQL Server Locale Support".

Bugs Fixed

- **Security Fix**: If a user has access to `MyISAM` table `t`, that user can create a `MERGE` table `m` that accesses `t`. However, if the user’s privileges on `t` are subsequently revoked, the user can continue to access `t` by doing so through `m`. If this behavior is undesirable, you can start the server with the new `--skip-merge` option to disable the `MERGE` storage engine. (Bug #15195, CVE-2006-4031)

- **Security Fix**: Invalid arguments to `DATE_FORMAT()` [824] caused a server crash. Thanks to Jean-David Maillefer for discovering and reporting this problem to the Debian project and to Christian Hammers from the Debian Team for notifying us of it. (Bug #20729, CVE-2006-3469)

- **Security Fix**: On Linux, and possibly other platforms using case-sensitive file systems, it was possible for a user granted rights on a database to create or access a database whose name differed only from that of the first by the case of one or more letters. (Bug #17647, CVE-2006-4226)

- **MySQL Cluster**: Resources for unique indexes on Cluster table columns were incorrectly allocated, so that only one-fourth as many unique indexes as indicated by the value of `UniqueHashIndexes` could be created. (Bug #19623)

- **MySQL Cluster**: It was possible to use port numbers greater than 65535 for `ServerPort [1240]` in the `config.ini` file. (Bug #19164)

- **MySQL Cluster**: Repeated use of the `SHOW` and `ALL STATUS` commands in the `ndb_mgm` client could cause the `mgmd` process to crash. (Bug #18591)

- **MySQL Cluster**: Renaming a table in such a way as to move it to a different database failed to move the table’s indexes. (Bug #19967)

- **MySQL Cluster**: Using “stale” `mysqld .frm` files could cause a newly restored cluster to fail. This situation could arise when restarting a MySQL Cluster using the `--initial` option while leaving connected `mysqld` processes running. (Bug #16875)

- **MySQL Cluster**: A problem with error handling when `ndb_use_exact_count` was enabled could lead to incorrect values returned from queries using `COUNT()` [874]. A warning is now returned in such cases. (Bug #19202)

- **MySQL Cluster**: A Cluster whose storage nodes were installed from the `MySQL-ndb-storage-*` RPMs could not perform `CREATE` or `ALTER` operations that made use of nondefault character sets or collations. (Bug #14918)

- **MySQL Cluster**: The failure of a data node when preparing to commit a transaction (that is, while the node’s status was `CS_PREPARE_TO_COMMIT`) could cause the failure of other cluster data nodes. (Bug #20185)

- **MySQL Cluster**: Data node failures could cause excessive CPU usage by `ndb_mgmd`. (Bug #13987)

- **MySQL Cluster**: A node failure during a scan could sometime cause the node to crash when restarting too quickly following the failure. (Bug #20197)

- **MySQL Cluster**: Some queries having a `WHERE` clause of the form `c1=val1 OR c2 LIKE 'val2'` were not evaluated correctly. (Bug #17421)
Changes in MySQL 4.1.21 (2006-07-19)

- **MySQL Cluster**: TRUNCATE TABLE failed on tables having BLOB or TEXT columns with the error Lock wait timeout exceeded. (Bug #19201)

- **MySQL Cluster**: An issue with ndb_mgmd prevented more than 27 mysql processes from connecting to a single cluster at one time. (Bug #17150)

- **MySQL Cluster**: The ndb_mgm client command ALL CLUSTERLOG STATISTICS=15 had no effect. (Bug #20336)

- **MySQL Cluster**: LOAD DATA LOCAL failed to ignore duplicate keys in Cluster tables. (Bug #19496)

- **MySQL Cluster**: The repeated creating and dropping of a table would eventually lead to NDB Error 826, Too many tables and attributes ... Insufficient space. (Bug #20847)

- **MySQL Cluster**: The cluster's data nodes failed while trying to load data when NoOfFrangmentLogFiles was set equal to 1. (Bug #19894)

- **MySQL Cluster**: TRUNCATE TABLE failed to reset the AUTO_INCREMENT counter. (Bug #18864)

- **MySQL Cluster**: When attempting to restart the cluster following a data import, the cluster failed during Phase 4 of the restart with Error 2334: Job buffer congestion. (Bug #20774)

- **MySQL Cluster**: Repeated CREATE - INSERT - DROP operations on tables could in some circumstances cause the MySQL table definition cache to become corrupt, so that some mysql processes could access table information but others could not. (Bug #18595)

- **Replication**: The binary log would create an incorrect DROP query when creating temporary tables during replication. (Bug #17263)

- **Cluster API**: On big-endian platforms, NdbOperation::write_attr() did not update 32-bit fields correctly. (Bug #19537)

- Checking a MyISAM table (using CHECK TABLE) having a spatial index and only one row would wrongly indicate that the table was corrupted. (Bug #17877)

- Use of MIN() [876] or MAX() [876] with GROUP BY on a ucs2 column could cause a server crash. (Bug #20076)

- Multiple-table DELETE statements containing a subquery that selected from one of the tables being modified caused a server crash. (Bug #19225)

- Concatenating the results of multiple constant subselects produced incorrect results. (Bug #16716)

- **ANALYZE TABLE** for TEMPORARY tables had no effect. (Bug #15225)

- The fill_help_tables.sql file did not contain a SET NAMES 'utf8' statement to indicate its encoding. This caused problems for some settings of the MySQL character set such as big5. (Bug #20551)

- The binary log lacked character set information for table names when dropping temporary tables. (Bug #14157)

- mysqldump did not respect the order of tables named with the --tables option. (Bug #18536)

- For a reference to a nonexistent index in FORCE INDEX, the error message referred to a column, not an index. (Bug #17873)

- DATE_ADD() [821] and DATE_SUB() [825] returned NULL when the result date was on the day '9999-12-31'. (Bug #12356)
Changes in MySQL 4.1.21 (2006-07-19)

- The `DATA_DIRECTORY` table option did not work for `TEMPORARY` tables. (Bug #8706)
- The `ARCHIVE` storage engine does not support `TRUNCATE TABLE`, but the server was not returning an appropriate error when truncation of an `ARCHIVE` table was attempted. (Bug #15558)
- Improper character set initialization in the embedded server could result in a server crash. (Bug #20318)
- For a `DATE` parameter sent using a `MYSQL_TIME` data structure, `mysql_stmt_execute()` zeroed the hour, minute, and second members of the structure rather than treating them as read only. (Bug #20152)
- Certain queries having a `WHERE` clause that included conditions on multi-part keys with more than 2 key parts could produce incorrect results and send `[Note] Use_count: Wrong count for key at...` messages to `STDERR`. (Bug #16168)
- `InnoDB` unlocked its data directory before committing a transaction, potentially resulting in nonrecoverable tables if a server crash occurred before the commit. (Bug #19727)
- Invalid escape sequences in option files caused MySQL programs that read them to abort. (Bug #15328)
- Queries using an indexed column as the argument for the `MIN()` and `MAX()` functions following an `ALTER TABLE .. DISABLE KEYS` statement returned `Got error 124 from storage engine until ALTER TABLE ... ENABLE KEYS` was run on the table. (Bug #20357)
- For very complex `SELECT` statements could create temporary tables that were too large, and for which the temporary files were not removed, causing subsequent queries to fail. (Bug #11824)
- For `SELECT ... FOR UPDATE` statements that used `DISTINCT` or `GROUP BY` over all key parts of a unique index (or primary key), the optimizer unnecessarily created a temporary table, thus losing the linkage to the underlying unique index values. This caused a `Result set not updatable` error. (The temporary table is unnecessary because under these circumstances the distinct or grouped columns must also be unique.) (Bug #16458)
- `IS_USED_LOCK()` could return an incorrect connection identifier. (Bug #16501)
- The server no longer uses a signal handler for signal 0 because it could cause a crash on some platforms. (Bug #15869)
- A statement containing `GROUP BY` and `HAVING` clauses could return incorrect results when the `HAVING` clause contained logic that returned `FALSE` for every row. (Bug #14927)
- The use of `MIN()` and `MAX()` on columns with an index prefix produced incorrect results in some queries. (Bug #18206)
- `INSERT INTO ... SELECT ... LIMIT 1` could be slow because the `LIMIT` was ignored when selecting candidate rows. (Bug #9676)
- `InnoDB` failed to increment the `handler_read_prev` counter. (Bug #19542)
- An invalid comparison between keys with index prefixes over multi-byte character fields could lead to incorrect result sets if the selected query execution plan used a range scan by an index prefix over a `UTF8` character field. This also caused incorrect results under similar circumstances with many other character sets. (Bug #14896)
- Closing of temporary tables failed if binary logging was not enabled. (Bug #20919)
- An update that used a join of a table to itself and modified the table on both sides of the join reported the table as crashed. (Bug #18036)
- The `MD5()` and `SHA()` functions treat their arguments as case-sensitive strings. But when they are compared, their arguments were compared as case-insensitive strings, which leads to two
function calls with different arguments (and thus different results) compared as being identical. This can lead to a wrong decision made in the range optimizer and thus to an incorrect result set. (Bug #15351)

• Using `SELECT` and a table join while running a concurrent `INSERT` operation would join incorrect rows. (Bug #14400)

• The `fill_help_tables.sql` file did not load properly if the `ANSI_QUOTES` SQL mode was enabled. (Bug #20542)

• The MySQL server startup script `/etc/init.d/mysql` (created from `mysql.server`) is now marked to ensure that the system services `ypbind`, `nscd`, `ldap`, and `NTP` are started first (if these are configured on the machine). (Bug #18810)

• The `ref` optimizer could choose the `ref_or_null` access method in cases where it was not applicable. This could cause inconsistent `EXPLAIN` or `SELECT` results for a given statement. (Bug #16798)

• The `mysql` client did not understand `help` commands that had spaces at the end. (Bug #20328)

• Concurrent reading and writing of privilege structures could crash the server. (Bug #16372)

• Slave SQL thread cleanup was not handled properly on Mac OS X when a statement was killed, resulting in a slave crash. (Bug #16900)

• When `mysqldump` disabled keys and locked a `MyISAM` table, the lock operation happened second. If another client performed a query on the table in the interim, it could take a long time due to indexes not being used. Now the lock operation happens first. (Bug #15977)

• `LOAD_FILE()`[790] returned an error if the file did not exist, rather than `NULL` as it should according to the manual. (Bug #10418)

• `SHOW CREATE TABLE` did not display the `AUTO_INCREMENT` column attribute if the SQL mode was `MYSQL323` or `MYSQL40`. This also affected `mysqldump`, which uses `SHOW CREATE TABLE` to get table definitions. (Bug #14515)

• The `mysql` client did not ignore client-specific commands (such as `use` or `help`) that occurred as the first word on a line within multiple-line `/* ... */` comments. (Bug #20432)

• A number of dependency issues in the RPM `bench` and `test` packages caused installation of these packages to fail. (Bug #20078)

• In a multiple-row `INSERT` statement, `LAST_INSERT_ID()`[866] should return the same value for each row. However, in some cases, the value could change if the table being inserted into had its own `AUTO_INCREMENT` column. (Bug #6880)

• Some memory leaks in the `libmysqld` embedded server were corrected. (Bug #16017)

• Some queries that used `ORDER BY` and `LIMIT` performed quickly in MySQL 3.23, but slowly in MySQL 4.x/5.x due to an optimizer problem. (Bug #4981)

• `MONTHNAME(STR_TO_DATE(NULL, '%m'))`[829] could cause a server crash. (Bug #18501)

• The omission of leading zeros in dates could lead to erroneous results when these were compared with the output of certain date and time functions.

   **Note**

   The patch for this bug was reverted in MySQL 4.1.22.

   (Bug #16377)
Changes in MySQL 4.1.20 (2006-05-24)

- Repeated `DROP TABLE` statements in a stored procedure could sometimes cause the server to crash. (Bug #19399)

- The length of the pattern string prefix for `LIKE` operations was calculated incorrectly for multi-byte character sets. As a result, the scanned range was wider than necessary if the prefix contained any multi-byte characters, and rows could be missing from the result set. (Bug #18359, Bug #16674)

- Using `SELECT` on a corrupt `MyISAM` table using the dynamic record format could cause a server crash. (Bug #19835)

- No error message was being issued for storage engines that do not support `ALTER TABLE`. Now an `ER_NOT_SUPPORTED_YET` error occurs. (Bug #7643)

- A cast problem caused incorrect results for prepared statements that returned float values when MySQL was compiled with `gcc` 4.0. (Bug #19694)

- Use of uninitialized user variables in a subquery in the `FROM` clause resulted in invalid entries in the binary log. (Bug #19136)

- When `myisamchk` needed to rebuild a table, `AUTO_INCREMENT` information was lost. (Bug #10405)

- Failure to account for a `NULL` table pointer on big-endian machines could cause a server crash during type conversion. (Bug #21135)

C.1.6 Changes in MySQL 4.1.20 (2006-05-24)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

This is a security fix release for the MySQL 4.1 release family.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized update alerts about fixes that are relevant to the version and features you use, please consider subscribing to MySQL Enterprise (a commercial MySQL offering). For more details, please see [http://www.mysql.com/products/enterprise](http://www.mysql.com/products/enterprise).

**Bugs Fixed**

- **Security Fix:** An SQL-injection security hole has been found in multi-byte encoding processing. The bug was in the server, incorrectly parsing the string escaped with the `mysql_real_escape_string()` C API function.

  This vulnerability was discovered and reported by Josh Berkus <josh@postgresql.org> and Tom Lane <tgl@sss.pgh.pa.us> as part of the inter-project security collaboration of the OSDB consortium. For more information about SQL injection, please see the following text.

**Discussion.** An SQL injection security hole has been found in multi-byte encoding processing. An SQL injection security hole can include a situation whereby when a user supplied data to be inserted into a database, the user might inject SQL statements into the data that the server will execute. With regards to this vulnerability, when character set-unaware escaping is used (for example, `addslashes()` in PHP), it is possible to bypass the escaping in some multi-byte character sets (for example, SJIS, BIG5 and GBK). As a result, a function such as `addslashes()` is not able to prevent SQL-injection attacks. It is impossible to fix this on the server side. The best solution is for applications to use character set-aware escaping offered by a function such as `mysql_real_escape_string()`.
However, a bug was detected in how the MySQL server parses the output of `mysql_real_escape_string()`. As a result, even when the character set-aware function `mysql_real_escape_string()` was used, SQL injection was possible. This bug has been fixed.

**Workarounds.** If you are unable to upgrade MySQL to a version that includes the fix for the bug in `mysql_real_escape_string()` parsing, but run MySQL 5.0.1 or higher, you can use the `NO_BACKSLASH_ESCAPES` SQL mode as a workaround. (This mode was introduced in MySQL 5.0.1.) `NO_BACKSLASH_ESCAPES` enables an SQL standard compatibility mode, where backslash is not considered a special character. The result will be that queries will fail.

To set this mode for the current connection, enter the following SQL statement:

```sql
SET sql_mode='NO_BACKSLASH_ESCAPES';
```

You can also set the mode globally for all clients:

```sql
SET GLOBAL sql_mode='NO_BACKSLASH_ESCAPES';
```

This SQL mode also can be enabled automatically when the server starts by using the command-line option `--sql-mode=NO_BACKSLASH_ESCAPES` or by setting `sql-mode=NO_BACKSLASH_ESCAPES` in the server option file (for example, `my.cnf` or `my.ini`, depending on your system). (Bug #8378, CVE-2006-2753)

References: See also Bug #8303.

- **Replication:** The dropping of a temporary table whose name contained a backtick (`'`) character was not correctly written to the binary log, which also caused it not to be replicated correctly. (Bug #19188)

- Running `myisampack` followed by `myisamchk` with the `--unpack` option would corrupt the `AUTO_INCREMENT` key. (Bug #12633)

- The patch for Bug #8303 broke the fix for Bug #8378 and was reverted.

  In string literals with an escape character (`\`) followed by a multi-byte character that had (`\`) as its second byte, the literal was not interpreted correctly. Now only next byte now is escaped, and not the entire multi-byte character. This means it is a strict reverse of the `mysql_real_escape_string()` function.

- RPM packages had spurious dependencies on Perl modules and other programs. (Bug #13634)

- The client libraries were not compiled for position-independent code on Solaris-SPARC and AMD x86_64 platforms. (Bug #18091, Bug #13159, Bug #14202)

## C.1.7 Changes in MySQL 4.1.19 (2006-04-29)

### End of Product Lifecycle.

Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

This release includes the patches for recently reported security vulnerabilities in the MySQL client/server protocol. We would like to thank Stefano Di Paola `<stefano.dipaola@wisec.it>` for finding and reporting these to us.

**Functionality Added or Changed**
Changes in MySQL 4.1.19 (2006-04-29)

- **Security Enhancement:** Added the global `max_prepared_stmt_count` system variable to limit the total number of prepared statements in the server. This limits the potential for denial-of-service attacks based on running the server out of memory by preparing huge numbers of statements. The current number of prepared statements is available through the `prepared_stmt_count` system variable. (Bug #16365)

- **Packaging:** The MySQL-shared-compat-4.1.X-.i386.rpm shared compatibility RPMs no longer contain libraries for MySQL 5.0 and up. They now contain libraries for MySQL 3.23, 4.0, and 4.1.1 only. (Bug #19288)

- **InnoDB** now caches a list of unflushed files instead of scanning for unflushed files during a table flush operation. This improves performance when `--innodb_file_per_table` is set on a system with a large number of InnoDB tables. (Bug #15653)

- New `charset` command added to `mysql` command-line client. By typing `charset name` or `\C name` (such as `\C UTF8`), the client character set can be changed without reconnecting. (Bug #16217)

- When using the `GROUP_CONCAT()` function where the `group_concat_max_len` system variable was greater than 255, the result type differed depending on whether an `ORDER BY` clause was included: `BLOB` if it was, `VARBINARY` if it was not. (For nonbinary string arguments, the result was `TEXT` or `VARCHAR`.)

  Now an `ORDER BY` does not affect the result, which is `VARBINARY (VARCHAR)` only if `group_concat_max_len` is less than or equal to 255, `BLOB (TEXT)` otherwise. (Bug #14169)

- Large file support was re-enabled for the MySQL server binary for the AIX 5.2 platform. (Bug #13571)

**Bugs Fixed**

- **Security Fix:** A malicious client, using specially crafted invalid login or `COM_TABLE_DUMP` packets was able to read uninitialized memory, which potentially, though unlikely in MySQL, could have led to an information disclosure. (,) Thanks to Stefano Di Paola <stefano.dipaola@wisec.it> for finding and reporting this bug. (CVE-2006-1516, CVE-2006-1517)

- **MySQL Cluster:** In some cases, `LOAD DATA INFILE` did not load all data into NDB tables. (Bug #17081)

- **MySQL Cluster:** The server would not compile with NDB support on AIX 5.2. (Bug #10776)

- **MySQL Cluster:** In a 2-node cluster with a node failure, restarting the node with a low value for `StartPartialTimeout` [1257] could cause the cluster to come up partitioned (“split-brain” issue).

  A similar issue could occur when the cluster was first started with a sufficiently low value for this parameter. (Bug #16447, Bug #18612)

- **MySQL Cluster:** A timeout in the handling of an `ABORT` condition with more that 32 operations could yield a node failure. (Bug #18414)

- **MySQL Cluster:** A simultaneous `DROP TABLE` and table update operation utilising a table scan could trigger a node failure. (Bug #18597)

- **MySQL Cluster:** When replacing a failed master node, the replacement node could cause the cluster to crash from a buffer overflow if it had an excessively large amount of data to write to the cluster log. (Bug #18118)

- **MySQL Cluster:** A `DELETE` with a join in the `WHERE` clause failed to retrieve any records if both tables in the join did not have a primary key. (Bug #17249)
Changes in MySQL 4.1.19 (2006-04-29)

- **MySQL Cluster:** The cluster created a crashed replica of a table having an ordered index—or when logging was not enabled, of a table having a table or unique index—leading to a crash of the cluster following 8 successive restarts. (Bug #18298)

- **MySQL Cluster:** The REDO log would become corrupted (and thus unreadable) in some circumstances, due to a failure in the query handler. (Bug #17295)

- **MySQL Cluster:** Inserting and deleting BLOB column values while a backup was in process could cause data nodes to shut down. (Bug #14028)

- **MySQL Cluster:** No error message was generated for setting NoOfFragmentLogFiles[1251] too low. (Bug #13966)

- **MySQL Cluster:** In event of a node failure during a rollback, a “false” lock could be established on the backup for that node, which lock could not be removed without restarting the node. (Bug #18352)

- **MySQL Cluster:** No error message was generated for setting MaxNoOfAttributes[1252] too low. (Bug #13965)

- **MySQL Cluster:** A node restart immediately following a CREATE TABLE would fail.

  Important
  This fix supports 2-node Clusters only.

  (Bug #18385)

- **MySQL Cluster:** Backups could fail for large clusters with many tables, where the number of tables approached MaxNoOfTables[1253]. (Bug #17607)

- **MySQL Cluster:** An UPDATE with an inner join failed to match any records if both tables in the join did not have a primary key. (Bug #17257)

- **MySQL Cluster:** Restarting nodes were permitted to start and join the cluster too early. (Bug #16772)

- **MySQL Cluster:** ndb_delete_all ran out of memory when processing tables containing BLOB columns. (Bug #16693)

- **MySQL Cluster:** On systems with multiple network interfaces, data nodes would get “stuck” in startup phase 2 if the interface connecting them to the management server was working on node startup while the interface interconnecting the data nodes experienced a temporary outage. (Bug #15695)

- **Replication:** Use of TRUNCATE TABLE for a TEMPORARY table on a master server was propagated to slaves properly, but slaves did not decrement the Slave_open_temp_tables counter properly. (Bug #17137)

- The IN-to-EXISTS transformation was making a reference to a parse tree fragment that was left out of the parse tree. This caused problems with prepared statements. (Bug #18492)

- Conversion of a number to a CHAR UNICODE string returned an invalid result. (Bug #18691)

- The mysql_close() C API function leaked handles for shared-memory connections on Windows. (Bug #15846)

- **MyISAM:** Keys for which the first part of the key was a CHAR or VARCHAR column using the UTF-8 character set and longer than 254 bytes could become corrupted. (Bug #17705)

- A query using WHERE (column_1, column_2) IN ((value_1, value_2)[, (...), ...]) would return incorrect results. (Bug #16248)
Changes in MySQL 4.1.19 (2006-04-29)

- The euro sign (€) was not stored correctly in columns using the `latin1_german1_ci` or `latin1_general_ci` collation. (Bug #18321)
- If InnoDB encountered a `HA_ERR_LOCK_TABLE_FULL` error and rolled back a transaction, the transaction was still written to the binary log. (Bug #18283)
- A `FULLTEXT` query in a `UNION` could result in unexpected behavior. (Bug #16893)
- A key on a `MEMORY` table would sometimes fail to match a row. (Bug #12796)
- When running a query that contained a `GROUP_CONCAT(SELECT GROUP_CONCAT(...) )` [875], the result was `NULL` except in the `ROLLUP` part of the result, if there was one. (Bug #15560)
- Connecting to a server with a UCS2 default character set with a client using a non-UCS2 character set crashed the server. (Bug #18004)
- Security Improvement: GRANTs to users with wildcards in their host information could be erroneously applied to similar users with the same user name and similar wildcards. For example, a privilege granted to `foo@%` are also applied to user `foo@192.%`. (Bug #14385)
- `LOAD DATA FROM MASTER` produced invalid warnings and `Packet out of order` errors when the database already existed on the slave. (Bug #15302)
- Dropping InnoDB constraints named `tbl_name_ibfk_0` could crash the server. (Bug #16387)
- A `LOCK TABLES` statement that failed could cause MyISAM not to update table statistics properly, causing a subsequent `CHECK TABLE` to report table corruption. (Bug #18544)
- `CAST(double AS SIGNED INT)` [851] for large `double` values outside the signed integer range truncated the result to be within range, but the result sometimes had the wrong sign, and no warning was generated. (Bug #15098)
- For single-`SELECT` union constructs of the form `(SELECT ... ORDER BY order_list1 [LIMIT n]) ORDER BY order_list2`, the `ORDER BY` lists were concatenated and the `LIMIT` clause was ignored. (Bug #18767)
- Killing a long-running query containing a subquery could cause a server crash. (Bug #14851)
- Security improvement: In grant table comparisons, improper use of a `latin1` collation caused some host name matches to be true that should have been false. Thanks to Deomid Ryabkov for finding this bug and proposing a solution. (Bug #15756)
- Index corruption could occur in cases when the `key_cache_block_size` was not a multiple of the `myisam-block-size` value (for example, with `--key_cache_block_size=1536` and `--myisam-block-size=1024`). (Bug #19079)
- `mysql_reconnect()` sent a `SET NAMES` statement to the server, even for pre-4.1 servers that do not understand the statement. (Bug #18830)
- A race condition could occur when dropping the adaptive hash index for a B-tree page in InnoDB. (Bug #16582)
- `SET` value definitions containing commas were not rejected. Now a definition such as `SET('a,b','c,d')` results in an error. (Bug #15316)
- The `-lmtmalloc` library was removed from the output of `mysql_config` on Solaris, as it caused problems when building `DBD::mysql` (and possibly other applications) on that platform that tried to use `dlopen()` to access the client library. (Bug #18322)
Changes in MySQL 4.1.19 (2006-04-29)

• Attempting to set the default value of an ENUM or SET column to NULL caused a server crash. (Bug #19145)

• The server was always built as though --with-extra-charsets=complex [97] had been specified. (Bug #12076)

• UNCOMPRESS(NULL) [861] could cause subsequent UNCOMPRESS() [861] calls to return NULL for legal non-NULL arguments. (Bug #18643)

• Setting the myisam_repair_threads system variable to a value larger than 1 could cause corruption of large MyISAM tables. (Bug #11527)

• MySQL would not compile on Linux distributions that use the tinfo library. (Bug #18912)

• Avoid trying to include <asm/atomic.h> when it doesn’t work in C++ code. (Bug #13621)

• Executing SELECT on a large table that had been compressed within myisampack could cause a crash. (Bug #17917)

• Binary distributions for Solaris contained files with group ownership set to the nonexisting wheel group. Now the bin group is used. (Bug #15562)

• IA-64 RPM packages for Red Hat and SuSE Linux that were built with the icc compiler incorrectly depended on icc runtime libraries. (Bug #16662)

• SELECT ... WHERE column LIKE 'A%', when column had a key and used the latin2_czech_cs collation, caused the wrong number of rows to be returned. (Bug #17374)

• A call to MIN() [876] with a CASE [782] expression as its argument could return a nonminimum value. (Bug #17896)

• A FULLTEXT query in a prepared statement could result in unexpected behavior. (Bug #14496)

• MYSQL_STMT objects were not preserved following a connection reset. Attempting to operate on them afterward caused the server to crash. (Bug #12744)

• SELECT COUNT(*) for a MyISAM table could return different results depending on whether an index was used. (Bug #14980)

• Creating a table in an InnoDB database with a column name that matched the name of an internal InnoDB column (including DB_ROW_ID, DB_TRX_ID, DB_ROLL_PTR and DB_MIX_ID) would cause a crash. MySQL now returns Error 1005 Cannot create table with errno set to -1. (Bug #18934)

• mysql_config returned incorrect libraries on x86_64 systems. (Bug #13158)

• Repeated invocation of my_init() and my_end() caused corruption of character set data and connection failure. (Bug #6536)

• mysqldump tried to dump data from a view. (In MySQL 4.1, this applies when connecting to a server from MySQL 5.0 or higher.) (Bug #16389)

• MySQL-shared-compat-4.1.15-0.i386.rpm, MySQL-shared-compat-4.1.16-0.i386.rpm, and MySQL-shared-compat-4.1.18-0.i386.rpm incorrectly depended on glibc 2.3 and could not be installed on a glibc 2.2 system. (Bug #16539)

• Index prefixes for utf8 VARCHAR columns did not work for UPDATE statements. (Bug #19080)

• Character set conversion of string constants for UNION of constant and table column was not done when it was safe to do so. (Bug #15949)
Changes in MySQL 4.1.18 (2006-01-27)

- During conversion from one character set to ucs2, multi-byte characters with no ucs2 equivalent were converted to multiple characters, rather than to 0x003F QUESTION MARK. (Bug #15375)

C.1.8 Changes in MySQL 4.1.18 (2006-01-27)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Functionality Added or Changed

- MySQL Cluster: More descriptive warnings are now issued when inappropriate logging parameters are set in config.ini. (Formerly, the warning issued was simply could not add logfile destination.) (Bug #11331)
  - libmysqlclient now uses versioned symbols with GNU ld. (Bug #3074)

Bugs Fixed

- Replication: The --replicate-do and --replicate-ignore options were not being enforced on multiple-table statements. (Bug #16487, Bug #15699)
- A CREATE TABLE ... SELECT ... on an equation involving DOUBLE values could result in the table being created with columns too small to hold the equation result. (Bug #9855)
- A prepared statement created from a SELECT ... LIKE query (such as PREPARE stmt1 FROM 'SELECT col_1 FROM tedd_test WHERE col_1 LIKE ?';) would begin to produce erratic results after being executed repeatedly numerous (thousands) of times. (Bug #12734)
- UPDATE statement crashed multi-byte character set FULLTEXT index if update value was almost identical to initial value only differing in some spaces being changed to &nbsp;. (Bug #16489)
- Single table UPDATE statements without ORDER BY clauses which updated the same indexed column that was being filtered on were optimized with a full index scan instead of a more appropriate index range scan. (Bug #15935)
- RPM packages had an incorrect zlib dependency. (Bug #15223)
- Running out of disk space in the location specified by the tmpdir option resulted in incorrect error message. (Bug #14634)
- Test suite func_math test returned warnings when the server was not compiled with InnoDB support. (Bug #15429)
- The MBROverlaps GIS function returned incorrect results. (Bug #14320)
- STR_TO_DATE(1,NULL) [830] caused a server crash. (Bug #15828, CVE-2006-3081)
- The length of a VARCHAR() column that used the utf8 character set would increase each time the table was re-created in a stored procedure or prepared statement, eventually causing the CREATE TABLE statement to fail. (Bug #13134)

C.1.9 Changes in MySQL 4.1.17 (Not released)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.
Functionality Added or Changed

• Support files for compiling with Visual Studio 6 have been removed. (Bug #15094)

• In the latin5_turkish_ci collation, the order of the characters A WITH CIRCUMFLEX, I WITH CIRCUMFLEX, and U WITH CIRCUMFLEX was changed. If you have used these characters in any indexed columns, you should rebuild those indexes. (Bug #13421)

• Internal sha1_result function renamed to mysql_sha1_result to prevent conflicts with other projects. (Bug #13944)

Bugs Fixed

• MySQL Cluster: A node which failed during cluster startup was sometimes not removed from the internal list of active nodes. (Bug #15587)

• MySQL Cluster: If an abort by the Transaction Coordinator timed out, the abort condition was incorrectly handled, causing the transaction record to be released prematurely. (Bug #15685)

• MySQL Cluster: Under some circumstances, it was possible for a restarting node to undergo a forced shutdown. (Bug #15632)

• MySQL Cluster: There was a small window for a node failure to occur during a backup without an error being reported. (Bug #15425)

• MySQL Cluster: A memory leak occurred when performing ordered index scans using indexes on columns larger than 32 bytes. This would eventually lead to the forced shutdown of all mysqld server processes used with the cluster. (Bug #13078)

• Cluster API: Upon the completion of a scan where a key request remained outstanding on the primary replica and a starting node died, the scan did not terminate. This caused incomplete error handling for the failed node. (Bug #15908)

• Multiple-table update operations were counting updates and not updated rows. As a result, if a row had several updates it was counted several times for the “rows matched” value but updated only once. (Bug #15028)

• InnoDB: Comparison of indexed VARCHAR CHARACTER SET ucs2 COLLATE ucs2_bin columns using LIKE could fail. (Bug #14583)

• Performing a RENAME TABLE on an InnoDB table when the server was started with the --innodb_file_per_table option and the data directory was a symlink caused a server crash. (Bug #15991)

• Characters in the gb2312 and euckr character sets which did not have Unicode mappings were truncated. (Bug #15377)

• Using an aggregate function as the argument for a HAVING clause resulted in the aggregate function always returning FALSE. (Bug #14274)

• SELECT queries that began with an opening parenthesis were not being placed in the query cache. (Bug #14652)

• DELETE could report full-text index corruption (Invalid key for table ...) if the index was built with repair-by-sort, the data in the full-text index used UCA collation, and some word appeared in the data terminated by a 0xC2A0 character as well as by other nonletter characters. (Bug #11336)

• InnoDB: If foreign_key_checks was 0, InnoDB permitted inconsistent foreign keys to be created. (Bug #13778)
Changes in MySQL 4.1.16 (2005-11-29)

- CAST(... AS TIME) operations returned different results when using versus not using prepared-statement protocol. (Bug #15805)
- The COALESCE() function truncated data in a TINYTEXT column. (Bug #15581)
- BDB: A DELETE, INSERT, or UPDATE of a BDB table could cause the server to crash where the query contained a subquery using an index read. (Bug #15536)
- Symbolic links did not function properly on Windows platforms. (Bug #14960, Bug #14310)
- Certain CREATE TABLE ... AS ... statements involving ENUM columns could cause server crash. (Bug #12913)
- Using CAST() to convert values with long fractional or exponent parts to TIME returned wrong results. (Bug #12440)
- A race condition when creating temporary files caused a deadlock on Windows with threads in Opening tables or Waiting for table states. (Bug #12071)
- Certain permission management statements could create a NULL host name for a user, resulting in a server crash. (Bug #15598)
- Issuing a DROP USER statement could cause some users to encounter a hostname is not permitted to connect to this MySQL server error. (Bug #15775)
- For InnoDB tables, using a column prefix for a utf8 column in a primary key caused Cannot find record errors when attempting to locate records. (Bug #14056)
- Access Denied error could be erroneously returned with specific grant combinations under high load. (Bug #7209)
- Piping the fill_help_tables.sql file into mysqld resulted in a syntax error. (Bug #15965)
- An INSERT ... SELECT statement between tables in a MERGE set can return errors when statement involves insert into child table from merge table or vice-versa. (Bug #5390)

C.1.10 Changes in MySQL 4.1.16 (2005-11-29)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Functionality Added or Changed

- MySQL now supports character set conversion for seven additional cp950 characters into the big5 character set: 0xF9D6, 0xF9D7, 0xF9D8, 0xF9D9, 0xF9DA, 0xF9DB, and 0xF9DC.

Note

If you move data containing these additional characters to an older MySQL installation which does not support them, you may encounter errors. (Bug #12476)

- When a date column is set NOT NULL and contains 0000-00-00, it will be updated for UPDATE statements that contains columnname IS NULL in the WHERE clause. (Bug #14186)
• The MySQL-server RPM now explicitly assigns the mysql system user to the mysql user group during the postinstallation process. This corrects an issue with upgrading the server on some Linux distributions whereby a previously existing mysql user was not changed to the mysql group, resulting in wrong groups for files created following the installation. (Bug #12823)

• The CHAR() function now takes an optional USING charset clause that may be used to produce a result in a specific character set rather than in the connection character set.

• When executing single-table UPDATE or DELETE queries containing an ORDER BY ... LIMIT N clause, but not having any WHERE clause, MySQL can now take advantage of an index to read the first N rows in the ordering specified in the query. If an index is used, only the first N records will be read, as opposed to scanning the entire table. (Bug #12915)

Bugs Fixed

• MySQL Cluster: Creating a table with packed keys failed silently. NDB now supports the PACK_KEYS option to CREATE TABLE correctly. (Bug #14514)

• MySQL Cluster: REPLACE failed when attempting to update a primary key value in a Cluster table. (Bug #14007)

• MySQL Cluster: Repeated transactions using unique index lookups could cause a memory leak leading to error 288, Out of index operations in transaction coordinator. (Bug #14199)

• MySQL Cluster: Placing multiple [tcp default] sections in the cluster's config.ini file crashed ndb_mgmd. (The process now exits gracefully in such cases, with an appropriate error message.) (Bug #13611)

• MySQL Cluster: The perror utility included with the MySQL-Server RPM did not provide support for the --ndb option. It now supports this option, and so can be used to obtain error message text for MySQL Cluster error codes. (Bug #13740)

• Replication: On Windows, the server could crash during shutdown if both replication threads and normal client connection threads were active. (Bug #11796)

• Replication: Multiple update queries using any type of subquery would be ignored by a replication slave when a condition such as --replicate-ignore-table like condition was used. (Bug #13236)

• Replication: InnoDB: During replication, There was a failure to record events in the binary log that still occurred even in the event of a ROLLBACK. For example, this sequence of commands:

```
BEGIN;
CREATE TEMPORARY TABLE t1 (a INT) ENGINE=INNODB;
ROLLBACK;
INSERT INTO t1 VALUES (1);
```

would succeed on the replication master as expected. However, the INSERT would fail on the slave because the ROLLBACK would (erroneously) cause the CREATE TEMPORARY TABLE statement not to be written to the binlog. (Bug #7947)

• Replication: An UPDATE query using a join would be executed incorrectly on a replication slave. (Bug #12618)

• Given a column col_name defined as NOT NULL, a SELECT ... FROM ... WHERE col_name IS NULL query following SHOW TABLE STATUS would erroneously return a nonempty result. (Bug #13535)

• The default value of query_prealloc_size was set to 8192, lower than its minimum of 16384. The minimum has been lowered to 8192. (Bug #13334)
Changes in MySQL 4.1.16 (2005-11-29)

• make failed when attempting to build MySQL in different directory other than that containing the source. (Bug #11827)

• CREATE TABLE tbl_name (...) SELECT ... could crash the server and write invalid data into the .frm file if the CREATE TABLE and SELECT both contained a column with the same name. Also, if a default value is specified in the column definition, it is now actually used. (Bug #14480)

• InnoDB: Pad UTF-8 VARCHAR columns with 0x20. Pad UCS2 CHAR columns with 0x0020. (Bug #10511)

• Queries of the form (SELECT ...) ORDER BY ... were being treated as a UNION. This improperly resulted in only distinct values being returned (because UNION by default eliminates duplicate results). Also, references to column aliases in ORDER BY clauses following parenthesized SELECT statements were not resolved properly. (Bug #7672)

• On Windows, the server was not ignoring hidden or system directories that Windows may have created in the data directory, and would treat them as available databases. (Bug #4375)

• An expression in an ORDER BY clause failed with Unknown column 'col_name' in 'order clause' if the expression referred to a column alias. (Bug #11694)

• TIMEDIFF() [832], ADDTIME() [820], and STR_TO_DATE() [830] were not reporting that they could return NULL, so functions that invoked them might misinterpret their results. (Bug #14009)

• With --log-slave-updates Exec_master_log_pos of SQL thread lagged IO (Bug #13023)

• LIKE operations did not work reliably for the cp1250 character set. (Bug #13347)

• mysqladmin and mysqldump would hang on SCO OpenServer. (Bug #13238)

• For MyISAM tables, incorrect query results or incorrect updates could occur under these conditions: There is a multiple-column index that includes a BLOB column that is not the last column in the index, and the statement performs a lookup on the index using key column values that have NULL for the BLOB column and that provide values for all columns up to the BLOB column and at least the next column in the index. (Bug #13814)

• Closed a memory leak in the SSL code. (Bug #14780)

• PURGE MASTER LOGS statement that used subquery for date crashed server. (Bug #10308)

• Multiple race conditions existed in OpenSSL, particularly noticeable on Solaris. (Bug #9270)

• A UNION of DECIMAL columns could produce incorrect results. (Bug #14216)

• Use of WITH ROLLUP PROCEDURE ANALYSE() could hang the server. (Bug #14138)

• For a table that had been opened with HANDLER OPEN, issuing OPTIMIZE TABLE, ALTER TABLE, or REPAIR TABLE caused a server crash. (Bug #14397)

• ALTER TABLE ... ENABLE INDEXES treated NULL values as equal when collecting index statistics for MyISAM tables, resulting in different statistics from those generated by ANALYZE TABLE and causing the optimizer to make poor index choices later. The same problem occurred for bulk insert statistics collection. Now NULL values are treated as unequal, just as for ANALYZE TABLE. (Bug #9622)

• A LIMIT-related optimization failed to take into account that MyISAM table indexes can be disabled, causing Error 124 when it tried to use such an index. (Bug #14616)

• Corrected a memory-copying problem for big5 values when using icc compiler on Linux IA-64 systems. (Bug #10836)
Changes in MySQL 4.1.16 (2005-11-29)

- **LOAD DATA INFILE** would not accept the same character for both the **ESCAPED BY** and the **ENCLOSED BY** clauses. (Bug #11203)

- An update of a **CSV** table could cause a server crash. (Bug #13894)

- Full-text indexing/searching failed for words that end with more than one apostrophe. (Bug #5686)

- Character set conversion was not being done for **FIND_IN_SET()** [788]. (Bug #13751)

- The endiian byte in for spatial values in WKB format was not consistently respected. (Bug #12839)

- Creating a table containing an **ENUM** or **SET** column from within a stored procedure or prepared statement caused a server crash later when executing the procedure or statement. (Bug #14410)

- Use of *col_name* = VALUES(*col_name*) in the **ON DUPLICATE KEY UPDATE** clause of an **INSERT** statement failed with an **Column 'col_name' in field list is ambiguous** error. (Bug #13392)

- **SELECT DISTINCT** CHAR(*col_name*) returned incorrect results after **SET NAMES utf8**. (Bug #13233)

- Maximum values were handled incorrectly for command-line options of type **GET_LL**. (Bug #12925)

- **CAST(1E+300 TO SIGNED INT)** [851] produced an incorrect result on little-endian machines. (Bug #13344)

- The server did not take character set into account in checking the width of the **mysql.user.Password** column. As a result, it could incorrectly generate long password hashes even if the column was not long enough to hold them. (Bug #13064)

- The **--interactive-timeout** and **--slave-net-timeout** options for **mysqld** were not being obeyed on Mac OS X and other BSD-based platforms. (Bug #8731)

- **mysqld_safe** did not correctly start the **-max** version of the server (if it was present) if the **--ledir** option was given. (Bug #13774)

- Issuing **STOP SLAVE** after having acquired a global read lock with **FLUSH TABLES WITH READ LOCK** caused a deadlock. Now **STOP SLAVE** is generates an error in such circumstances. (Bug #10942)

- Deletes from a **CSV** table could cause table corruption. (Bug #14672)

- Selecting from a table in both an outer query and a subquery could cause a server crash. (Bug #14482)

- Character set file parsing during **mysql_real_connect()** read past the end of a memory buffer. (Bug #6413)

- Specifying **--default-character-set=cp-932** for **mysqld** would cause SQL scripts containing comments written using that character set to fail with a syntax error. (Bug #13487)

- On BSD systems, the system **crypt()** call could return an error for some salt values. The error was not handled, resulting in a server crash. (Bug #13619)

- Statements of the form **CREATE TABLE ... SELECT ...** that created a column with a multi-byte character set could incorrectly calculate the maximum length of the column, resulting in a **Specified key was too long** error. (Bug #14139)

- The example configuration files supplied with MySQL distributions listed the **thread_cache_size** variable as **thread_cache**. (Bug #13811)

- Perform character set conversion of constant values whenever possible without data loss. (Bug #10446)

- Portability fixes to support OpenSSL 0.9.8a. (Bug #14221)
Changes in MySQL 4.1.15 (2005-10-13)

- Non-\texttt{latin1} object names were written with wrong character set to grant tables. (Bug #14406)
- \texttt{PROCEDURE ANALYSE()} could suggest a data type with a negative display width. (Bug #10716)
- \texttt{mysql_fix_privilege_tables.sql} contained an erroneous comment that resulted in an error when the file contents were processed. (Bug #14469)
- When the \texttt{DATE_FORMAT()} function appeared in both the \texttt{SELECT} and \texttt{ORDER BY} clauses of a query but with arguments that differ by case (for example, \%m and \%M), incorrect sorting may have occurred. (Bug #14016)

C.1.11 Changes in MySQL 4.1.15 (2005-10-13)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see \url{http://www.mysql.com/about/legal/lifecycle/#calendar}. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Functionality Added or Changed

- **MySQL Cluster**: The parsing of the \texttt{CLUSTERLOG} command by \texttt{ndb_mgm} was corrected to permit multiple items. (Bug #12833)
- **Replication**: Better detection of connection timeout for replication servers on Windows enables elimination of extraneous \texttt{Lost connection} errors in the error log. (Bug #5588)
- A new command line argument was added to \texttt{mysqld} to ignore client character set information sent during handshake, and use server side settings instead, to reproduce 4.0 behavior:
  
  \begin{verbatim}
  mysqld --skip-character-set-client-handshake
  \end{verbatim}
  
  (Bug #9948)
- When using \texttt{IF NOT EXISTS} with \texttt{CREATE DATABASE} or \texttt{CREATE TABLE}, a warning now is generated if the database or table already exists. : (Bug #6008)
- Added the \texttt{myisam_stats_method}, which controls whether \texttt{NULL} values in indexes are considered the same or different when collecting statistics for \texttt{MyISAM} tables. This influences the query optimizer as described in Section 7.4.4, “MyISAM Index Statistics Collection”. (Bug #12232)
- The limit of 255 characters on the input buffer for \texttt{mysql} on Windows has been lifted. The exact limit depends on what the system permits, but can be up to 64KB characters. A typical limit is 16KB characters. (Bug #12929)
- \texttt{RAND()} no longer permits nonconstant initializers. (Previously, the effect of nonconstant initializers is undefined.) (Bug #6172)

Bugs Fixed

- **MySQL Cluster**: With two \texttt{mgmd} processes in a cluster, \texttt{ndb_mgm} output for \texttt{SHOW} would display the same IP address for both processes, even when they were on different hosts. (Bug #11595)
- **MySQL Cluster**: Adding an index to a table with a large number of columns (more then 100) crashed the storage node. (Bug #13316)
- **MySQL Cluster**: Improved error messages related to file system issues. (Bug #11218)
- **MySQL Cluster**: The cluster management client \texttt{START BACKUP} command could be interrupted by a \texttt{SHOW} command. (Bug #13054)
Changes in MySQL 4.1.15 (2005-10-13)

- **MySQL Cluster**: Multiple `ndb_mgmd` processes in a cluster did not know each other's IP addresses. (Bug #12037)

- **MySQL Cluster**: When it could not copy a fragment, `ndbd` exited without printing a message about the condition to the error log. Now the message is written. (Bug #12900)

- **MySQL Cluster**: When a schema was detected to be corrupt, `ndb` neglected to close it, resulting in a `file already open` error if the schema was opened again later. (Bug #12027)

- **MySQL Cluster**: `LOAD DATA INFILE` with a large data file failed. (Bug #10694)

- **MySQL Cluster**: A cluster shutdown following the crash of a data node failed to terminate any remaining node processes, even though `ndb_mgm` showed the shutdown request as having been completed. (Bug #9996, Bug #10938, Bug #11623)

- **MySQL Cluster**: When deleting a great many (tens of thousands of) rows at once from an `NDB` table, an improperly dereferenced pointer could cause the `mysqld` process to crash. (Bug #9282)

- **MySQL Cluster**: Invalid values in `config.ini` caused `ndb_mgmd` to crash. (Bug #12043)

- **MySQL Cluster**: An `ALTER TABLE` statement caused loss of data stored prior to the issuing of the command. (Bug #12118)

- **MySQL Cluster**: Updating a column of one of the `TEXT` types during a cluster backup could cause the `ndbd` process to crash, due to the incorrect use of charset-normalized reads. This could also lead to character data having the wrong lettercase in the backup if such a column was updated during the backup; for example, supposing that the column used `latin_ci`, then "aAa" might be stored in the backup as "AAA". (Bug #12950)

- **MySQL Cluster**: MySQL failed to compile when `--with-ndb-ccflags` was specified. (Bug #11538)

- **MySQL Cluster**: When a `Disk is full` condition occurred, `ndbd` exited without reporting this condition in the error log. (Bug #12716)

- **Replication**: The `--replicate-rewrite-db` and `--replicate-do-table` options did not work for statements in which tables were aliased to names other than those listed by the options. (Bug #11139)

- **Replication**: If a `DROP DATABASE` fails on a master server due to the presence of a nondatabase file in the database directory, the master have the database tables deleted, but not the slaves. To deal with failed database drops, we now write `DROP TABLE` statements to the binary log for the tables so that they are dropped on slaves. (Bug #4680)

- **Replication**: When any `--replicate-wild-*` option is used, the slave ignores `SET ONE_SHOT TIME_ZONE` statements as belonging to a nonreplicated table. (Bug #12542)

- `SHOW CREATE TABLE` did not display any `FOREIGN KEY` clauses if a temporary file could not be created. Now `SHOW CREATE TABLE` displays an error message in an SQL comment if this occurs. (Bug #13002)

- The counters for the `Key_read_requests`, `Key_reads`, `Key_write_requests`, and `Key_writes` status variables were changed from `unsigned long` to `unsigned longlong` to accommodate larger values before the variables roll over and restart from 0. (Bug #12920)

- A `SELECT DISTINCT` query with a constant value for one of the columns would return only a single row. (Bug #12625)

- A client connection thread cleanup problem caused the server to crash when closing the connection if the binary log was enabled. (Bug #12517)
Changes in MySQL 4.1.15 (2005-10-13)

- The ARCHIVE storage engine does not support deletes, but it was possible to delete by using DELETE or TRUNCATE TABLE with a FEDERATED table that points to an ARCHIVE table. (Bug #12836)

- If a client has opened an InnoDB table for which the .ibd file is missing, InnoDB would not honor a DROP TABLE statement for the table. (Bug #12852)

- UNION of two DECIMAL columns returned the wrong field type. (Bug #13372)

- If special characters such as '_', '%', or the escape character were included within the prefix of a column index, LIKE pattern matching on the indexed column did not return the correct result. (Bug #13046, Bug #13919)

- For VARCHAR columns with the ucs2 character set, InnoDB trimmed trailing 0x20 bytes rather than 0x0020 words, resulting in incorrect index lookups later. (Bug #12178)

- Display of the AUTO_INCREMENT attribute by SHOW CREATE TABLE was not controlled by the NO_FIELD_OPTIONS SQL mode as it should have been. (Bug #7977)

- The CHECKSUM TABLE statement returned incorrect results for tables with deleted rows. After upgrading, users who used stored checksum information to detect table changes should rebuild their checksum data. (Bug #12296)

- On Windows, the server was preventing tables from being created if the table name was a prefix of a forbidden name. For example, nul is a forbidden name because it is the same as a Windows device name, but a table with the name of n or nu was being forbidden as well. (Bug #12325)

- Deadlock occurred when several account management statements were run (particularly between FLUSH PRIVILEGES/SET PASSWORD and GRANT/REVOKE statements). (Bug #12423)

- Aggregate functions sometimes incorrectly were permitted in the WHERE clause of UPDATE and DELETE statements. (Bug #13180)

- The server could over-allocate memory when performing a FULLTEXT search for stopwords only. (Bug #13582)

- Reverted a change introduced in MySQL 4.1.13 (SHOW FIELDS truncated the TYPE column to 40 characters). This fix was reverted for MySQL 4.1 because it broke existing applications. The fix will be made in MySQL 5.0 instead (5.0.13). (Bug #12817)

  References: The patch for the following bug was reverted: Bug #7142.

- SELECT GROUP_CONCAT(...) FROM DUAL in a subquery could cause the client to hang. (Bug #12861)

- A concurrency problem for CREATE ... SELECT could cause a server crash. (Bug #12845)

- CHECKSUM TABLE locked InnoDB tables and did not use a consistent read. (Bug #12669)

- DELETE or UPDATE for an indexed MyISAM table could fail. This was due to a change in end-space comparison behavior from 4.0 to 4.1. (Bug #12565)

- MEMORY tables using B-Tree index on 64-bit platforms could produce false table is full errors. (Bug #12460)

- A prepared statement failed with Illegal mix of collations if the client character set was utf8 and the statement used a table that had a character set of latin1. (Bug #12371)

- Performing an IS NULL[775] check on the MIN() [876] or MAX() [876] of an indexed column in a complex query could produce incorrect results. (Bug #12695)
• On Windows when the `--innodb_buffer_pool_awe_mem_mb` option has been given, the server detects whether AWE support is available and has been compiled into the server, and displays an appropriate error message if not. (Bug #6581)

• **InnoDB** was too permissive with `LOCK TABLE ... READ LOCAL` and permitted new inserts into the table. Now `READ LOCAL` is equivalent to `READ` for InnoDB. This will cause slightly more locking in `mysqldump`, but makes InnoDB table dumps consistent with MyISAM table dumps. (Bug #12410)

• For queries with `DISTINCT` and `WITH ROLLUP`, the `DISTINCT` should be applied after the rollup operation, but was not always. (Bug #12887)

• `ALTER TABLE db_name.t` `RENAME` `t` did not move the table to default database unless the new name was qualified with the database name. (Bug #11493)

• MySQL would pass an incorrect key length to storage engines for `MIN()` [876]. This could cause spurious warnings such as **InnoDB: Warning: using a partial-field key prefix in search** to appear in the `.err` log. (Bug #13218, Bug #11039)

• The data type for `DECIMAL` columns was not respected when updating the column from another column. For example, updating a `DECIMAL(10,1)` column with the value from a `DECIMAL(10,5)` column resulted in a `DECIMAL(10,5)` value being stored. Similarly, altering a column with a `DECIMAL(10,5)` data type to a `DECIMAL(10,1)` data type did not properly convert data values. (Bug #7598)

• Shared-memory connections were not working on Windows. (Bug #12723)

• `LOAD DATA INFILE` did not respect the `NO_AUTO_VALUE_ON_ZERO` SQL mode setting. (Bug #12053)

• After changing the character set with `SET CHARACTER SET`, the result of the `GROUP_CONCAT()` [875] function was not converted to the proper character set. (Bug #12829)

• Queries against a `MERGE` table that has a composite index could produce incorrect results. (Bug #9112)

• `GROUP_CONCAT()` [875] ignored an empty string if it was the first value to occur in the result. (Bug #12863)

• `TRUNCATE TABLE` did not work with `TEMPORARY` InnoDB tables. (Bug #11816)

• An optimizer estimate of zero rows for a nonempty InnoDB table used in a left or right join could cause incomplete rollback for the table. (Bug #12779)

• Use of a user-defined function within the `HAVING` clause of a query resulted in an **Unknown column** error. (Bug #11553)

• Users created using an IP address or other alias rather than a host name listed in `/etc/hosts` could not set their own passwords. (Bug #12302)

• The value of `character_set_results` could be set to `NULL`, but returned the string "NULL" when retrieved. (Bug #12363)

• Outer join elimination was erroneously applied for some queries that used a `NOT BETWEEN` condition, an `IN(value_list)` [776] condition, or an `IF()` [782] condition. (Bug #12102, Bug #12101)

• A `UNION` of long `utf8` `VARCHAR` columns was sometimes returned as a column with a `LONGTEXT` data type rather than `VARCHAR`. This could prevent such queries from working at all if selected into a `MEMORY` table because the `MEMORY` storage engine does not support the `TEXT` data types. (Bug #12537)

• A column that can be `NULL` was not handled properly for `WITH ROLLUP` in a subquery or view. (Bug #12885)
• Spatial index corruption could occur during updates. (Bug #9645)

• Queries that created implicit temporary tables could return incorrect data types for some columns. (Bug #11718)

• On HP-UX 11.x (PA-RISC), the `-L` option caused `mysqlimport` to crash. (Bug #12958)

• The `have_innodb` read-only system variable could not be selected with `SELECT @@have_innodb`. (Bug #9613)

• After running `configure` with the `--with-embedded-privilege-control` option, the embedded server failed to build. (Bug #13501)

• The server crashed when one thread resized the query cache while another thread was using it. (Bug #12848)

• `mysqld_multi` now quotes arguments on command lines that it constructs to avoid problems with arguments that contain shell metacharacters. (Bug #11280)

• Comparisons involving row constructors containing constants could cause a server crash. (Bug #13356)

• `myisampack` did not properly pack `BLOB` values larger than $2^{24}$ bytes. (Bug #4214)

• The `LIKE ... ESCAPE` syntax produced invalid results when escape character was larger than one byte. (Bug #12611)

• MySQL programs in binary distributions for Solaris 8/9/10 x86 systems would not run on Pentium III machines. (Bug #6772)

• `MIN()` [876] and `MAX()` [876] sometimes returned a non-NULL value for an empty row set (for example, `SELECT MAX(1) FROM empty_table`). (Bug #12882)

C.1.12 Changes in MySQL 4.1.14 (2005-08-17)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Functionality Added or Changed

• **MySQL Cluster**: Improved handling of the configuration variables `NoOfPagesToDiskDuringRestartACC`, `NoOfPagesToDiskAfterRestartACC`, `NoOfPagesToDiskDuringRestartTUP`, and `NoOfPagesToDiskAfterRestartTUP` should result in noticeably faster startup times for MySQL Cluster. (Bug #12149)

• **MySQL Cluster**: A new `-P` option is available for use with the `ndb_mgmd` client. When called with this option, `ndb_mgmd` prints all configuration data to `stdout`, then exits.

• The MySQL server now starts correctly with all combinations of `--basedir` and `--datadir`, resolving an issue introduced by the original fix for this bug in MySQL 4.1.9. (Bug #7249)

  References: See also Bug #7518.

• Added support of where clause for queries with `FROM DUAL`. (Bug #11745)

• `SHOW CHARACTER SET` and `INFORMATION_SCHEMA` now properly report the Latin1 character set as `cp1252`. (Bug #11216)
• If a thread (connection) has tables locked, the query cache is switched off for that thread. This prevents
invalid results where the locking thread inserts values between a second thread connecting and
selecting from the table. (Bug #12385)

• Added an optimization that avoids key access with NULL keys for the ref method when used in outer
joins. (Bug #12144)

• Added new query cache test for the embedded server to the test suite, there are now specific tests for
the embedded and nonembedded servers. (Bug #9508)

Bugs Fixed

• MySQL Cluster: NDB ignored the Hostname option in the [ndbd default] section of the cluster
configuration file. (Bug #12028)

• MySQL Cluster: ndb_mgmd leaked file descriptors. (Bug #11898)

• MySQL Cluster: The temporary tables created by an ALTER TABLE on an NDB table were visible to all
SQL nodes in the cluster. (Bug #12055)

• MySQL Cluster: The output of perror --help did not display any information about the --ndb
option. (Bug #11999)

• MySQL Cluster: Attempting to create or drop tables during a backup would cause the cluster to shut
down. (Bug #11942)

• Replication: Slave I/O threads were considered to be in the running state when launched (rather than
after successfully connecting to the master server), resulting in incorrect SHOW SLAVE STATUS output.
(Bug #10780)

• SELECT @@local... returned @@session... in the column header. (Bug #10724)

• The value of max_connections_per_hour was capped by the unrelated max_user_connections
setting. (Bug #9947)

• Performing DATE(LEFT(column, 8)) [821] on a DATE column produces incorrect results. (Bug
#12266)

• Renamed the rest() macro in my_list.h to list_rest() to avoid name clashes with user code.
(Bug #12327)

• For prepared statements, the SQL parser did not disallow ? parameter markers immediately adjacent
to other tokens, which could result in malformed statements in the binary log. (For example, SELECT *
FROM t WHERE? = 1 could become SELECT * FROM t WHERE0 = 1.) (Bug #11299)

• Some subqueries of the form SELECT ... WHERE ROW(...) IN (subquery) were being handled
incorrectly. (Bug #11867)

• References to system variables in an SQL statement prepared with PREPARE were evaluated during
EXECUTE to their values at prepare time, not to their values at execution time. (Bug #9359)

• When two threads competed for the same table, a deadlock could occur if one thread also had a lock on
another table through LOCK TABLES and the thread was attempting to remove the table in some manner
while the other thread tried to place locks on both tables. (Bug #10600)

• A UNION query with FULLTEXT could cause server crash. (Bug #11869)

• ISO-8601 formatted dates were not being parsed correctly. (Bug #7308)

• Character data truncated when GBK characters 0xA3A0 and 0xA1 are present. (Bug #11987)
Changes in MySQL 4.1.14 (2005-08-17)

- Two threads could potentially initialize different characters sets and overwrite each other. (Bug #12109)
- Comparisons like `SELECT "A\"" LIKE "A\"";` fail when using `SET NAMES utf8;`. (Bug #11754)
- Attempting to repair a table having a full-text index on a column containing words whose length exceeded 21 characters and where `myisam_repair_threads` was greater than 1 would crash the server. (Bug #11684)
- **InnoDB**: Do not flush after each write, not even before setting up the doublewrite buffer. Flushing can be extremely slow on some systems. (Bug #12125)
- `SHOW BINARY LOGS` displayed a file size of 0 for all log files but the current one if the files were not located in the data directory. (Bug #12004)
- Mishandling of comparison for rows containing `NULL` values against rows produced by an `IN` subquery could cause a server crash. (Bug #12392)
- Concatenating `USER()` or `DATABASE()` with a column produced invalid results. (Bug #12351)
- Creation of the `mysql` group account failed during the RPM installation. (Bug #12348)
- `myisam.test` failed when server compiled using `--without-geometry` option. (Bug #11083)
- Pathname values for options such as `--basedir` or `--datadir` didn't work on Japanese Windows machines for directory names containing multi-byte characters having a second byte of `0x5C` (" "). (Bug #5439)
- `myisampack` failed to delete `.TMD` temporary files when run with the `-T` option. (Bug #12235)
- `INSERT ... SELECT ... ON DUPLICATE KEY UPDATE` could fail with an erroneous “Column 'col_name' specified twice” error. (Bug #10109)
- Multiplying `ABS()` output by a negative number would return incorrect results. (Bug #11402)
- `big5` strings were not being stored in `FULLTEXT` index. (Bug #12075)
- `FLUSH TABLES WITH READ LOCK` combined with `LOCK TABLE .. WRITE` caused deadlock. (Bug #9459)
- `GROUP_CONCAT()` sometimes returned a result with a different collation from that of its arguments. (Bug #10201)
- Incorrect error message displayed if user attempted to create a table in a nonexisting database using `CREATE database_name.table_name` syntax. (Bug #10407)
- The `LPAD()` and `RPAD()` functions returned the wrong length to `mysql_fetch_fields()`. (Bug #11311)
- The `mysql_info()` C API function could return incorrect data when executed as part of a multi-statement that included a mix of statements that do and do not return information. (Bug #11688)
- Queries with subqueries that contain outer joins could return wrong results. (Bug #11479)
- Corrected a problem with the optimizer incorrectly adding `NOT NULL` constraints, producing in incorrect results for complex queries. (Bug #11482)
- Creating a table with a `SET` or `ENUM` column with the `DEFAULT 0` clause caused a server crash if the table's character set was `utf8`. (Bug #11819)
Changes in MySQL 4.1.13 (2005-07-15)

- In SQL prepared statements, comparisons could fail for values not equally space-padded. For example,
  `SELECT 'a' = 'a ';` returns 1, but `PREPARE s FROM 'SELECT ?=?'; SET @a = 'a', @b = 'a '; PREPARE s FROM 'SELECT ?=?'; EXECUTE s USING @a, @b;` incorrectly returned 0. (Bug #9379)

- Updated dependency list for RPM builds to include missing dependencies such as `useradd` and `groupadd`. (Bug #12233)

- `mysql_fetch_fields()` returned incorrect length information for `MEDIUM` and `LONG TEXT` and `BLOB` columns. (Bug #9735)

- Corrected an optimizer problem with `NOT NULL` constraints within a subquery in an `UPDATE` statement that resulted in a server crash. (Bug #11868)

- For DMG installs on Mac OS X, the preinstallation and postinstallation scripts were being run only for new installations and not for upgrade installations, resulting in an incomplete installation process. (Bug #11380)

- `mysql_next_result()` returns incorrect value if final query in a batch fails. (Bug #12001)

- Prepared statement parameters could cause errors in the binary log if the character set was `cp932`. (Bug #11338)

- LIKE pattern matching using prefix index didn't return correct result. (Bug #11650)

- Multiple-table `UPDATE` queries using `CONVERT_TZ()` would fail with an error. (Bug #9979)

- `GROUP_CONCAT` ignored the `DISTINCT` modifier when used in a query joining multiple tables where one of the tables had a single row. (Bug #12095)

- The C API function `mysql_stmt_reset()` did not clear error information. (Bug #11183)

- User variables were not automatically cast for comparisons, causing queries to fail if the column and connection character sets differed. Now when mixing strings with different character sets but the same coercibility, permit conversion if one character set is a superset of the other. (Bug #10892)

- Server-side prepared statements failed for columns with a character set of `ucs2`. (Bug #9442)

C.1.13 Changes in MySQL 4.1.13 (2005-07-15)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see `http://www.mysql.com/about/legal/lifecycle/#calendar`. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Functionality Added or Changed

- Security Fix: A UDF library-loading vulnerability could result in a buffer overflow and code execution. (CVE-2005-2558)

- Incompatible Change: Previously, conversion of `DATETIME` values to numeric form by adding zero produced a result in `YYYYMMDDHHMMSS` format. The result of `DATETIME+0` is now in `YYYYMMDDHHMMSS.000000` format. (Bug #12268)

- Replication: Some data definition statements (create table where the table was not a temporary table, `TRUNCATE TABLE`, `DROP DATABASE`, and `CREATE DATABASE`) were not being written to the binary log after a `ROLLBACK`. This also caused problems with replication.
As a result of this fix, the following statements now cause an implicit commit:

- CREATE TABLE
- TRUNCATE TABLE
- DROP DATABASE
- CREATE DATABASE

(Bug #6883)

- System variables are now treated as having SYSVAR (system constant) coercibility. For example, @@version is now treated like VERSION() [868] and @@character_set_client is now treated like CHARSET( USER() ) [862]. See Section 9.1.7.5, “Collation of Expressions”. (Bug #10904)

- InnoDB: When creating or extending an InnoDB data file, allocate at most one megabyte at a time for initializing the file. Previously, InnoDB used to allocate and initialize 1 or 8 megabytes of memory, even if a few 16-kilobyte pages were to be written. This fix improves the performance of CREATE TABLE in innodb_file_per_table mode.

- Added the --add-drop-database option to mysqldump. (Bug #3716)

- Added mysql_set_character_set() C API function for setting the default character set of the current connection. This enables clients to affect the character set used by mysql_real_escape_string(). (Bug #8317)

- SHOW BINARY LOGS now displays a File_size column that indicates the size of each file.

- You can again refer to other tables in the ON DUPLICATE KEY UPDATE part of an INSERT ... SELECT statement as long as there is no GROUP BY in the SELECT part. One side effect of this is that you may have to qualify nonunique column names in the values part of ON DUPLICATE KEY UPDATE. (Bug #9728, Bug #8147)

- Added the --log-slow-admin-statements server option to request logging of slow administrative statements such as OPTIMIZE TABLE, ANALYZE TABLE, and ALTER TABLE to the slow query log. These statements were logged in MySQL 4.0, but not in 4.1. (Bug #9141)

- MEMORY tables now support indexes of up to 500 bytes. See Section 13.4, “The MEMORY (HEAP) Storage Engine”. (Bug #10566)

- The table, type, and rows columns of EXPLAIN output can now be NULL. This is required for using EXPLAIN on SELECT queries that use no tables, such as EXPLAIN SELECT 1). (Bug #9899)

- Expanded on information provided in general log and slow query log for prepared statements. (Bug #8367, Bug #9334)

Bugs Fixed

- Security Fix: A vulnerability in zlib could result in a buffer overflow and arbitrary code execution. Shortly after MySQL 4.1.13 was released, a second potential zlib security flaw was discovered and fixed. A patch for this flaw was applied to the 4.1.13 sources, and the result published as MySQL 4.1.13a. The affected binaries were rebuilt. (Bug #11844, CVE-2005-2096, CVE-2005-1849)

- Security Fix: On Windows systems, a user with any of the following privileges on *.* could crash mysqld by issuing a USE LPT1; or USE PRN; command:
Changes in MySQL 4.1.13 (2005-07-15)

- REFERENCES
- CREATE TEMPORARY TABLES
- GRANT OPTION
- CREATE
- SELECT

In addition, any of the commands `USE NUL;`, `USE CON;`, `USE COM1;`, or `USE AUX;` would report success even though the database was not in fact changed. (Bug #9148)

- **MySQL Cluster:** When trying to open a table that could not be discovered or unpacked, the cluster returned error codes which the MySQL server falsely interpreted as operating system errors. (Bug #10365)

- **MySQL Cluster:** NDB failed to build with `gcc` 4.0. (Bug #11377)

- **Replication:** `LOAD DATA ... REPLACE INTO ...` on a replication slave failed for an InnoDB table having a unique index in addition to the primary key. (Bug #11401)

- **Replication:** An UPDATE query containing a subquery caused replication to fail. (Bug #9361)

- **Replication:** An invalid comparison caused warnings for packet length in replication on 64-bit compilers. (Bug #11064)

- **Replication:** Queries of the form `UPDATE ... (SELECT ... ) SET ...` run on a replication master would crash all the slaves. (Bug #10442, CVE-2004-4380)

- Some internal functions did not take into account that, for multi-byte character sets, `CHAR` and `VARCHAR` columns could exceed 255 bytes, which could cause the server to crash. (Bug #11167)

- Queries with subqueries in the `FROM` clause were not being added to the query cache. (Bug #11522)

- Invoking the `DES_ENCRYPT()` function could cause a server crash if the server was started without the `--des-key-file` option. (Bug #11643)

- Incorrect results when searching using `IN()` where search items included `NULL` and `0`. (Bug #9393)

- Queries with `ROLLUP` returned wrong results for expressions containing `GROUP BY` columns. (Bug #7894)

- `SHOW WARNINGS` with a `LIMIT 0` clause returned all messages rather than an empty result set. (Bug #11095)

- Using `#pragma interface` or `#pragma implementation` in source files caused portability issues for cygwin. (Bug #10241)

- Table names were not handled correctly when `lower_case_table_names` = 2 if the table name lettercase differed in the `FROM` and `WHERE` clauses. (Bug #9500)

- On Mac OS X, `libmysqlclient_r.a` now is built with `--fno-common` to make it possible to link a shared two-level namespace library against `libmysqlclient_r.a`. (Bug #10638)

- Optimizer performed range check when comparing unsigned integers to negative constants, could cause errors. (Bug #11185)
The host name cache was not working. (Bug #10931)

When used within a subquery, `SUBSTRING()` returned an empty string. (Bug #10269)

Possible `NULL` values in `BLOB` columns could crash the server when a `BLOB` was used in a `GROUP BY` query. (Bug #11295)

A simultaneous `CREATE TABLE ... SELECT FROM table` and `ALTER TABLE table` on the same table caused the server to crash. (Bug #10224)

`SHOW FIELDS` truncated the `TYPE` column to 40 characters.

Note
This fix was reverted in MySQL 4.1.15 because it broke existing applications.

(Bug #7142)

References: See also Bug #12817.

The `LAST_DAY()` failed to return `NULL` when supplied with an invalid argument. See Section 11.7, "Date and Time Functions". (Bug #10568)

Modifying a `CHAR` column with the `utf8` character set to a shorter length did not properly truncate values due to not computing their length in `utf8` character units. (Bug #11591)

`mysqldump` could crash for illegal or nonexistent table names. (Bug #9358)

Inserting a `DOUBLE` value into a `utf8` string column crashed the server on Windows. (Bug #10714)

Corrected an optimization failure where a query returned an incorrect result for use of a newly populated table until the table was flushed. (Bug #11700)

`mysqldump` crashed using the `--complete-insert` option while dumping tables with a large number of long column names. (Bug #10286)

The `mysql_config` script did not handle symbolic linking properly. (Bug #10986)

`CASE` operator returns incorrect result when its arguments are not constants and its return value is put into a regular or temporary table (temporary == created by SQL engine for `UNION`/nonindexed `GROUP BY` and such operations). (Bug #10151)

For a `MERGE` table with `MyISAM` tables in other, symlinked, databases, `SHOW CREATE TABLE` reported the `MyISAM` tables using the name of the symlinked directory rather than the database name. (Bug #8183)

`INSERT ... ON DUPLICATE KEY UPDATE` with `MERGE` tables, which do not have unique indexes, caused the server to crash. (Bug #10400)

A three byte buffer overflow in the client functions caused improper exiting of the client when reading a command from the user. (Bug #10841)

`mysqld_safe` would sometimes fail to remove the pid file for the old `mysql` process after a crash. As a result, the server would fail to start due to a false `A mysqld process already exists...` error. (Bug #11122)

Selecting the result of an aggregate function for an `ENUM` or `SET` column within a subquery could result in a server crash. (Bug #11821)
Changes in MySQL 4.1.13 (2005-07-15)

- The server timed out SSL connections too quickly on Windows. (Bug #8572)
- `mysqldump --xml` did not format NULL column values correctly. (Bug #9657)
- When used in joins, `SUBSTRING()` [794] failed to truncate to zero those string values that could not be converted to numbers. (Bug #10124)
- `DES_ENCRYPT()` [858] and `DES_DECRYPT()` [858] require SSL support to be enabled, but were not checking for it. Checking for incorrect arguments or resource exhaustion was also improved for these functions. (Bug #10589)
- For a `UNION` that involved long string values, values were not being converted correctly to `TEXT` values. (Bug #10025)
- The incorrect sequence of statements `HANDLER tbl_name READ index_name NEXT` without a preceding `HANDLER tbl_name READ index_name = (value_list)` for an InnoDB table resulted in a server crash rather than an error. (Bug #5373)
- A `CREATE TABLE db_name.tbl_name LIKE ...` statement would crash the server when no database was selected. (Bug #11028)
- IP addresses not shown in `ndb_mgm SHOW` command on second `ndb_mgmd` (or on `ndb_mgmd` restart). (Bug #11596)
- MySQL sometimes reported erroneously that certain character values had crashed a table when trying to convert other character sets to UTF-8. (Bug #9557)
- Setting `@@sql_mode = NULL` caused an erroneous error message. (Bug #10732)
- `ALTER TABLE ... ENABLE INDEXES` treated NULL values as equal when collecting index statistics for MyISAM tables, resulting in different statistics from those generated by `ANALYZE TABLE` and causing the optimizer to make poor index choices later. The same problem occurred for bulk insert statistics collection. Now NULL values are treated as unequal, just as for `ANALYZE TABLE`. (Bug #9622)
- `CREATE TABLE t AS SELECT UUID()` created a `VARCHAR(12)` column, which is too small to hold the 36-character result from `UUID()` [871]. (Bug #9535)
- A problem with the `my_global.h` file caused compilation of MySQL to fail on single-processor Linux systems running 2.6 kernels. (Bug #10364)
- Temporary tables were created in the data directory instead of `tmpdir`. (Bug #11440)
- A Boolean full-text search where a query contained more query terms than one-third of the query length caused the server to hang or crash. (Bug #7858)
- The `mysqlhotcopy` script was not parsing the output of `SHOW SLAVE STATUS` correctly when called with the `--record_log_pos` option. (Bug #7967)
- Prepared statement with subqueries returned corrupt data. (Bug #11458)
- On Windows, with `lower_case_table_names` set to 2, using `ALTER TABLE` to alter a MEMORY or InnoDB table that had a mixed-case name also improperly changed the name to lowercase. (Bug #9660)
- InnoDB wrongly reported in the `.err` log that MySQL was trying to drop a nonexistent table, if no more room remained in the tablespace. (Bug #10607)
- `SHOW WARNINGS` did not properly display warnings generated by executing a cached query. (Bug #9414)
Changes in MySQL 4.1.13 (2005-07-15)

- The server could crash due to an attempt to allocate too much memory when GROUP BY blob_col and COUNT(DISTINCT) were used. (Bug #11088)

- When applying the group_concat_max_len limit, GROUP_CONCAT() could truncate multi-byte characters in the middle. (Bug #23451)

- Under certain rare circumstances, inserting into the mysql.host table could cause the server to crash. (Bug #10181)

- For MEMORY tables, it was possible for updates to be performed using outdated key statistics when the updates involved only very small changes in a very few rows. This resulted in the random failures of queries such as UPDATE t SET col = col + 1 WHERE col_key = 2; where the same query with no WHERE clause would succeed. (Bug #10178)

- The --master-data option for mysqldump resulted in no error if the binary log was not enabled. Now an error occurs unless the --force option is given. (Bug #11678)

- A ROLLUP query could return a wrong result set when its GROUP BY clause contained references to the same column. (Bug #11543)

- Testing for crypt() support caused compilation problems when using OpenSSL/yaSSL on HP-UX and Mac OS X. (Bug #11150, Bug #10675)

- Manually inserting a row with host='' into mysql.tables_priv and performing a FLUSH PRIVILEGES would cause the server to crash. (Bug #11330)

- Added a missing mutex when rotating the relay logs. Also, the server now logs an error message if the size of a relay log cannot be read. (Bug #6987)

- MySQL would not compile correctly on QNX due to missing rint() function. (Bug #11544)

- An incorrect result was obtained for columns that included an aggregate function as part of an expression, and when WITH ROLLUP was used with GROUP BY. (Bug #7914)

- INSERT ... SELECT ... ON DUPLICATE KEY UPDATE produced inaccurate results. (Bug #10886)

- The handling by the HEX() function of numbers larger than $2^{64}$ was improved. (Bug #9854)

- A problem with the cp1250_czech_cs collation caused some LIKE comparisons to fail. (Bug #9759)

- The value returned by the FIELD() function was incorrect when its parameter list contained one or more instances of NULL. (Bug #10944)

- The NULLIF() function could produce incorrect results if the first argument was NULL. (Bug #11142)

- OPTIMIZE run on an InnoDB table did not return a Table is full error if there was insufficient room in the tablespace. (Bug #8135)

- The mysql client would output a prompt twice following input of very long strings, because it incorrectly assumed that a call to the _cgets() function would clear the input buffer. (Bug #10840)

- Executing LOAD INDEX INTO CACHE for a table while other threads where selecting from the table caused a deadlock. (Bug #10602)

- Errors could occur when performing GROUP BY on calculated values of a single row table. These could sometimes cause the server to crash on Windows. (Bug #11414)

- Server crashed when using GROUP BY on the result of a DIV operation on a DATETIME value. (Bug #11385)
• Queries against a table using a compound index based on the length of a UTF-8 text column produced incorrect results. For example, given a table with an index defined as shown:

```sql
CREATE TABLE t (  
id INT NOT NULL,  
city VARCHAR(20) NOT NULL,  
KEY (city(7),id)  
) TYPE=MYISAM CHARACTER SET=utf8;
```

Assuming that suitable data has been inserted into the table, then a query such as `SELECT * FROM t WHERE city = 'Durban';` would fail. (Bug #10253)

• `GROUP_CONCAT()` [875] with `DISTINCT` and `WITH ROLLUP` ignored `DISTINCT` for some rows. (Bug #7405)

• The `--no-data` option for `mysqldump` was being ignored if table names were given after the database name. (Bug #9558)

• Locking for `CREATE TABLE ... SELECT` for InnoDB tables was too weak. It permitted `INSERT` statements issued for the created table while the `CREATE TABLE` statement was still running to appear in the binary log before the `CREATE TABLE` statement. (Bug #6678)

• `SELECT DISTINCT ... GROUP BY constant` returned multiple rows (it should return a single row). (Bug #8614)

• An overly strict debugging assertion caused debug server builds to fail for some `col_name = const_expr`, where `const_expr` was a constant expression such as a subquery. (Bug #10020)

• `DROP DATABASE` failed to check for all referencing InnoDB tables from other databases before dropping any tables. (Bug #10335)

• `mysqldump` now exports `HASH` index definitions using `USING` rather than `TYPE` when the index name is optional. This corrects a problem when reloading the output for `PRIMARY KEY` definition, because `TYPE` must be preceded an index name, which is not given for a `PRIMARY KEY`. (Bug #11635)

• Using `CONCAT_WS()` [787] on a column set `NOT NULL` caused incorrect results when used in a `LEFT JOIN`. (Bug #11469)

• `SUBSTRING()` [794] did not work properly for input in the `ucs2` character set. (Bug #10344)

C.1.14 Changes in MySQL 4.1.12 (2005-05-13)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Note

The fix for interpretation of `MERGE` table `.MRG` files (Bug #10687) was made for Windows builds after MySQL 4.1.12 was released and is present in MySQL 4.1.12a.

Functionality Added or Changed

• **Incompatible Change:** The behavior of `LOAD DATA INFILE` and `SELECT ... INTO OUTFILE` has changed when the `FIELDS TERMINATED BY` and `FIELDS ENCLOSED BY` values both are empty. Formerly, a column was read or written the display width of the column. For example, `INT(4)` was
read or written using a field with a width of 4. Now columns are read and written using a field width wide enough to hold all values in the field. However, data files written before this change was made might not be reloaded correctly with `LOAD DATA INFILE` for MySQL 4.1.12 and up. This change also affects data files read by `mysqlimport` and written by `mysqldump --tab`, which use `LOAD DATA INFILE` and `SELECT ... INTO OUTFILE`. For more information, see Section 12.2.5, “LOAD DATA INFILE Syntax”. (Bug #12564)

- New /*> prompt for `mysql`. This prompt indicates that a /* ... */ comment was begun on an earlier line and the closing */ sequence has not yet been seen. (Bug #9186)

- Added a `--debug` option to `my_print_defaults`.

- Updated version of `libedit` to 2.9. (Bug #2596)

- **InnoDB**: When `foreign_key_checks = 0`, `ALTER TABLE` and `RENAME TABLE` will ignore any type incompatibilities between referencing and referenced columns. Thus, it will be possible to convert the character sets of columns that participate in a foreign key. Be sure to convert all tables before modifying any data! (Bug #9802)

- **InnoDB**: When the maximum length of `SHOW INNODB STATUS` output would be exceeded, truncate the beginning of the list of active transactions, instead of truncating the end of the output. (Bug #5436)

- When the server cannot read a table because it cannot read the `.frm` file, print a message that the table was created with a different version of MySQL. (This can happen if you create tables that use new features and then downgrade to an older version of MySQL.) (Bug #10435)

- Added the `cp932` Japanese character set.

- Previously in MySQL 4.1, an Illegal mix of collations error occurred when mixing strings from same character set when one had a nonbinary collation and the other a binary collation. Now the binary collation takes precedence, so that both strings are treated as having the binary collation. This restores compatibility with MySQL 4.0 behavior.

- **InnoDB**: If `innodb_locks_unsafe_for_binlog` is enabled and the isolation level of the transaction is not set to `SERIALIZABLE`, InnoDB uses a consistent read for select in clauses such as `INSERT INTO ... SELECT` and `UPDATE ... (SELECT)` that do not specify `FOR UPDATE` or `LOCK IN SHARE MODE`. Thus, no locks are set to rows read from selected table.

**Bugs Fixed**

- **Security Fix**: `mysql_install_db` created the `mysql_install_db.X` file with a predictable file name and insecure permissions, which permitted local users to execute arbitrary SQL statements by modifying the file’s contents. (CVE-2005-1636)

- **Security Fix**: Starting `mysqld` with `--user=non_existent_user` caused it to run using the privileges of the account from which it was invoked, including the `root` account. (Bug #9833)

- **Performance**: InnoDB: At shutdown, the latest lsn is now written only to the first pages of the `ibdata` files of the system tablespace, and not to the `.ibd` files, saving up to several minutes in some cases.

- **MySQL Cluster**: `AUTO_INCREMENT` did not work with `INSERT...SELECT` on NDB tables. (Bug #9675)

- Queries containing `CURRENT_USER()` [864] incorrectly were registered in the query cache. (Bug #9796)

- Concurrent inserts were permitted into the tables in the `SELECT` part of `INSERT ... SELECT ... UNION ....` This could result in the incorrect order of queries in the binary log. (Bug #9922)

- `myisampack` run on 64-bit systems resulted in segmentation violations. (Bug #9487)
• InnoDB: Assertion failures of types `ut_a(cursor->old_stored == BTR_PCUR_OLD_STORED) and prebuilt->template_type == 0` could occur when performing multi-table updates. This bug was introduced in 4.1.10 and 4.0.24. (Bug #9670)

• mysqld was not checking whether the PID file was successfully created. (Bug #5843)

• awk script portability problems were found in `cmd-line-utils/libedit/makelist.sh`. (Bug #9954)

• `SELECT ROUND(expr)` produced a different result from `CREATE TABLE ... SELECT ROUND(expr)`. (Bug #9837)

• `INSERT ... ON DUPLICATE KEY UPDATE` incorrectly updated a `TIMESTAMP` column to the current timestamp, even if the update list included `col_name = col_name` for that column to prevent the update. (Bug #7806)

• The `--delimiter` option for the `nds_select` program was nonfunctional. (Bug #10287)

• An error in the implementation of the MyISAM compression algorithm caused `myisampack` to fail with very large sets of data (total size of all the records in a single column needed to be at least 3 GB to trigger this issue). (Bug #8321)

• The error message for exceeding `MAX_CONNECTIONS_PER_HOUR` mistakenly referred to `max_connections`. (Bug #9947)

• A problem with `readline` caused the `mysql` client to crash when the user pressed `Control+R`. (Bug #9568)

• The warning message from `GROUP_CONCAT()` [875] did not always indicate the correct number of lines. (Bug #8681)

• Additional fix for `mysql_server_init()` and `mysql_server_end()` C API functions so that stopping and restarting the embedded server would not cause a crash. (Bug #7344)

• The `latin2_croatian_ci` collation was not sorted correctly. After upgrading to MySQL 4.1.12, all tables that have indexes using this collation are treated as crashed; for each such table, you must use `CHECK TABLE` and possibly repair the table.

  Support for the `cp1250_croatian_ci` collation was also added as part of the fix for this bug. (Bug #6505)

• A deadlock resulted from using `FLUSH TABLES WITH READ LOCK` while an `INSERT DELAYED` statement was in progress. (Bug #7823)

• InnoDB: Prevent `ALTER TABLE` from changing the storage engine if there are foreign key constraints on the table. (Bug #5574, Bug #5670)

• The optimizer did not compute the union of two ranges for the `OR` operator correctly. (Bug #9348)

• ENUM and SET columns in InnoDB tables were treated incorrectly as character strings. This bug did not manifest itself with latin1 collations, but it caused malfunction with utf8. Old tables will continue to work. In new tables, ENUM and SET will be stored internally as unsigned integers. (Bug #9526)

• MySQL no longer automatically blocks IP addresses for which `gethostbyname_r()` fails when the reason is that the DNS server is down. Thanks to Jeremy Cole for patch. (Bug #8467)

• Setting the initial `AUTO_INCREMENT` value for an InnoDB table using `CREATE TABLE ... AUTO_INCREMENT = n` did not work, and `ALTER TABLE ... AUTO_INCREMENT = n` did not reset the current value. (Bug #7061)
Changes in MySQL 4.1.12 (2005-05-13)

- **MAX()** [876] for an **INT UNSIGNED** (unsigned 4-byte integer) column could return negative values if the column contained values larger than $2^{31}$. (Bug #9298)

- Floats and doubles were not handled correctly when using the prepared statement API in the embedded server. (Bug #10443)

- For a user-defined function invoked from within a prepared statement, the UDF’s initialization routine was invoked for each execution of the statement, but the deinitialization routine was not. (It was invoked only when the statement was closed.) For UDFs that have an expensive deinit function (such as **myperl**), this fix has negative performance consequences. (Bug #9913)

- Use of a subquery that used **WITH ROLLUP** in the **FROM** clause of the main query sometimes resulted in a **Column cannot be null** error. (Bug #9681)

- **CAST(string_argument AS UNSIGNED)** [851] didn’t work for big integers above the signed range. Now this function and **CAST(string_argument AS SIGNED)** [851] also produces warnings for wrong string arguments. (Bug #7036)

- Memory block allocation did not function correctly for the query cache in the embedded server. (Bug #9549)

- Multiple-table updates could produce spurious data-truncation warnings if they used a join across columns that are indexed using a column prefix. (Bug #9103)

- A deadlock could occur on an update followed by a **SELECT** on an **InnoDB** table without any explicit locks being taken. **InnoDB** now takes an exclusive lock when **INSERT ON DUPLICATE KEY UPDATE** is checking duplicate keys. (Bug #7975)

- **mysql.cc** did not compile correctly using **VC++** on Windows. (Bug #10245)

- **CREATE TABLE ... LIKE** did not work correctly when **lower_case_table_names** was set on a case-sensitive file system and the source table name was not given in lowercase. (Bug #9761)

- Changed metadata for result of **SHOW KEYS**: Data type for **Sub_part** column now is **SMALLINT** rather than **TINYINT** because key part length can be longer than 255. (Bug #9439)

- In the client/server protocol for prepared statements, reconnection failed when the connection was killed with reconnection enabled. (Bug #8866)

- **my_print_defaults** was ignoring the **--defaults-extra-file** option or crashing when the option was given. (Bug #9851, Bug #9136)

- **mysql.server** no longer uses nonportable **alias** command or LSB functions. (Bug #9852)

- **InnoDB**: Crash recovery of **.ibd** files on Windows did not work correctly if **lower_case_table_names = 0** or **lower_case_table_names = 2** had been used; the directory scan used in crash recovery failed to force all paths to lowercase, so that the tablespace name was consistent with the **InnoDB** internal data dictionary.

- **mysqldump** dumped core when invoked with **--tmp** and **--single-transaction** options and a nonexistent table name. (Bug #9175)

- **InnoDB**: Add fault tolerance in the scan of **.ibd** files at a crash recovery; formerly a single failure of **readdir_get_next** caused the rest of the directory to be skipped.

- An **InnoDB** test suite failure was caused by a locking conflict between two server instances at server shutdown or startup. This conflict on advisory locks appears to be the result of a bug in the operating
Changes in MySQL 4.1.12 (2005-05-13)

- When `SELECT constant` was the final `SELECT` in a `UNION`, a trailing `LIMIT ...` worked, but a trailing `ORDER BY ...` or `ORDER BY ... LIMIT ...` did not. (Bug #10032)

- `CHAR` and `VARCHAR` columns that used the `sjis` character set were not being saved correctly, causing the following columns to be corrupted. (Bug #10493)

- A server installed as a Windows service and started with `--shared-memory` could not be stopped. (Bug #9665)

- Extraneous comparisons between `NULL` values in indexed columns were performed by the optimizer for operators such as `=` that are never true for `NULL`. (Bug #8877)

- In some cases, concurrent `DELETE` and `INSERT...SELECT` queries could crash the MySQL server. The issue was a problem in the key cache. (Bug #10167)

- For `MERGE` tables, avoid writing absolute path names in the `.MRG` file for the names of the constituent `MyISAM` tables so that if the data directory is moved, `MERGE` tables will not break. For `mysqld`, write just the `MyISAM` table name if it is in the same database as the `MERGE` table, and a path relative to the data directory otherwise. For the embedded servers, absolute path names may still be used. (Bug #5964)

- Indexes on `MyISAM` tables could sometimes be corrupted; this was the result of padding values with spaces for comparison: Dumping a table with `mysqldump`, reloading it, and then re-running the binary log against it crashed the index and required a repair. (Bug #9188)

- With `DISTINCT`, `CONCAT(col_name,...)` [787] returned incorrect results when the arguments to `CONCAT()` [787] were columns with an integer data type declared with a display width narrower than the values in the column. (For example, if an `INT(1)` column contained `1111`.) (Bug #4082)

- `RENAME TABLE` for an `ARCHIVE` table failed if the `.arn` file was not present. (Bug #9911)

- An error occurred if you specified a default value of `TRUE` or `FALSE` for a `BOOL` column. (Bug #9666)

- Starting `mysqld` with the `--skip-innodb` and `--default-storage-engine=innodb` (or `--default-table-type=innodb`) caused a server crash. (Bug #9815)

- `MERGE` tables could fail on Windows due to incorrect interpretation of path name separator characters for file names in the `.MRG` file. (Bug #10687)

- `net_read_timeout` and `net_write_timeout` were not being respected on Windows. (Bug #9721)

- `TIMEDIFF()` [832] with a negative time first argument and positive time second argument produced incorrect results. (Bug #8068)

- A segmentation fault in `mysqlcheck` occurred when the last table checked in `--auto-repair` mode returned an error (such as the table being a `MERGE` table). (Bug #9492)

- Remove extra slashes in `--tmpdir` value (for example, convert `/var//tmp` to `/var/tmp`, because they caused various errors. (Bug #8497)

- Corrected some failures of prepared statements for SQL (`PREPARE` plus `EXECUTE`) to return all rows for some `SELECT` statements. (Bug #9777, Bug #9096)

- The server did not compile correctly with MinGW. Our thanks to Nils Durner for the patch. (Bug #8872)

- `configure` did not properly recognize whether NPTL was available on Linux. (Bug #2173)

- `configure` did not check the system for atomic operations capabilities. (Bug #7970)
C.1.15 Changes in MySQL 4.1.11 (2005-04-01)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Functionality Added or Changed

- **MySQL Cluster; Replication**: Added a new global system variable `slave_transaction_retries`: If the replication slave SQL thread fails to execute a transaction because of an InnoDB deadlock or exceeded InnoDB’s `innodb_lock_wait_timeout` or NDBCLUSTER’s `TransactionDeadlockDetectionTimeout` [1261] or `TransactionInactiveTimeout` [1260], it automatically retries `slave_transaction_retries` times before stopping with an error. The default is 0, and you must explicitly set the value greater than 0 to enable the “retry” behavior. (Bug #8325)

- **MySQL Cluster**: More informative error messages are provided when a query is issued against an NDB table that has been modified by another mysqld server. (Bug #6762)

- **Replication**: For slave replication servers started with `--replicate-*` options, statements that should not be replicated according those options no longer are written to the slave’s general query log. (Bug #8297)

- **NULL** now is considered more coercible than string constants. This resolves some Illegal mix of collations conflicts.

- Added configuration directives `!include` and `!includedir` for including option files and searching directories for option files. See Section 4.2.3.3, “Using Option Files”, for usage.

- Modified the parser to permit `SELECT` statements following the `UNION` keyword to be subqueries in parentheses. (Bug #2435)

- Added `sql_notes` session variable to cause Note-level warnings not to be recorded. (Bug #6662)

- The coercibility for the return value of functions such as `USER()` [868] or `VERSION()` [868] now is “system constant” rather than “implicit.” This makes these functions more coercible than column values so that comparisons of the two do not result in Illegal mix of collations errors. `COERCIBILITY()` [863] was modified to accommodate this new coercibility value. See Section 11.13, “Information Functions”.

- Added `--with-big-tables` compilation option to `configure`. (Previously it was necessary to pass `--DBIG_TABLES` to the compiler manually to enable large table support.) See Section 2.9.3, “MySQL Source-Configuration Options”, for details.

- User variable coercibility has been changed from “coercible” to “implicit.” That is, user variables have the same coercibility as column values.

- The use of `SESSION` or `GLOBAL` is no longer permitted for user variables. (Bug #9286)

- InnoDB: Commit after every 10,000 copied rows when executing `CREATE INDEX`, `DROP INDEX` or `OPTIMIZE TABLE`, which are internally implemented as `ALTER TABLE`. This makes it much faster to recover from an aborted operation.

- `mysqld_safe` will create the directory where the UNIX socket file is to be located if the directory does not exist. This applies only to the last component of the directory path name. (Bug #8513)

- **ONLY_FULL_GROUP_BY** no longer is included in the ANSI composite SQL mode. (Bug #8510)
Bugs Fixed

- **Replication**: If multiple semicolon-separated statements were received in a single packet, they were written to the binary log as a single event rather than as separate per-statement events. For a server serving as a replication master, this caused replication to fail when the event was sent to slave servers. (Bug #8436)

- **Replication**: A replication master stamped a generated statement (such as a SET statement) with an error code intended only for another statement. This could happen, for example, when a statement generated a duplicate key error on the master but still had to be replicated to the slave. (Bug #8412)

- **Replication**: Treat user variables as having IMPLICIT derivation (coercibility) to avoid “Illegal mix of collations” errors when replicating user variables. (Bug #6676)

- **Replication**: If the slave was running with `--replicate-*-table` options which excluded one temporary table and included another, and the two tables were used in a single `DROP TEMPORARY TABLE IF EXISTS` statement, as the ones the master automatically writes to its binary log upon client’s disconnection when client has not explicitly dropped these, the slave could forget to delete the included replicated temporary table. Only the slave needs to be upgraded. (Bug #8055)

- The `tee` command could sometimes cause the `mysql` client to crash. (Bug #8499)

- **MATCH ... AGAINST** in natural language mode could cause a server crash if the FULLTEXT index was not used in a join (that is, `EXPLAIN` did not show `fulltext` join mode) and the search query matched no rows in the table. (Bug #8522)

- Unions between binary and nonbinary columns failed due to a collation coercibility problem. (Bug #6519)

- Conversion of strings to doubles is now more accurate for floating point values that can be represented by integers, such as `123.45E+02`. (Bug #7840)

- `REPAIR TABLE` did not invalidate query results in the query cache that were generated from the table. (Bug #8480)

- Using `NOW()` in a subquery caused the server to crash. (Bug #8824)

- **InnoDB**: Work around a problem in AIX 5.1 patched with ML7 security patch: **InnoDB** would refuse to open its `.ibdata` files, complaining about an operating system error 0.

- If the `mysql` prompt was configured to display the default database name, and that database was dropped, `mysql` did not update the prompt. (Bug #4802)

- Use of `GROUP_CONCAT(x)` in a subquery, where `x` was an alias to a column in the outer query, resulted in a server crash. (Bug #8656)

- For a query with both `GROUP BY` and `COUNT(DISTINCT)` clauses and a `FROM` clause with a subquery, `NULL` was returned for any `VARCHAR` column selected by the subquery. (Bug #8218)

- Changed `mysql_server_end()` C API function to restore more variables to their initial state so that a subsequent call to `mysql_server_init()` would not cause a client program crash. (Bug #7344)

- Setting the `max_error_count` system variable to 0 resulted in a setting of 1. (Bug #9072)

- In prepared statements, subqueries containing parameters were erroneously treated as `const` tables during preparation, resulting in a server crash. (Bug #8807)

- **InnoDB**: Honor the `--tmpdir` startup option when creating temporary files. Previously, **InnoDB** temporary files were always created in the temporary directory of the operating system. On Netware, **InnoDB** will continue to ignore `--tmpdir`. (Bug #5822)
Changes in MySQL 4.1.11 (2005-04-01)

• The `--set-character-set` option for `myisamchk` was changed to `--set-collation`. The value needed for specifying how to sort indexes is a collation name, not a character set name. (Bug #8349)

• With `lower_case_table_names` set to 1, `mysqldump` on Windows could write the same table name in different lettercase for different SQL statements. (Bug #8216)

• A rare race condition could cause `FLUSH TABLES WITH READ LOCK` to hang. (Bug #8682)

• Using a comparison where the left expression of `IN`, `ALL`, or `ANY` was a subquery caused the server to crash. (Bug #8888)

• Neither `SHOW ERRORS` nor `SHOW WARNINGS` were displaying Error-level messages. (Bug #6572)

• When the server was started with `--skip-name-resolve`, specifying host name values that included netmasks in `GRANT` statements did not work. (Bug #8471)

• Table creation for a `MyISAM` table failed if `DATA DIRECTORY` or `INDEX DIRECTORY` options were given that specified the path name to the database directory where the table files would be created by default. (Bug #8707)

• Matching of table names by `mysqlhotcopy` now accommodates `DBD::mysql` versions 2.9003 and up, which implement identifier quoting. (Bug #8136)

• `mysqldump` misinterpreted “” and “$” characters in the names of tables to be dumped as wildcard characters. (Bug #9123)

• On Windows, create shared memory objects with the proper access rights to make them usable when the client and server are running under different accounts. (Bug #8226)

• InnoDB: If one used `LOCK TABLES`, created an InnoDB temp table, and did a multiple-table update where a `MyISAM` table was the update table and the temp table was a read table, then InnoDB asserted in `row0sel.c` because `n_mysql_tables_in_use` was 0. Also, we remove the assertion altogether and just print an error to the `.err` log if this important consistency check fails. (Bug #8677)

• Accented letters were improperly treated as distinct by the `utf_general_ci` collation. (Bug #7878)

• Using `TIMESTAMP` columns with no minute or second parts in `GROUP BY` clauses with the `new` system variable set to 1 caused the server to crash. (Bug #9401)

• The `utf8_spanish2_ci` and `ucs2_spanish2_ci` collations no longer consider `r` equal to `rr`. If you upgrade to this version from an earlier version, you should rebuild the indexes of any affected tables. (Bug #9269)

• Privileges could be escalated using database wildcards in `GRANT` statements. (CVE-2004-0957)

• Made the `relay_log_space_limit` system variable show up in the output of `SHOW VARIABLES`. (Bug #7100)

• `my_print_defaults` ignored the `--defaults-extra-file` and `--defaults-file` options.

• Some user variables were not being handled with “implicit” coercibility. (Bug #9425)

• `mysqldump` now avoids writing `SET NAMES` to the dump output if the server is older than version 4.1 and would not understand that statement. (Bug #7997)

• Worked around a bug in support for NSS support in `glibc` when static linking is used and LDAP is one of the NSS sources. The workaround is to detect when the bug causes a segmentation fault and issue a diagnostic message with information about the problem. (Bug #4872, Bug #3037)
• An expression that tested a case-insensitive character column against string constants that differed in lettercase could fail because the constants were treated as having a binary collation. (For example, WHERE city='London' AND city='london' could fail.) (Bug #7098, Bug #8690)

• **InnoDB**: If InnoDB cannot allocate memory, keep retrying for 60 seconds before we intentionally crash mysqld; maybe the memory shortage is just temporary.

• When using the cp1250_czech_cs collation, empty literal strings were not regarded as equal to empty character columns. (Bug #8840)

• **InnoDB**: If MySQL wrote to its binlog, but for some reason `trx->update_undo` and `trx->insert_undo` were NULL in InnoDB, then `trx->commit_lsn` was garbage, and InnoDB could assert in the log flush of `trx_commit_complete_for_mysql()`. (Bug #9277)

• When setting integer system variables to a negative value with `SET VARIABLES`, the value was treated as a positive value modulo $2^{32}$. (Bug #6958)

• Too many rows were returned from queries that combined `ROLLUP` and `LIMIT` if `SQL_CALC_FOUND_ROWS` was given. (Bug #8617)

• A problem with static variables did not permit building the server on Fedora Core 3. (Bug #6554)

• Platform and architecture information in version information produced for `--version` option on Windows was always Win95/Win98. More accurately determine platform as Win32 or Win64 for 32-bit or 64-bit Windows, and architecture as ia32 for x86, ia64 for Itanium, and axp for Alpha. (Bug #4445)

• The use of `XOR` together with `NOT ISNULL()` erroneously resulted in some outer joins being converted to inner joins by the optimizer. (Bug #9017)

• Subqueries using `ALL` or `ANY` that contained a `HAVING` clause did not work correctly. (Bug #9350)

• The `MAX_CONNECTIONS_PER_HOUR` resource limit was not being reset hourly and thus imposed an absolute limit on number of connections per account until the server is restarted or the limits flushed. (Bug #8350)

• `LIKE` pattern-matching for strings did not work correctly with the `cp1251_bin` collation. (Bug #8560)

• Expressions involving nested `CONCAT()` calls and character set conversion of string constants could return an incorrect result. (Bug #8785)

• Creating a table using a name containing a character that is illegal in `character_set_client` resulted in the character being stripped from the name and no error. The character now is considered an error. (Bug #8041)

• Host name matching didn't work if a netmask was specified for table-specific privileges. (Bug #3309)

• Binary data stored in `BLOB` or `BINARY` columns would be erroneously dumped if `mysqldump` was invoked with `--hex-blob` and `--skip-extended-insert` arguments. This happened if data contained characters larger then 0x7F. (Bug #8830)

• Mixed-case database and table names in the grant tables were ignored for authentication if the `lower_case_table_names` system variable was set. `GRANT` will not create such privileges when `lower_case_table_names` is set, but it is possible to create them by direct manipulation of the grant tables, or that old grant records were present before setting the variable. (Bug #7989)

• The bundled `readline` library caused a segmentation fault in `mysql` when the user entered `Shift+Enter`. (Bug #5672)
• Killing a filesort could cause an assertion failure. (Bug #8799)

• Permit extra HKSCS and cp950 characters (big5 extension characters) to be accepted in big5 columns. (Bug #9357)

• Do not try to space-pad BLOB columns containing ucs2 characters. (Bug #8771)

References: This bug was introduced by Bug #7350.

• Incorrectly ordered results were returned from a query using a FULLTEXT index to retrieve rows and there was another index that was usable for ORDER BY. For such a query, EXPLAIN showed the fulltext join type, but showed the other (not FULLTEXT) index in the Key column. (Bug #6635)

• The CHARSET() [862], COLLATION() [863], and COERCIBILITY() [863] functions sometimes returned NULL. CHARSET() [862] and COLLATION() [863] returned NULL when given any of these arguments that evaluated to NULL: A system function such as DATABASE() [864]; a column value; and a user variable. Now CHARSET() [862] and COLLATION() [863] return the system character set and collation; the column character set and collation; and binary.COERCIBILITY(NULL) [863] now returns "ignorable" coercibility rather than NULL. (Bug #9129)

• Fixed option-parsing code for the embedded server to understand K, M, and G suffixes for the net_buffer_length and max_allowed_packet options. (Bug #9472)

• FOUND_ROWS() [864] returned an incorrect value for preceding SELECT statements that used no table or view. (Bug #6089)

• Incorrect results were returned from queries that combined SELECT DISTINCT, GROUP BY, and ROLLUP. (Bug #8616)

• When performing boolean full-text searches on utf8 columns, a double-quote character in the search string caused the server to crash. (Bug #8351)

• A problem in index cost calculation caused a USE INDEX or FORCE INDEX hint not to be used properly for a LEFT JOIN across indexed BLOB columns. (Bug #7520)

• In string literals with an escape character ("\") followed by a multi-byte character that has a second byte of "\", the literal was not interpreted correctly. The next character now is escaped, not just the next byte. (Bug #8303)

• perror was printing a spurious extra line of output (“Error code ###: Unknown error ###” printed directly before the correct line with the error message). (Bug #8517)

• OPTIMIZE TABLE was written twice to the binary log when used on InnoDB tables. (Bug #9149)

• Ordering by an unsigned expression (more complex than a column reference) was treating the value as signed, producing incorrectly sorted results. HAVING was also treating unsigned columns as signed. (Bug #7425)

• The MEMORY storage engine did not properly increment an AUTO_INCREMENT column if there was a second composite index that included the column. (Bug #8489)

• The output of the STATUS (\s) command in mysql had the values for the server and client character sets reversed. (Bug #7571)

• ENUM and SET columns in privilege tables incorrectly had a case-sensitive collation, resulting in failure of assignments of values that did not have the same lettercase as given in the column definitions. The collation was changed to be case insensitive. (Bug #7617)
Changes in MySQL 4.1.11 (2005-04-01)

• **InnoDB**: A table with a primary key that contained at least two column prefixes was prone to memory corruption. An example of an affected `CREATE TABLE` statement is shown here:

```sql
CREATE TABLE t  (
  a CHAR(100),
  b TINYBLOB,
  PRIMARY KEY(a(5), b(10))
);
```

• If a **MyISAM** table on Windows had **INDEX DIRECTORY** or **DATA DIRECTORY** table options, `mysqldump` dumped the directory path names with single-backslash path name separators. This would cause syntax errors when importing the dump file. `mysqldump` now changes "\" to "/" in the path names on Windows. (Bug #6660)

• For a statement string that contained multiple slow queries, only the last one would be written to the slow query log. (Bug #8475)

• `MIN(col_name)` [876] and `MAX(col_name)` [876] could fail to produce the correct result if `col_name` was contained in multiple indexes and the optimizer did not choose the first index that contained the column. (Bug #8893)

• For **MyISAM** tables, **REPAIR TABLE** no longer discard rows that have incorrect checksum. (Bug #9824)

• The data type for `MAX(datetime_col)` [876] was returned as VARCHAR rather than DATETIME if the query included a `GROUP BY` clause. (Bug #5615)

• Depending on index statistics, `GROUP BY col1, col2, ...` could return incorrect results if the first table processed for a join had several indexes that cover the grouped columns. (Bug #9213)

• A join on two tables failed when each contained a **BIGINT UNSIGNED** column that were compared when their values exceeded $2^{63} - 1$. The match failed and the join returned no rows. (Bug #8562)

• **BLOB(M)** and **TEXT(M)** columns, with $M$ less than 256, were being created as **BLOB** and **TEXT** columns rather than **TINYBLOB** or **TINYTEXT** columns. (Bug #9303)

• `AES_DECRYPT(col_name, key)` [857] could fail to return NULL for invalid values in `col_name`, if `col_name` was declared as NOT NULL. (Bug #8669)

• **InnoDB**: An error in `mysqld` caused **InnoDB** in MySQL 4.1.8 to 4.1.10 **InnoDB** to refuse to use a table created with MySQL 3.23.49 or earlier if it was in the new compact **InnoDB** table format of 5.0.3 or later.

  **Workaround.** Upgrade to 4.1.11 or newer, or dump the table and re-create it with MySQL 3.23.50 or newer before upgrading.

• If `max_join_size` was set, a query containing a subquery that exceeded the examined-rows limit could hang. (Bug #8726)

• With a database was dropped with `lower_case_table_names = 2`, tables in the database also were dropped but not being flushed properly from the table cache. If the database was re-created, the tables also would appear to have been re-created. (Bug #8355)

• Retrieving from a view defined as a `SELECT` that mixed `UNION ALL` and `UNION DISTINCT` resulted in a different result than retrieving from the original `SELECT`. (Bug #8565)

• Corruption of **MyISAM** table indexes could occur with **TRUNCATE TABLE** if the table had already been opened. For example, this was possible if the table had been opened implicitly by selecting from a `MERGE` table that mapped to the **MyISAM** table. The server now issues an error message for **TRUNCATE TABLE** under these conditions. (Bug #8306)
• The Cyrillic letters I (И) and SHORT I (Й) were treated as being the same character by the utf8_general_ci collation. (Bug #8385)

• Queries that combined SELECT DISTINCT, SUM() [876], and ROLLUP could cause the MySQL server to crash. (Bug #8615)

• The CHAR() [786] function was not ignoring NULL arguments, contrary to the documentation. (Bug #6317)

• Bundled zlib in the source distribution was upgraded to 1.2.2. (Bug #9118)

C.1.16 Changes in MySQL 4.1.10 (2005-02-12)

End of Product Lifecycle.  Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Note
The security improvements related to creation of table files and to user-defined functions were made after MySQL 4.1.10 was released and are present in MySQL 4.1.10a. We would like to thank Stefano Di Paola <stefano.dipaola@wisec.it> for making us aware of these.

Functionality Added or Changed

• Setting the connection collation to a value different from the server collation followed by a CREATE TABLE statement that included a quoted default value resulted in a server crash. (Bug #8235)

• Added mysql_library_init() and mysql_library_end() as synonyms for the mysql_server_init() and mysql_server_end() C API functions. mysql_library_init() and mysql_library_end() are #define symbols, but the names more clearly indicate that they should be called when beginning and ending use of a MySQL C API library no matter whether the application uses libmysqlclient or libmysqld. (Bug #6149)

• InnoDB: A shared record lock (LOCK_REC_NOT_GAP) is now taken for a matching record in the foreign key check because inserts can be permitted into gaps.

• Thread stack size was increased from 192KB to 256KB on Linux/IA-64 (too small stack size was causing server crashes on some queries). (Bug #8391)

• The server now issues a warning when lower_case_table_names = 2 and the data directory is on a case-sensitive file system, just as when lower_case_table_names = 0 on a case-insensitive file system. (Bug #7887)

• Security improvement: The server creates .frm, .MYD, .MYI, .MRG, .ISD, and .ISM table files only if a file with the same name does not already exist. Thanks to Stefano Di Paola <stefano.dipaola@wisec.it> for finding and informing us about this issue. (CVE-2005-0711)

• Added back faster subquery execution from 4.1.8. This adds also back a bug from 4.1.8 in comparing NULL to the value of a subquery.

• Security improvement: User-defined functions should have at least one symbol defined in addition to the xxx symbol that corresponds to the main xxx() function. These auxiliary symbols correspond to the xxx_init(), xxx_deinit(), xxx_reset(), xxx_clear(), and xxx_add() functions. mysqld by default no longer loads UDFs unless they have at least one auxiliary symbol defined in addition to the main symbol. The --allow-suspicious-udfs option controls whether UDFs
Changes in MySQL 4.1.10 (2005-02-12)

that have only an xxx symbol can be loaded. By default, the option is off. mysqld also checks UDF file names when it reads them from the mysql.func table and rejects those that contain directory path name separator characters. (It already checked names as given in CREATE FUNCTION statements.) See Section 18.2.2.1, “UDF Calling Sequences for Simple Functions”, Section 18.2.2.2, “UDF Calling Sequences for Aggregate Functions”, and Section 18.2.2.6, “User-Defined Function Security Precautions”. Thanks to Stefano Di Paola <stefano.dipaola@wisec.it> for finding and informing us about this issue. (CVE-2005-0709, CVE-2005-0710)

• InnoDB: When MySQL/InnoDB is compiled on Mac OS X 10.2 or earlier, detect the operating system version at run time and use the fcntl() file flush method on Mac OS X versions 10.3 and later. In Mac OS X, fsync() does not flush the write cache in the disk drive, but the special fcntl() does; however, the flush request is ignored by some external devices. Failure to flush the buffers may cause severe database corruption at power outages.

• From the Windows distribution, predefined accounts without passwords for remote users ('root'@'%', ''@'%'') were removed (other distributions never had them).

• InnoDB: Relaxed locking in INSERT ... SELECT, single table UPDATE ... (SELECT) and single table DELETE ... (SELECT) clauses when innodb_locks_unsafe_for_binlog is used and isolation level of the transaction is not SERIALIZABLE. InnoDB uses consistent read in these cases for a selected table.

• The server now issues a warning to the error log when it encounters older tables that contain character columns that might be interpreted by newer servers to have a different column length. See Section 2.11.1.1, “Upgrading from MySQL 4.0 to 4.1”, for a discussion of this problem and what to do about it. (Bug #6913)

Bugs Fixed

• Replication: Multiple-table updates did not replicate properly to slave servers where --replicate-*-table options had been specified. (Bug #7011)

• The CONVERT_TZ() [820] function, when its second or third argument was from a const table, caused the server to crash. (See Section 12.7.2, “EXPLAIN Syntax”.) (Bug #7705)

• FOUND_ROWS() [864] returned an incorrect value after a SELECT SQL_CALC_FOUND_ROWS DISTINCT statement that selected constants and included GROUP BY and LIMIT clauses. (Bug #7945)

• The CONV() [810] function returned an unsigned BIGINT number, which does not fit in 32 bits. (Bug #7751)

• TIMESTAMP columns with their display width so specified were not treated as identical to DATETIME columns when the server was run in MAXDB mode. (Bug #7418)

• MySQL permitted concurrent updates (including inserts and deletes) to a table if binary logging was enabled. Now, all updates are executed in a serialized fashion, because they are executed serialized when the binary log is replayed. (Bug #7879)

• The TIMEDIFF() [832] function returned incorrect results if one of its arguments had a nonzero microsecond part. (Bug #7856)

• InnoDB: ALTER TABLE ... ADD CONSTRAINT PRIMARY KEY ... complained about bad foreign key definition. (Bug #7831)

• Updates were being written to the binary log when there were binlog-do-db or binlog-ignore-db options even when there was no current database, contrary to Section 14.9.1, “Evaluation of Database-Level Replication and Binary Logging Options”. (Bug #6749)
Changes in MySQL 4.1.10 (2005-02-12)

- **SHOW INDEX** on a **MERGE** table could cause debug versions of the server to crash. (Bug #7377)

- The number of columns in a row comparison against a subquery was calculated incorrectly. (Bug #8020)

- Conversion of floating-point values to character values was not performed correctly when the absolute value of the float was less than 1 (including negative values). (Bug #7774)

- For indexes, **SHOW CREATE TABLE** now displays the index type even if it is the default, for storage engines that support multiple index types. (Bug #7235)

- A slave running MySQL 3.23.51 or newer hung while trying to connect to a master running MySQL 3.23.50 or older. (This occurred due to a bug in the old masters—`SELECT @@unknown_var` caused the server to hang—which was fixed in MySQL 3.23.50.) (Bug #7965)

- **mysqld** had problems finding its language files if the **--basedir** value was specified as a very long path name. (Bug #8015)

- **InnoDB**: A rare race condition could cause an assertion in **DROP TABLE** or in **ALTER TABLE**.

- **ALTER TABLE** on a **TEMPORARY** table with a mixed-lettercase name could cause the table to disappear when **lower_case_table_names** was set to 2. (Bug #7261)

- Multiple-table **UPDATE** statements could cause spurious **Table '##sql.....' is full** errors if the number of rows to update was sufficiently large. (Bug #7788)

- **LOAD INDEX** statement now loads the index into memory. (Bug #8452)

- Corrected a problem with references to **DUAL** where statements such as **SELECT 1 AS a FROM DUAL** would succeed but statements such as **SELECT 1 AS a FROM DUAL LIMIT 1** would fail. (Bug #8023)

- Strings that began with **CHAR(31)** were considered equal to the empty string. (Bug #8134)

- Executing a multi-statement query more than once with the query cache active could yield incorrect result sets. (Bug #7966)

- **InnoDB**: Fixed a bug introduced in 4.1.9, where, if you used **innodb_file_per_table** with the Windows version of MySQL, **mysqld** stopped with Windows error 87. (See the Bugs database or the MySQL 4.1.9 changelog for information about a workaround for the issue in 4.1.9). (Bug #8021)

- If one used **CONVERT_TZ()** function in **SELECT**, which in its turn was used in **CREATE TABLE** statements, then system time zone tables were added to list of tables joined in **SELECT** and thus erroneous result was produced. (Bug #7899)

- If multiple prepared statements were executed without retrieving their results, executing one of them again would cause the client program to crash. (Bug #8330)

- The **IN()** operator did not return correct results if all values in the list were constants and some of them used substring functions such as **LEFT()**, **RIGHT()**, or **MID()**. (Bug #7716)

- Nonnumeric values inserted into a **YEAR** column were being stored as 2000 rather than as 0000. (Bug #6067)

- The combination of **~not** and **trunc* operators in a full-text search did not work correctly. Using more than one truncated negative search term caused the result to be empty.

- **SHOW INDEX** reported **Sub_part** values in bytes rather than characters for columns with a multi-byte character set. (Bug #7943)
Changes in MySQL 4.1.10 (2005-02-12)

- Adding an ORDER BY clause for an indexed column caused a SELECT to return an empty result. (Bug #7331)

- InnoDB: Use native tmpfile() function on Netware. All InnoDB temporary files are created under sys:\tmp. Previously, InnoDB temporary files were never deleted on Netware.

- CREATE TABLE ... LIKE failed on Windows when the source or destination table was located in a symlinked database directory. (Bug #6607)

- Re-execution of prepared statements containing subqueries caused the server to crash. (Bug #8125)

- ALTER TABLE improperly accepted an index on a TIMESTAMP column that CREATE TABLE would reject. (Bug #7884)

- Handling of trailing spaces was incorrect for the ucs2 character set. (Bug #7350)

- Certain correlated subqueries with forward references (referring to an alias defined later in the outer query) could crash the server. (Bug #8025)

- Key cache statistics were reported incorrectly by the server after receipt of a SIGHUP signal. (Bug #4285)

- Correct a problem with mysql_config, which was failing to produce proper zlib option for linking under some circumstances. (Bug #6273)

- Comparing a nested row expression (such as ROW(1, (2, 3))) with a subquery caused the server to crash. (Bug #8022)

- mysqlbinlog forgot to add backquotes around the collation of user variables (causing later parsing problems as BINARY is a reserved word). (Bug #7793)

- A symlink vulnerability in the mysqlaccess script was reported by Javier Fernandez-Sanguino Pena and Debian Security Audit Team. (CVE-2005-0004)

- A HAVING clause that referred to RAND() [814] or a user-defined function in the SELECT part of a query through an alias could cause MySQL to crash or to return an incorrect value. (Bug #5185)

- Erroneous output resulted from SELECT DISTINCT combined with a subquery and GROUP BY. (Bug #7946)

- Column headers in query results retrieved from the query cache could be corrupted when a non-4.1 client was served a result originally generated for a 4.1 client. The query cache was not keeping track of which client/server protocol was being used. (Bug #6511)

- Modify SET statements produced by mysqldump to write quoted strings using single quotation marks rather than double quotation marks. This avoids problems if the dump file is reloaded while the ANSI_QUOTES SQL mode is in effect. (Bug #8148)

- Changed mysql client so that including \\p as part of a prompt command uses the name of the shared memory connection when the connection is using shared memory. (Bug #7922)

- Cardinality estimates for HASH indexes of TEMPORARY tables created using MEMORY storage engine were inaccurate. As a result, queries that were using this index (as shown by EXPLAIN) could returned incorrect results. (Bug #8371)

- Add description of debug command to mysqladmin help output. (Bug #8207)

- A problem with UNION statements resulted in the wrong number of examined rows being reported in the slow query log.
Changes in MySQL 4.1.9 (2005-01-11)

- DELETE FROM tbl_name ... WHERE ... ORDER BY tbl_name.col_name when the ORDER BY column was qualified with the table name caused the server to crash. (Bug #8392)
- mysql_stmt_close() C API function was not clearing an error indicator when a previous prepare call failed, causing subsequent invocations of error-retrieving calls to indicate spurious error values. (Bug #7990)
- mysql_stmt_prepare() was very slow when used in client programs on Windows. (Bug #5787)
- A Table is full error occurred when the table was still smaller than max_heap_table_size. (Bug #7791)
- perror.exe was always returning “Unknown error” on Windows. See Section 4.8.1, “perror — Explain Error Codes”. (Bug #7390)
- Removed a dependence of boolean full-text search on --default-character-set option. (Bug #8159)
- Comparing the result of a subquery to a nonexistent column caused the server to crash. This issue affected MySQL on Windows platforms only. (Bug #7885)
- Use of GROUP_CONCAT() [875] with HAVING caused the server to crash. (Bug #7769)
- Certain joins used with boolean full-text search could cause the server to crash. (Bug #8234)
- Ensured that mysqldump --single-transaction sets its transaction isolation level to REPEATABLE READ before proceeding (otherwise if the MySQL server was configured to run with a default isolation level lower than REPEATABLE READ it could give an inconsistent dump). (Bug #7850)

C.1.17 Changes in MySQL 4.1.9 (2005-01-11)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Functionality Added or Changed

- mysqld_safe no longer tests for the presence of the data directory when using a relatively located server binary. It just assumes the directory is there, and fails to start up if it is not. This permits the data directory location to be specified on the command line, and avoids running a server binary that was not intended. (Bug #7249)
  References: See also Bug #7518.
- The MySQL server aborts immediately instead of simply issuing a warning if it is started with the --log-bin option but cannot initialize the binary log at startup (that is, an error occurs when writing to the binary log file or binary log index file).
- The platform suffix was changed from -win to -win32
- InnoDB: Print a more descriptive error and refuse to start InnoDB if the size of ibdata files is smaller than what is stored in the tablespace header; innodb_force_recovery overrides this.
- The MySQL-shared-compat Linux RPM now includes the 3.23 as well as the 4.0 libmysqlclient.so shared libraries. (Bug #6342)
- The product descriptions --noinstall and --essential have been moved in front of the version number
Changes in MySQL 4.1.9 (2005-01-11)

- The binary log file and binary log index file now behave like MyISAM when there is a "disk full" or "quota exceeded" error. See Section B.5.4.3, "How MySQL Handles a Full Disk".

- InnoDB: Do not acquire an internal InnoDB table lock in LOCK TABLES if autocommit = 1. This helps in porting old MyISAM applications to InnoDB. InnoDB table locks in that case caused deadlocks very easily.

- Seconds_Behind_Master is NULL (which means "unknown") if the slave SQL thread is not running, or if the slave I/O thread is not running or not connected to master. It is zero if the SQL thread has caught up with the I/O thread. It no longer grows indefinitely if the master is idle.

- The naming scheme of the Windows installation packages has changed slightly:
  - The platform suffix was changed from -win to -win32
  - The product descriptions -noinstall and -essential have been moved in front of the version number

Examples: mysql-essential-4.1.9-win32.msi, mysql-noinstall-4.1.9-win32.zip See Section 2.3, "Installing MySQL on Microsoft Windows".

- The Mac OS X 10.3 installation disk images now include a MySQL Preference Pane for the Mac OS X Control Panel that enables the user to start and stop the MySQL server using the GUI and activate and deactivate the automatic MySQL server startup on bootup.

Bugs Fixed

- Replication: A replication slave could crash after replicating many ANALYZE TABLE, OPTIMIZE TABLE, or REPAIR TABLE statements from the master. (Bug #6461, Bug #7658)

- FLOAT values were not truncated correctly. (Bug #7361)

- When encountering a disk full or quota exceeded write error, MyISAM sometimes failed to sleep and retry the write, resulting in a corrupted table. (Bug #7714)

- Include compression library flags in the output from mysql_config --lib_r. (Bug #7021)

- Made the MySQL server accept executing SHOW CREATE DATABASE even if the connection has an open transaction or locked tables. Refusing it made mysqldump --single-transaction sometimes fail to print a complete CREATE DATABASE statement for some dumped databases. (Bug #7358)

- Corrected a problem with mysql_config not producing all relevant flags from CFLAGS. (Bug #6964)

- mysqladmin password now checks whether the server has the old_passwords enabled or predates 4.1 and uses the old-format password if so. (Bug #7451)

- Running mysql_fix_privilege_tables could result in grant table columns with lengths that were too short if the server character set had been set to a multi-byte character set first. (Bug #7539)

- Incorrect results were obtained for complex datetime expressions containing casts of datetime values to TIME or DATE values. (Bug #6914)

- InnoDB: InnoDB failed to drop a table in the background drop queue if the table was referenced by a FOREIGN KEY constraint.

- PROCEDURE ANALYSE() did not quote some ENUM values properly. (Bug #2813)

- Using INSERT DELAYED with prepared statements could lead to table corruption.
Changes in MySQL 4.1.8 (2004-12-14)

- **InnoDB**: When `DISCARD TABLESPACE` failed because the table was referenced by a foreign key, the error code returned did not indicate that this was the case.

- **InnoDB**: Dropping a table where an `INSERT` was waiting for a lock to check a `FOREIGN KEY` constraint caused an assertion.

- **InnoDB**: The storage of an SQL `NULL` value in some rare cases took more space than should have been required.

- Corrected a problem with `mysql_safe` not properly capturing output from `ps`. (Bug #5878)

- `--expire-logs-days` was not honored if using only transactions. (Bug #7236)

- Microseconds were dropped from the string result of the `STR_TO_DATE` function, when there was some other specifier in the format string following `%f`. (Bug #7458)

- **InnoDB**: Use the `fcntl(F_FULLFSYNC)` flush method on Mac OS X versions 10.3 and up instead of `fsync()` that could cause corruption at power outages.

- Added a `--default-character-set` option to `mysqladmin` to avoid problems when the default character set is not `latin1`. (Bug #7524)

- Linking both the MySQL client library and IMAP library in the same build failed. (Bug #7428)

- **InnoDB**: When `innodb_file_per_table` was enabled in `my.cnf`, records could disappear from the secondary indexes of a table after `mysqld` was killed.

  **Note**
  
  This fix introduced a new Bug #8021, affecting Windows and users of `innodb_file_per_table` only. If you are using `innodb_file_per_table` on Windows, you can work around this new issue by adding the line `innodb_flush_method=unbuffered` to the `my.cnf` or `my.ini` file.

  (Bug #7496)

- **InnoDB**: 32-bit `mysqld` binaries built on HP-UX 11 did not work with InnoDB files greater than 2 GB in size. (Bug #6189)

**C.1.18 Changes in MySQL 4.1.8 (2004-12-14)**

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

**Note**

Due to a `libtool`-related bug in the source distribution, the creation of shared `libmysqlclient` libraries was not possible (the resulting files were missing the `.so` file name extension). The file `ltmain.sh` was updated to fix this problem and the resulting source distribution was released as `mysql-4.1.8a.tar.gz`. This modification did not affect the binary packages. (Bug #7401)

**Functionality Added or Changed**

- **MySQL Cluster**: Added support for a `[mysql_cluster]` section to the `my.cnf` file for configuration settings specific to MySQL Cluster. The `ndb-connectstring` variable was moved here.
Changes in MySQL 4.1.8 (2004-12-14)

• **Replication:** `mysqldump --single-transaction --master-data` is now able to take an online (nonblocking) dump of InnoDB and report the corresponding binary log coordinates, which makes a backup suitable for point-in-time recovery, roll-forward or replication slave creation. See Section 4.5.4, "mysqldump — A Database Backup Program".

• Added `mysql_hex_string()` C API function that hex-encodes a string.

• **InnoDB:** Do not periodically write `SHOW INNODB STATUS` information to a temporary file unless the configuration option `innodb-status-file = 1` is set.

• **FULLTEXT** index block size is changed to be 1024 instead of 2048.

• **InnoDB:** Commit after every 10,000 copied rows when executing `ALTER TABLE`. This makes it much faster to recover from an aborted `ALTER TABLE` or `OPTIMIZE TABLE`.

• Added `--order-by-primary` to `mysqldump`, to sort each table's data in a dump file. This may be useful when dumping a MyISAM table which will be loaded into an InnoDB table. Dumping a MyISAM table with this option is considerably slower than without.

• Added `--hex-blob` option to `mysqldump` for dumping binary string columns using hexadecimal notation.

• The `--master-data` option for `mysqldump` now takes an optional argument of 1 or 2 to produce a noncommented or commented `CHANGE MASTER TO` statement. The default is 1 for backward compatibility.

• The statements `CREATE TABLE`, `TRUNCATE TABLE`, `DROP DATABASE`, and `CREATE DATABASE` cause an implicit commit.

• Added `WITH CONSISTENT SNAPSHOT` clause to `START TRANSACTION` to begin a transaction with a consistent read.

• For `ALTER DATABASE`, the database name now can be omitted to apply the change to the default database.

• Automatic character set conversion formerly was done for operations that mix a column and a string such as assigning a string to a column, when this was possible without loss of information. Automatic conversion for operations that mix columns and strings has been expanded to cover many functions (such as `CONCAT()` [787]) and assignment operators. This reduces the frequency of `Illegal mix of collations` errors.

• Added `--disable-log-bin` option to `mysqlbinlog`. Using this option you can disable binary logging for the statements produced by `mysqlbinlog`. That is, `mysqlbinlog --disable-log-bin <file_name> | mysql` won't write any statements to the MySQL server binary log.

• `mysqlbinlog` now prints an informative commented line (thread id, timestamp, server id, and so forth) before each `LOAD DATA INFILE`, like it does for other queries; unless `--short-form` is used.

• In the normal log MySQL now prints the log position for Binlog Dump requests.

• Added `--lock-all-tables` to `mysqldump` to lock all tables by acquiring a global read lock.

• A connection doing a rollback now displays “Rolling back” in the `State` column of `SHOW PROCESSLIST`.

Bugs Fixed

• **Replication:** `OPTIMIZE TABLE`, `REPAIR TABLE`, and `ANALYZE TABLE` are now replicated without any error code in the binary log. (Bug #5551)
• **Replication:** *LOAD DATA INFILE* now works with option `replicate-rewrite-db`. (Bug #6353)

• **Replication:** Changed semantics of `CREATE/ALTER/DROP DATABASE` statements so that replication of `CREATE DATABASE` is possible when using `--binlog-do-db` and `--binlog-ignore-db`. (Bug #6391)

• **Replication:** InnoDB: If one used `INSERT IGNORE` to insert several rows at a time, and the first inserts were ignored because of a duplicate key collision, then InnoDB in a replication slave assigned `AUTO_INCREMENT` values 1 bigger than in the master. This broke the MySQL replication. (Bug #6287)

• Using a modified client library, a malicious user could take advantage of an issue in MySQL authentication code to crash the server with specially crafted packets. (Bug #7187)

• Prevent adding `CREATE TABLE .. SELECT` query to the binary log when the insertion of new records partially failed. (Bug #6682)

• Server warnings now are reset when you execute a prepared statement.

• InnoDB: Do not intentionally crash `mysqld` if the buffer pool is exhausted by the lock table; return error 1206 instead. Do not intentionally crash `mysqld` if we cannot allocate the memory for the InnoDB buffer pool. (Bug #6817, Bug #6827)

• If a connection was interrupted by a network error and did a rollback, the network error code got stored into the `BEGIN` and `ROLLBACK` binary log events; that caused superfluous slave stops. (Bug #6522)

• InnoDB: `innodb_data_file_path` was not handled correctly in some cases. This bug was introduced in MySQL 4.1.1.

• InnoDB: Let the InnoDB FOREIGN KEY parser remove the `latin1` character 0xA0 from the end of an unquoted identifier. The EMS MySQL Manager in `ALTER TABLE` adds that character after a table name, which caused error 121 when we tried to add a new constraint.

• A spurious "duplicate key" error resulted from executing a `REPLACE` or `INSERT ... ON DUPLICATE KEY UPDATE` statement performing a multiple-row insert on a table having unique and full-text indexes. (Bug #6784)

• InnoDB: Made the foreign key parser better aware of quotation marks. (Bug #6340)

• `mysqlbinlog` did not print `SET PSEUDO_THREAD_ID` statements in front of `LOAD DATA INFILE` statements inserting into temporary tables, thus causing potential problems when rolling forward these statements after restoring a backup. (Bug #6671)

• A reference to a column by name from a `WHERE` subquery to an outer query, with use of a temporary table by the outer query. (Bug #7079)

• A spurious `Record has changed since last read in table` error could be raised by some queries on `HEAP` tables containing only one row. (Bug #7478)

• Improved performance of identifier comparisons (if many tables or columns are specified).

• Execution of subqueries in `SET` and `DO` statements caused wrong results to be returned from subsequent queries. (Bug #6462)

• A multiple-table `DELETE` could cause MySQL to crash when using InnoDB tables. (Bug #6378, Bug #5837)

• If a connection had an open transaction but had done no updates to transactional tables (for example if had just done a `SELECT FOR UPDATE` then executed a nontransactional update, that update automatically committed the transaction (thus releasing InnoDB’s row-level locks etc). (Bug #5714)
Changes in MySQL 4.1.8 (2004-12-14)

- **INSERT** on a table with **FULLTEXT** indexes, could under rare circumstances result in a corrupted table if words of different lengths could be considered equal. This is possible in some collations such as `utf8_general_ci` and `latin1_german2_ci`. (Bug #6265)

- `mysqld_safe` was in many cases ignoring any `--no-defaults`, `--defaults-file`, or `--defaults-extra-file` arguments. Those arguments are now honored, and this may change what options are passed to `mysqld` in some installations.

- A prepared statement using **SELECT ... PROCEDURE** could cause the server to crash.

- A prepared statement using a subquery could cause the server to crash.

- Starting and stopping the slave thread (only) could in some circumstance cause the server to crash. (Bug #6148)

- **NULL** was not always processed correctly in subqueries using **ALL** or **SOME**. (Bug #6247)

- MySQL required explicit privileges on system time zone description tables for implicit access to them (that is, if one set the `time_zone` variable or used the `CONVERT_TZ()` [820] function) in cases where some table-level or column-level privileges already existed. (Bug #6765)

- `mysql_stmt_data_seek(stmt,0)` now rewinds a counter and enables buffered rows to be re-fetched on the client side. (Bug #6996)

- **NULL** were not handled correctly in cases of empty results in subqueries. (Bug #6806)

- Some internal structures were not initialized correctly prior to first execution. (Bug #6517)

- InnoDB: `innodb_locks_unsafe_for_binlog` still uses next-key locking, which is unnecessary next-key. Such locks are now removed when the `innodb_locks_unsafe_for_binlog` option is enabled. (Bug #6747)

- Some complex queries did not work correctly with subqueries. (Bug #6841, Bug #6406)

- If **STMT_ATTR_UPDATE_MAX_LENGTH** is set for a prepared statement, `mysql_stmt_store_result()` updates `field->max_length` for numeric columns as well. (Bug #6096)

-538pxInnoDB: FOREIGN KEY constraints treated table and database names as case-insensitive, so that `RENAME TABLE t TO T` would hang in an endless loop if `t` had a foreign key constraint defined on it. The server would also hang if one tried using an `ALTER TABLE` or `RENAME TABLE` statement to create a foreign key constraint name that collided with existing one. (Bug #3478)

- A prepared statement using **SELECT * FROM t1 NATURAL JOIN t2...** could cause the server to crash.

- InnoDB: Do not call `rewind()` when displaying `SHOW INNODB STATUS` information on `stderr`.

- Using the string function **LEFT** as part of the expression used as **GROUP BY** column caused the server to crash. (Bug #7101)

- The server was interpreting **CHAR BINARY** and **VARCHAR BINARY** columns from 4.0 tables as having the **BINARY** and **VARBINARY** data types. Now they are interpreted as **CHAR** and **VARCHAR** columns that have the binary collation of the column's character set. (This is the same way that **CHAR BINARY** and **VARCHAR BINARY** are handled for new tables created in 4.1.)

- **GROUP_CONCAT(....ORDER BY)** [875] when used with prepared statements gave wrong sorting order.

- **INSERT ... SELECT** no longer reports spurious "column truncated" warnings (Bug #6284)
• The server accepted datetime values with an invalid year part. The server now also performs the same checks for datetime values passed through MYSQL_TIME structures as for datetime values passed as strings. (Bug #6266)

• Prepared statements now handle ZEROFILL when converting integer to string.

• CREATE TABLE created_table didn't signal when table was created. This could cause a DROP TABLE created_table in another thread to wait "forever".

• A sequence of BEGIN (or SET autocommit = 0), FLUSH TABLES WITH READ LOCK, transactional update, COMMIT, FLUSH TABLES WITH READ LOCK could hang the connection forever and possibly the MySQL server itself. This happened for example when running the innobackup script several times. (Bug #6732)

• A rare memory corruption problem could cause MATCH ... AGAINST on columns using multi-byte character sets to crash the server. (Bug #6269)

• A call to mysql_stmt_store_result() occurred without a preceding call to mysql_stmt_bind_result() caused the server to crash.

• Insufficient privilege checks were made for SHOW CREATE TABLE. (Bug #7043)

• InnoDB: Refuse to open new-style tables created with MySQL 5.0.3 or later. (Bug #7089)

• Backported a fix for the full-text interface from MySQL 5.0. (Bug #6523)

C.1.19 Changes in MySQL 4.1.7 (2004-10-23, Production)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Functionality Added or Changed

• Added a startup option and settable system variable innodb_table_locks for making LOCK TABLE acquire locks on InnoDB tables. The default value is 1, which means that LOCK TABLES also causes InnoDB to take a table lock internally. In applications using autocommit = 1 and LOCK TABLES, InnoDB's internal table locks (added in MySQL 4.0.20 and 4.1.2) can cause deadlocks. You can set innodb_table_locks = 0 in my.cnf to remove that problem.

  In addition, SHOW TABLE STATUS now shows the creation time of InnoDB tables. That this timestamp might not always be correct because (for example) it was changed by ALTER TABLE. See Section 13.2.15, "Restrictions on InnoDB Tables". (Bug #3299, Bug #5998)

• InnoDB: If innodb_thread_concurrency would be exceeded, let a thread sleep 10 ms before entering the FIFO queue; previously, the value was 50 ms.

• MOD() no longer rounds arguments with a fractional part to integers. Now it returns exact remainder after division. (Bug #6138)

Bugs Fixed

• Security Fix: A missing UPDATE privilege could be circumvented by a user having INSERT and SELECT privileges for table with a primary key. (Bug #6173)

• Replication: A problem introduced in MySQL 4.0.21 caused replication slaves to stop (error 1223) where a connection started a transaction, performed updates, then issued a FLUSH TABLES WITH
Changes in MySQL 4.1.6 (2004-10-10)

**READ LOCK** followed by a **COMMIT**. This issue occurred when using the InnoDB `innobackup` script. (Bug #5949)

- **DATE, TIME, and DATETIME** columns were not handled correctly by the binary protocol. The problem was compiler-specific and could have been observed on HP-UX, AIX, and Solaris 9, when using native compilers. (Bug #6025)

- Selecting from a **HEAP** table with `key_column IS NOT NULL` could cause the server to crash. The crash could also occur even if all index parts were not used. (Bug #6082)

- **FOUND_ROWS()** did not work correctly with **LIMIT** clause in prepared statements. (Bug #6088)

- **libmysqlclient** did not convert zero date values (0000-00-00) to strings correctly. (Bug #6058)

- Invoking the deprecated **libmysqlclient** function `mysql_create_db()` caused the server to crash. (Bug #6081)

- **MyISAM** indexes could be corrupted when key values started with character codes below **BLANK**. This was caused by the new key sort order introduced in MySQL 4.1. (Bug #6151)

- **InnoDB**: Release the dictionary latch during a long cascaded **FOREIGN KEY** operation, so that we do not starve other users doing **CREATE TABLE** or other DDL operation. This caused a notorious ‘Long semaphore wait’ message to be printed to the `.err` log. (Bug #5961)

- Now implicit access to system time zone description tables (which happens when you set the `time_zone` variable or use `CONVERT_TZ()` function) does not require any privileges. (Bug #6116)

- **TINYINT** columns were not handled correctly in the binary protocol. The problem was specific to platforms where the C compiler has the **char** data type unsigned by default. (Bug #6024)

- **libmysqlclient** did not convert negative time values to strings correctly. (Bug #6049)

- **InnoDB**: `LOAD DATA INFILE...REPLACE` printed duplicate key errors when executing the same **LOAD** statement several times. (Bug #5835)

- Attempting to prepare a statement with **RAND(?)** caused the server to crash. (Bug #5985)

- Bad metadata was sent for **SELECT** statements not returning a result set (such as **SELECT ... INTO OUTFILE**) by the prepared statements protocol. (Bug #6059)

- **NATURAL JOIN** did not work correctly in prepared statements. (Bug #6046)

- **REVOKE ALL PRIVILEGES, GRANT OPTION FROM user** did not remove all privileges correctly. (Bug #5831)

- Join of tables from different databases having columns with identical names did not work correctly, returning the error `Column 'xxx' in field list is ambiguous`. (Bug #6050)

**C.1.20 Changes in MySQL 4.1.6 (2004-10-10)**

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

**Functionality Added or Changed**

- Now if **ALTER TABLE** converts one **AUTO_INCREMENT** column to another **AUTO_INCREMENT** column it preserves zero values (this includes the case that we don’t change such column at all).
Changes in MySQL 4.1.6 (2004-10-10)

- On Windows, the MySQL configuration files included in the package now use `.ini` instead of `.cnf` as the file name suffix.

- If a write to a MyISAM table fails because of a full disk or an exceeded disk quota, it now prints a message to the error log every 10 minutes, and waits until disk space becomes available. (Bug #3248)

- InnoDB: The `innodb_autoextend_increment` startup option that was introduced in release 4.1.5 was made a settable global variable. (Bug #5736)

- InnoDB: If DROP TABLE is invoked on an InnoDB table for which the `.ibd` file is missing, print to error log that the table was removed from the InnoDB data dictionary, and enable MySQL to delete the `.frm` file. Maybe DROP TABLE should issue a warning in this case.

- InnoDB: Added the startup option and settable global variable `innodb_max_purge_lag` for delaying INSERT, UPDATE and DELETE operations when the purge operations are lagging. The default value of this parameter is zero, meaning that there are no delays. See Section 13.2.10, “InnoDB Multi-Versioning”.

- Added option `--sigint-ignore` to the `mysql` command line client to make it ignore SIGINT signals (typically the result of the user pressing Control+C).

- Now if `ALTER TABLE` converts some column to TIMESTAMP NOT NULL column it converts NULL values to current timestamp value (One can still get old behavior by setting system TIMESTAMP variable to zero).

- TIMESTAMP columns now can store NULL values. To create such a column, you must explicitly specify the NULL attribute in the column specification. (Unlike all other data types, TIMESTAMP columns are NOT NULL by default.)

**Bugs Fixed**

- Replication: `SET COLLATION_SERVER...` statements replicated by the slave SQL thread no longer advance its position. This is so that, if the thread is interrupted before the update is completed, it later performs the SET again. (Bug #5705)

- The server sometimes chose a nonoptimal execution plan for a prepared statement executed with changed placeholder values. (Bug #6042)

- Behavior of `ALTER TABLE` converting column containing NULL values to AUTO_INCREMENT column is no longer affected by `NO_AUTO_VALUE_ON_ZERO` mode. . (Bug #5915)

- InnoDB: `CREATE TEMPORARY TABLE ... ENGINE=InnoDB` terminated `mysqld` when running in `innodb_file_per_table` mode. Now, per-table for temporary tables are created in the temporary directory used by `mysqld`. (Bug #5137)

- InnoDB: The FOREIGN KEY parser did not permit ALTER TABLE on tables whose names contained # characters. (Bug #5856)

- InnoDB: `ALTER TABLE t DISCARD TABLESPACE` did not work correctly. (Bug #5851)

- InnoDB: Change error code to `HA_ERR_ROW_IS_REFERENCED` if we cannot DROP a parent table referenced by a FOREIGN KEY constraint; this error number is less misleading than the previous number `HA_ERR_CANNOT_ADD_FOREIGN`, but misleading still. (Bug #6202)

- An attempt to execute a prepared statement with a subquery inside a boolean expression caused the server to crash. (Bug #5987)

- The server crashed when character set conversion was implicitly used in prepared mode, as in `"abc" LIKE CONVERT(\'abc\' as utf8)`. (Bug #5688)
Changes in MySQL 4.1.5 (2004-09-16)

- The `mysql_change_user()` C API function now frees all prepared statements associated with the connection. (Bug #5315)

- **InnoDB**: `SHOW CREATE TABLE` now obeys the `SET sql_mode = ANSI` and `SET sql_quote_show_create = 0` settings. (Bug #5292)

- **InnoDB**: If one updated a column so that its size changed, or updated it to an externally stored (TEXT or BLOB) value, then ANOTHER externally stored column would show up as 512 bytes of good data + 20 bytes of garbage in a consistent read that fetched the old version of the row. (Bug #5960)

- **InnoDB**: UTF-8 characters were not always handled correctly in column prefix indexes. (Bug #5975)

- If the slave SQL thread finds a syntax error in a query (which should be rare, as the master parsed it successfully), it now stops immediately. (Bug #5711)

- Inserting NULL into an AUTO_INCREMENT column failed when using prepared statements. (Bug #5510)

- **InnoDB**: Make the check for excessive semaphore waits tolerate glitches in the system clock (do not crash the server if the system time is adjusted while InnoDB is under load.). (Bug #5898)

---

**C.1.21 Changes in MySQL 4.1.5 (2004-09-16)**

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

**Functionality Added or Changed**

- **InnoDB**: Added the configuration option `innodb_autoextend_increment` for setting the size in megabytes by which InnoDB tablespaces are extended when they become full. The default value is 8, corresponding to the fixed increment of 8MB in previous versions of MySQL.

- **InnoDB**: The new Windows installation wizard of MySQL makes InnoDB as the MySQL default table type on Windows, unless explicitly specified otherwise. Note that it places the `my.ini` file in the installation directory of the MySQL server. See Section 2.3.4.14, "The Location of the my.ini File".

**Bugs Fixed**

- Providing '0000-00-00' date as a prepared statement parameter value led to a server crash. (Bug #4231, Bug #4562)

- Detection of using the same table for updating and selecting in multi-update queries was not done correctly. (Bug #5455)

- The internal field length of integer user variables was incorrect. This showed up when creating a table as `SELECT @var_name`. (Bug #4788)

- After reaching a certain limit of prepared statements per connection (97), statement IDs began to overlap, so occasionally wrong statements were chosen for execution. (Bug #5399)

- The syntax analyzer did not handle the `IGNORE_SPACE` server SQL mode correctly, using (for example) `default.07` in place of `default .07`. (Bug #5318)

- `OPTIMIZE TABLE` could cause table corruption on FULLTEXT indexes. (Bug #5327)

- Executing a prepared statement with `BETWEEN ? AND ?` [775] and a datetime column caused the server to crash. (Bug #5748)
Changes in MySQL 4.1.4 (2004-08-26, Gamma)

- Executing a statement containing thousands of placeholders caused a buffer overflow in the prepared statements API (libmysqlclient). (Bug #5194)
- Name resolution of external columns of subqueries was done correctly if the subquery was placed in the select list of the outer query and used grouping. (Bug #5326)
- A prepared statement using LIKE and called with arguments in different character sets caused the server to crash. (Bug #4368)
- InnoDB: A maximum of 1000 connections could occur inside InnoDB at the same time, a higher number causing an assertion failure. Now the maximum can be much higher, and depends on the buffer pool size. (Bug #5414)
- The values of the max_sort_length, sql_mode, and group_concat_max_len system variables now are stored in the query cache with other query information to avoid returning an incorrect result from the query cache. (Bug #5394, Bug #5515)

C.1.22 Changes in MySQL 4.1.4 (2004-08-26, Gamma)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Note

To fix a compile problem on systems that do not have automake 1.7 installed, an updated 4.1.4a source tarball has been published. In addition to resolving this automake dependency (Bug #5319), it also fixes some reported libedit compile errors when using a non-gcc compiler (Bug #5353).

Functionality Added or Changed

- Made internal representation of TIMESTAMP values in InnoDB in 4.1 to be the same as in 4.0. This difference resulted in incorrect datetime values in TIMESTAMP columns in InnoDB tables after an upgrade from 4.0 to 4.1. Warning: extra steps during upgrade required! Unfortunately this means that if you are upgrading from 4.1.x, where x <= 3, to 4.1.4 you should use mysqldump for saving and then restoring your InnoDB tables with TIMESTAMP columns. (Bug #4492)
- The mysqld-opt Windows server was renamed to mysqld. This completes the Windows server renaming begun in MySQL 4.1.2. See Section 2.3.8, “Selecting a MySQL Server Type”.
- Added --start-datetime, --stop-datetime, --start-position, and --stop-position options to mysqlbinlog. These make point-in-time recovery easier.
- Killing a CHECK TABLE statement does not result in the table being marked as “corrupted” any more; the table remains as if CHECK TABLE had not even started. See Section 12.4.6.3, “KILL Syntax”.
- Added the CSV storage engine.
- Added Latin language collations for the ucs2 and utf8 Unicode character sets. These are called ucs2_roman_ci and utf8_roman_ci.
- Corrected the name of the Mac OS X StartupItem script (it must match the name of the subdirectory, which was renamed to MySQLCOM in MySQL 4.1.2). Thanks to Bryan McCormack for reporting this.
- Made the MySQL server ignore SIGHUP and SIGQUIT on Mac OS X 10.3. This is needed because under this OS, the MySQL server receives lots of these signals. (Bug #2030)
Support of usage of column aliases qualified by table name or alias in ORDER BY and GROUP BY was dropped. For example the following query `SELECT a AS b FROM t1 ORDER BY t1.b` is not permitted. One should use `SELECT a AS b FROM t1 ORDER BY t1.a` or `SELECT a AS b FROM t1 ORDER BY b` instead. This was nonstandard (since aliases are defined on query level not on table level) and caused problems with some queries.

Bugs Fixed

Replication: When the slave SQL thread was replicating a `LOAD DATA INFILE` statement, it didn't show the statement in the output of `SHOW PROCESSLIST`. (Bug #4326)

Replication: When a multiple-table `DROP TABLE` failed to drop a table on the master server, the error was not written to the binary log. (Bug #4553)

Replication: A `CREATE TABLE ... TYPE=HEAP ... AS SELECT...` statement caused the replication slave to stop. (Bug #4971)

`libmysqlclient` crashed when attempting to fetch the value of a `MEDIUMINT` column. (Bug #5126)

Executing `UNHEX(NULL)` [795] caused the server to crash. (Bug #4441)

The `.err` extension was omitted from the error log file (`--log-error`) when the host name contained a domain name. The domain name is now replaced by the extension. (Bug #4997)

`myisasmchk --extend-check` crashed when run on a list of files. (Bug #4901)

`disable-local-infile` option had no effect if the client read it from a configuration file using `mysql_options(..., MYSQL_READ_DEFAULT,...)`. (Bug #5073)

The MySQL server crashed when attempting to execute a prepared statement with `SELECT ... INTO @var` for the second time. (Bug #5034)

`mysqlbinlog --position --read-from-remote-server` had incorrect output for `# at log_pos`. (Bug #4506)

An error was reported when a column from an `ORDER BY` clause was present in two tables participating in a `SELECT`, even if the second instance of column in select list was renamed. (For example, `SELECT t1.a AS c FROM t1, t2 ORDER BY a` produced an error if both `t1` and `t2` tables contain column a).

Now MySQL does not prefer columns, mentioned in a select list but renamed, over columns from other tables participating in a `FROM` clause when it resolves the `ORDER BY` clause. (Bug #4302)

`FLUSH TABLES WITH READ LOCK` now blocks `COMMIT` statements if the server is running with binary logging enabled; this ensures that the binary log position is trustable when doing a full backup of tables and the binary log. (Bug #4953)

Concurrent accesses to more than one `MERGE` table, or to one `MERGE` table and a `MyISAM` tables, could result in a crash or hang of the server. (Bug #2408)

`mysql-test-run` failed the `rpl_trunc_binlog` test when running the test from the installation directory. (Bug #5050)

A deadlock could happen under certain rare circumstances when using `KILL`. (Bug #4810)

Support for `%T, %r, %V, %v and %X, %x` format specifiers was added to `STR_TO_DATE()`. (Bug #4756)

`MATCH ... AGAINST` now works in a subquery. (Bug #4769)
• **mysql-test-run** failed the `grant_cache` test when run as Unix root user. (Bug #4678)

• Prohibited resolving of table fields in inner queries if fields do not take part in grouping for queries with grouping (inside aggregate function arguments, all table fields are still permitted). (Bug #4814)

• **SET GLOBAL SYNC_BINLOG** did not work on some platforms (Mac OS X). (Bug #5064)

• If **CREATE TEMPORARY TABLE** t **SELECT** failed while loading the data, the temporary table was not dropped. (Bug #4551)

• An assertion failure could occur when reading the grant tables (Bug #4407)

• Using the `CONVERT_TZ()` function with a time zone described in the database as parameter where this time zone had not been used before caused the server to crash. (Bug #4508)

• Fixed a crash after **STOP SLAVE** if the IO replication thread is in the state **Waiting to reconnect after a failed master event read**. (Bug #4629)

• **NATURAL JOIN** where the joined tables had no common column caused the server to hang. (Bug #4807)

• **mysql_fix_privilege_tables** did not handle the `--password=password_val` option correctly. (Bug #4240, Bug #4543)

• **mysqlbinlog --read-from-remote-server** sometimes could not accept 2 binary logs in a single invocation. (Bug #4507)

• The counter for an **AUTO_INCREMENT** column was not reset by **TRUNCATE TABLE** if the table was a temporary one. (Bug #5033)

• **KILL**ing a connection while it was performing **START SLAVE** caused the server to crash. (Bug #4827)

• Execution **IN** subqueries that use compound indexes was better optimized. (Bug #4435)

• **mysql_options(...,MYSQL_OPT_LOCAL_INFILE,...)** failed to disable **LOAD DATA LOCAL INFILE**. (Bug #5038)

• Attempting to execute for a second time a prepared statement with **NOT** in an **WHERE** or **ON** clause caused the server to crash. (Bug #4912)

### C.1.23 Changes in MySQL 4.1.3 (2004-06-28, Beta)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

**Note**

The initial release of MySQL 4.1.3 for Windows was accidentally compiled without support for the Spatial Extensions (OpenGIS). This was fixed by rebuilding from the same 4.1 code snapshot with the missing option and releasing those packages as version 4.1.3a.

To enable compiling the newly released PHP 5 against MySQL 4.1.3 on Windows, the Windows packages had to be rebuilt once more to add a few missing symbols to the MySQL client library. These packages were released as MySQL 4.1.3b.

**Functionality Added or Changed**
Changes in MySQL 4.1.3 (2004-06-28, Beta)

- **Incompatible Change:** The `timezone` system variable has been removed and replaced by `system_time_zone`. See Section 5.1.3, “Server System Variables”.

- **Incompatible Change:** C API change: `mysql_shutdown()` now requires a second argument. This is a source-level incompatibility that affects how you compile client programs; it does not affect the ability of compiled clients to communicate with older servers. See Section 17.6.6.63, “mysql_shutdown()”.

- **Replication:** Replication and `mysqlbinlog` now have better support for the case that the session character set and collation variables are changed within a given session. See Section 14.7, “Replication Features and Issues”.

- **Replication:** `DROP DATABASE IF EXISTS`, `DROP TABLE IF EXISTS`, single-table `DELETE` and single-table `UPDATE` are now written to the binary log even if they changed nothing on the master (for example, even if the `DELETE` matched no row). The old behavior sometimes caused bad surprises in replication setups.

- Added SQL syntax for prepared statements. See Section 12.6, “SQL Syntax for Prepared Statements”.

- Added the `sync_binlog=N` global variable and startup option, which makes the MySQL server synchronize its binary log to disk (`fdatasync()`) after every `N`th write to the binary log.

- `CHECK TABLE` now can be killed. It then marks the table as corrupted. See Section 12.4.6.3, “KILL Syntax”.

- `OPTIMIZE TABLE` for InnoDB tables is now mapped to `ALTER TABLE` instead of `ANALYZE TABLE`.

- Added the `ARCHIVE` storage engine.

- Added `--innodb-safe-binlog` server option, which adds consistency guarantees between the content of InnoDB tables and the binary log. See Section 5.3.4, “The Binary Log”.

- `sync_frm` is now a settable global variable (not only a startup option).

- Support for per-connection time zones was added. Now you can set the current time zone for a connection by setting the `@@time_zone` system variable to a value such as '+10:00' or 'Europe/Moscow' (where 'Europe/Moscow' is the name of one of the time zones described in the system tables). Functions like `CURRENT_TIMESTAMP`, `UNIX_TIMESTAMP`, and so forth honor this time zone. Values of `TIMESTAMP` type are also interpreted as values in this time zone. So now our `TIMESTAMP` type behaves similar to Oracle's `TIMESTAMP WITH LOCAL TIME ZONE`. That is, values stored in such a column are normalized toward UTC and converted back to the current connection time zone when they are retrieved from such a column. To set up the tables that store time zone information, see Section 2.10, “Postinstallation Setup and Testing”.

- `LIKE` now supports the use of a prepared statement parameter or delimited constant expression as the argument to `ESCAPE` . (Bug #4200)

- Language-specific collations were added for the `ucs2` and `utf8` Unicode character sets: Icelandic, Latvian, Romanian, Slovenian, Polish, Estonian, Swedish, Turkish, Czech, Danish, Lithuanian, Slovak, Spanish, Traditional Spanish.

- Changed the slave SQL thread to print fewer useless error messages (no more message duplication; no more messages when an error is skipped (because of `slave-skip-errors`).

- Basic time zone conversion function `CONVERT_TZ()` [820] was added. It assumes that its first argument is a datetime value in the time zone specified by its second argument and returns the equivalent datetime value in the time zone specified by its third argument.

Bugs Fixed
• **Replication:** Complex expressions using AND, OR, or both could result in a crash if the query containing the expression query was ignored, either by a replication server due to `--replicate-*=table` rules, or by any MySQL server due to a syntax error. (Bug #3969, Bug #4494)

• **Replication:** The slave SQL thread refused to replicate `INSERT ... SELECT` if it examined more than 4 billion rows. (Bug #3871)

• Re-execution of optimized `COUNT(*)` [874], `MAX()` [876], and `MIN()` [876] functions is now handled correctly for prepared statements. (Bug #2687)

• Different numbers of warnings were generated when an invalid datetime (as a string or as a number) was inserted into a `DATETIME` or `TIMESTAMP` column. (Bug #2336)

• During the installation process of the server RPM on Linux, if `mysql` was run as the `root` system user and with `--log-bin` pointing to a directory outside of `/var/lib/mysql`, it created binary log files owned by `root` in this directory, which remained owned by `root` after the installation. Now `mysql` is started as the `mysql` system user instead. (Bug #4038)

• A potential memory overrun could occur in `mysql_real_connect()` (which required a compromised DNS server and certain operating systems). (Bug #4017)

• `CREATE DATABASE IF NOT EXISTS` caused an error on Win32 platforms if the database existed. (Bug #4378)

• Attempt to prepare a statement containing a character set introducer caused the server to crash. (Bug #4105)

• Attempting to execute a nonprepared statement could cause the server to crash. (Bug #4236)

• `mysqlbinlog` didn't escape the string content of user variables, and did not deal well when these variables were in non-ASCII character sets; this is now fixed by always printing the string content of user variables in hexadecimal. The character set and collation of the string is now also printed. (Bug #3875)

• `UNION` returned incorrect results if the display length of columns for numeric types was set to less than the actual length of values in them. (Bug #4067)

• Conversion of a client-side string column to a `MYSQL_TIME` application buffer was not handled correctly by the prepared statements API. (Bug #4030)

• Prepared `EXPLAIN` statements could lead to a server crash. (Bug #4271)

• A malicious user could bypass password verification with specially crafted packets, using a modified client library. (CVE-2004-0627, CVE-2004-0628)

• `NULL` was not handled correctly with derived tables. (Bug #4097)

• `MERGE` tables created with `INSERT_METHOD=LAST` were not able to report a key number, causing Duplicate entry errors for UNIQUE keys in `INSERT` statements. As a result, the error message was not precise enough (error 1022 instead of error 1062) and `INSERT ... ON DUPLICATE KEY UPDATE` did not work. (Bug #4008)

• Parameters in some prepared statements were not handled correctly. (Bug #4280)

• Prepared statements did not always work correctly on big-endian platforms. (Bug #4173)

• `CONCAT(?, col_name)` [787], when used in prepared statements, returned incorrect results. (Bug #3796)

• Tables were unlocked too early in cases of a subquery in a query's `HAVING` clause. (Bug #3984)
• The range optimizer did not perform correctly when using many \texttt{IN()} queries on different key parts. (Bug #4157)

• Performance of \texttt{COUNT(DISTINCT \[874\]} degraded in cases like \texttt{COUNT(DISTINCT a TEXT, b CHAR(1)) \[874\]} (no index used). (Bug #3904)

• In rare circumstances, \texttt{DELETE} from a table with \texttt{FULLTEXT} indexes resulted in a corrupted table, if words of different lengths could be considered equal. This is possible with some collations, for example, \texttt{utf8_general_ci} and \texttt{lng1\_german2\_ci}. (Bug #3808)

• \texttt{mysql\_stmt\_close()} hung when attempting to close a statement after failed \texttt{mysql\_stmt\_fetch()} call. (Bug #4079)

• Using \texttt{--with-charset} with \texttt{configure} did not affect the MySQL client library. (Bug #3990)

• Added missing \texttt{root} account to Windows version of \texttt{mysqld}. (Bug #4242)

• The microseconds part of \texttt{MYSQL\_TYPE\_TIME/MYSQL\_TYPE\_DATETIME} columns was not sent to the client by prepared statements. (Bug #4026)

• \texttt{mysqldump} when it did not return any error if the output device was full. (Bug #1851)

• Made \texttt{DROP DATABASE} honor the value of \texttt{lower\_case\_table\_names}. (Bug #4066)

• Under rare circumstances, \texttt{MATCH \ldots AGAINST(\ldots IN BOOLEAN MODE)} could yield incorrect results if, in the collation used for the data, one byte could match many (as in \texttt{utf8\_general\_ci} and \texttt{lng1\_german2\_ci}). (Bug #3964)

### C.1.24 Changes in MySQL 4.1.2 (2004-05-28)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

**Functionality Added or Changed**

• **Security Fix:** The \texttt{--defaults-file=file\_name} option now requires that the file name must exist. (Bug #3413)

• **Incompatible Change:** The signature of the \texttt{mysql\_stmt\_prepare()} function was changed to \texttt{int mysql\_stmt\_prepare(MYSQL\_STMTP stmt, const char *query, unsigned long length)}. To create a \texttt{MYSQL\_STMTP} handle, you should use the \texttt{mysql\_stmt\_init()} function, not \texttt{mysql\_stmt\_prepare()}.

• **Incompatible Change:** Renamed prepared statements C API functions:

<table>
<thead>
<tr>
<th>Old Name</th>
<th>New Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{mysql_bind_param()}</td>
<td>\texttt{mysql_stmt_bind_param()}</td>
</tr>
<tr>
<td>\texttt{mysql_bind_result()}</td>
<td>\texttt{mysql_stmt_bind_result()}</td>
</tr>
<tr>
<td>\texttt{mysql_prepare()}</td>
<td>\texttt{mysql_stmt_prepare()}</td>
</tr>
<tr>
<td>\texttt{mysql_execute()}</td>
<td>\texttt{mysql_stmt_execute()}</td>
</tr>
<tr>
<td>\texttt{mysql_fetch()}</td>
<td>\texttt{mysql_stmt_fetch()}</td>
</tr>
<tr>
<td>\texttt{mysql_fetch_column()}</td>
<td>\texttt{mysql_stmt_fetch_column()}</td>
</tr>
</tbody>
</table>
Changes in MySQL 4.1.2 (2004-05-28)

<table>
<thead>
<tr>
<th>Old Name</th>
<th>New Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>mysql_param_count()</td>
<td>mysql_stmt_param_count()</td>
</tr>
<tr>
<td>mysql_param_result()</td>
<td>mysql_stmt_param_metadata()</td>
</tr>
<tr>
<td>mysql_get_metadata()</td>
<td>mysql_stmt_result_metadata()</td>
</tr>
<tr>
<td>mysql_send_long_data()</td>
<td>mysql_stmt_send_long_data()</td>
</tr>
</tbody>
</table>

Now all functions that operate with a `MYSQL_STMT` structure begin with the prefix `mysql_stmt_`.

• **Incompatible Change:** Added support for `DEFAULT CURRENT_TIMESTAMP` and for `ON UPDATE CURRENT_TIMESTAMP` specifications for `TIMESTAMP` columns. Now you can explicitly say that a `TIMESTAMP` column should be set automatically to the current timestamp for `INSERT` or `UPDATE` statements, or even prevent the column from updating automatically. Only one column with such an auto-set feature per table is supported. `TIMESTAMP` columns created with earlier versions of MySQL behave as before. Behavior of `TIMESTAMP` columns that were created without explicit specification of default/on as earlier depends on its position in table: If it is the first `TIMESTAMP` column, it be treated as having been specified as `TIMESTAMP DEFAULT CURRENT_TIMESTAMP ON UPDATE CURRENT_TIMESTAMP`. In other cases, it would be treated as a `TIMESTAMP DEFAULT 0` column. `NOW` is supported as an alias for `CURRENT_TIMESTAMP`.

Unlike in previous versions, explicit specification of default values for `TIMESTAMP` column is never ignored and turns off the auto-set feature (unless you have `CURRENT_TIMESTAMP` as the default).

• **Incompatible Change:** String comparison now works according to the SQL standard. Because we have that 'a' = 'a ' then from it must follow that 'a' > 'a\t'. (The latter was not the case before MySQL 4.1.2.) To implement it, we had to change how storage engines compare strings internally. As a side effect, if you have a table where a `CHAR` or `VARCHAR` column in some row has a value with the last character less than ASCII(32) [785], you have to repair this table. `CHECK TABLES` tells you if this problem exists. (Bug #3152)

• **Incompatible Change:** Handling of the `FLOAT` and `DOUBLE` floating-point data types is more strict to follow standard SQL. For example, a data type of `FLOAT(3,1)` stores a maximum value of 99.9. Previously, the server permitted larger numbers to be stored. That is, it stored a value such as 100.0 as 100.0. Now the server clips 100.0 to the maximum permissible value of 99.9. If you have tables that were created before MySQL 4.1.2 and that contain floating-point data not strictly legal for the column type, you should alter the data types of those columns. For example:

```
ALTER TABLE tbl_name MODIFY col_name FLOAT(4,1);
```

• **Incompatible Change:** The `Type` output column for `SHOW TABLE STATUS` now is labeled `Engine`.

• **Replication:** For replication of `MEMORY` (HEAP) tables: Made the master automatically write a `DELETE FROM` statement to its binary log when a `MEMORY` table is opened for the first time since the master's startup. This is for the case where the slave has replicated a nonempty `MEMORY` table, and then the master is shut down and restarted: the table is now empty on the master; the `DELETE FROM` empties it on the slave as well.

Even with this fix, between the master's restart and the first use of the table on master, the slave still has out-of-date data in the table. However, if you use the `--init-file` option to populate the `MEMORY` table on the master at startup, it ensures that the failing time interval is zero. (Bug #2477)

• **Replication:** Added option `--replicate-same-server-id`.

• **Replication:** `UUID()` function implemented. Note that it does not work with replication yet. See Section 11.14, "Miscellaneous Functions".
Changes in MySQL 4.1.2 (2004-05-28)

- MySQL now issues a warning when a `SET` or `ENUM` column with duplicate values in the list is created. (Bug #1427)
- The `ft_boolean_syntax` variable now can be changed while the server is running. See Section 5.1.3, “Server System Variables”.
- `MyISAM` tables now support keys up to 1000 bytes long.
- `mysql` command-line client now supports multiple `-e` options. (Bug #591)
- `CHAR BYTE` is an alias for the `BINARY` data type. (Previously, it was an alias for `CHAR BINARY`.)
- `mysqlhotcopy` now works on NetWare.
- Prepared statements now work with all types of subqueries.
- Added the `--default-storage-engine` server option as a synonym for `--default-table-type`.
- `MyISAM` and `InnoDB` tables now support index prefix lengths up to 1000 bytes long.
- The `mysqld` Windows server was renamed to `mysqld-debug`. See Section 2.3.8, “Selecting a MySQL Server Type”.
- The MySQL server now returns an error if `SET sql_log_bin` or `SET sql_log_update` is issued by a user without the `SUPER` privilege (in previous versions it just silently ignored the statement in this case).
- Added `init_connect` and `init_slave` system variables. The values should be SQL statements to be executed when each client connects or each time a slave’s SQL thread starts, respectively.
- Added the `mysql_set_local_infile_handler()` and `mysql_set_local_infile_default()` C API functions.
- Added `Handler_discover` status variable.
- C API enhancement: `SERVER_QUERY_NO_INDEX_USED` and `SERVER_QUERY_NO_GOOD_INDEX_USED` flags are now set in the `server_status` field of the `MYSQL` structure. It is these flags that make the query to be logged as slow if `mysqld` was started with `--log-slow-queries --log-queries-not-using-indexes`.
- The `FLOAT` and `DECIMAL` types now obey (precision,scale) settings. (Bug #10897)
- The `mysql` command-line client no longer stores in the history file multiple copies of identical queries that are run consecutively.
- If you try to create a key with a key part that is too long, and it is safe to auto-truncate it to a smaller length, MySQL now does so. A warning is generated, rather than an error.
- The improved character set support introduced in MySQL 4.1.0 for the `MyISAM` and `HEAP` storage engines is now available for `InnoDB` as well.
- Added `latin1_spanish_ci` (Modern Spanish) collation for the `latin1` character set.
- Added `Binlog_cache_use` and `Binlog_cache_disk_use` status variables that count the number of transactions that used transaction binary log and that had to flush this temporary binary log to disk instead of using only the in-memory buffer. They can be used for tuning the `binlog_cache_size` system variable.
- Added the `storage_engine` system variable as a synonym for `table_type`. 
Changes in MySQL 4.1.2 (2004-05-28)

- Added explanation of hidden `SELECT` of `UNION` in output of `EXPLAIN SELECT` statement.

- Added the `EXAMPLE` storage engine.

- Internal string-to-number conversion now supports only SQL:2003 compatible syntax for numbers. In particular, `'0x10' + 0` does not work anymore. (Actually, it worked only on some systems before, such as Linux. It did not work on others, such as FreeBSD or Solaris. Making these queries OS-independent was the goal of this change.) Use `CONV()` to convert hexadecimal numbers to decimal. Example: `CONV(MID('0x10',3),16,10)+0`.

- The `--log-warnings` server option now is enabled by default. Disable with `--log-warnings=0`.

- Added the `ENGINE` table option as a synonym for the `TYPE` option for `CREATE TABLE` and `ALTER TABLE`.

- `UNHEX()` function implemented. See Section 11.5, “String Functions”.

- Multi-line statements in the `mysql` command-line client now are stored in the history file as a single line.

- `ALTER TABLE DROP PRIMARY KEY` no longer drops the first `UNIQUE` index if there is no primary index. (Bug #2361)

- The Mac OS X Startup Item has been moved from the directory `/Library/StartupItems/MySQL` to `/Library/StartupItems/MySQLCOM` to avoid a file name collision with the MySQL Startup Item installed with Mac OS X Server. See Section 2.12.2, “Mac OS X Notes”.

- MySQL now supports up to 64 indexes per table.

- New `myisam_data_pointer_size` system variable. See Section 5.1.3, “Server System Variables”.

- A name of “Primary” no longer can be specified as an index name. (That name is reserved for the `PRIMARY KEY` if the table has one.) (Bug #856)

- Now `sql_select_limit` variable has no influence on subqueries. (Bug #2600)

- `REVOKE ALL PRIVILEGES, GRANT FROM user_list` is changed to a more consistent `REVOKE ALL PRIVILEGES, GRANT OPTION FROM user_list`. (Bug #2642)

- Added option `--to-last-log` to `mysqlbinlog`, for use in conjunction with `--read-from-remote-server`.

- When a session having open temporary tables terminates, the statement automatically written to the binary log is now `DROP TEMPORARY TABLE IF EXISTS` instead of `DROP TEMPORARY TABLE`, for more robustness.

- Added support for character set conversion and `MYSQL_TYPE_BLOB` type code in prepared statement protocol.

- Changed that when the MySQL server has binary logging disabled (that is, no `--log-bin` option was used), then no transaction binary log cache is allocated for connections. This should save `binlog_cache_size` bytes of memory (32KB by default) for every connection.

- `mysqld_multi` now creates the log in the directory named by `datadir` (from the `[mysqld]` section in `my.cnf` or compiled in), not in `/tmp`. Thanks to Christian Hammers from Debian Security Team for reporting this. (CVE-2004-0388)

- `SHOW GRANTS` with no `FOR` clause or with `FOR CURRENT_USER()` shows the privileges for the current session.
Bugs Fixed

- **Packaging:** In the Mac OS DMG `postinstall` script, `mysql_install_db` was invoked with an invalid argument.

- **Replication:** Replication: a rare race condition in the slave SQL thread that could lead to an incorrect complaint that the relay log is corrupted. (Bug #2011)

- **Replication:** Replication: Removed a misleading "check permissions on master.info" from a replication error message, because the cause of the problem could be different from permissions. (Bug #2121)

- **Replication:** A MySQL slave server built using `--with-debug`, and replicating itself, crashed. (Bug #3568)

- **Replication:** Multiple-table `DELETE` statements were never replicated by the slave if there were any `--replicate-*-table` options. (Bug #2527)

- **Replication:** If `server-id` was not set using startup options but with `SET GLOBAL`, the replication slave still complained that it was not set. (Bug #3829)

- **Replication:** If a replication slave was unable to create the first relay log, it crashed. (Bug #2145)

- **Replication:** In some replication error messages, a very long query caused the rest of the message to be invisible (truncated), by putting the query last in the message. (Bug #3357)

- **Replication:** Memory could be corrupted by replicating a `LOAD DATA INFILE` from a MySQL 3.23 master. Some less critical issues remain; see Section 14.7, "Replication Features and Issues". (Bug #3422)

- **Replication:** Replication: in the slave SQL thread, a multiple-table `UPDATE` could produce an incorrect complaint that some record was not found in one table, if the `UPDATE` was preceded by a `INSERT ... SELECT`. (Bug #1701)

- **Replication:** Multiple-table `DELETE` statements were always replicated by the slave if there were some `--replicate-*-ignore-table` options and no `--replicate-*-do-table` options. (Bug #3461)

- **Replication:** Following a nonfatal error during the execution of a statement that later succeeded, the master failed to reset the error code to 0, so the error code was written into the binary log. This caused `false Did not get the same error as on master` errors on the slave. (Bug #2083)

- **Replication:** Corrected the master's binary log position that InnoDB reports when it is doing a crash recovery on a slave server. (Bug #3015)

- **Replication:** Changed that when a thread handling `INSERT DELAYED` (also known as a `delayed_insert` thread) is killed, its statements are recorded with an error code of value zero (killing such a thread does not endanger replication, so we thus avoid a superfluous error on the slave). (Bug #3081)

- **Replication:** `CREATE TABLE ... LIKE ...` statements were not always written to the binary log. (Bug #2557)

- **Replication:** Replication: If a client connects to a slave server and issues an administrative statement for a table (for example, `OPTIMIZE TABLE` or `REPAIR TABLE`), this could sometimes stop the slave SQL thread. This does not lead to any corruption, but you must use `START SLAVE` to get replication going again. (Bug #1858)

- **Replication:** `--replicate-wild-*-table` rules now apply to `ALTER DATABASE` when the table pattern is `%`, as is the case for `CREATE DATABASE` and `DROP DATABASE`. (Bug #3000)
• **Replication:** Statements did not raise errors on the slave, if the slave was excluded given the `--replicate-*` options in use at the time. The effect of this problem was: when a statement was killed on the master, the slave stopped. (Bug #2983)

• A rare error condition caused the slave SQL thread spuriously to print the message `Binlog has bad magic number` and stop when it was not necessary to do so. (Bug #3401)

• Queries with subqueries in the `FROM` clause now lock all tables at once. `EXPLAIN` of subqueries in `FROM` output was also not handled correctly. (Bug #2120)

• Prepare statements parameter do not cause error message as fields used in select list but not included in `ORDER BY` list.

• Attempting to bind a negative value bind to unsigned caused an `Unknown error`. (Bug #3223)

• `UNION` statements did not consult `sql_select_limit` value when set. This is now fixed properly, which means that this limit is applied to the top level query, unless `LIMIT` for entire `UNION` is used.

• The `GROUP_CONCAT()` [875] had a number of issues with `ORDER BY` and `DISTINCT`, and with `GROUP BY` in subqueries. (Bug #2695, Bug #3319, Bug #3381)

• Full-text indexing of strings in multi-byte (all besides `utf8`) charsets could sometimes hang. (Bug #2065)

• `SHOW GRANTS` and `EXPLAIN SELECT` did not always perform character set conversion correctly. (Bug #3403)

• `REPAIR TABLE` could corrupt a table containing `FULLTEXT` indexes and many words of different lengths that are considered equal (which is possible in certain collations, such as `latin1_german2_ci` or `utf8_general_ci`). (Bug #3835)

• Processing of `RAND()` [814] in subqueries with static tables was not always handled correctly. (Bug #2645)

• When a `Rotate` event was found by the slave SQL thread in the middle of a transaction, the value of `Relay_Log_Pos` in `SHOW SLAVE STATUS` was incorrectly altered. (Bug #3017)

• `Index_length` in `HEAP` table status for `BTREE` indexes was not calculated correctly. (Bug #2719)

• The `Exec_master_log_pos` column and its disk image in the `relay-log.info` were not handled correctly if the master had version 3.23. (The value was too big by six bytes.) This bug does not exist in MySQL 5.0. (Bug #3400)

• `mysql_stmt_fetch()` and `mysql_stmt_store_result()` could hang if they were called without a prior call to `mysql_stmt_execute()`. Now they give an error instead. (Bug #2248)

• `CHECK TABLE` sometimes produced a spurious error `Found key at page ... that points to record outside datafile` for a table with a `FULLTEXT` index. (Bug #2190)

• `myisamchk` and `CHECK TABLE` that sometimes a spurious error `Found key at page ... that points to record outside datafile` for a table with a `FULLTEXT` index. (Bug #1977)

• Optimization of `ALL` and `SOME` subqueries was not performed well (key field present in subquery). (Bug #3646)

• Starting `mysql`d with binary logging disabled, but with a nonzero value for the `expire_logs_days` system variable caused the server to crash. (Bug #3807)

• Full-text search on multi-byte character sets (such as `UTF8`) that appeared when a search word was shorter than a matching word from the index (for example, searching for “Uppsala” when the table contains “Uppsa*la”). (Bug #3011)
Changes in MySQL 4.1.2 (2004-05-28)

- On Linux platforms, setting the `character_set_results` variable to `NULL` and then attempting to retrieve it using `SELECT @@character_set_results` caused the server to crash. (Bug #3296)

- The output of `mysqldump --tab` was not correct. (Bug #2705)

- Added support for unsigned integer types to prepared statement API. (Bug #3035)

- An issue with the range optimizer caused a segmentation fault on some very rare queries. (Bug #2698)

- The `INTERVAL()` function did not work correctly when 8 or more comparison arguments were used. (Bug #1561)

- Made clearer the error message that one gets when an update is refused because of the `--read-only` option. (Bug #2757)

- UTF8 charset breaks joins with mixed column/string constant. (Bug #2959)

- Prepared statements are supported for `INSERT`, `REPLACE`, `CREATE`, `DELETE`, `SELECT`, `DO`, `SET` and `SHOW` statements. All other statements are now prohibited by the prepared statement interface. (Bug #3406, Bug #3398, Bug #2811)

- Running `LOAD DATA FROM MASTER` after `RESET SLAVE` caused a segmentation fault. (Bug #2922)

- `EXPLAIN` should now work correctly with `UNION` queries. (Bug #3639)

- `UNION` operations with the InnoDB storage engine, when some columns from one table were used in one `SELECT` statement and some were used in another `SELECT` statement, were not handled correctly. (Bug #2552)

- Incorrect error message when wrong table used in multiple-table `DELETE` statement in prepared statements. (Bug #3411)

- `SHOW CREATE TABLE ...` did not properly double quotation marks. (Bug #2593)

- `CREATE ... SELECT` sometimes created a string column with a multi-byte character set (such as UTF8) of insufficient length for holding the data.

- The second execution of a prepared statement using `UNION` caused the server to crash. (Bug #3577)

- Removed try to check `NULL` if index built on column where `NULL` is impossible in `IN` subquery optimization. (Bug #2393)

- Using the `GROUP_CONCAT()` function on an expression with `ORDER BY` as well as an external `ORDER BY` in a query caused the server to crash. (Bug #3752)

- Changed that when a `DROP TEMPORARY TABLE` statement is automatically written to the binary log when a session ends, the statement is recorded with an error code of value zero (this ensures that killing a `SELECT` on the master does not result in a superfluous error on the slave). (Bug #3063)

- Short-form IP addresses used as arguments to `INET_ATON()` were not parsed correctly. (Bug #3210)

- Results of aggregate functions used in subqueries with empty result sets were incorrect. (Bug #3505)

- `mysqlbinlog --read-from-remote-server` now print the exact positions of events in lines beginning with `at #` in the log. (Bug #3214)

- Compiling the server using the `--with-pstack` options did not work with binutils 2.13.90. (Bug #1661)
Changes in MySQL 4.1.2 (2004-05-28)

- Changed the column `Seconds_Behind_Master` in `SHOW SLAVE STATUS` to never show a value of -1. (Bug #2826)

- Packaging: Added missing file `mysql_create_system_tables` to the server RPM package. This bug was fixed for the 4.1.1 RPMs by updating the MySQL-server RPM from `MySQL-server-4.1.1-0` to `MySQL-server-4.1.1-1`. The other RPMs were not affected by this change.

- A memory leak could occur with `INSERT ... ON DUPLICATE KEY UPDATE`. (Bug #2438)

- Privileges were not checked correctly for `ALTER TABLE RENAME`. (Bug #3270)

- The MySQL server did not report any error if a statement (submitted through `mysql_real_query()` or `mysql_stmt_prepare()`) was terminated by garbage characters. This can happen if you pass a wrong `length` parameter to these functions. The result was that the garbage characters were written into the binary log. (Bug #2703)

- `Max_used_connections` was less than the actual maximum number of connections in use simultaneously.

- Aggregate functions could lead to server crashes when used in prepared statements. (Bug #3360)

- `mysqlbinlog --read-from-remote-server` read all binary logs following the one that was requested. It now stops at the end of the requested file, the same as it does when reading a local binary log. There is an option `--to-last-log` to get the old behavior. (Bug #3204)

- Full-text indexing of UTF8 data did not work correctly. (Bug #2033)

- The `--local-load` option of `mysqlbinlog` now requires an argument.

- `CONCAT_WS()` makes the server die in case of illegal mix of collations. (Bug #3087)

- The `mysql` client program crashed when passed a database name that was longer then expected. (Bug #2221)

- Table names in were quoted in `mysqldump` when using values for the server SQL mode where this was not appropriate. (Bug #2591)

- `ANALYZE TABLE` on a `BDB` table inside a transaction caused the server to hang. (Bug #2342)

- `DROP DATABASE` now reports the number of tables deleted.

- Using an impossible `WHERE` with `PROCEDURE ANALYSE()` caused the server to hang. (Bug #2238)

- Parallel repair (`myisamchk -p,myisam_repair_threads`) sometimes failed to repair a table. (Bug #1334)

- Added optimization that enables prepared statements using a large number of tables or tables with a large number of columns to be re-executed significantly faster. (Bug #2050)

- A memory leak occurred in the client library when a statement handle was freed on a closed connection (call to `mysql_stmt_close()` after `mysql_close()`). (Bug #3073)

- Invalid results were returned when `CAST()` was applied to `NULL` to obtain a signed or unsigned integer value. (Bug #2219)

- `FLUSH TABLES` sometimes corrupted table resolution for statements which were prepared before the `FLUSH TABLES` but which were being executed repeatedly afterward. (Bug #3307)

- `GRANT` did not handle table-level privileges correctly. (Bug #2178)
Changes in MySQL 4.1.2 (2004-05-28)

- Invoking `mysql_set_server_option()` caused client/server communications to be broken. (Bug #2207)

- A multiple-table `UPDATE` statement resulted in an error when one of the tables was not updated but was used in the nested query contained therein.

- Subqueries in the `FROM` clause were not always parsed correctly. (Bug #2421)

- There was a symlink vulnerability in the `mysqlbug` script. (Bug #3284)

- Table and column privileges were not loaded on startup. (Bug #2546)

- `UNION` operations did not handle `NULL` columns properly, when a column in the first `SELECT` node was `NOT NULL`. (Bug #2508)

- `vio_timeout()` virtual function was not set for all protocols. This lead to crashes on Windows. (Bug #2025)

- You can now call `mysql_stmt_attr_set(..., STMT_ATTR_UPDATE_MAX_LENGTH)` to tell the client library to update `MYSQL_FIELD->max_length` when doing `mysql_stmt_store_result()`. (Bug #1647)

- A deadlock occurred when two `START SLAVE` statements were run at the same time. (Bug #2921)

- Comparison of table and database names when using the `--lower_case_table_names` option was not always performed correctly. (Bug #2880)

- A query that uses both `UNION [DISTINCT]` and `UNION ALL` now works correctly. (Bug #1428)

- `mysql_stmt_send_long_data()` misbehaved on the second execution of a prepared statement when long data had zero length. (Bug #1664)

- Table default character set affects `LONGBLOB` columns. (Bug #2821)

- Requiring `UPDATE` privilege for tables which are not updated in multiple-table `UPDATE` statement in prepared statements.

- Segmentation faults could occur when processing malformed prepared statements. (Bug #2795, Bug #2274)

- `mysqldump` did not quote names containing backtick characters (``) correctly. (Bug #2592)

- The results of a query that used `DISTINCT` and `ORDER BY` by a column's real name, while the column had an alias specified in the `SELECT` clause, were not returned in the correct order. (Bug #3681)

- Compile the `MySQL-client` RPM package against `libreadline` instead of `libedit`. (Bug #2289)

- A password was not checked for changes in `GRANT` accounts until `FLUSH PRIVILEGES` was executed. (Bug #3404)

- Subqueries with `OR` and `AND` did not always work correctly. (Bug #2838)

- `ALTER DATABASE` caused the client to hang if the database did not exist. (Bug #2333)

- `ORDER BY` did not always work correctly with `SMALLINT` columns. (Bug #2147)

- When a password was assigned to an account at the global level and then privileges were granted at the database level (without specifying any password), the existing password was replaced temporarily in memory until the next `FLUSH PRIVILEGES` operation or the server was restarted. (Bug #2953)
Changes in MySQL 4.1.1 (2003-12-01)

• **DOUBLE** and **FLOAT** columns could store out of range values. (Bug #2082)

• A prepared statement using parameters and having a subquery in the **FROM** clause could cause the server to crash. (Bug #3020)

• **MATCH ... AGAINST()** on a phrase search operator with a missing closing double quote caused the server to crash. (Bug #2708)

• **mysql_stmt_affected_rows()** now always returns the number of rows affected by a given statement. (Bug #2247)

• When **ALTER TABLE RENAME**, was used to rename a table with the same name in another database, it silently dropped the destination table if it existed. (Bug #2628)

• The syntax **CONVERT(expr, type)** [851] is now supported again.

• **mysqld** could crash when a table was altered and used at the same time. This was a 4.1.2-specific bug. (Bug #3643)

• Write operations on a column having a **FULLTEXT** index could under some rare circumstances lead to table file corruption. (Bug #2417)

• **mysqlbinlog** failed to print a **USE** statement under those rare circumstances where the binary log contained a **LOAD DATA INFILE** statement. (Bug #3415)

C.1.25 Changes in MySQL 4.1.1 (2003-12-01)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

This release includes all fixes in MySQL 4.0.16 and most of the fixes in MySQL 4.0.17.

**Functionality Added or Changed**

• **Incompatible Change:** Renamed the C API **mysql_prepare_result()** function to **mysql_get_metadata()** because the old name was confusing.

• **Incompatible Change:** Client authentication now is based on 41-byte passwords in the **user** table, not 45-byte passwords as in 4.1.0. Any 45-byte passwords created for 4.1.0 must be reset after running the **mysql_fix_privilege_tables** script.

• **Replication:** Replication over SSL now works.

• **Replication:** **ANALYZE TABLE, OPTIMIZE TABLE, REPAIR TABLE, and FLUSH** statements are now stored in the binary log and thus replicated to slaves. This logging does not occur if the optional **NO_WRITE_TO_BINLOG** keyword (or its alias **LOCAL**) is given. Exceptions are that **FLUSH LOGS, FLUSH MASTER, FLUSH SLAVE, and FLUSH TABLES WITH READ LOCK** are not logged in any case. For a syntax example, see Section 12.4.6.2, “FLUSH Syntax”.

• Added **SQLSTATE** codes for all server errors.

• New **CHECKSUM TABLE** statement for reporting table checksum values.

• Added new **type values** **DAY_MICROSECOND, HOUR_MICROSECOND, MINUTE_MICROSECOND, SECOND_MICROSECOND, and MICROSECOND** for **DATE_ADD()** [821], **DATE_SUB()** [825], and **EXTRACT()** [826].
Changes in MySQL 4.1.1 (2003-12-01)

- **TIME** columns with hour values greater than 24 were returned incorrectly to the client.

- Added new syntax for `ADDDATE()` [819] and `SUBDATE()` [831]. The second argument now may be a number representing the number of days to be added to or subtracted from the first date argument.

- Disabled the `PURGE LOGS` statement that was added in version 4.1.0. The statement now should be issued as `PURGE MASTER LOGS` or `PURGE BINARY LOGS`.

- Added the OLAP (On-Line Analytical Processing) function `ROLLUP`, which provides summary rows for each `GROUP BY` level.

- You can revoke all privileges from a user with `REVOKE ALL PRIVILEGES, GRANT FROM user_list`.

- `LIMIT` no longer accepts negative arguments (they used to be treated as very big positive numbers before).

- New `COERCIBILITY()` [863] function to return the collation coercibility of a string.

- Added `DROP USER 'user_name'@'host_name'` statement to drop an account that has no privileges.

- Added new `COMPRESS()` [858], `UNCOMPRESS()` [861], and `UNCOMPRESSED_LENGTH()` [861] functions.

- New global system variable `relay_log_purge` to enable or disable automatic relay log purging.

- `CREATE TABLE tbl_name (...) TYPE=storage_engine` now generates a warning if the named storage engine is not available. The table is still created as a MyISAM table, as before.

- Added new `ADDTIME()` [820], `DATE()` [821], `DATEDIFF()` [821], `LAST_DAY()` [828], `MAKEDATE()` [828], `MAKETIME()` [828], `MICROSECOND()` [829], `SUBTIME()` [832], `TIME()` [832], `TIMEDIFF()` [832], `TIMESTAMP()` [832], `UTC_DATE()` [834], `UTC_TIME()` [834], `UTC_TIMESTAMP()` [835], and `WEEKOFYEAR()` [836] functions.

- It is now possible to create a `MERGE` table from MyISAM tables in different databases. Formerly, all the MyISAM tables had to be in the same database, and the `MERGE` table had to be created in that database as well.

- All queries in which at least one `SELECT` does not use indexes properly now are written to the slow query log when long log format is used.

- MyISAM tables now use a better checksum algorithm (if checksum is enabled with `CREATE TABLE ... CHECKSUM = 1`). Old tables will appear to have incorrect checksum, and should be repaired.

- Added `PURGE BINARY LOGS` as an alias for `PURGE MASTER LOGS`.

- Produce warnings even for single-row `INSERT` statements, not just for multiple-row `INSERT` statements. Previously, it was necessary to set `sql_warnings = 1` to generate warnings for single-row statements.

- The `--quote-names` option for `mysqldump` now is enabled by default.

- Table aliases are not case sensitive if `lower_case_table_names` is nonzero.

- Changed that the relay log is flushed to disk by the slave I/O thread every time it reads a relay log event. This reduces the risk of losing some part of the relay log in case of brutal crash.

- Added `secure_auth` global server system variable and `--secure-auth` server option that disallow authentication for accounts that have old (pre-4.1.1) passwords.
• Added new %f microseconds format specifier for DATE_FORMAT() [824] and TIME_FORMAT() [832].
• Phrase search in MATCH ... AGAINST ( ... IN BOOLEAN MODE) no longer matches partial words.

mysql dump now includes a statement in the dump output to set foreign_key_checks to 0 to avoid problems with tables having to be reloaded in a particular order when the dump is reloaded. The existing foreign_key_checks value is saved and restored.

• Added delimiter (\d) command to the mysql command-line client for changing the statement delimiter (terminator). The default delimiter is semicolon.

• Added preload_buffer_size system variable.
• The interface to aggregate user-defined functions has changed a bit. You must now declare a xxx_clear() function for each aggregate function XXX(). xxx_clear() is used instead of xxx_reset().

• Added MATCH ... AGAINST( ... WITH QUERY EXPANSION) and the ft_query_expansion_limit system variable.

• Added mysql_set_server_option() C API client function to enable multiple statement handling in the server to be enabled or disabled.

• Added Slave_IO_State and Seconds_Behind_Master columns to the output of SHOW SLAVE STATUS. Slave_IO_State indicates the state of the slave I/O thread, and Seconds_Behind_Master indicates the number of seconds by which the slave is late compared to the master.

• MySQL source distributions now also include the MySQL Internals Manual internals.texi.

• Most subqueries are now much faster than before.

• The START SLAVE statement now supports an UNTIL clause for specifying that the slave SQL thread should be started but run only until it reaches a given position in the master's binary logs or in the slave's relay logs.

• Added support for syntax CREATE TABLE table2 (LIKE table1) that creates an empty table table2 with a definition that is exactly the same as table1, including any indexes.

• LOAD DATA now produces warnings that can be fetched with SHOW WARNINGS.

• The --lower-case-table-names=1 server option now also makes aliases case insensitive. (Bug #534)

• Renamed bdb_version system variable to version_bdb.

• Added mysql_sqlstate() and mysql_stmt_sqlstate() C API client functions that return the SQLSTATE error code for the last error.

• Added IGNORE option for DELETE statement.

• EXPLAIN now supports an EXTENDED option. When given, EXPLAIN generates extra information that may be viewed with the SHOW WARNINGS statement.

• Full-text search now supports multi-byte character sets and the Unicode utf8 character set. (The Unicode ucs2 character set is not yet supported.)

• Added SHOW MASTER LOGS as an alias for SHOW BINARY LOGS. (In 4.1.0, SHOW MASTER LOGS was renamed to SHOW BINARY LOGS. Now you can use either one.)
Changes in MySQL 4.1.1 (2003-12-01)

- Added `--sql-mode=NO_AUTO_VALUE_ON_ZERO` option to suppress the usual behavior of generating the next sequence number when zero is stored in an AUTO_INCREMENT column. With this mode enabled, zero is stored as zero; only storing NULL generates a sequence number.

- Require `DEFAULT` before table and database default character set. This enables us to use `ALTER TABLE tbl_name ... CHARACTER SET=...` to change the character set for all CHAR, VARCHAR, and TEXT columns in a table.

- Added aggregate function `BIT_XOR()` [874] for bitwise XOR operations.

- Removed unused `ft_max_word_len_for_sort` system variable.

- Removed unused `ft_max_word_len_for_sort` variable from `myisamchk`.

- The `DATABASE()` [864] function now returns NULL rather than the empty string if there is no database selected.

- Added `character_set_client`, `character_set_connection`, `character_set_database`, `character_set_results`, `character_set_server`, `character_set_system`, `collation_connection`, `collation_database`, and `collation_server` system variables to provide information about character sets and collations.

- Added `SHOW BDB LOGS` as an alias for `SHOW LOGS`.

- It is now possible to create multiple key caches, assign table indexes to particular caches, and to preload indexes into caches. See Section 12.4.6.1, “CACHE INDEX Syntax”. See Section 12.4.6.4, “LOAD INDEX INTO CACHE Syntax”. Structured system variables are introduced as a means of grouping related key cache parameters. See Section 5.1.4.1, “Structured System Variables”.

- The `mysql_next_result()` C API function now returns -1 if there are no more result sets.

- Added `--secure-auth` option to `mysql` command-line client. If this option is set, the client refuses to send passwords in old (pre-4.1.1) format.

- Renamed `CLIENT_MULTI_QUERIES` connect option flag to `CLIENT_MULTI_STATEMENTS`. To permit a transition period, the old option continues to be recognized for a while.

- CHAR, VARCHAR, and TEXT columns now have lengths measured in characters rather than in bytes. The character size depends on the column's character set. This means, for example, that a `CHAR(n)` column for a multi-byte character set takes more storage than before. Similarly, index values on such columns are measured in characters, not bytes.

- When using `SET sql_mode='mode'` for a complex mode (such as `ANSI`), we now update the `sql_mode` variable to include all the individual options implied by the complex mode.

- The `--old-protocol` option for `mysqld` is no longer supported and has been removed.

Bugs Fixed

- **Security Fix:** A server compiled without SSL support still permitted connections by users who had the REQUIRE SSL option specified for their accounts.

- **Security Fix:** Connections from some IP addresses were assigned incorrect database-level privileges. A connection could be assigned the database privileges of the previous successful authentication from one of those IP addresses, even if the IP address user name and database name were different. (Bug #1636)

- **Replication:** The new `PASSWORD()` [860] function in 4.1 is now properly replicated. (Bug #344)
Changes in MySQL 4.1.1 (2003-12-01)

- **Replication:** When an undefined user variable was used in an updating query on the master (such as `INSERT INTO t VALUES(@a)`, where @a had never been set by this connection before), the slave could replicate the query incorrectly if a previous transaction on the master used a user variable of the same name. (Bug #1331)

- **Replication:** `CONNECTION_ID()` now is properly replicated. (Bug #177)

- **Replication:** Replication failed between a 3.23 master and a 4.0 slave. The slave lost replicated temporary tables if `FLUSH LOGS` was issued on the master. (Bug #254)

- **Replication:** When a transaction spanned two or more relay logs, and the slave was stopped while executing the part of the transaction that was in the second or later relay log, replication resumed at the beginning of the second or later relay log, which was incorrect. (It should resume at `BEGIN`, in the first relay log.) (Bug #53)

- **LAST_INSERT_ID()** now returns 0 if the last `INSERT` statement didn't insert any rows.

- HASH, BTREE, RTREE, ERRORS, and WARNINGS no longer are reserved words. (Bug #724)

- A memory overrun could occur due to in subqueries in the `SELECT` list with `WHERE` clause larger than that of the outer query's `WHERE` clause. (Bug #726)

- Using the `?` prepared statement parameter as the argument to certain functions or statement clauses caused a server crash when `mysql_prepare()` was invoked. (Bug #1500)

- Error-handling functions were not called properly when an error resulted from `[CREATE | REPLACE] INSERT` statements.

- `REPAIR TABLE ... USE_FRM` could cause data loss when used with tables that contained `TIMESTAMP` columns and were created in 4.0.x.

- A `SELECT` that required a temporary table (marked by Using temporary in EXPLAIN output) and was used as a derived table in EXPLAIN statement caused the server to crash. (Bug #251)

- Using `EXPLAIN` on a derived table with a join caused the server to crash.

- The `USER()` function occasionally failed due an error in the size of the string allocated to it.

- `mysql` parser erroneously interpreted a `;` character within a multi-line comment (`/* ... */`) as a statement terminator.

- The types and lengths of result set columns for UNION operations are now determined taking into account values for all `SELECT` statements in the UNION, and not just the first `SELECT`.

- `ROLLUP` did not work correctly when all tables in the join were `const` tables. (Bug #714)

- The final character was omitted from the output of `USER()`. (Bug #447)

- `DELETE` with `ORDER BY` and `LIMIT` could cause the server to crash.

- Subqueries in `ORDER BY` and `GROUP BY` clauses were not processed correctly. (Bug #442)

- Under certain, rare circumstances table corruption was caused by a `DELETE` from a large table with a “new” (created by MySQL-4.1) full-text index.

- `UNION` with an empty select list and a nonexistent column being used in some of the individual `SELECT` statements could cause the server to crash.

- `SLAVE START` (which is a deprecated syntax, `START SLAVE` should be used instead) could crash the slave. (Bug #2516)
Changes in MySQL 4.1.0 (2003-04-03, Alpha)

- **UNION** operations that involved temporary tables could cause the server to crash.
- Attempting to create a table containing a spatial (GIS) column using a storage engine that does not support spatial types cause the server to crash.
- When no host name is specified in `SET PASSWORD FOR user`, it now defaults to `%` instead of the current host.
- MyISAM tables with FULLTEXT indexes created in MySQL 4.0 were unreadable by MySQL 4.1.
- `CREATE FULLTEXT INDEX` was not supported.
- Double the required amount of memory was freed by the server.
- Names of outer columns of subqueries in `INSERT/REPLACE` statements were not resolved correctly. (Bug #446)
- Name resolution of columns of reduced subqueries in `UNION` statements was not always performed correctly. (Bug #745)
- Columns of reduced subqueries were not always handled correctly. (Bug #679)
- Following a call to `mysql_prepare()`, placeholders were permitted in all consequent statements, even if they were not prepared. (Bug #1946)
- Privileges could be escalation using database wildcards in `GRANT` statements. (Bug #3924)
- When `ALTER TABLE RENAME`, was used to rename a table with the same name in another database, it silently dropped the destination table if it existed. (Bug #2628)
- A problem with `UNION` kept NULL values from being inserted into result set columns where the first `SELECT` of the `UNION` retrieved NOT NULL columns. The type and maximum length of the result column are now defined based on all parts of the `UNION`.

C.1.26 Changes in MySQL 4.1.0 (2003-04-03, Alpha)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

**Functionality Added or Changed**

- **Incompatible Change:** `TIMESTAMP` is now returned as a string of type `YYYY-MM-DD HH:MM:SS` and different timestamp lengths are not supported.
  
  This change was necessary for SQL standards compliance. In a future version, a further change will be made (backward compatible with this change), permitting the timestamp length to indicate the desired number of digits of fractions of a second.

- **Replication:** Replication now works with `RAND()` [814] and user variables `@var`.

- The `--opt` option for `mysqldump` now is enabled by default, as are all the options implied by `--opt`.

- `SLAVE START` and `SLAVE STOP` are no longer accepted by the query parser; use `START SLAVE` and `STOP SLAVE` instead.

- On Windows, we are now using shared memory to communicate between server and client when they are running on the same machine and you are connecting to `localhost`.
• If one creates a too long `CHAR/VARCHAR` it is now automatically changed to `TEXT` or `BLOB`; One get a warning in this case.

• `BTREE` index on `MEMORY (HEAP)` tables.

• New `CRC32` [811] function to compute cyclic redundancy check value.

• Added new `mysql_get_server_version()` C API client function.

• Character sets to be defined per column, table and database.

• `SHOW FULL COLUMNS FROM tbl_name` shows column comments.

• Permit empty index lists to be specified for `USE INDEX, IGNORE INDEX, and FORCE INDEX`.

• Server side help for all MySQL functions. One can now type `help week` in the `mysql` client and get help for the `WEEK()` function.

• `EXPLAIN SELECT` now can be killed. See Section 12.4.6.3, “KILL Syntax”.

• `SELECT ... FROM DUAL` is an alias for `SELECT ...` (To be compatible with some other database systems).

• New function `IS_USED_LOCK()` [871] for determining the connection identifier of the client that holds a given advisory lock.

• `SERIAL DEFAULT VALUE` added as an alias for `AUTO_INCREMENT`.

• One can add a comment per column in `CREATE TABLE`.

• One can create a table from the existing table using `CREATE [TEMPORARY] TABLE [IF NOT EXISTS] table (LIKE table)`. The table can be either normal or temporary.

• `SELECT .. LIMIT 0` did not return the proper row count for `SQL_CALC_FOUND_ROWS`.

• `DROP TEMPORARY TABLE` now drops only temporary tables and doesn't end transactions.

• Added `--compatible` option to `mysqldump` for producing output that is compatible with other database systems or with older MySQL servers.

• Derived tables:

```sql
SELECT a.col1, b.col2
    FROM (SELECT MAX(col1) AS col1 FROM root_table) a,
    other_table b
    WHERE a.col1=b.col1;
```

• `REPAIR TABLE` of `MyISAM` tables now uses less temporary disk space when sorting char columns.

• `DATE/DATETIME` checking is now a bit stricter to support the ability to automatically distinguish between date, datetime, and time with microseconds. For example, dates of type `YYYYMMDD HHMMDD` are no longer supported; you must either have separators between each `DATE/TIME` part or not at all.

• `TRUE` and `FALSE` added as alias for 1 and 0, respectively.

• New options `--reconnect` and `--skip-reconnect` for the `mysql` client, to reconnect automatically or not if the connection is lost.

• `START SLAVE (STOP SLAVE)` no longer returns an error if the slave is started (stopped); it returns a warning instead.
Changes in MySQL 4.1.0 (2003-04-03, Alpha)

• Subqueries: `SELECT * from t1 where t1.a=(SELECT t2.b FROM t2)`.

• New more secure client authentication based on 45-byte passwords in the `user` table. (CVE-2000-0981)

• One can specify the different `BLOB/TEXT` types with the syntax `BLOB(length)` and `TEXT(length)`. MySQL automatically changes it to one of the internal `BLOB/TEXT` types.

• The `mysql` command-line client attempted to interpret quotation marks within comments. (Bug #539)

• In `CREATE TABLE` the attribute `SERIAL` is now an alias for `BIGINT UNSIGNED NOT NULL AUTO_INCREMENT UNIQUE`.

• Added `old-password` command to `mysqladmin` for changing password but storing it using the old password-hashing format.

• `ALTER DATABASE`.

• New `CONVERT(... USING ...) [851]` syntax for converting string values between character sets.

• Multi-line queries: You can now issue several queries at once and then read the results in one go.

• `expr SOUNDS LIKE expr [793]` same as `SOUNDEX(expr)=SOUNDEX(expr) [793]`.

• One can specify a data type for a column in `CREATE TABLE ... SELECT` by defining the column in the `CREATE TABLE` part.

```sql
CREATE TABLE foo (a TINYINT NOT NULL) SELECT b+1 AS a FROM bar;
```

• New operators `integer MOD integer` and `integer DIV integer`. `DIV` is now a reserved word.

• `SHOW [COUNT(*]) WARNINGS` shows warnings from the last command.

• Added support for `UNION` in derived tables.

• `VARCHRACTER` is an alias for `VARCHAR`.

• `CHAR BYTE` is an alias for the `CHAR BINARY` data type.

• In `CREATE TABLE foo (a INT not null primary key)` the `PRIMARY` word is now optional.

• Added new `VARIANCE(expr) [876]` function that returns the variance of `expr`

• New `CHARSET() [862]` and `COLLATION() [863]` functions to return the character set and collation of a string.

• Added `record_in_range()` method to `MERGE` tables to be able to choose the correct index when there are many to choose from.

• `REPAIR TABLE` and `OPTIMIZE TABLE` now can be killed. See Section 12.4.6.3, “KILL Syntax”.

• Support for GIS (Geometrical data). See Chapter 16, Spatial Extensions.

• `libmysqlclient` did not always fetch column default values correctly.

• Aliases are now forced in derived tables, as per standard SQL.

• New faster client/server protocol that supports prepared statements, bound parameters, and bound result columns, binary transfer of data, warnings.
Changes in Release 4.0.x (Lifecycle Support Ended)

- One can specify many temporary directories to be used in a round-robin fashion with: `--tmpdir=dirname1:dirname2:dirname3`.
- Faster embedded server (new internal communication protocol).
- Permit the `ANSI_QUOTES` SQL mode to be changed on the fly.
- Unicode (UTF8) support.
- Renamed `SHOW MASTER LOGS` statement to `SHOW BINARY LOGS`.
- Added database and real table name (in case of alias) to the `MYSQL_FIELD` structure.
- Permit `DEFAULT(col_name)` [869] in expressions; it produces the column's default value.
- Permit index type to be specified explicitly for some storage engines using `USING type_name` syntax in index definition.

C.2 Changes in Release 4.0.x (Lifecycle Support Ended)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

The following list summarizes the features in MySQL Server 4.0 that are not present in previous versions. For a full list of changes, please refer to the changelog sections for individual 4.0 releases.

- The InnoDB storage engine is now included in the standard binaries, adding transactions, row-level locking, and foreign keys. See Section 13.2, “The InnoDB Storage Engine”.
- A query cache, offering vastly increased performance for many applications. By caching complete result sets, later identical queries can return instantly. See Section 7.5.3, “The MySQL Query Cache”.
- Improved full-text indexing with boolean mode, truncation, and phrase searching. See Section 11.9, “Full-Text Search Functions”.
- Enhanced `MERGE` tables, now supporting `INSERT` statements and `AUTO_INCREMENT`. See Section 13.3, “The MERGE Storage Engine”.
- `UNION` syntax in `SELECT`. See Section 12.2.7.3, “UNION Syntax”.
- Multiple-table `DELETE` statements. See Section 12.2.1, “DELETE Syntax”.
- `libmysqld`, the embedded server library. See Section 17.5, “libmysqld, the Embedded MySQL Server Library”.
- Additional `GRANT` privilege options for even tighter control and security. See Section 12.4.1.2, “GRANT Syntax”.
- Management of user resources in the `GRANT` system, particularly useful for ISPs and other hosting providers. See Section 5.6.4, “Setting Account Resource Limits”.
- Dynamic server variables, allowing configuration changes to be made without having to stop and restart the server. See Section 12.4.4, “SET Syntax”.
- Improved replication code and features. See Chapter 14, Replication.
• Numerous new functions and options.
• Changes to existing code for enhanced performance and reliability.

For a full list of changes, please refer to the changelog sections for each individual 4.0.x release.

C.2.1 Changes in Release 4.0.31 (Not released)

End of Product Lifecycle.  Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

This is a bugfix release for the MySQL 4.0 release family.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized update alerts about fixes that are relevant to the version and features you use, please consider subscribing to MySQL Enterprise (a commercial MySQL offering). For more details, please see (http://www.mysql.com/products/enterprise).

Bugs fixed:

• Security Fix: Using RENAME TABLE against a table with explicit DATA DIRECTORY and INDEX DIRECTORY options can be used to overwrite system table information by replacing the symbolic link points. the file to which the symlink points.

MySQL will now return an error when the file to which the symlink points already exists. (Bug #321111, CVE-2007-5969)

• Error returns from the time() system call were ignored. (Bug #27198)

C.2.2 Changes in Release 4.0.30 (12 February 2007)

End of Product Lifecycle.  Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

This is a bugfix release for the MySQL 4.0 release family.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized update alerts about fixes that are relevant to the version and features you use, please consider subscribing to MySQL Enterprise (a commercial MySQL offering). For more details, please see (http://www.mysql.com/products/enterprise).

Bugs fixed:

• Idle connections were not killed during timeout when using the Native POSIX Thread Library (NPTL) and mysqld. In the course of this fix, code to detect and handle the NPTL has been backported from 4.1 to 4.0. (Bug #16995)

C.2.3 Changes in Release 4.0.29 (Not released)

End of Product Lifecycle.  Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please
consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

This is a bugfix release for the MySQL 4.0 release family.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized update alerts about fixes that are relevant to the version and features you use, please consider subscribing to MySQL Enterprise (a commercial MySQL offering). For more details, please see (http://www.mysql.com/products/enterprise).

Bugs fixed:

• InnoDB exhibited thread thrashing with more than 50 concurrent connections under an update-intensive workload. (Bug #22868)

• InnoDB showed substandard performance with multiple queries running concurrently. (Bug #15815)

• User-defined variables could consume excess memory, leading to a crash caused by the exhaustion of resources available to the MEMORY storage engine, due to the fact that this engine is used by MySQL for variable storage and intermediate results of GROUP BY queries. Where SET had been used, such a condition could instead give rise to the misleading error message You may only use constant expressions with SET, rather than Out of memory (Needed NNNNNN bytes). (Bug #23443)

C.2.4 Changes in Release 4.0.28 (Not released)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

This is a bugfix release for the MySQL 4.0 release family.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized update alerts about fixes that are relevant to the version and features you use, please consider subscribing to MySQL Enterprise (a commercial MySQL offering). For more details, please see (http://www.mysql.com/products/enterprise).

Functionality added or changed:

• The mysqldumpslow script has been moved from client RPM packages to server RPM packages. This corrects a problem where mysqldumpslow could not be used with a client-only RPM install, because it depends on my_print_defaults which is in the server RPM. (Bug #20216)

Bugs fixed:

• Deleting entries from a large MyISAM index could cause index corruption when it needed to shrink. Deletes from an index can happen when a record is deleted, when a key changes and must be moved, and when a key must be un-inserted because of a duplicate key. This can also happen in REPAIR TABLE when a duplicate key is found and in myisamchk when sorting the records by an index. (Bug #22384)

• Transient errors in replication from master to slave may trigger multiple Got fatal error 1236: 'binlog truncated in the middle of event' errors on the slave. (Bug #4053)

• A server or network failure with an open client connection would cause the client to hang even though the server was no longer available. (Bug #9678)
**Changes in Release 4.0.27 (06 May 2006)**

- `mysqlhotcopy` did not copy RAID directories with names that contained nondecimal hex digits. (It copied only directories containing the characters 0 through 9 and ignored those containing a through f.) (Bug #18777)

- Using `SELECT` and a table join while running a concurrent `INSERT` operation would join incorrect rows. (Bug #14400)

- A query with a `WHERE` clause containing `column = ELT(int_value_1, value_list) OR column = ELT(int_value_2, value_list)` could return unexpected results. (Bug #12728)

**C.2.5 Changes in Release 4.0.27 (06 May 2006)**

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

This is a security fix release and bugfix release for the MySQL 4.0 release family.

This release includes the patches for recently reported security vulnerabilities in the MySQL client/server protocol. We would like to thank Stefano Di Paola <stefano.dipaola@wisec.it> for finding and reporting these to us.

Functionality added or changed:

- The MySQL-server RPM now explicitly assigns the `mysql` system user to the `mysql` user group during the postinstallation process. This corrects an issue with upgrading the server on some Linux distributions whereby a previously existing `mysql` user was not changed to the `mysql` group, resulting in wrong groups for files created following the installation. (Bug #12823)

- Better detection of connection timeout for replication servers on Windows enables elimination of extraneous Lost connection errors in the error log. (Bug #5588)

Bugs fixed:

- **Security fix:** A malicious client, using specially crafted invalid login or `COM_TABLE_DUMP` packets was able to read uninitialized memory, which potentially, though unlikely in MySQL, could have led to an information disclosure. (CVE-2006-1516, CVE-2006-1517) Thanks to Stefano Di Paola <stefano.dipaola@wisec.it> for finding and reporting this bug.

- MySQL-shared-compat-4.0.26-0.i386.rpm incorrectly depend on `glibc` 2.3 and cannot not be installed on a `glibc` 2.2 system. For MySQL 4.0, use the older MySQL-shared-compat-4.0.25-0.i386.rpm package. (Bug #16539)

- Running `myisampack` followed by `myisamchk` with the `--unpack` option would corrupt the `auto_increment` key. (Bug #12633)

- When `myisamchk` needed to rebuild a table, `AUTO_INCREMENT` information was lost. (Bug #10405)

- Avoid trying to include `<asm/atomic.h>` when it doesn't work in C++ code. (Bug #13621)

- `BIT_COUNT()` [855] could return an incorrect value for right table columns in a `LEFT JOIN`. (Bug #13044)

- MySQL would not compile on Linux distributions that use the tinfo library. (Bug #18912)

- An `UPDATE` statement which tried to update a column with a name beginning with an asterisk would cause the server to crash. This was because the server would wrongly expand the `*` character to the list
Changes in Release 4.0.26 (08 September 2005)

of all table columns, causing the list of columns to become longer than the list of values. Now the server performs this expansion only if the * character is followed by a space. (Bug #16510)

- An INSERT ... SELECT statement between tables in a MERGE set can return errors when statement involves insert into child table from merge table or vice-versa. (Bug #5390)

- Fixed problems with static variables to allow building on Fedora Core 3. (Bug #6554)

- A LIMIT-related optimization failed to take into account that MyISAM table indexes can be disabled, causing Error 124 when it tried to use such an index. (Bug #14616)

- For a table that had been opened with HANDLER_OPEN, issuing OPTIMIZE TABLE, ALTER TABLE, or REPAIR TABLE caused a server crash. (Bug #14397)

- Queries of the form (SELECT ... ORDER BY ...) were being treated as a UNION. This improperly resulted in only distinct values being returned (because UNION by default eliminates duplicate results). Also, references to column aliases in ORDER BY clauses following parenthesized SELECT statements were not resolved properly. (Bug #7672)

- SELECT DISTINCT with a GROUP BY clause caused a server crash. (Bug #13855)

- SHOW CREATE TABLE did not display any FOREIGN KEY clauses if a temporary file could not be created. Now SHOW CREATE TABLE displays an error message in an SQL comment if this occurs. (Bug #13002)

- MySQL programs in binary distributions for Solaris 8/9/10 x86 systems would not run on Pentium III machines. (Bug #6772)

- Queries against a MERGE table that has a composite index could produce incorrect results. (Bug #9112)

- The counters for the Key_read_requests, Key_reads, Key_write_requests, and Key_writes status variables were changed from unsigned long to unsigned longlong to accommodate larger values before the variables roll over and restart from 0. (Bug #12920)

- A concurrency problem for CREATE ... SELECT could cause a server crash. (Bug #12845)

- On HP-UX 11.x (PA-RISC), the -L option caused mysqlimport to crash. (Bug #12958)

- The server crashed when one thread resized the query cache while another thread was using it. (Bug #12848)

C.2.6 Changes in Release 4.0.26 (08 September 2005)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Functionality added or changed:

- Added the mysql_get_client_version() C API function to the embedded server library. (It was present in the regular client library but inadvertently omitted from the embedded library.) (Bug #10266)

Bugs fixed:

- An optimizer estimate of zero rows for a nonempty InnoDB table used in a left or right join could cause incomplete rollback for the table. (Bug #12779)
• Query cache is switched off if a thread (connection) has tables locked. This prevents invalid results where the locking thread inserts values between a second thread connecting and selecting from the table. (Bug #12385)

• For DMG installs on Mac OS X, the preinstallation and postinstallation scripts were being run only for new installations and not for upgrade installations, resulting in an incomplete installation process. (Bug #11380)

• On Windows, applications that used the embedded server made it not possible to remove certain files in the data directory, even after the embedded server had been shut down. This occurred because a file descriptor was being held open. (Bug #12177)

• Creation of the mysql group account failed during the RPM installation. (Bug #12348)

• Attempting to repair a table having a fulltext index on a column containing words whose length exceeded 21 characters and where myisam_repair_threads was greater than 1 would crash the server. (Bug #11684)

• When two threads compete for the same table, a deadlock could occur if one thread has also a lock on another table through LOCK TABLES and the thread is attempting to remove the table in some manner and the other thread want locks on both tables. (Bug #10600)

C.2.7 Changes in Release 4.0.25 (05 July 2005)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Functionality added or changed:

• Security improvement: Applied a patch to fix a UDF library-loading vulnerability that could result in a buffer overflow and code execution. (CVE-2005-2558)

• Added --with-big-tables compilation option to configure. (Previously it was necessary to pass -DBIG_TABLES to the compiler manually in order to enable large table support.) See Section 2.9.3, “MySQL Source-Configuration Options”, for details.

Bugs fixed:

• On Mac OS X, libmysqlclient_r.a now is built with --fno-common to make it possible to link a shared two-level namespace library against libmysqlclient_r.a. (Bug #10638)

• An error in the implementation of the MyISAM compression algorithm caused myisampack to fail with very large sets of data (total size of all the records in a single column needed to be >= 3 GB to trigger this issue). (Bug #8321)

• A problem with the my_global.h file caused compilation of MySQL to fail on single-processor Linux systems running 2.6 kernels. (Bug #10364)

• Fixed a portability problem testing for crypt() support that caused compilation problems when using OpenSSL/yaSSL on HP-UX and Mac OS X. (Bug #10675, Bug #11150)

• MyISAM table corruption could occur with ANALYZE TABLE if a write lock was acquired with LOCK TABLES and then an INSERT or DELETE was done prior to analyzing the table. (Bug #10901)

• Fixed a server crash resulting from CREATE TABLE ... SELECT that selected from a table being altered by ALTER TABLE. (Bug #10224)
Changes in Release 4.0.24 (04 March 2005)

C.2.8 Changes in Release 4.0.24 (04 March 2005)

End of Product Lifecycle.  Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please
consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Functionality added or changed:

- Security improvement: The server creates .frm, .MYD, .MYI, .MRG, .ISD, and .ISM table files only if a file with the same name does not already exist. Thanks to Stefano Di Paola <stefano.dipaola@wisec.it> for finding and informing us about this issue. (CVE-2005-0711)

- Security improvement: User-defined functions should have at least one symbol defined in addition to the xxx symbol that corresponds to the main xxx() function. These auxiliary symbols correspond to the xxx_init(), xxx_deinit(), xxx_reset(), xxx_clear(), and xxx_add() functions. mysqld by default no longer loads UDFs unless they have at least one auxiliary symbol defined in addition to the main symbol. The --allow-suspicious-udfs option controls whether UDFs that have only an xxx symbol can be loaded. By default, the option is off. mysqld also checks UDF file names when it reads them from the mysql.func table and rejects those that contain directory path name separator characters. (It already checked names as given in CREATE FUNCTION statements.) See Section 18.2.2.1, “UDF Calling Sequences for Simple Functions”, Section 18.2.2.2, “UDF Calling Sequences for Aggregate Functions”, and Section 18.2.2.6, “User-Defined Function Security Precautions”. Thanks to Stefano Di Paola <stefano.dipaola@wisec.it> for finding and informing us about this issue. (CVE-2005-0709, CVE-2005-0710)

- InnoDB: Added configuration option and settable global variable innodb_autoextend_increment for setting the size in megabytes by which InnoDB tablespaces are extended when they become full. The default value is 8, corresponding to the fixed increment of 8MB in previous versions of MySQL.

- InnoDB: Do not acquire an internal InnoDB table lock in LOCK TABLES if autocommit = 1. This helps in porting old MyISAM applications to InnoDB. InnoDB table locks in that case caused deadlocks very easily.

Bugs fixed:

- AES_DECRYPT(col_name, key) [857] could fail to return NULL for invalid values in col_name, if col_name was declared as NOT NULL. (Bug #8669)

- FOUND_ROWS() [864] returned an incorrect value after a SELECT SQL_CALC_FOUND_ROWS DISTINCT statement that selected constants and included GROUP BY and LIMIT clauses. (Bug #7945)

- Index cardinality was not being updated properly for TEMPORARY tables under some circumstances, such as CREATE TABLE ... SELECT followed by ANALYZE TABLE. (Bug #7519)

- Fixed a server crash caused by DELETE FROM tbl_name ... WHERE ... ORDER BY tbl_name.col_name when the ORDER BY column was qualified with the table name. (Bug #8392)

- Fixed a bug in MATCH ... AGAINST in natural language mode that could cause a server crash if the FULLTEXT index was not used in a join (EXPLAIN did not show fulltext join mode) and the search query matched no rows in the table. (Bug #8522)

- Platform and architecture information in version information produced for --version option on Windows was always Win95/Win98 (i32). More accurately determine platform as Win32 or Win64 for 32-bit or 64-bit Windows, and architecture as ia32 for x86, ia64 for Itanium, and axp for Alpha. (Bug #4445)

- Fixed an optimization problem that permitted a negative number to be stored in a DOUBLE UNSIGNED column when it was assigned a value from a signed DOUBLE column. (Bug #7700)

- Fixed a failure of multiple-table updates to replicate properly on slave servers when --replicate-* table options had been specified. (Bug #7011)
• Renamed `set_bit()` and `clear_bit()` functions in source code to avoid a conflict with functions of the same names in Linux kernel header files. (Bug #7971)

• Part of the information being used to cache access-permission lookups was not always reinitialized properly, particularly for connections from localhost on Windows. The result was connection failures that appeared to occur randomly. (Bug #5569)

• Corrected a problem with the `QUOTE()` function returning bad results. (Bug #8248)

• Fixed a problem where `INSERT INTO ...SELECT` failed when the source and target table were the same. (Bug #6034)

• Fixed a problem where RPM installation on Linux as a nonprivileged user would result in incomplete installation. (Bug #7347)

• Change thread stack size used for building Linux RPM distributions to avoid warnings about stack size during server startup. (Bug #6226)

• Fixed a symlink vulnerability in the `mysqlaccess` script. Reported by Javier Fernandez-Sanguino Pena and Debian Security Audit Team. (CVE-2005-0004)

• Fixed support for C API function `mysql_list_fields()`, which was accidentally broken in 4.0.22 (Bug #6761)

• Make `query_cache_wlock_invalidate` system variable visible in `SHOW VARIABLES` output. (Bug #7594)

• Fixed a bug which caused `FROM_UNIXTIME()` function to return `NULL` for zero argument instead of the Epoch. (Bug #7515)

• Now in datetime values two digit year is interpreted as year in 20th or 21st century even with zero month and day. (Bug #7297)

• Fixed a bug in `QUOTE` function when used in conjunction with some other string functions. This lead to severe buffer overflow and server crashing. (Bug #7495)

• InnoDB: Work around a problem in AIX 5.1 patched with ML7 security patch: InnoDB would refuse to open its `ibdata` files, complaining about an operating system error 0.

• InnoDB: Fixed a memory corruption bug if one created a table with a primary key that contained at least two column prefixes. An example: `CREATE TABLE t(a char(100), b tinyblob, PRIMARY KEY(a(5), b(10)))`.

• InnoDB: Use native `tmpfile()` function on Netware. All InnoDB temporary files are created under `sys:	mp`. Previously, InnoDB temporary files were never deleted on Netware.

• InnoDB: Honor the `--tmpdir` startup option when creating temporary files. Previously, InnoDB temporary files were always created in the temporary directory of the operating system. On Netware, InnoDB will continue to ignore `--tmpdir`. (Bug #5822)

• InnoDB: Fix a theoretical hang over the adaptive hash latch in InnoDB if one runs `INSERT ... SELECT ...` (binlog not enabled), or a multiple-table `UPDATE` or `DELETE`, and only the read tables are InnoDB type, the rest are `MyISAM`; this also fixes bug #7879 for InnoDB type tables. (Bug #7879)

• InnoDB: Fixed a bug: 32-bit `mysql` binaries built on HP-UX-11 did not work with InnoDB files greater than 2 GB in size. (Bug #6189)

• InnoDB: Fixed a bug: InnoDB failed to drop a table in the background drop queue if the table was referenced by a foreign key constraint.
Changes in Release 4.0.23 (18 December 2004)

- InnoDB: Fixed a bug: if we dropped a table where an `INSERT` was waiting for a lock to check a `FOREIGN KEY` constraint, then an assertion would fail in `lock_reset_all_on_table()`, since that operation assumes no waiting locks on the table or its records.

- Fixed that, when encountering a “disk full” or “quota exceeded” write error, MyISAM sometimes didn’t sleep and retry the write, thus resulting in a corrupted table. (Bug #7714)

- Fixed that a slave could crash after replicating many `ANALYZE TABLE`, `OPTIMIZE TABLE`, or `REPAIR TABLE` statements from the master. (Bug #6461, Bug #7658)

- Fixed a bug where MySQL was allowing concurrent updates (inserts, deletes) to a table if binary logging is enabled. Changed to ensure that all updates are executed in a serialized fashion, because they are executed serialized when binlog is replayed. (Bug #7879)

- Fixed a bug in replication that caused the master to stamp generated statements (such as `SET` statements) with an `error_code` intended only for another statement. This could happen, for example, when a statements generates a duplicate key error on the master but must be replicated. (Bug #8412)

- Documented problem with using `mysqldump` in 4.0.x to dump `TIMESTAMP(2)` and `TIMESTAMP(4)` data types. (Bug #6530)

C.2.9 Changes in Release 4.0.23 (18 December 2004)

End of Product Lifecycle.  Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Note

Due to a `libtool`-related bug in the source distribution, the creation of shared `libmysqlclient` libraries was not possible (the resulting files were missing the `.so` file name extension). The file `ltmain.sh` was updated to fix this problem and the resulting source distribution was released as `mysql-4.0.23a.tar.gz`. This modification did not affect the binary packages. (Bug #7401)

Functionality added or changed:

- Added `--hex-blob` option to `mysqldump` for dumping binary string columns using hexadecimal notation.

- Added `mysql_hex_string()` C API function that hex-encodes a string.

- InnoDB: Do not periodically write `SHOW INNODB STATUS` information to a temporary file unless the configuration option `innodb-status-file = 1` is set.

- InnoDB: Made the foreign key parser better aware of quotation marks. (Bug #6340)

- `mysqlbinlog` now prints an informative commented line (thread id, timestamp, server id, and so forth) before each `LOAD DATA INFILE`, like it does for other queries; unless `--short-form` is used.

Bugs fixed:

- A multiple-table `DELETE` could cause MySQL to crash when using InnoDB tables. (Bug #5837, Bug #6378)

- Corrected accounts in the `mysql.user` table in Windows distributions that had been created with a `Host` value of `build` rather than `%`. (Bug #6000)
Changes in Release 4.0.22 (27 October 2004)

- Prevent adding `CREATE TABLE .. SELECT` query to the binary log when the insertion of new records partially failed. (Bug #6682)
- Fixed bug which caused `FROM_UNIXTIME()` function to return wrong result if the argument was too big. (Bug #6439)
- Fixed bug which caused MySQL server to store wrong values in `TIMESTAMP` columns and give wrong results for `UNIX_TIMESTAMP()` function if it was run in time zone with leap seconds. (Bug #6387)
- InnoDB: Fixed a bug in `LOAD DATA INFILE...REPLACE` printing duplicate key error when executing the same load query several times. (Bug #5835)
- InnoDB: Refuse to open new-style tables created with MySQL 5.0.3 or later. (Bug #7089)
- InnoDB: Do not call `rewind()` when displaying `SHOW INNODB STATUS` information on `stderr`.
- InnoDB: If one used `INSERT IGNORE` to insert several rows at a time, and the first inserts were ignored because of a duplicate key collision, then InnoDB in a replication slave assigned `AUTO_INCREMENT` values 1 bigger than in the master. This broke the MySQL replication. (Bug #6287)
- InnoDB: Fix two hangs: FOREIGN KEY constraints treated table and database names as case-insensitive. `RENAME TABLE t TO T` would hang in an endless loop if `t` had a foreign key constraint defined on it. Fix also a hang over the dictionary mutex that would occur if one tried in `ALTER TABLE` or `RENAME TABLE` to create a foreign key constraint name that collided with another existing name. (Bug #3478)
- InnoDB: Treat character `0xA0` as space in InnoDB's FOREIGN KEY parser if MySQL treats it as space in the default charset. EMS MySQL Manager inserts character `0xA0` after the table name in an `ALTER`, which confused InnoDB's parser.
- Fixed a bug which caused a crash when only the slave I/O thread was stopped and restarted. (Bug #6148)
- If a connection had an open transaction but had done no updates to transactional tables (for example, if had just done a `SELECT FOR UPDATE` then executed a nontransactional update, that update automatically committed the transaction (thus releasing InnoDB's row-level locks etc). (Bug #5714)
- If a connection was interrupted by a network error and did a rollback, the network error code got stored into the `BEGIN` and `ROLLBACK` binary log events; that caused superfluous slave stops. (Bug #6522)
- A sequence of `BEGIN` (or `SET autocommit = 0`), `FLUSH TABLES WITH READ LOCK`, transactional update, `COMMIT`, `FLUSH TABLES WITH READ LOCK` could hang the connection forever and possibly the MySQL server itself. This happened for example when running the `innobackup` script several times. (Bug #6732)

C.2.10 Changes in Release 4.0.22 (27 October 2004)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Functionality added or changed:
- The `--with-openssl` option for `configure` now accepts a path prefix as an argument. `--with-openssl-includes` and `--with-openssl-libs` are still supported, but are needed only to override the default values. (Bug #5494)
Changes in Release 4.0.22 (27 October 2004)

• Added new **--without-man** option to **configure** to suppress building/installing the manual pages. (Bug #5379)

• InnoDB: New **mysql** option session variable **innodb_table_locks** (on by default). In applications using **autocommit = 1** and MySQL's **LOCK TABLES** statement, InnoDB's internal table locks that were added in 4.0.20 can cause deadlocks. You can set **innodb_table_locks = 0** in **my.cnf** to remove that problem. See Section 13.2.15, “Restrictions on InnoDB Tables”. (Bug #3299, Bug #5998)

• InnoDB: Added the startup option and settable global variable **innodb_max_purge_lag** for delaying **INSERT**, **UPDATE** and **DELETE** operations when the purge operations are lagging. The default value of this parameter is zero, meaning that there are no delays. See Section 13.2.10, “InnoDB Multi-Versioning”.

• InnoDB: Change error code to **HA_ERR_ROW_IS_REFERENCED** if we cannot **DROP** a parent table because it is referenced by a **FOREIGN KEY** constraint.

Bugs fixed:

• Fixed bug in server which caused connection stall when one of deprecated **libmysqlclient** functions **mysql_create_db()** and **mysql_rm_db()** were called and were going to return error. (Bug #6081)

• Fixed returning wrong query result from query cache if a temporary table was hiding a real table after putting results to query cache. (Bug #6084)

• Fixed **ENABLE KEYS**, which failed if **tmpdir** ran out of space. Now, a full repair is done in this case. (Bug #5625)

• Fixed an improper error message when trying to drop a table which is referenced by a **FOREIGN KEY** constraint. (Bug #5784)

• Fixed a bug that permitted **FLUSH TABLES** to close **HANDLER** tables. **HANDLER** tables are now reopened after a **FLUSH TABLES** the next time they are used. However, they lose their file position if this happens. (Bug #4286)

• Fixed a bug that permitted **HANDLER** tables with the same alias to be opened multiple times. **HANDLER** aliases must now be unique, even though it is syntactically correct in versions below 4.1 to qualify them with their base table's database name (for example, **test_db.handler_tbl** now conflicts with **another_db.handler_tbl**). (Bug #4335)

• Fixed crash when using MySQL 4.0 with privilege tables from MySQL 5.0.

• **mysqlimport** now reads input files locally from the client host only if the **--local** option is given. Previously, it assumed incorrectly in some cases that files were local even without **--local**. (Bug #5829)

• InnoDB: Make the check for excessive semaphore waits to tolerate glitches in the system clock (do not crash the server if the system time is adjusted while InnoDB is under load.). (Bug #5898)

• InnoDB: Fixed a bug in the InnoDB **FOREIGN KEY** parser that prevented **ALTER TABLE** of tables containing “#” in their names. (Bug #5856)

• InnoDB: Fixed problem introduced in 4.0.21 where a connection starting a transaction, doing updates, then **FLUSH TABLES WITH READ LOCK**, then **COMMIT**, would cause replication slaves to stop (complaining about error 1223). Bug surfaced when using the InnoDB **innobackup** script. (Bug #5949)

• InnoDB: If one updated a column so that its size changed, or updated it to an externally stored (**TEXT** or **BLOB**) value, then ANOTHER externally stored column would show up as 512 bytes of good data + 20 bytes of garbage in a consistent read that fetched the old version of the row. (Bug #5960)
Changes in Release 4.0.21 (06 September 2004)

- InnoDB: Release the dictionary latch during a long cascaded `FOREIGN KEY` operation, so that we do not starve other users doing `CREATE TABLE` or other DDL operations. This caused a notorious 'Long semaphore wait' message to be printed to the `.err` log. (Bug #5961)

- InnoDB: Let InnoDB remember row locking type (X or S) inside `LOCK TABLES`, also over plain consistent reads `SELECT`.

- InnoDB: Fixed a bug introduced in 4.0.21. An assertion failed if one used `mysqldump` with the option `-l` or `--opt`, or if one used `LOCK TABLES ... LOCAL`. (Workaround in 4.0.21: use `--quick` and `--single-transaction`. (Bug #5538)

- InnoDB: Having a column prefix index in the primary key, and the same column fully in a secondary key could cause an assertion failure in `row_build_row_ref()`. (Bug #5180)

- Fixed a bug which resulted in an erroneously calculated number of examined rows in `UNIONS`. This value is printed in the slow query log. (Bug #5879)

- Fixed bug with crash of server on some values of `read_rnd_buffer_size` (Bug #5492)

- Fixed bug which caused truncation of values read from or into `TIMESTAMP` fields if `--new` mode was enabled. (Bug #4131)

- `mysqladmin` now returns a status of 0 even when the server denies access; such an error means the server is running. (Bug #3120)

- Fixed that if the slave SQL thread found a syntax error in a query (which should be rare, as the master parsed it successfully), it stops. (Bug #5711)

- Fixed that if a write to a `MyISAM` table fails because of a full disk or an exceeded disk quota, it prints a message to the error log every 10 minutes, and waits until disk becomes free. (Bug #3248)

- Fixed problem with symlinked databases on Windows being shown with `SHOW DATABASES` even if the database name doesn't match the given wildcard (Bug #5539)

C.2.11 Changes in Release 4.0.21 (06 September 2004)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Functionality added or changed:

- Print `version_comment` (from `./configure --comment` during compilation) when starting the server. Example: `Version: '4.0.21-debug' socket: '/tmp/mysql.sock' port: 0` Official MySQL Binary

- Made the MySQL server not react to signals `SIGHUP` and `SIGQUIT` on Mac OS X 10.3. This is needed because under this OS, the MySQL server receives lots of these signals (reported as Bug #2030).

- On Windows, the `mysqld-nt` and `mysqld-max-nt` servers now write error messages to the Windows event log in addition to the MySQL error log.

Bugs fixed:

- Fixed an old bug in concurrent accesses to `MERGE` tables (even one `MERGE` table and `MyISAM` tables), that could've resulted in a crash or hang of the server. (Bug #2408, CVE-2004-0837)
• Fixed a bug that caused incorrect results from `GROUP BY` queries with expression in `HAVING` clause that refers to a columns such as `BLOB`, `TEXT`, or `TINYBLOB`. (Bug #4358)

• Fixed a bug when memory was not released when `HEAP` table is dropped. It could only happen on Windows when a symlink file (.sym) is used and if that symlink file contained double backslashes (`\`). (Bug #4973)

• Fixed a bug which prevented `TIMESTAMP(19)` fields from being created. (Bug #4491)

• Fixed a bug that caused wrong results in queries that were using index to search for `NULL` values in `BLOB` (`TINYBLOB`, `TEXT`, `TINYTEXT`, etc) columns of `MyISAM` tables. (Bug #4816)

• Fixed a bug in the function `ROUND()` [815] reporting incorrect metadata (number of digits after the decimal point). It can be seen, for example, in `CREATE TABLE t1 SELECT ROUND(1, 34)`. (Bug #4393)

• Fixed precision loss bug in some mathematical functions such as `SQRT()` [816] and `LOG()` [812]. (Bug #4356)

• Fixed a long-standing problem with `LOAD DATA` with the `LOCAL` option. The problem occurs when an error happens during the `LOAD DATA` operation. Previously, the connection was broken. Now the error message is returned and connection stays open.

• Optimizer now treats `col IN (val)` the same way it does for `col = val`.

• Fixed a problem with `net_buffer_length` when building the `DBD::mysql` Perl module. (Bug #4206)

• `lower_case_table_names = 2` (keep case for table names) was not honored with `ALTER TABLE` and `CREATE/DROP INDEX`. (Bug #3109)

• Fixed a crash on declaration of `DECIMAL(0,...)` column. (Bug #4046)

• Fixed a bug in `IF()` [782] function incorrectly determining the result type if aggregate functions were involved. (Bug #3987)

• Fixed bug in privilege checking where, under some conditions, one was able to grant privileges on the database, he has no privileges on. (Bug #3933)

• Fixed crash in `MATCH ... AGAINST()` on a phrase search operator with a missing closing double quote. (Bug #3870, CVE-2004-0956)

• Values greater than 4294967295 of system variables were truncated on 64-bit platforms. (Bug #3754)

• If `server-id` was not set using startup options but with `SET GLOBAL`, the replication slave still complained that it was not set. (Bug #3829)

• Fixed potential memory overrun in `mysql_real_connect()` (which required a compromised DNS server and certain operating systems). (Bug #4017, CVE-2004-0836)

• During the installation process of the server RPM on Linux, `mysqld` was run as the `root` system user, and if you had `--log-bin= somewhere_out_of_var_lib_mysql` it created binary log files owned by `root` in this directory, which remained owned by `root` after the installation. This is now fixed by starting `mysqld` as the `mysql` system user instead. (Bug #4038)

• Made `DROP DATABASE` honor the value of `lower_case_table_names`. (Bug #4066)

• The slave SQL thread refused to replicate `INSERT ... SELECT` if it examined more than 4 billion rows. (Bug #3871)
Changes in Release 4.0.20 (17 May 2004)

- Fixed incorrect destruction of expression which led to crash of server on complex `AND [779]/OR [779]` expressions if query was ignored (either by a replication server because of `--replicate-.extent-table` rules, or by any MySQL server because of a syntax error). (Bug #3969, Bug #4494)

- Fixed that `mysqlbinlog --position --read-from-remote-server` had wrong `#` at lines. (Bug #4506)

- If `CREATE TEMPORARY TABLE t SELECT` failed while loading the data, the temporary table was not dropped. (Bug #4551)

- Fixed that when a multiple-table `DROP TABLE` failed to drop a table on the master server, the error code was not written to the binary log. (Bug #4553)

- When the slave SQL thread was replicating a `LOAD DATA INFILE` statement, it didn't show the statement in the output of `SHOW PROCESSLIST`. (Bug #4326)

- Fixed that `CREATE TABLE ... TYPE=HEAP ... AS SELECT...` caused replication slave to stop. (Bug #4971)

- Fixed that `disable-local-infile` option had no effect if client read it from a configuration file using `mysql_options(...,MYSQL_READ_DEFAULT,...)`. (Bug #5073)

- Fixed that `mysql-test-run` failed on the `rpl_trunc_binlog` test if running test from the installed (the target of 'make install') directory. (Bug #5050)

- Fixed an unlikely deadlock which could happen when using `KILL`. (Bug #4810)

- Fixed a crash when one connection got `KILLED` while it was doing `START SLAVE`. (Bug #4827)

- Made `FLUSH TABLES WITH READ LOCK` block `COMMIT` if server is running with binary logging; this ensures that the binary log position is trustable when doing a full backup of tables and the binary log. (Bug #4953)

- Fixed that the counter of an `auto_increment` column was not reset by `TRUNCATE TABLE` is the table was a temporary one. (Bug #5033)

- Made database names to compare case-insensitively in fully qualified column names (`database.table.column`) when `lower_case_table_names = 1`. (Bug #4792)

- Fixed that `SET CHARACTER_SET` was not replicated correctly. MySQL 4.1 does not have that bug. (Bug #4500)

- Fixed a symlink vulnerability in the `mysqlhotcopy` script. (CVE-2004-0457)

C.2.12 Changes in Release 4.0.20 (17 May 2004)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

**Note**

The windows packages had to be repackaged and re-released several times to resolve packaging issues (such as missing files). This did not affect the binaries included (they have not been recompiled), therefore the installation packages are of version 4.0.20d, while the binaries included still identify themselves as version 4.0.20b.
Changes in Release 4.0.19 (04 May 2004)

Functionality added or changed:

• From the Windows distribution, predefined accounts without passwords for remote users ("root@%", "@ %") were removed (other distributions never had them).

• Phrase search in MATCH ... AGAINST ( ... IN BOOLEAN MODE) no longer matches partial words.

Bugs fixed:

• A crashing bug (race condition) was fixed in InnoDB diagnostic logging. It was introduced in 4.0.19. (Bug #3596)

• Fixed a bug in division / reporting incorrect metadata (number of digits after the decimal point). It can be seen, for example, in CREATE TABLE t1 SELECT "0.01"/"3". (Bug #3612)

• Fixed a problem with nonworking DROP DATABASE on some configurations (in particular, Linux 2.6.5 with ext3 are known to expose this bug). (Bug #3594)

• Fixed that in some replication error messages, a very long query caused the rest of the message to be invisible (truncated), by putting the query last in the message. (Bug #3357)

C.2.13 Changes in Release 4.0.19 (04 May 2004)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Note

The MySQL 4.0.19 binaries were uploaded to the download mirrors on May, 10th. However, a potential crashing bug was found just before the 4.0.19 release was publicly announced and published from the 4.0 download pages at http://dev.mysql.com/.

A fix for the bug was pushed into the MySQL source tree shortly after it could be reproduced and is included in MySQL 4.0.20. Users upgrading from MySQL 4.0.18 should upgrade directly to MySQL 4.0.20 or later.

See (Bug #3596) for details (it was reported against MySQL-4.1, but was confirmed to affect 4.0.19 as well).

Functionality added or changed:

• If length of a timestamp field is defined as 19, the timestamp is displayed as "YYYY-MM-DD HH:MM:SS. This is done to make it easier to use tables created in MySQL 4.1 to be used in MySQL 4.0.

• If you use RAID_CHUNKS with a value > 255 it is set to 255. This was made to ensure that all raid directories are always 2 hex bytes. (Bug #3182)

• Changed that the optimizer now considers the index specified in FORCE INDEX clause as a candidate to resolve ORDER BY as well.

• The --log-warnings server option now is enabled by default. Disable with --log-warnings=0.

• Until now, in SELECT ... UNION SELECT ... ORDER BY ..., it was possible to qualify a column name in the ORDER BY clause with a table name. This is no longer possible. Column names in ORDER BY should refer to names established in the first SELECT of the UNION. (Bug #3064)
Changes in Release 4.0.19 (04 May 2004)

- Added `max_insert_delayed_threads` system variable as a synonym for `max_delayed_threads`.
- Added `query_cache_wlock_invalidate` system variable. It enables emulation of MyISAM table write-locking behavior, even for queries in the query cache. (Bug #2693)
- The keyword `MASTER_SERVER_ID` is not reserved anymore.
- The following is relevant mainly for Mac OS X users who use a case-insensitive file system. This is not relevant for Windows users as InnoDB in this case always stores file names in lower case:

  You can now force `lower_case_table_names` to 0 from the command line or a configuration file. This is useful with case-insensitive file systems when you have previously not used lower_case_table_names = 1 or lower_case_table_names = 2 and you have created InnoDB tables. With lower_case_table_names = 0, InnoDB tables were stored in mixed case while setting lower_case_table_names to a nonzero value now forces it to lower case (to make the table names case insensitive).

  Because it is possible to crash MyISAM tables by referring to them with different case on a case-insensitive file system, use lower_case_table_names or lower_case_table_names = 2 on such file systems.

  The easiest way to convert to use lower_case_table_names = 2 is to dump all your InnoDB tables with `mysqldump`, drop them and then restore them.

- Changed that the relay log is flushed to disk by the slave I/O thread every time it reads a relay log event. This reduces the risk of losing some part of the relay log in case of brutal crash.

- When a session having open temporary tables terminates, the statement automatically written to the binary log is now `DROP TEMPORARY TABLE IF EXISTS` instead of `DROP TEMPORARY TABLE`, for more robustness.

- Added option `--replicate-same-server-id`.

Bugs fixed:

- Added missing full-text variable `ft_stopword_file` to `myisamchk`.
- Do not allow stray `', '` at the end of field specifications. (Bug #3481)
- `INTERVAL` now can handle big values for seconds, minutes and hours. (Bug #3498)
- Blank host name did not work as documented for table and column privileges. Now it works the same way as `'%'`. (Bug #3473)
- Fixed a harmless buffer overflow in `replace` utility. (Bug #3541)
- Fixed `SOUNDEX()` [793] to ignore nonalphabetic characters also in the beginning of the string. (Bug #3556)
- Fixed a bug in `MATCH ... AGAINST()` searches when another thread was doing concurrent inserts into the MyISAM table in question. The first --- full-text search --- query could return incorrect results in this case (for example, “phantom” rows or not all matching rows, even an empty result set). The easiest way to check whether you are affected is to start `mysql` with `--skip-concurrent-insert` switch and see whether it helps.
- Fixed bug when doing `DROP DATABASE` on a directory containing non- MySQL files. Now a proper error message is returned.
- Fixed bug in `ANALYZE TABLE` on a BDB table inside a transaction that hangs server thread. (Bug #2342)
Changes in Release 4.0.19 (04 May 2004)

- Fixed a symlink vulnerability in the `mysqlbug` script. (Bug #3284, CVE-2004-0381)
- Fixed core dump bug in `SELECT DISTINCT` where all selected parts where constants and there were hidden columns in the created temporary table. (Bug #3203)
- Fixed core dump bug in `COUNT(DISTINCT)` when there was a lot of values and one had a big value for `max_heap_table_size`.
- Fixed problem with multiple-table-update and BDB tables. (Bug: #3098)
- Fixed memory leak when dropping database with `RAID` tables. (Bug #2882)
- Fixed core dump crash in replication during relay-log switch when the relay log went over `max_relay_log_size` and the slave thread did a `flush_io_cache()` at the same time.
- Fixed hangup bug when issuing multiple `SLAVE START` from different threads at the same time. (Bug #2921)
- Fixed bug when using `DROP DATABASE` with `lower_case_table_names = 2`.
- Fixed wrong result in `UNION` when using `lower_case_table_names = 2`. (Bug #2858)
- One can now kill threads that is 'stuck' in the join optimizer (can happen when there is MANY tables in the join in which case the optimizer can take really long time). (Bug #2825)
- Rollback `DELETE` and `UPDATE` statements if thread is killed. (Bug #2422)
- Ensure that all rows in an `INSERT DELAYED` statement is written at once if binary logging is enabled. (Bug #2491).
- Fixed bug in query cache statistic, more accurate formula linked statistic variables mentioned in the manual.
- Fixed a bug in parallel repair (`myisamchk -p,myisam_repair_threads`) - sometimes repair process failed to repair a table. (Bug #1334)
- Fixed bugs with names of tables, databases, and columns that end to space (Bug #2985)
- Fixed a bug in multiple-table `UPDATE` statements involving at least one constant table. Bug was exhibited in allowing non matching row to be updated. (Bug #2996).
- Fixed all bugs in scripts for creating/upgrading system database (Bug #2874) Added tests which guarantee against such bugs in the future.
- Fixed bug in `mysql` command-line client in interpreting quotation marks within comments. (Bug #539)
- `--set-character-set` and `--character-sets-dir` options in `myisamchk` now work.
- Fixed a bug in `mysqlbinlog` that caused one pointer to be free'd twice in some cases.
- Fixed a bug in boolean full-text search, that sometimes could lead to false matches in queries with several levels of subexpressions using `+` operator (for example, `MATCH ... AGAINST('+(+(word1 word2)) +word3*' IN BOOLEAN MODE)`.
- Fixed Windows-specific portability bugs in `myisam_ftdump`.
- Fixed a bug in multiple-table `DELETE` that was caused by foreign key constraints. If the order of the tables established by MySQL optimizer did not match parent-child order, no rows were deleted and no error message was provided. (Bug #2799)
Changes in Release 4.0.18 (12 February 2004)

- Fixed a few years old bug in the range optimizer that caused a segmentation fault on some very rare queries. (Bug #2698)

- Replication: If a client connects to a slave server and issues an administrative statement for a table (for example, OPTIMIZE TABLE or REPAIR TABLE), this could sometimes stop the slave SQL thread. This does not lead to any corruption, but you must use START SLAVE to get replication going again. (Bug #1858) The bug was accidentally not fixed in 4.0.17 as it was unfortunately earlier said.

- Fixed that when a Rotate event is found by the slave SQL thread in the middle of a transaction, the value of Relay_Log_Pos in SHOW SLAVE STATUS remains correct. (Bug #3017)

- Corrected the master's binary log position that InnoDB reports when it is doing a crash recovery on a slave server. (Bug #3015)

- Changed that when a DROP TEMPORARY TABLE statement is automatically written to the binary log when a session ends, the statement is recorded with an error code of value zero (this ensures that killing a SELECT on the master does not result in a superfluous error on the slave). (Bug #3063)

- Changed that when a thread handling INSERT DELAYED (also known as a delayed_insert thread) is killed, its statements are recorded with an error code of value zero (killing such a thread does not endanger replication, so we thus avoid a superfluous error on the slave). (Bug #3081)

- Fixed deadlock when two START SLAVE statements were run at the same time. (Bug #2921)

- Fixed that a statement never triggers a superfluous error on the slave, if it must be excluded given the --replicate-* options. The bug was that if the statement had been killed on the master, the slave would stop. (Bug #2983)

- The --local-load option of mysqlbinlog now requires an argument.

- Fixed a segmentation fault when running LOAD DATA FROM MASTER after RESET SLAVE. (Bug #2922)

- Fixed a rare error condition that caused the slave SQL thread spuriously to print the message Binlog has bad magic number and stop when it was not necessary to do so. (Bug #3401)

- Fixed bug in privilege checking of ALTER TABLE RENAME. (Bug #3270, CVE-2004-0835)

- Fixed the column Exec_master_log_pos (and its disk image in the relay-log.info file) to be correct if the master had version 3.23 (it was too big by 6 bytes). This bug does not exist in the 5.0 version. (Bug #3400)

- Fixed that mysqlbinlog does not forget to print a USE statement under rare circumstances where the binary log contained a LOAD DATA INFILE statement. (Bug #3415)

- Fixed a memory corruption when replicating a LOAD DATA INFILE when the master had version 3.23. Some smaller problems remain in this setup, See Section 14.7, “Replication Features and Issues”. (Bug #3422)

- Multiple-table DELETE statements were always replicated by the slave if there were some --replicate-**-ignore-table options and no --replicate-**-do-table options. (Bug #3461)

- Fixed a crash of the MySQL slave server when it was built with --with-debug and replicating itself. (Bug #3568)

C.2.14 Changes in Release 4.0.18 (12 February 2004)

End of Product Lifecycle.  Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please
consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Functionality added or changed:

- Fixed processing of `LOAD DATA` by `mysqlbinlog` in remote mode. (Bug #1378)
- The `ft_dump` utility program was renamed to `myisam_ftdump`, and is included in binary distributions.
- `ENGINE` is now a synonym for the `TYPE` option for `CREATE TABLE` and `ALTER TABLE`.
- `lower_case_table_names` system variable now can take a value of 2, to store table names in mixed case on case-insensitive file systems. It is forced to 2 if the database directory is located on a case-insensitive file system.
- For replication of `MEMORY (HEAP)` tables: Made the master automatically write a `DELETE FROM` statement to its binary log when a `MEMORY` table is opened for the first time since master's startup. This is for the case where the slave has replicated a nonempty `MEMORY` table, then the master is shut down and restarted: the table is now empty on master; the `DELETE FROM` empties it on slave too. Note that even with this fix, between the master's restart and the first use of the table on master, the slave still has out-of-date data in the table. But if you use the `init-file` option to populate the `MEMORY` table on the master at startup, it ensures that the failing time interval is zero. (Bug #2477)
- Optimizer is now better tuned for the case where the first used key part (of many) is a constant. (Bug #1679)
- Removed old nonworking `--old-rpl-compat` server option, which was a holdover from the very first 4.0.x versions. (Bug #2428)
- Added `sync_frm` system variable. It is enabled by default, to instruct MySQL to sync to disk each time an `.frm` file is created. Disable it to suppress these sync operations.

Bugs fixed:

- `mysqlhotcopy` now works on NetWare.
- `DROP DATABASE` could not drop databases with RAID tables that had more than nine `RAID_CHUNKS`. (Bug #2627)
- Fixed bug in range optimizer when using overlapping ranges. (Bug #2448)
- Limit `wait_timeout` to 2147483 on Windows (OS limit). (Bug #2400)
- Fixed bug when `--init-file` crashes MySQL if it contains a large `SELECT`. (Bug #2526)
- `SHOW KEYS` now shows `NULL` in the `Sub_part` column for `FULLTEXT` indexes.
- The signal thread's stack size was increased to enable `mysqld` to run on Debian/IA-64 with a TLS-enabled `glibc`. (Bug #2599)
- Now only the `SELECT` privilege is needed for tables that are only read in multiple-table `UPDATE` statements. (Bug #2377)
- Give proper error message if one uses `LOCK TABLES ... ; INSERT ... SELECT` and one used the same table in the `INSERT` and `SELECT` part. (Bug #2296)
- `SELECT INTO ... DUMPFILE` now deletes the generated file on error.
- Fixed foreign key reference handling to allow references to column names that contain spaces. (Bug #1725)
Changes in Release 4.0.18 (12 February 2004)

• Fixed problem with index reads on character columns with BDB tables. The symptom was that data could be returned in the wrong lettercase. (Bug #2509)

• Fixed a spurious table corruption problem that could sometimes appear on tables with indexed TEXT columns if these columns happened to contain values having trailing spaces. This bug was introduced in 4.0.17.

• Fixed a problem where some queries could hang if a condition like `indexed_TEXT_column = expr` was present and the column contained values having trailing spaces. This bug was introduced in 4.0.17. (Bug #2295)

• Fixed incorrect path names in some of the manual pages. (Bug #2270)

• Fixed spurious “table corrupted” errors in parallel repair operations. See Section 5.1.3, “Server System Variables”.

• Fixed a crashing bug in parallel repair operations. See Section 5.1.3, “Server System Variables”.

• Fixed bug in updating MyISAM tables for BLOB values longer than 16MB. (Bug #2159)

• Fixed bug in `mysqld_safe` when running multiple instances of MySQL. (Bug #2114)

• Fixed a bug in using HANDLER statement with tables not from a current database. (Bug #2304)

• Fixed a crashing bug that occurred due to the fact that multiple-table UPDATE statements did not check that there was only one table to be updated. (Bug #2103)

• Fixed a crashing bug that occurred due to BLOB data type index size being calculated incorrectly in `MIN()` [876] and `MAX()` [876] optimizations. (Bug #2189)

• Fixed a bug with incorrect syntax for LOCK TABLES in `mysqldump`. (Bug #2242)

• Fixed a bug in `mysqld_safe` that caused `mysqld` to generate a warning about duplicate `user=xxx` options if this option was specified in the [mysqld] or [server] sections of `my.cnf`. (Bug #2163)

• `INSERT DELAYED ... SELECT ...` could cause table corruption because tables were not locked properly. This is now fixed by ignoring DELAYED in this context. (Bug #1983)

• Replication: Sometimes the master gets a nonfatal error during the execution of a statement that does not immediately succeed. (For example, a write to a MyISAM table may first receive “no space left on device,” but later complete when disk space becomes available. See Section B.5.4.3, “How MySQL Handles a Full Disk”.) The bug was that the master forgot to reset the error code to 0 after success, so the error code got into its binary log, thus causing the slave to issue false alarms such as “did not get the same error as on master.” (Bug #2083)

• Removed a misleading “check permissions on master.info” from a replication error message, because the cause of the problem could be something other than permissions. (Bug #2121)

• Fixed a crash when the replication slave was unable to create the first relay log. (Bug #2145)

• Replication of `LOAD DATA INFILE` for an empty file from a 3.23 master to a 4.0 slave caused the slave to print an error. (Bug #2452)

• When automatically forcing `lower_case_table_names` to 1 if the file system was case insensitive, `mysqld` could crash. This bug existed only in MySQL 4.0.17. (Bug #2481)
• Restored ability to specify default values for TIMESTAMP columns that was erroneously disabled in previous release. (Bug #2539) Fixed SHOW CREATE TABLE to reflect these values. (Bug #1885) Note that because of the auto-update feature for the first TIMESTAMP column in a table, it makes no sense to specify a default value for the column. Any such default is silently ignored (unless another TIMESTAMP column is added before this one). Also fixed the meaning of the DEFAULT keyword when it is used to specify the value to be inserted into a TIMESTAMP column other than the first. (Bug #2464)

• Fixed bug for out-of-range arguments on QNX platform that caused UNIX_TIMESTAMP() to produce incorrect results or that caused nonzero values to be inserted into TIMESTAMP columns. (Bug #2523) Also, current time zone now is taken into account when checking if datetime values satisfy both range boundaries for TIMESTAMP columns. The range permitted for a TIMESTAMP column is time zone-dependent and equivalent to a range of 1970-01-01 00:00:01 UTC to 2037-12-31 23:59:59 UTC.

• Multiple-table DELETE statements were never replicated by the slave if there were any --replicate-*-table options. (Bug #2527)

• Changes to session counterparts of variables query_prealloc_size, query_alloc_block_size, trans_prealloc_size, trans_alloc_block_size now have an effect. (Bug #1948)

• Fixed bug in ALTER TABLE RENAME, when rename to the table with the same name in another database silently dropped destination table if it existed. (Bug #2628)

C.2.15 Changes in Release 4.0.17 (14 December 2003)
Changes in Release 4.0.17 (14 December 2003)

- When you install `mysqld` as a service on Windows systems, `mysqld` reads startup options in option files from the option group with the same name as the service name. (Except when the service name is `MySQL`).

Bugs fixed:

- Sending `SIGHUP` to `mysqld` crashed the server if it was running with `--log-bin`. (Bug #2045)

- One can now configure MySQL as a Windows service as a normal user. (Bug #1802). Thanks to Richard Hansen for fixing this.

- Database names are now compared in lowercase in `ON` clauses when `lower_case_table_names` is set. (Bug #1736)

- `IGNORE ... LINES` option to `LOAD DATA INFILE` didn't work when used with fixed length rows. (Bug #1704)

- Fixed problem with `UNIX_TIMESTAMP()` [833] for timestamps close to 0. (Bug #1998)

- Fixed problem with character values greater than 128 in the `QUOTE()` [792] function. (Bug #1868)

- Fixed searching of `TEXT` with endspace. (Bug #1651)

- Fixed caching bug in multiple-table updates where same table was used twice. (Bug #1711)

- Fixed directory permissions for the MySQL-server RPM documentation directory. (Bug #1672)

- Fixed server crash when updating an `ENUM` column that is set to the empty string (for example, with `REPLACE()` [792]). (Bug #2023)

- `mysql` client program now correctly prints connection identifier returned by `mysql_thread_id()` as unsigned integer rather than as signed integer. (Bug #1951)

- `FOUND_ROWS()` [864] could return incorrect number of rows after a query with an impossible `WHERE` condition. (Bug #1468)

- `SHOW DATABASES` no longer shows `.sym` files (on Windows) that do not point to a valid directory. (Bug #1385)

- Fixed a possible memory leak on Mac OS X when using the shared `libmysql.so` library. (from `pthread_key_create()`). (Bug #2061)

- Fixed bug in `UNION` statement with alias `*`. (Bug #1249)

- Fixed a bug in `DELETE ... ORDER BY ... LIMIT` where the rows were not deleted in the proper order. (Bug #1024, Bug #1697).

- Fixed serious problem with multi-threaded programs on Windows that used the embedded MySQL libraries. (Locks of tables were not handled correctly between different threads).

- Code cleanup: Fixed a few code defects (potential memory leaks, null pointer dereferences, uninitialized variables). Thanks to Reasoning Inc. for informing us about these findings.

- Fixed a buffer overflow error that occurred with prepended “0” characters in some columns of type `DECIMAL`. (Bug #2128)

- Filesort was never shown in `EXPLAIN` if query contained an `ORDER BY NULL` clause. (Bug #1335)

- Fixed invalidation of whole query cache on `DROP DATABASE`. (Bug #1898)
Changes in Release 4.0.17 (14 December 2003)

• Fixed bug in range optimizer that caused wrong results for some unlikely AND [779] OR [779] queries. (Bug #1828)

• Fixed a crash in ORDER BY when ordering by expression and identifier. (Bug #1945)

• Fixed a crash in an open HANDLER when an ALTER TABLE was executed in a different connection. (Bug #1826)

• Fixed a bug in \texttt{trunc*} operator of full-text search which sometimes caused MySQL not to find all matched rows.

• Fixed bug in prepending "0" characters to DECIMAL column values.

• Fixed optimizer bug, introduced in 4.0.16, when \texttt{REF} access plan was preferred to more efficient \texttt{RANGE} on another column.

• Fixed problem when installing a MySQL server as a Windows service using a command of the form \texttt{mysqld --install mysql --defaults-file=path-to-file}. (Bug #1643)

• Fixed an incorrect result from a query that uses only const tables (such as one-row tables) and nonconstant expression (such as \texttt{RAND()} [814]). (Bug #1271)

• Fixed bug when the optimizer did not take \texttt{SQL\_CALC\_FOUND\_ROWS} into account if \texttt{LIMIT} clause was present. (Bug #1274)

• \texttt{mysqlbinlog} now asks for a password at the console when the \texttt{-p} or \texttt{--password} option is used with no argument. This is consistent with the way that other clients such as \texttt{mysqladmin} and \texttt{mysqldump} behave.

\begin{itemize}
    \item A consequence of this change is that it is no longer possible to invoke \texttt{mysqlbinlog} as \texttt{mysqlbinlog -p pass_val} (with a space between the \texttt{-p} option and the following password value). (Bug #1595)
\end{itemize}

• Fixed bug accidentally introduced in 4.0.16 where the slave SQL thread deleted its replicated temporary tables when \texttt{STOP SLAVE} was issued.

• In a "chain" replication setup A->B->C, if 2 sessions on A updated temporary tables of the same name at the same time, the binary log of B became incorrect, resulting in C becoming confused. (Bug #1686)

• In a "chain" replication setup A->B->C, if \texttt{STOP SLAVE} was issued on B while it was replicating a temporary table from A, then when \texttt{START SLAVE} was issued on B, the binary log of B became incorrect, resulting in C becoming confused. (Bug #1240)

• When \texttt{MASTER\_LOG\_FILE} and \texttt{MASTER\_LOG\_POS} were not specified, \texttt{CHANGE MASTER TO} used the coordinates of the slave I/O thread to set up replication, which broke replication if the slave SQL thread lagged behind the slave I/O thread. This caused the slave SQL thread to lose some events. The new behavior is to use the coordinates of the slave SQL thread instead. See Section 12.5.2.1, "CHANGE MASTER TO Syntax". (Bug #1870)

• Now if integer is stored or converted to \texttt{TIMESTAMP} or \texttt{DATETIME} value checks of year, month, day, hour, minute and second ranges are performed and numbers representing illegal timestamps are converted to 0 value. This behavior is consistent with manual and with behavior of string to \texttt{TIMESTAMP/DATETIME} conversion. (Bug #1448)

• Fixed bug when \texttt{BIT\_AND()} [874] and \texttt{BIT\_OR()} [874] group functions returned incorrect value if \texttt{SELECT} used a temporary table and no rows were found. (Bug #1790).
Changes in Release 4.0.16 (17 October 2003)

- **BIT_AND() [874]** is now unsigned in all contexts. This means that it now returns 18446744073709551615 (= 0xffffffffffffffff) instead of -1 if there were no rows in the result.

- Fixed bug with **BIT_AND() [874]** still returning signed value for an empty set in some cases. (Bug #1972)

- Fixed bug with **^ [855]** (XOR) and **>> [855]** (bit shift) still returning signed value in some cases. (Bug #1993)

- Replication: a rare race condition in the slave SQL thread, which could lead to a wrong complain that the relay log is corrupted. (Bug #2011)

- Replication: in the slave SQL thread, a multiple-table **UPDATE** could produce a wrong complain that some record was not found in one table, if the **UPDATE** was preceded by a **INSERT ... SELECT**. (Bug #1701)

- Fixed deficiency in MySQL code which is responsible for scanning directories. This deficiency caused **SHOW TABLE STATUS** to be very slow when a database contained a large number of tables, even if a single particular table were specified. (Bug #1952)

**C.2.16 Changes in Release 4.0.16 (17 October 2003)**

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Functionality added or changed:

- Option values in option files now may be quoted. This is useful for values that contain whitespace or comment characters.

- Write memory allocation information to error log when doing **mysqladmin debug**. This works only on systems that support the **mallinfo()** call (like newer Linux systems).

- Added the following new system variables to allow more precise memory allocation:
  - **range_alloc_block_size**, **query_alloc_block_size**, **query_prealloc_size**, **transaction_alloc_block_size**, and **transaction_prealloc_size**.

- **mysqlbinlog** now reads option files. To make this work, you must now specify **--read-from-remote-server** when reading binary logs from a MySQL server. (Note that using a remote server is deprecated and may disappear in future **mysqlbinlog** versions).

- Block **SIGPIPE** signals also for nonthreaded programs. The blocking is moved from **mysql_init()** to **mysql_server_init()**, which is automatically called on the first call to **mysql_init()**.

- Added **--libs_r** and **--include** options to **mysql_config**.

- New ">" prompt for **mysql**. This prompt is similar to the ">" and ">" prompts, but indicates that an identifier quoted with backticks was begun on an earlier line and the closing backtick has not yet been seen.

- Updated **mysql_install_db** to be able to use the local machine's IP address instead of the host name when building the initial grant tables if **skip-name-resolve** has been specified. This option can be helpful on FreeBSD to avoid thread-safety problems with the FreeBSD resolver libraries. (Thanks to Jeremy Zawodny for the patch.)
Changes in Release 4.0.16 (17 October 2003)

- A documentation change: Added a note that when backing up a slave, it is necessary also to back up the `master.info` and `relay-log.info` files, as well as any `SQL_LOAD-*` files located in the directory specified by the `--slave-load-tmpdir` option. All these files are needed when the slave resumes replication after you restore the slave's data.

Bugs fixed:

- Fixed a spurious error `ERROR 14: Can't change size of file (Errcode: 2)` on Windows in `DELETE FROM tbl_name` without a `WHERE` clause or `TRUNCATE TABLE tbl_name`, when `tbl_name` is a MyISAM table. (Bug #1397)

- Fixed a bug that resulted in `thr_alarm queue is full` warnings after increasing the `max_connections` variable with `SET GLOBAL`. (Bug #1435)

- Made `LOCK TABLES` to work when `Lock_tables_priv` is granted on the database level and `Select_priv` is granted on the table level.

- Fixed crash of `FLUSH QUERY CACHE` on queries that use same table several times (Bug #988).

- Fixed core dump bug when setting an enum system variable (such as `sql_warnings`) to `NULL`.

- Extended the default timeout value for Windows clients from 30 seconds to 1 year. (The timeout that was added in MySQL 4.0.15 was way too short). This fixes a bug that caused `ERROR 2013: Lost connection to MySQL server during query` for queries that lasted longer than 30 seconds, if the client didn’t specify a limit with `mysql_options()`. Users of 4.0.15 on Windows should upgrade to avoid this problem.

- More “out of memory” checking in range optimizer.

- Fixed and documented a problem when setting and using a user variable within the same `SELECT` statement. (Bug #1194).

- Fixed bug in overrun check for `BLOB` values with compressed tables. This was a bug introduced in 4.0.14. It caused MySQL to regard some correct tables containing `BLOB` values as corrupted. (Bug #770, Bug #1304, and maybe Bug #1295)

- `SHOW GRANTS` showed `USAGE` instead of the real column-level privileges when no table-level privileges were given.

- When copying a database from the master, `LOAD DATA FROM MASTER` dropped the corresponding database on the slave, thus erroneously dropping tables that had no counterpart on the master and tables that may have been excluded from replication using `--replicate-*-table` rules. Now `LOAD DATA FROM MASTER` no longer drops the database. Instead, it drops only the tables that have a counterpart on the master and that match the `--replicate-*-table` rules. `--replicate-*-db` rules can still be used to include or exclude a database as a whole from `LOAD DATA FROM MASTER`. A database also is included or excluded as a whole if there are some rules like `--replicate-wild-do-table=db1.%` or `--replicate-wild-ignore-table=db1.%`, as is the case for `CREATE DATABASE` and `DROP DATABASE` in replication. (Bug #1248)

- Fixed a bug where `mysqlbinlog` crashed with a segmentation fault when used with the `-h` or `--host` option. (Bug #1258)

- Fixed a bug where `mysqlbinlog` crashed with a segmentation fault when used on a binary log containing only final events for `LOAD DATA`. (Bug #1340)

- `mysqlbinlog` does not reuse temporary file names from previous runs. Previously `mysqlbinlog` failed if was used several times on the same binary log file that contained a `LOAD DATA` statement.
Changes in Release 4.0.15 (03 September 2003)

- Fixed compilation problem when compiling with OpenSSL 0.9.7 with disabled old DES support (If OPENSSL_DISABLE_OLD_DES_SUPPORT option was enabled).

- Fixed a bug when two (or more) MySQL servers were running on the same machine, and they were both slaves, and at least one of them was replicating some LOAD DATA INFILE statement from its master. The bug was that one slave MySQL server sometimes deleted the SQL_LOAD-* files (used for replication of LOAD DATA INFILE and located in the slave-load-tmpdir directory, which defaults to tmpdir) belonging to the other slave MySQL server of this machine, if these slaves had the same slave-load-tmpdir directory. When that happened, the other slave could not replicate LOAD DATA INFILE and complained about not being able to open some SQL_LOAD-* file. (Bug #1357)

- If LOAD DATA INFILE failed for a small file, the master forgot to write a marker (a Delete_file event) in its binary log, so the slave could not delete 2 files (SQL_LOAD-* .info and SQL_LOAD-* .data from its tmpdir). (Bug #1391)

- On Windows, the slave forgot to delete a SQL_LOAD-* .info file from tmpdir after successfully replicating a LOAD DATA INFILE statement. (Bug #1392)

- When a connection terminates, MySQL writes DROP TEMPORARY TABLE statements to the binary log for all temporary tables which the connection had not explicitly dropped. MySQL forgot to use backticks to quote the database and table names in the statement. (Bug #1345)

- On some 64-bit machines (some HP-UX and Solaris machines), a slave installed with the 64-bit MySQL binary could not connect to its master (it connected to itself instead). (Bug #1256, Bug #1381)

- Code was introduced in MySQL 4.0.15 for the slave to detect that the master had died while writing a transaction to its binary log. This code reported an error in a legal situation: When the slave I/O thread was stopped while copying a transaction to the relay log, the slave SQL thread would later pretend that it found an unfinished transaction. (Bug #1475)

C.2.17 Changes in Release 4.0.15 (03 September 2003)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Important

If you are using this release on Windows, you should upgrade at least your clients (any program that uses libmysql.lib) to 4.0.16 or above. This is because the 4.0.15 release had a bug in the Windows client library that causes Windows clients using the library to die with a Lost connection to MySQL server during query error for queries that take more than 30 seconds. This problem is specific to Windows; clients on other platforms are unaffected.

Functionality added or changed:

- mysqldump now correctly quotes all identifiers when communicating with the server. This assures that during the dump process, mysqldump never sends queries to the server that result in a syntax error. This problem is not related to the mysqldump program’s output, which was not changed. (Bug #1148)

- Change result set metadata information so that MIN( ) [876] and MAX( ) [876] report that they can return NULL (this is true because an empty set returns NULL). (Bug #324)

- Produce an error message on Windows if a second mysqld server is started on the same TCP/IP port as a running mysqld server.
Changes in Release 4.0.15 (03 September 2003)

- The `mysqld` system variables `wait_timeout`, `net_read_timeout`, and `net_write_timeout` now work on Windows. One can now also set timeouts for read and writes in Windows clients with `mysql_options()`.

- Added option `--sql-mode=NO_DIR_IN_CREATE` to make it possible for slaves to ignore `INDEX DIRECTORY` and `DATA DIRECTORY` options given to `CREATE TABLE`. When this is mode is on, `SHOW CREATE TABLE` does not show the given directories.

- `SHOW CREATE TABLE` now shows the `INDEX DIRECTORY` and `DATA DIRECTORY` options, if they were specified when the table was created.

- The `open_files_limit` system variable now shows the real open files limit.

- `MATCH ... AGAINST()` in natural language mode now treats words that are present in more than 2,000,000 rows as stopwords.

- The Mac OS X installation disk images now include an additional `MySQLStartupItem.pkg` package that enables the automatic startup of MySQL on system startup. See Section 2.5, “Installing MySQL on Mac OS X”.

- Most of the documentation included in the binary tarball distributions (.tar.gz) has been moved into a subdirectory `docs`. See Section 2.1.5, “Installation Layouts”.

- The manual is now included as an additional `info` file in the binary distributions. (Bug #1019)

- The binary distributions now include the embedded server library (libmysqld.a) by default. Due to a linking problem with non-gcc compilers, it was not included in all packages of the initial 4.0.15 release. The affected packages were rebuilt and released as 4.0.15a. See Section 1.5, “MySQL 4.0 in a Nutshell”.

- MySQL can now use range optimization for `BETWEEN` with nonconstant limits. (Bug #991)

- Replication error messages now include the default database, so that users can check which database the failing query was run for.

- A documentation change: Added a paragraph about how the `binlog-do-db` and `binlog-ignore-db` options are tested against the database on the master (see Section 5.3.4, “The Binary Log”), and a paragraph about how `--replicate-do-db`, `--replicate-do-table` and analogous options are tested against the database and tables on the slave (see Section 14.8, “Replication and Binary Logging Options and Variables”).

- Now the slave does not replicate `SET PASSWORD` if it is configured to exclude the `mysql` database from replication (using for example `--replicate-wild-ignore-table=mysql.%`). This was the case for `GRANT` and `REVOKE` since version 4.0.13 (although there was Bug #980 in 4.0.13 & 4.0.14, which has been fixed in 4.0.15).

- Rewrote the information shown in the `State` column of `SHOW PROCESSLIST` for replication threads and for `MASTER_POS_WAIT()` [871] and added the most common states for these threads to the documentation, see Section 14.3, “Replication Implementation Details”.

- Added a test in replication to detect the case where the master died in the middle of writing a transaction to the binary log; such unfinished transactions now trigger an error message on the slave.

- A `GRANT` statement that creates an anonymous user (that is, an account with an empty user name) no longer requires `FLUSH PRIVILEGES` for the account to be recognized by the server. (Bug #473)

- `CHANGE MASTER TO` now flushes `relay-log.info`. Previously this was deferred to the next run of `START SLAVE`, so if `mysqld` was shutdown on the slave after `CHANGE MASTER TO` without having run
START SLAVE, the relay log’s name and position were lost. At restart they were reloaded from relay-log.info, thus reverting to their old (incorrect) values from before CHANGE MASTER TO and leading to error messages (as the old relay log did not exist any more) and the slave threads refusing to start. (Bug #858)

Bugs fixed:

- Fixed buffer overflow in password handling which could potentially be exploited by MySQL users with ALTER privilege on the mysql.user table to execute random code or to gain shell access with the UID of the mysqld process (thanks to Jedi/Sector One for spotting and reporting this bug). (CVE-2003-0780)
- Fixed server crash on FORCE INDEX in a query that contained "Range checked for each record" in the EXPLAIN output. (Bug #1172)
- Fixed table/column grant handling: The proper sort order (from most specific to less specific, see Section 5.5.5, "Access Control, Stage 2: Request Verification") was not honored. (Bug #928)
- Fixed rare bug in MYISAM introduced in 4.0.3 where the index file header was not updated directly after an UPDATE of split dynamic rows. The symptom was that the table had a corrupted delete-link if mysqld was shut down or the table was checked directly after the update.
- Fixed Can't unlock file error when running myisamchk --sort-index on Windows. (Bug #1119)
- Fixed possible deadlock when changing key_buffer_size while the key cache was actively used. (Bug #1088)
- Fixed overflow bug in MyISAM and ISAM when a row is updated in a table with a large number of columns and at least one BLOB/TEXT column.
- Fixed incorrect result when doing UNION and LIMIT #,# when braces were not used around the SELECT parts.
- Fixed incorrect result when doing UNION and ORDER BY .. LIMIT # when one didn't use braces around the SELECT parts.
- Fixed problem with SELECT SQL_CALC_FOUND_ROWS ... UNION ALL ... LIMIT # where FOUND_ROWS() returned incorrect number of rows.
- Fixed unlikely stack bug when having a BIG expression of type 1+1-1+1-1... in certain combinations. (Bug #871)
- Fixed the bug that sometimes prevented a table with a FULLTEXT index from being marked as "analyzed".
- Fixed MySQL so that the column length (in C API) for the second column in SHOW CREATE TABLE is always larger than the data length. The only known application that was affected by the old behavior was Borland dbExpress, which truncated the output from the command. (Bug #1064)
- Fixed crash in comparisons of strings using the tis620 character set. (Bug #1116)
- Fixed ISAM bug in MAX() optimization.
- myisamchk --sort-records=N no longer marks table as crashed if sorting failed because of an inappropriate key. (Bug #892)
- Fixed a minor bug in MyISAM compressed table handling that sometimes made it impossible to repair compressed table in "Repair by sort" mode. "Repair with keycache" (myisamchk --safe-recover) worked, though. (Bug #1015)
Changes in Release 4.0.15 (03 September 2003)

- Fixed bug in propagating the version number to the manual included in the distribution files. (Bug #1020)
- Fixed key sorting problem (a PRIMARY key declared for a column that is not explicitly marked NOT NULL was sorted after a UNIQUE key for a NOT NULL column).
- Fixed the result of INTERVAL when applied to a DATE value. (Bug #792)
- Fixed compiling of the embedded server library in the RPM spec file. (Bug #959)
- Added some missing files to the RPM spec file and fixed some RPM building errors that occurred on Red Hat Linux 9. (Bug #998)
- Fixed incorrect XOR evaluation in WHERE clause. (Bug #992)
- Fixed bug with processing in query cache merged tables constructed from more than 255 tables. (Bug #930)
- Fixed incorrect results from outer join query (for example, LEFT JOIN) when ON condition is always false, and range search in used. (Bug #926)
- Fixed a bug causing incorrect results from MATCH ... AGAINST() in some joins. (Bug #942)
- MERGE tables do not ignore Using index (from EXPLAIN output) anymore.
- Fixed a bug that prevented an empty table from being marked as "analyzed". (Bug #937)
- Fixed myisamchk --sort-records crash when used on compressed table.
- Fixed slow (as compared to 3.23) ALTER TABLE and related commands such as CREATE INDEX. (Bug #712)
- Fixed segmentation fault resulting from LOAD DATA FROM MASTER when the master was running without the --log-bin option. (Bug #934)
- Fixed a security bug: A server compiled without SSL support still permitted connections by users who had the REQUIRE SSL option specified for their accounts.
- Fixed a random bug: Sometimes the slave would replicate GRANT or REVOKE queries even if it was configured to exclude the mysql database from replication (for example, using --replicate-wild-ignore-table=mysql.%). (Bug #980)
- The Last_Errno and Last_Error fields in the output of SHOW SLAVE STATUS are now cleared by CHANGE MASTER TO and when the slave SQL thread starts. (Bug #986)
- A documentation mistake: It said that RESET SLAVE does not change connection information (master host, port, user, and password), whereas it does. The statement resets these to the startup options (master-host etc) if there were some. (Bug #985)
- SHOW SLAVE STATUS now shows correct information (master host, port, user, and password) after RESET SLAVE (that is, it shows the new values, which are copied from the startup options if there were some). (Bug #985)
- Disabled propagation of the original master's log position for events because this caused unexpected values for Exec_Master_Log_Pos and problems with MASTER_POS_WAIT(). [871] in A->B->C replication setup. (Bug #1086)
- Fixed a segmentation fault in mysqlbinlog when --position=x was used with x being between a Create_file event and its fellow Append_block, Exec_load or Delete_file events. (Bug #1091)
Changes in Release 4.0.14 (18 July 2003)

- **mysqlbinlog** printed superfluous warnings when using `--database`, which caused syntax errors when piped to **mysql**. (Bug #1092)

- Made **mysqlbinlog --database** filter **LOAD DATA INFILE** too (previously, it filtered all queries except **LOAD DATA INFILE**). (Bug #1093)

- **mysqlbinlog** in some cases forgot to put a leading '#' in front of the original **LOAD DATA INFILE** (this command is displayed only for information, not to be run; it is later reworked to **LOAD DATA LOCAL** with a different file name, for execution by **mysql**). (Bug #1096)

- **binlog-do-db** and **binlog-ignore-db** incorrectly filtered **LOAD DATA INFILE** (it was half-written to the binary log). This resulted in a corrupted binary log, which could cause the slave to stop with an error. (Bug #1100)

- When, in a transaction, a transactional table (such as an **InnoDB** table) was updated, and later in the same transaction a nontransactional table (such as a **MyISAM** table) was updated using the updated content of the transactional table (with **INSERT ... SELECT** for example), the queries were written to the binary log in an incorrect order. (Bug #873)

- When, in a transaction, **INSERT ... SELECT** updated a nontransactional table, and **ROLLBACK** was issued, no error was returned to the client. Now the client is warned that some changes could not be rolled back, as this was the case for normal **INSERT**. (Bug #1113)

- Fixed a potential bug: When **STOP SLAVE** was run while the slave SQL thread was in the middle of a transaction, and then **CHANGE MASTER TO** was used to point the slave to some nontransactional statement, the slave SQL thread could get confused (because it would still think, from the past, that it was in a transaction).

### C.2.18 Changes in Release 4.0.14 (18 July 2003)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Functionality added or changed:

- Added `default_week_format` system variable. The value is used as the default mode for the **WEEK()** function.

- **mysqlld** now reads an additional option file group having a name corresponding to the server’s release series: [mysqlld-4.0] for 4.0.x servers, [mysqlld-4.1] for 4.1.x servers, and so forth. This enables options to be specified on a series-specific basis.

- The **CONCAT_WS()** function no longer skips empty strings. (Bug #586).

- **InnoDB** now supports indexing a prefix of a column. This means, in particular, that **BLOB** and **TEXT** columns can be indexed in **InnoDB** tables, which was not possible before.

- A documentation change: Function **INTERVAL(NULL, ...)** returns `-1`.

- Enabled **INSERT** from **SELECT** when the table into which the records are inserted is also a table listed in the **SELECT**.

- Permit **CREATE TABLE** and **INSERT** from any **UNION**.

- The **SQL_CALC_FOUND_ROWS** option now always returns the total number of rows for any **UNION**.
Changes in Release 4.0.14 (18 July 2003)

- Removed `--table` option from `mysqlbinlog` to avoid repeating `mysqldump` functionality.
- Comment lines in option files can now start from the middle of a line, too (like `basedir=c:\mysql # installation directory`).
- Changed optimizer slightly to prefer index lookups over full table scans in some boundary cases.
- Added thread-specific `max_seeks_for_key` variable that can be used to force the optimizer to use keys instead of table scans even if the cardinality of the index is low.
- Added optimization that converts `LEFT JOIN` to normal join in some cases.
- A documentation change: added a paragraph about failover in replication (how to use a surviving slave as the new master, how to resume to the original setup). See Section 14.10, “Replication FAQ”.
- A documentation change: added warning notes about safe use of the `CHANGE MASTER TO` statement. See Section 12.5.2.1, “CHANGE MASTER TO Syntax”.
- MySQL now issues a warning (not an error, as in 4.0.13) when it opens a table that was created with MySQL 4.1.
- Added `--nice` option to `mysqld_safe` to allow setting the niceness of the `mysqld` process. (Thanks to Christian Hammers for providing the initial patch.) (Bug #627)
- Added `--read-only` option to cause `mysqld` to allow no updates except from slave threads or from users with the `SUPER` privilege. (Original patch from Markus Benning).
- `SHOW BINLOG EVENTS FROM x` where `x` is less than 4 now silently converts `x` to 4 instead of printing an error. The same change was done for `CHANGE MASTER TO MASTER_LOG_POS=x` and `CHANGE MASTER TO RELAY_LOG_POS=x`.
- `mysqld` now only adds an interrupt handler for the `SIGINT` signal if you start it with the new `--gdb` option. This is done because some MySQL users encountered strange problems when they accidentally sent `SIGINT` to `mysqld` threads.
- `RESET SLAVE` now clears the `Last_Errno` and `Last_Error` fields in the output of `SHOW SLAVE STATUS`.
- Added `max_relay_log_size` variable; the relay log is rotated automatically when its size exceeds `max_relay_log_size`. But if `max_relay_log_size` is 0 (the default), `max_binlog_size` is used (as in older versions). `max_binlog_size` still applies to binary logs in any case.
- `FLUSH LOGS` now rotates relay logs in addition to the other types of logs it rotates.

Bugs fixed:

- Comparison/sorting for `latin1_de` character set was rewritten. The old algorithm could not handle cases like "sä" > "ßa". See Section 9.2, “Using the German Character Set”. In rare cases it resulted in table corruption.
- Fixed a problem with the password prompt on Windows. (Bug #683)
- `ALTER TABLE ... UNION=(...)` for `MERGE` table is now permitted even if some underlying `MyISAM` tables are read only. (Bug #702)
- Fixed a problem with `CREATE TABLE t1 SELECT x'41'`. (Bug #801)
- Removed some incorrect lock warnings from the error log.
Changes in Release 4.0.14 (18 July 2003)

- Fixed memory overrun when doing `REPAIR TABLE` on a table with a multiple-part auto_increment key where one part was a packed `CHAR`.

- Fixed a probable race condition in the replication code that could potentially lead to `INSERT` statements not being replicated in the event of a `FLUSH LOGS` command or when the binary log exceeds `max_binlog_size`. (Bug #791)

- Fixed a crashing bug in `INTERVAL` and `GROUP BY` or `DISTINCT`. (Bug #807)

- Fixed bug in `mysqlhotcopy` so it actually aborts for unsuccessful table copying operations. Fixed another bug so that it succeeds when there are thousands of tables to copy. (Bug #812)

- Fixed a security problem that enabled users with no privileges to obtain information on the list of existing databases by using `SHOW TABLES` and similar commands.

- Fixed a stack problem on UnixWare/OpenUnix.

- Fixed a configuration problem on UnixWare/OpenUNIX and OpenServer.

- Fixed a problem with `max_user_connections`.

- `HANDLER` without an index now works properly when a table has deleted rows. (Bug #787)

- Fixed a bug with `LOAD DATA` in `mysqlbinlog`. (Bug #670)

- Fixed that `SET CHARACTER SET DEFAULT` works. (Bug #462)

- Fixed `MERGE` table behavior in `ORDER BY ... DESC` queries. (Bug #515)

- Fixed server crash on `PURGE MASTER LOGS` or `SHOW MASTER LOGS` when the binary log is off. (Bug #733)

- Fixed password-checking problem on Windows. (Bug #464)

- Fixed the bug in comparison of a `DATETIME` column and an integer constant. (Bug #504)

- Fixed remote mode of `mysqlbinlog`. (Bug #672)

- Fixed `ERROR 1105: Unknown error` that occurred for some `SELECT` queries, where a column that was declared as `NOT NULL` was compared with an expression that took `NULL` value.

- Changed timeout in `mysql_real_connect()` to use `poll()` instead of `select()` to work around problem with many open files in the client.

- Fixed incorrect results from `MATCH ... AGAINST` used with a `LEFT JOIN` query.

- The maximum value for system variables was limited to 4294967295 when specified on the command line.

- Fixed a bug that sometimes caused spurious “Access denied” errors in `HANDLER ... READ` statements, when a table is referenced through an alias.
Changes in Release 4.0.14 (18 July 2003)

- Fixed a portability problem with `safe_malloc`, which caused MySQL to produce “Freeing wrong aligned pointer” errors on SCO 3.2.

- `ALTER TABLE ... ENABLE/DISABLE KEYS` could cause a core dump when done after an `INSERT DELAYED` statement on the same table.

- Fixed problem with conversion of localtime to GMT where some times resulted in different (but correct) timestamps. Now MySQL should use the smallest possible timestamp value in this case. (Bug #316)

- Very small query cache sizes could crash `mysqld`. (Bug #549)

- Fixed a bug (accidentally introduced by us but present only in version 4.0.13) that made `INSERT ... SELECT` into an `AUTO_INCREMENT` column not replicate well. This bug is in the master, not in the slave. (Bug #490)

- Fixed a bug: When an `INSERT ... SELECT` statement inserted rows into a nontransactional table, but failed at some point (for example, due to a “Duplicate key” error), the query was not written to the binary log. Now it is written to the binary log, with its error code, as all other queries are. About the `slave-skip-errors` option for how to handle partially completed queries in the slave, see Section 14.8, “Replication and Binary Logging Options and Variables”. (Bug #491)

- `SET foreign_key_checks = 0` was not replicated properly. The fix probably will not be backported to 3.23.

- On a slave, `LOAD DATA INFILE` which had no `IGNORE` or `REPLACE` clause on the master, was replicated with `IGNORE`. Although this is not a problem if the master and slave data are identical (a `LOAD` that produces no duplicate conflicts on the master produces none on the slave anyway), which is true in normal operation, it is better for debugging not to silently add the `IGNORE`. That way, you can get an error message on the slave and discover that for some reason, the data on master and slave are different and investigate why. (Bug #571)

- On a slave, `LOAD DATA INFILE` printed an incomplete “Duplicate entry '%-.64s' for key %d'” message (the key name and value were not mentioned) in case of duplicate conflict (which does not happen in normal operation). (Bug #573)

- When using a slave compiled with `--debug`, `CHANGE MASTER TO RELAY_LOG_POS` could cause a debug assertion failure. (Bug #576)

- When doing a `LOCK TABLES WRITE` on an InnoDB table, commit could not happen, if the query was not written to the binary log (for example, if `--log-bin` was not used, or `binlog-ignore-db` was used). (Bug #578)

- If a 3.23 master had open temporary tables that had been replicated to a 4.0 slave, and the binary log got rotated, these temporary tables were immediately dropped by the slave (which caused problems if the master used them subsequently). This bug had been fixed in 4.0.13, but in a manner which caused an unlikely inconvenience: If the 3.23 master died brutally (power failure), without having enough time to automatically write `DROP TABLE` statements to its binary log, then the 4.0.13 slave would not notice the temporary tables have to be dropped, until the slave `mysqld` server is restarted. This minor inconvenience is fixed in 3.23.57 and 4.0.14 (meaning the master must be upgraded to 3.23.57 and the slave to 4.0.14 to remove the inconvenience). (Bug #254)

- If `MASTER_POS_WAIT() [871]` was waiting, and the slave was idle, and the slave SQL thread terminated, `MASTER_POS_WAIT() [871]` would wait forever. Now when the slave SQL thread terminates, `MASTER_POS_WAIT() [871]` immediately returns NULL (“slave stopped”). (Bug #651)

- After `RESET SLAVE; START SLAVE;`, the `Relay_Log_Space` value displayed by `SHOW SLAVE STATUS` was too big by four bytes. (Bug #763)
Changes in Release 4.0.13 (16 May 2003)

• If a query was ignored on the slave (because of --replicate-ignore-table and other similar rules), the slave still checked if the query got the same error code (0, no error) as on the master. So if the master had an error on the query (for example, “Duplicate entry” in a multiple-row insert), then the slave stopped and warned that the error codes didn't match. (Bug #797)

C.2.19 Changes in Release 4.0.13 (16 May 2003)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Functionality added or changed:

• PRIMARY KEY now implies NOT NULL. (Bug #390)

• The Windows binary packages are now compiled with --enable-local-infile to match the Unix build configuration.

• Removed timing of tests from mysql-test-run.time does not accept all required parameters on many platforms (for example, QNX) and timing the tests is not really required (it is not a benchmark anyway).

• SHOW MASTER STATUS and SHOW SLAVE STATUS required the SUPER privilege; now they accept REPLICATION CLIENT as well. (Bug #343)

• Added multi-threaded MyISAM repair optimization and myisam_repair_threads variable to enable it. See Section 5.1.3, “Server System Variables”.

• Added innodb_max_dirty_pages_pct variable which controls amount of dirty pages permitted in InnoDB buffer pool.

• CURRENT_USER()[864] and Access denied error messages now report the host name exactly as it was specified in the GRANT statement.

• Removed benchmark results from the source and binary distributions. They are still available in the BK source tree, though.

• InnoDB tables now support ANALYZE TABLE.

• MySQL now issues an error when it opens a table that was created with MySQL 4.1.

• Option --new now changes binary items (0xFFDF) to be treated as binary strings instead of numbers by default. This fixes some problems with character sets where it is convenient to input the string as a binary item. After this change you have to convert the binary string to INTEGER with a CAST if you want to compare two binary items with each other and know which one is bigger than the other. SELECT CAST(0xfeff AS UNSIGNED) < CAST(0xff AS UNSIGNED). This is the default behavior in MySQL 4.1. (Bug #152)

• Enabled delayed_insert_timeout on Linux (most modern glibc libraries have a fixed pthread_cond_timedwait()). (Bug #211)

• Do not create more insert delayed threads than given by max_delayed_threads. (Bug #211)

• Changed UPDATE ... LIMIT to apply the limit to rows that were matched, whether or not they actually were changed. Previously the limit was applied as a restriction on the number of rows changed.

• Tuned optimizer to favor clustered index over table scan.
Changes in Release 4.0.13 (16 May 2003)

- **BIT_AND()** [874] and **BIT_OR()** [874] now return an unsigned 64-bit value.
- Added warnings to error log indicating why a secure connection failed (when running with **--log-warnings**).
- Deprecated the options **--skip-symlink** and **--use-symbolic-links** and replaced them with **--symbolic-links**.
- The default option for **innodb_flush_log_at_trx_commit** was changed from 0 to 1 to make InnoDB tables ACID by default. See Section 13.2.4, “InnoDB Startup Options and System Variables”.
- Added a feature to **SHOW KEYS** to display keys that are disabled by **ALTER TABLE DISABLE KEYS** statement.
- When using a nonexistent table type with **CREATE TABLE**, first try if the default table type exists before falling back to **MyISAM**.
- Added **MEMORY** as an alias for **HEAP**.
- Renamed function **rnd** to **my_rnd** as the name was too generic and is an exported symbol in **libmysqlclient** (thanks to Dennis Haney for the initial patch).
- Portability fix: renamed **include/dbug.h** to **include/my_dbug.h**.
- **mysql dump** no longer silently deletes the binary logs when invoked with the **--master-data** or **--first-slave** option; while this behavior was convenient for some users, others may suffer from it. Now you must explicitly ask for binary logs to be deleted by using the new **--delete-master-logs** option.
- If the slave is configured (using for example **--replicate-wild-ignore-table=mysql.%**) to exclude **mysql.user, mysql.host, mysql.db, mysql.tables_priv** and **mysql.columns_priv** from replication, then **GRANT** and **REVOKE** are not replicated.

Bugs fixed:
- Logged **Access denied** error message had incorrect **Using password** value. (Bug #398)
- Fixed bug with **NATURAL LEFT JOIN, NATURAL RIGHT JOIN** and **RIGHT JOIN** when using many joined tables. The problem was that the **JOIN** method was not always associated with the tables surrounding the **JOIN** method. If you have a query that uses many **RIGHT JOIN** or **NATURAL ... JOINS** you should verify that they work as you expected after upgrading MySQL to this version. (Bug #291)
- Fixed mysql parser not to erroneously interpret “’” or “” characters within /* ... */ comment as beginning a quoted string.
- mysql command-line client no longer looks for \* commands inside backtick-quoted strings.
- Fixed **Unknown error** when using **UPDATE ... LIMIT**. (Bug #373)
- Fixed problem with ANSI mode and **GROUP BY** with constants. (Bug #387)
- Fixed bug with **UNION** and **OUTER JOIN**. (Bug #386)
- Fixed bug if one used a multiple-table **UPDATE** and the query required a temporary table bigger than **tmp_table_size**. (Bug #286)
- Run **mysql install db** with the **-IN-RPM** option for the Mac OS X installation to not fail on systems with improperly configured host name configurations.
- **LOAD DATA INFILE** now reads 000000 as a zero date instead of "2000-00-00".
Changes in Release 4.0.13 (16 May 2003)

- Fixed bug that caused **DELETE FROM table WHERE const_expression** always to delete the whole table (even if expression result was false). (Bug #355)

- Fixed core dump bug when using **FORMAT('nan', #)** [788]. (Bug #284)

- Fixed name resolution bug with **HAVING ... COUNT(DISTINCT ...)**.

- Fixed incorrect result from truncation operator (*) in **MATCH ... AGAINST()** in some complex joins.

- Fixed a crash in **REPAIR ... USE_FRM** command, when used on a read-only table, nonexistent table, or a table with a crashed index file.

- Fixed a crashing bug in **mysql** monitor program. It occurred if program was started with **--no-defaults**, with a prompt that contained the host name and a connection to a nonexistent database was requested.

- Fixed problem when comparing a key for a multi-byte character set. (Bug #152)

- Fixed bug in **LEFT**, **RIGHT** and **MID** when used with multi-byte character sets and some **GROUP BY** queries. (Bug #314)

- Fix problem with **ORDER BY** being discarded for some **DISTINCT** queries. (Bug #275)

- Fixed that **SET sql_big_selects = 1** works as documented (This corrects a new bug introduced in 4.0)

- Fixed some serious bugs in **UPDATE ... ORDER BY**. (Bug #241)

- Fixed unlikely problem in optimizing **WHERE** clause with constant expression like in **WHERE 1 AND (a=1 AND b=1)**.

- Fixed that **SET sql_big_selects = 1** works again.

- Introduced proper backtick quoting for db.table in **SHOW GRANTS**.

- **FULLTEXT** index stopped working after **ALTER TABLE** that converts **TEXT** column to **CHAR**. (Bug #283)

- Fixed a security problem with **SELECT** and wildcarded select list, when user only had partial column **SELECT** privileges on the table.

- Mark a **MyISAM** table as "analyzed" only when all the keys are indeed analyzed.

- Only ignore world-writable **my.cnf** files that are regular files (and not, for example, named pipes or character devices).

- Fixed few smaller issues with **SET PASSWORD**.

- Fixed error message which contained deprecated text.

- Fixed a bug with two **NATURAL JOINS** in the query.

- **SUM()** [876] didn't return **NULL** when there was no rows in result or when all values was **NULL**.

- On Unix, symbolic link handling was not enabled by default and there was no way to turn this on.

- Added missing dashes to parameter **--open-files-limit** in **mysqld_safe**. (Bug #264)

- Fixed incorrect host name for TCP/IP connections displayed in **SHOW PROCESSLIST**.

- Fixed a bug with **NAN** in **FORMAT( ...)** [788] function ...
Changes in Release 4.0.12 (15 March 2003: Production)

- Fixed a bug with improperly cached database privileges.
- Fixed a bug in `ALTER TABLE ENABLE / DISABLE KEYS` which failed to force a refresh of table data in the cache.
- Fixed bugs in replication of `LOAD DATA INFILE` for custom parameters (`ENCLOSED`, `TERMINATED` and so on) and temporary tables. (Bug #183, Bug #222)
- Fixed a replication bug when the master is 3.23 and the slave 4.0: the slave lost the replicated temporary tables if `FLUSH LOGS` was issued on the master. (Bug #254)
- Fixed a bug when doing `LOAD DATA INFILE IGNORE`: When reading the binary log, `mysqlbinlog` and the replication code read `REPLACE` instead of `IGNORE`. This could make the slave's table become different from the master's table. (Bug #218)
- Fixed a deadlock when `relay_log_space_limit` was set to a too small value. (Bug #79)
- Fixed a bug in `HAVING` clause when an alias is used from the `select list`.
- Fixed overflow bug in `MyISAM` when a row is inserted into a table with a large number of columns and at least one `BLOB/TEXT` column. Bug was caused by incorrect calculation of the needed buffer to pack data.
- Fixed a bug when `SELECT @non_existent_variable` caused an error in the client/server protocol due to `net_printf()` output being sent to the client twice.
- Fixed a bug in setting the `sql_big_selects` option.
- Fixed a bug in `SHOW PROCESSLIST` which only displayed a localhost in the "Host" column. This was caused by a glitch that used only current thread information instead of information from the linked list of threads.
- Removed unnecessary Mac OS X helper files from server RPM. (Bug #144)
- Permit optimization of multiple-table update for `InnoDB` tables as well.
- Fixed a bug in multiple-table updates that caused some rows to be updated several times.
- Fixed a bug in `mysqldump` when it was called with `--master-data`: the `CHANGE MASTER TO` statements appended to the SQL dump had incorrect coordinates. (Bug #159)
- Fixed a bug when an updating query using `USER()` [868] was replicated on the slave; this caused a segmentation fault on the slave. (Bug #178). `USER()` [868] is still badly replicated on the slave (it is replicated to ")

C.2.20 Changes in Release 4.0.12 (15 March 2003: Production)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Functionality added or changed:

- `mysqld` no longer reads options from world-writable config files. (CVE-2003-0150)
- Integer values between 922372036854775807 and 9999999999999999999 are now regarded as unsigned longlongs, not as floats. This makes these values work similar to values between 10000000000000000000 and 18446744073709551615.
Changes in Release 4.0.12 (15 March 2003: Production)

- **SHOW PROCESSLIST** now includes the client TCP port after the host name to make it easier to know from which client the request originated.

- The --new option can be used to make a 4.0 server return **TIMESTAMP** as a string in 'YYYY-MM-DD HH:MM:SS' format, the way that 4.1 servers do. This is also a new system variable that can be set for the same effect. See Section 10.3.1.1, “TIMESTAMP Properties Prior to MySQL 4.1”.

Bugs fixed:

- Fixed **mysqld** crash on extremely small values of **sort_buffer** variable.

- **INSERT INTO u SELECT ... FROM t** was written too late to the binary log if t was very frequently updated during the execution of this query. This could cause a problem with **mysqlbinlog** or replication. The master must be upgraded, not the slave. (Bug #136)

- Fixed checking of random part of **WHERE** clause. (Bug #142)

- Fixed a bug with multiple-table updates with InnoDB tables. This bug occurred as, in many cases, InnoDB tables cannot be updated “on the fly,” but offsets to the records have to be stored in a temporary table.

- Added missing file **mysql_secure_installation** to the server RPM subpackage. (Bug #141)

- Fixed MySQL (and **myisamchk**) crash on artificially corrupted .MYI files.

- Do not allow **BACKUP TABLE** to overwrite existing files.

- Fixed a bug with multiple-table **UPDATE** statements when user had all privileges on the database where tables are located and there were any entries in **tables_priv** table, that is, **grant_option** was true.

- Fixed a bug that permitted a user with table or column grants on some table, **TRUNCATE TABLE** any table in the same database.

- Fixed deadlock when doing **LOCK TABLE** followed by **DROP TABLE** in the same thread. In this case one could still kill the thread with **KILL**.

- **LOAD DATA LOCAL INFILE** was not properly written to the binary log (hence not properly replicated). (Bug #82)

- **RAND()** [814] entries were not read correctly by **mysqlbinlog** from the binary log which caused problems when restoring a table that was inserted with **RAND()** [814]. **INSERT INTO t1 VALUES(RAND())**. In replication this worked okay.

- **SET sql_log_bin = 0** was ignored for **INSERT DELAYED** queries. (Bug #104)

- **SHOW SLAVE STATUS** reported too old positions (columns **Relay_Master_Log_File** and **Exec_Master_Log_Pos**) for the last executed statement from the master, if this statement was the **COMMIT** of a transaction. The master must be upgraded for that, not the slave. (Bug #52)

- **LOAD DATA INFILE** was not replicated by the slave if **replicate_*_table** was set on the slave. (Bug #86)

- After **RESET SLAVE**, the coordinates displayed by **SHOW SLAVE STATUS** looked un-reset (although they were, but only internally). (Bug #70)

- Fixed query cache invalidation on **LOAD DATA**.

- Fixed memory leak on **ANALYZE** procedure with error.
Changes in Release 4.0.11 (20 February 2003)

• Fixed a bug in handling **CHAR(0)** columns that could cause incorrect results from the query.

• Fixed rare bug with incorrect initialization of **AUTO_INCREMENT** column, as a secondary column in a multi-column key (see Section 3.6.9, “Using **AUTO_INCREMENT**”), when data was inserted with **INSERT ... SELECT** or **LOAD DATA** into an empty table.

• On Windows, **STOP SLAVE** didn't stop the slave until the slave got one new command from the master (this bug has been fixed for MySQL 4.0.11 by releasing updated 4.0.11a Windows packages, which include this individual fix on top of the 4.0.11 sources). (Bug #69)

• Fixed a crash when no database was selected and **LOAD DATA** statement was issued with full table name specified, including database prefix.

• Fixed a crash when shutting down replication on some platforms (for example, Mac OS X).

• Fixed a portability bug with **pthread_attr_getstacksize** on HP-UX 10.20 (Patch was also included in 4.0.11a sources).

• Fixed the **bigint** test to not fail on some platforms (for example, HP-UX and Tru64) due to different return values of the **atof()** function.

• Fixed the **rpl_rotate_logs** test to not fail on certain platforms (such as Mac OS X) due to a too-long file name (changed **slave-master-info.opt** to **.slave-mi**).

C.2.21 Changes in Release 4.0.11 (20 February 2003)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Functionality added or changed:

• **NULL** is now sorted **LAST** if you use **ORDER BY ... DESC** (as it was before MySQL 4.0.2). This change was required to comply with the SQL standard. (The original change was made because we thought that standard SQL required **NULL** to be always sorted at the same position, but this was incorrect).

• Added **START TRANSACTION** (standard SQL syntax) as alias for **BEGIN**. This is recommended to use instead of **BEGIN** to start a transaction.

• Added **OLD_PASSWORD()** [860] as a synonym for **PASSWORD()** [860].

• Permit keyword **ALL** in group functions.

• Added support for some new **INNER JOIN** and **JOIN** syntaxes. For example, **SELECT * FROM t1 INNER JOIN t2** didn't work before.

• Novell NetWare 6.0 porting effort completed, Novell patches merged into the main source tree.

Bugs fixed:

• Fixed problem with multiple-table delete and **InnoDB** tables.

• Fixed a problem with **BLOB NOT NULL** columns used with **IS NULL** [775].

• Re-added missing pre- and post(un)install scripts to the Linux RPM packages (they were missing after the renaming of the server subpackage).
Changes in Release 4.0.10 (29 January 2003)

- Fixed that table locks are not released with multiple-table updates and deletes with InnoDB storage engine.

- Fixed bug in updating BLOB columns with long strings.

- Fixed integer-wraparound when giving big integer (>= 10 digits) to function that requires an unsigned argument, like CREATE TABLE (...) AUTO_INCREMENT=N.

- MIN(key_column) [876] could in some cases return NULL on a column with NULL and other values.

- MIN(key_column) [876] and MAX(key_column) [876] could in some cases return incorrect values when used in OUTER JOIN.

- MIN(key_column) [876] and MAX(key_column) [876] could return incorrect values if one of the tables was empty.

- Fixed rare crash in compressed MyISAM tables with blobs.

- Fixed bug in using aggregate functions as argument for INTERVAL() [777], CASE [782], FIELD() [788], CONCAT_WS() [787], ELT() [787] and MAKE_SET() [791] functions.

- When running with --lower-case-table-names (default on Windows) and you had tables or databases with mixed case on disk, then executing SHOW TABLE STATUS followed with DROP DATABASE or DROP TABLE could fail with Errcode 13.

C.2.22 Changes in Release 4.0.10 (29 January 2003)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Functionality added or changed:

- Added option --log-error=file_name to mysqld_safe and mysqld. This option forces all error messages to be put in a log file if the option --console is not given. On Windows --log-error is enabled as default, with a default name of host_name.err if the name is not specified.

- Changed some messages from Warning: to Note: in the log files.

- The mysqld server should now compile on NetWare.

- Added optimization that if one does GROUP BY ... ORDER BY NULL then result is not sorted.

- New ft_stopword_file system variable for mysqld to replace/disable the built-in stopword list that is used in full-text searches. See Section 5.1.3, “Server System Variables”.

- Changed default stack size from 64KB to 192KB; This fixes a core dump problem on Red Hat 8.0 and other systems with a glibc that requires a stack size larger than 128K for gethostbyaddr() to resolve a host name. You can fix this for earlier MySQL versions by starting mysqld with --thread-stack=192K.

- Added mysql_waitpid to the binary distribution and the MySQL-client RPM subpackage (required for mysql-test-run).

- Renamed the main MySQL RPM package to MySQL-server. When updating from an older version, MySQL-server.rpm simply replaces MySQL.rpm.
• If a slave is configured with `replicate_wild_do_table=db.%` or `replicate_wild_ignore_table=db.%`, these rules are applied to CREATE/DROP DATABASE, too.

• Added timeout value for `MASTER_POS_WAIT()` [871].

Bugs fixed:

• Fixed initialization of the random seed for newly created threads to give a better `rand()` distribution from the first call.

• Fixed a bug that caused `mysqld` to hang when a table was opened with the `HANDLER` statement and then dropped without being closed.

• Fixed bug in logging to binary log (which affects replication) a query that inserts a `NULL` in an `AUTO_INCREMENT` column and also uses `LAST_INSERT_ID()` [866].

• Fixed an unlikely bug that could cause a memory overrun when using `ORDER BY constant_expression`.

• Fixed a table corruption in `myisamchk` parallel repair mode.

• Fixed bug in query cache invalidation on simple table renaming.

• Fixed bug in `mysqladmin --relative`.

• On some 64-bit systems, `show status` reported a strange number for `Open_files` and `Open_streams`.

• Fixed incorrect number of columns in `EXPLAIN` on empty table.

• Fixed bug in `LEFT JOIN` that caused zero rows to be returned in the case the `WHERE` condition was evaluated as `FALSE` after reading `const` tables. (Unlikely condition).

• `FLUSH PRIVILEGES` didn’t correctly flush table/column privileges when `mysql.tables_priv` is empty.

• Fixed bug in replication when using `LOAD DATA INFILE` one a file that updated an `AUTO_INCREMENT` column with `NULL` or `0`. This bug only affected MySQL 4.0 masters (not slaves or MySQL 3.23 masters).

• Fixed possible memory overrun when sending a `BLOB` value larger than 16M to the client.

• Fixed incorrect error message when setting a `NOT NULL` column to an expression that returned `NULL`.

• Fixed core dump bug in `str LIKE %other_str%` where `str` or `other_str` contained characters `>= 128`.

• Fixed bug: When executing on master `LOAD DATA` and InnoDB failed with `table full` error the binary log was corrupted.

**C.2.23 Changes in Release 4.0.9 (09 January 2003)**

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please
Consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Functionality added or changed:

- **OPTIMIZE TABLE** for MyISAM tables treats all NULL values as different when calculating cardinality. This helps in optimizing joins between tables where one of the tables has a lot of NULL values in an indexed column:

  ```sql
  SELECT * from t1, t2 where t1.a=t2.key_with_a_lot_of_null;
  ```

- Added join operator **FORCE INDEX (index_list)**. This acts like USE INDEX (index_list) but with the addition that a table scan is assumed to be VERY expensive. One bad thing with this is that it makes **FORCE** a reserved word.

- Reset internal row buffer in MyISAM after each query. This reduces memory in case you have a lot of big blobs in a table.

Bugs fixed:

- A security patch in 4.0.8 causes the mysqld server to die if the remote host name can't be resolved. This is now fixed.

C.2.24 Changes in Release 4.0.8 (07 January 2003)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Functionality added or changed:

- Default **max_packet_length** for libmysqld.c is now 1024*1024*1024.

- You can now specify **max_allowed_packet** in a file read by mysql_options(MYSQL_READ_DEFAULT_FILE) for clients.

- When sending a too big packet to the server with the not compressed protocol, the client now gets an error message instead of a lost connection.

- We now send big queries/result rows in bigger hunks, which should give a small speed improvement.

- Fixed some bugs with the compressed protocol for rows > 16MB.

- InnoDB tables now also support **ON UPDATE CASCADE** in FOREIGN KEY constraints. See the InnoDB section in the manual for the InnoDB changelog.

Bugs fixed:

- Fixed bug in **ALTER TABLE** with BDB tables.

- Fixed core dump bug in **QUOTE()** [792] function.

- Fixed a bug in handling communication packets bigger than 16MB. Unfortunately this required a protocol change; If you upgrade the server to 4.0.8 and above and have clients that use packets >= 255*255*255
Changes in Release 4.0.7 (20 December 2002)

bytes (=16581375) you must also upgrade your clients to at least 4.0.8. If you don't upgrade, the clients hang when sending a big packet.

• Fixed bug when sending blobs longer than 16MB to client.

• Fixed bug in GROUP BY when used on BLOB column with NULL values.

• Fixed a bug in handling NULL values in CASE [782] WHEN ...

C.2.25 Changes in Release 4.0.7 (20 December 2002)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Functionality added or changed:

• mysqlbug now also reports the compiler version used for building the binaries (if the compiler supports the option --version).

Bugs fixed:

• Fixed compilation problems on OpenUnix and HPUX 10.20.

• Fixed some optimization problems when compiling MySQL with -DBIG_TABLES on a 32-bit system.

• mysql_drop_db() didn't check permissions properly so anyone could drop another users database. DROP DATABASE is checked properly.

C.2.26 Changes in Release 4.0.6 (14 December 2002: Gamma)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Functionality added or changed:

• Added syntax support for CHARACTER SET xxx and CHARSET=xxx table options (to be able to read table dumps from 4.1).

• Fixed replication bug that caused the slave to loose its position in some cases when the replication log was rotated.

• Fixed that a slave restarts from the start of a transaction if it is killed in the middle of one.

• Moved the manual pages from man to man/man1 in the binary distributions.

• The default type returned by IFNULL(A, B) [783] is now set to be the more 'general' of the types of A and B. (The order is STRING, REAL or INTEGER).

• Moved the mysql.server startup script in the RPM packages from /etc/rc.d/init.d/mysql to /etc/init.d/mysql (which almost all current Linux distributions support for LSB compliance).

• Added Qcache_lowmem_prunes status variable (number of queries that were deleted from the cache because of low memory).
• Fixed `mysqlcheck` so it can deal with table names containing dashes.

• Bulk insert optimization (see Section 5.1.3, “Server System Variables”) is no longer used when inserting small (less than 100) number of rows.

• Optimization added for queries like `SELECT ... FROM merge_table WHERE indexed_column=constant_expr`.

• Added functions `LOCALTIME` and `LOCALTIMESTAMP` as synonyms for `NOW()` [829].

• `CEIL` is now an alias for `CEILING`.

• The `CURRENT_USER()` [864] function can be used to get a `user@host` value as it was matched in the `GRANT` system. See Section 11.13, “Information Functions”.

• Fixed `CHECK` constraints to be compatible with standard SQL. This made `CHECK` a reserved word. (Checking of `CHECK` constraints is still not implemented).

• Added `CAST(... as CHAR)`.

• Added PostgreSQL compatible LIMIT syntax: `SELECT ... LIMIT row_count OFFSET offset`.

• `mysql_change_user()` now resets the connection to the state of a fresh connect (i.e., `ROLLBACK` any active transaction, close all temporary tables, reset all user variables etc.).

• `CHANGE MASTER TO` and `RESET SLAVE` now require that slave threads both be stopped; these commands return an error if at least one of these two threads is running.

Bugs fixed:

• Fixed number of found rows returned in `multi table updates`.

• Make `--lower-case-table-names` default on Mac OS X as the default file system (HFS+) is case insensitive. See Section 8.2.2, “Identifier Case Sensitivity”.

• Transactions in `autocommit = 0` mode didn’t rotate binary log.

• A fix for the bug in a `SELECT` with joined tables with `ORDER BY` and `LIMIT` clause when `filesort` had to be used. In that case `LIMIT` was applied to `filesort` of one of the tables, although it could not be. This fix also solved problems with `LEFT JOIN`.

• `mysql_server_init()` now makes a copy of all arguments. This fixes a problem when using the embedded server in C# program.

• Fixed buffer overrun in `libmysqlclient` library that permitted a malicious MySQL server to crash the client application. (CVE-2002-1376)

• Fixed security-related bug in `mysql_change_user()` handling. All users are strongly recommended to upgrade to version 4.0.6. (CVE-2002-1374, CVE-2002-1375)

• Fixed bug that prevented `--chroot` command-line option of `mysqld` from working.

• Fixed bug in phrase operator "..." in boolean full-text search.

• Fixed bug that caused `OPTIMIZE TABLE` to corrupt the table under some rare circumstances.

• Part rewrite of multiple-table-update to optimize it, make it safer and more bug-free.

• `LOCK TABLES` now works together with `multiple-table-update` and `multiple-table-delete`.
Changes in Release 4.0.5 (13 November 2002)

- **--replicate-do=xxx** didn't work for UPDATE commands. (Bug introduced in 4.0.0)
- Fixed shutdown problem on Mac OS X.
- Major InnoDB bugs in REPLACE, AUTO_INCREMENT, INSERT INTO ... SELECT ... were fixed. See the InnoDB changelog in the InnoDB section of the manual.
- **RESET SLAVE** caused a crash if the slave threads were running.

C.2.27 Changes in Release 4.0.5 (13 November 2002)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

Functionality added or changed:

- Port number was added to host name (if it is known) in SHOW PROCESSLIST statement.
- Changed handling of last argument in WEEK() [835] so that you can get week number according to the ISO 8601 specification. (Old code should still work).
- Fixed that INSERT DELAYED threads don't hang on Waiting for INSERT when one sends a SIGHUP to mysqld.
- Change that AND [779] works according to standard SQL when it comes to NULL handling. In practice, this affects only queries where you do something like WHERE ... NOT (NULL AND 0).
- mysqld now resolves basedir to its full path (with realpath()). This enables one to use relative symlinks to the MySQL installation directory. This however causes show variables to report different directories on systems where there is a symbolic link in the path.
- Fixed that MySQL does not use index scan on index disabled with IGNORE INDEX or USE INDEX. to be ignored.
- Added **--use frm** option to mysqlcheck. When used with REPAIR TABLE, it gets the table structure from the .frm file, so the table can be repaired even if the .MYI header is corrupted.
- Fixed bug in MAX() [876] optimization when used with JOIN and ON expressions.
- Added support for reading of MySQL 4.1 table definition files.
- BETWEEN behavior changed (see Section 11.3.2, “Comparison Functions and Operators”). Now datetime_col BETWEEN timestamp AND timestamp should work as expected.
- One can create TEMPORARY MERGE tables now.
- DELETE FROM myisam_table now shrinks not only the .MYD file but also the .MYI file.
- When one uses the --open-files-limit=val option to mysqld_safe it is now passed on to mysqld.
- Changed output from EXPLAIN from 'where used' to 'Using where' to make it more in line with other output.
- Removed variable safe_show_database as it was no longer used.
- Updated source tree to be built using automake 1.5 and libtool 1.4.
Changes in Release 4.0.5 (13 November 2002)

- Fixed an inadvertently changed option (--ignore-space) back to the original --ignore-spaces in mysqlclient. (Both syntaxes work).

- Do not require UPDATE privilege when using REPLACE.

- Added support for DROP TEMPORARY TABLE ..., to be used to make replication safer.

- When transactions are enabled, all commands that update temporary tables inside a BEGIN/COMMIT are now stored in the binary log on COMMIT and not stored if one does ROLLBACK. This fixes some problems with nontransactional temporary tables used inside transactions.

- Permit braces in joins in all positions. Formerly, things like SELECT * FROM (t2 LEFT JOIN t3 USING (a)), t1 worked, but not SELECT * FROM t1, (t2 LEFT JOIN t3 USING (a)). Note that braces are simply removed, they do not change the way the join is executed.

- InnoDB now supports also isolation levels READ UNCOMMITTED and READ COMMITTED. For a detailed InnoDB changelog, see Section C.4, “Changes in InnoDB”.

Bugs fixed:

- Fixed bug in MAX () [876] optimization when used with JOIN and ON expressions.

- Fixed that INSERT DELAY threads don't hang on Waiting for INSERT when one sends a SIGHUP to mysqld.

- Fixed that MySQL does not use an index scan on an index that has been disabled with IGNORE INDEX or USE INDEX.

- Corrected test for root user in mysqld_safe.

- Fixed error message issued when storage engine cannot do CHECK TABLE or REPAIR TABLE.

- Fixed rare core dump problem in complicated GROUP BY queries that didn't return any result.

- Fixed mysqlshow to work properly with wildcarded database names and with database names that contain underscores.

- Portability fixes to get MySQL to compile cleanly with Sun Forte 5.0.

- Fixed MyISAM crash when using dynamic-row tables with huge numbers of packed columns.

- Fixed query cache behavior with BDB transactions.

- Fixed possible floating point exception in MATCH relevance calculations.

- Fixed bug in full-text search IN BOOLEAN MODE that made MATCH to return incorrect relevance value in some complex joins.

- Fixed a bug that limited MyISAM key length to a value slightly less that 500. It is exactly 500 now.

- Fixed that GROUP BY on columns that may have a NULL value doesn't always use disk based temporary tables.

- The file name argument for the --des-key-file argument to mysql is interpreted relative to the data directory if given as a relative path name.

- Removed a condition that temp table with index on column that can be NULL has to be MyISAM. This was okay for 3.23, but not needed in 4.4. This resulted in slowdown in many queries since 4.0.2.
Changes in Release 4.0.4 (29 September 2002)

• Small code improvement in multiple-table updates.
• Fixed a newly introduced bug that caused ORDER BY ... LIMIT row_count to not return all rows.
• Fixed a bug in multiple-table deletes when outer join is used on an empty table, which gets first to be deleted.
• Fixed a bug in multiple-table updates when a single table is updated.
• Fixed bug that caused REPAIR TABLE and myisamchk to corrupt FULLTEXT indexes.
• Fixed bug with caching the mysql grant table database. Now queries in this database are not cached in the query cache.
• Small fix in mysql_safe for some shells.
• Give error if a MyISAM MERGE table has more than $2^{32}$ rows and MySQL was not compiled with -DBIG_TABLES.
• Fixed some ORDER BY ... DESC problems with InnoDB tables.

C.2.28 Changes in Release 4.0.4 (29 September 2002)

End of Product Lifecycle.  Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

• Fixed bug where GRANT/REVOKE failed if host name was given in nonmatching case.
• Do not give warning in LOAD DATA INFILE when setting a timestamp to a string value of '0'.
• Fixed bug in myisamchk -R mode.
• Fixed bug that caused mysqld to crash on REVOKE.
• Fixed bug in ORDER BY when there is a constant in the SELECT statement.
• One didn't get an error message if mysqld couldn't open the privilege tables.
• SET PASSWORD FOR ... closed the connection in case of errors (bug from 4.0.3).
• Increased maximum possible max_allowed_packet in mysqld to 1GB.
• Fixed bug when doing a multiple-row INSERT on a table with an AUTO_INCREMENT key which was not in the first part of the key.
• Changed LOAD DATA INFILE to not re-create index if the table had rows from before.
• Fixed overrun bug when calling AES_DECRYPT() [857] with incorrect arguments.
• --skip-ssl can now be used to disable SSL in the MySQL clients, even if one is using other SSL options in an option file or previously on the command line.
• Fixed bug in MATCH ... AGAINST( ... IN BOOLEAN MODE) used with ORDER BY.
• Added LOCK TABLES and CREATE TEMPORARY TABLES privilege on the database level. You must run the mysql_fix_privilege_tables script on old installations to activate these.
• In SHOW TABLE ... STATUS, compressed tables sometimes showed up as dynamic.
Changes in Release 4.0.4 (29 September 2002)

- **SELECT @@[global|session].var_name** didn't report `global` | `session` in the result column name.

- Fixed problem in replication that `FLUSH LOGS` in a circular replication setup created an infinite number of binary log files. Now a `rotate-binary-log` command in the binary log does not cause slaves to rotate logs.

- Removed `STOP EVENT` from binary log when doing `FLUSH LOGS`.

- Disabled the use of `SHOW NEW MASTER FOR SLAVE` as this needs to be completely reworked in a future release.

- Fixed a bug with constant expression (for example, column of a one-row table, or column from a table, referenced by a `UNIQUE` key) appeared in `ORDER BY` part of `SELECT DISTINCT`.

- `--log-bin=a.b.c` now properly strips off `.b.c`.

- `FLUSH LOGS` removed numeric extension for all future update logs.

- `GRANT ... REQUIRE` didn't store the SSL information in the `mysql.user` table if SSL was not enabled in the server.

- `GRANT ... REQUIRE NONE` can now be used to remove SSL information.

- `AND` is now optional between `REQUIRE` options.

- `REQUIRE` option was not properly saved, which could cause strange output in `SHOW GRANTS`.

- Fixed that `mysqld --help` reports correct values for `--datadir` and `--bind-address`.

- Fixed that one can drop UDFs that didn't exist when `mysqld` was started.

- Fixed core dump problem with `SHOW VARIABLES` on some 64-bit systems (like Solaris SPARC).

- Fixed a bug in `my_getopt()`; `--set-variable` syntax didn't work for those options that didn't have a valid variable in the `my_option` struct. This affected at least the `default-table-type` option.

- Fixed a bug from 4.0.2 that caused `REPAIR TABLE` and `myisamchk --recover` to fail on tables with duplicates in a unique key.

- Fixed a bug from 4.0.3 in calculating the default data type for some functions. This affected queries of type `CREATE TABLE tbl_name SELECT expression()`, ...

- Fixed bug in queries of type `SELECT * FROM table-list GROUP BY ...` and `SELECT DISTINCT * FROM ...`.

- Fixed bug with the `--log-slow-queries` option when logging an administrator command (like `FLUSH TABLES`).

- Fixed a bug that `OPTIMIZE TABLE` of locked and modified table, reported table corruption.

- Fixed a bug in `my_getopt()` in handling of special prefixes (`--skip-`, `--enable-`). `--skip-external-locking` didn't work and the bug may have affected other similar options.

- Fixed bug in checking for output file name of the `tee` option.

- Added some more optimization to use index for `SELECT ... FROM many_tables .. ORDER BY key limit #`
Changes in Release 4.0.3 (26 August 2002: Beta)

C.2.29 Changes in Release 4.0.3 (26 August 2002: Beta)

End of Product Lifecycle.  Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

• Fixed problem in SHOW OPEN TABLES when a user didn't have access permissions to one of the opened tables.

• Fixed problem with types of user variables. (Bug #551)

• Fixed problem with configure ... --localstatedir=....

• Cleaned up mysql.server script.

• Fixed a bug in mysqladmin shutdown when pid file was modified while mysqladmin was still waiting for the previous one to disappear. This could happen during a very quick restart and caused mysqladmin to hang until shutdown_timeout seconds had passed.

• Do not increment warnings when setting AUTO_INCREMENT columns to NULL in LOAD DATA INFILE.

• Fixed all boolean type variables/options to work with the old syntax, for example, all of these work: --lower-case-table-names, --lower-case-table-names=1, --set-variable=lower-case-table-names=1

• Fixed shutdown problem (SIGTERM signal handling) on Solaris. (Bug from 4.0.2).

• SHOW MASTER STATUS now returns an empty set if binary log is not enabled.

• SHOW SLAVE STATUS now returns an empty set if slave is not initialized.

• Do not update MyISAM index file on update if not strictly necessary.

• Fixed bug in SELECT DISTINCT ... FROM many_tables ORDER BY not-used-column.

• Fixed a bug with BIGINT values and quoted strings.

• AddedQUOTE() [792] function that performs SQL quoting to produce values that can be used as data values in queries.

• Changed variable DELAY_KEY_WRITE to an enumeration to allow it to be set for all tables without taking down the server.

• Changed behavior of IF(condition,column,NULL) so that it returns the value in the column's data type.

• Made safe_mysqld a symlink to mysqld_safe in binary distribution.

• Fixed security bug when having an empty database name in the user.db table.

• Fixed some problems with CREATE TABLE ... SELECT function().

• mysqld now has the option --temp-pool enabled by default as this gives better performance with some operating systems.

• Fixed problem with too many allocated alarms on slave when connecting to master many times (normally not a very critical error).
Changes in Release 4.0.3 (26 August 2002: Beta)

- Fixed hang in `CHANGE MASTER TO` if the slave thread died very quickly.
- Big cleanup in replication code (less logging, better error messages, etc.).
- If the `--code-file` option is specified, the server calls `setrlimit()` to set the maximum permitted core file size to unlimited, so core files can be generated.
- Fixed bug in query cache after temporary table creation.
- Added `--count=N (-c)` option to `mysqladmin`, to make the program do only \( N \) iterations. To be used with `--sleep (-i)`. Useful in scripts.
- Fixed bug in multiple-table `UPDATE`: when updating a table, `do_select()` became confused about reading records from a cache.
- Fixed bug in multiple-table `UPDATE` when several columns were referenced from a single table.
- Fixed bug in truncating nonexistent table.
- Fixed bug in `REVOKE` that caused user resources to be randomly set.
- Fixed bug in `GRANT` for the new `CREATE TEMPORARY TABLES` privilege.
- Fixed bug in multiple-table `DELETE` when tables are re-ordered in the table initialization method and `ref_lengths` are of different sizes.
- Fixed two bugs in `SELECT DISTINCT` with large tables.
- Fixed bug in query cache initialization with very small query cache size.
- Permit `DEFAULT` with `INSERT` statement.
- The startup parameters `myisam_max_sort_file_size` and `myisam_max_extra_sort_file_size` are now given in bytes, not megabytes.
- External system locking of `MyISAM/ISAM` files is now turned off by default. One can turn this on with `--external-locking`. (For most users this is never needed).
- Fixed core dump bug with `INSERT ... SET db_name.tbl_name.col_name=''`.
- Fixed client hangup bug when using some SQL statements with incorrect syntax.
- Fixed a timing bug in `DROP DATABASE`.
- New `SET [GLOBAL | SESSION]` syntax to change thread-specific and global system variables at runtime.
- Added variable `slave_compressed_protocol`.
- Renamed variable `query_cache_startup_type` to `query_cache_type`, `myisam_bulk_insert_tree_size` to `bulk_insert_buffer_size`, `record_buffer` to `read_buffer_size` and `record_rnd_buffer` to `read_rnd_buffer_size`.
- Renamed some SQL variables, but old names still work until 5.0. See Section 2.11.1.2, "Upgrading from MySQL 3.23 to 4.0".
- Renamed `--skip-locking` to `--skip-external-locking`.
- Removed unused variable `query_buffer_size`.
• Fixed a bug that made the pager option in the mysql client nonfunctional.

• Added full AUTO_INCREMENT support to MERGE tables.

• Extended LOG() [812] function to accept an optional arbitrary base parameter. See Section 11.6.2, “Mathematical Functions”.

• Added LOG2() [813] function (useful for finding out how many bits a number would require for storage).

• Added LN() [812] natural logarithm function for compatibility with other databases. It is synonymous with LOG(X) [812].

C.2.30 Changes in Release 4.0.2 (01 July 2002)

End of Product Lifecycle.  Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

• Cleaned up NULL handling for default values in DESCRIBE tbl_name.

• Fixed TRUNCATE() [817] to round up negative values to the nearest integer.

• Fixed buffer overflow problem if someone specified a too-long --datadir option to mysqld. (CVE-2002-0969)

• Changed --chroot= option to execute chroot() immediately after all options have been parsed.

• Do not allow database names that contain “\”.

• lower_case_table_names now also applies to database names.

• Added XOR [780] operator (logical and bitwise XOR [780]) with ^ [855] as a synonym for bitwise XOR [780].

• Added function IS_FREE_LOCK('lock_name') [871]. Based on code contributed by Hartmut Holzgraefe <hartmut@six.de>.

• Removed mysql_ssl_clear() from C API, as it was not needed.

• DECIMAL and NUMERIC types can now read exponential numbers.

• Added SHA1() [861] function to calculate 160 bit hash value as described in RFC 3174 (Secure Hash Algorithm). This function can be considered a cryptographically more secure equivalent of MD5() [860]. See Section 11.12, “Encryption and Compression Functions”.

• Added AES_ENCRYPT() [857] and AES_DECRYPT() [857] functions to perform encryption according to AES standard (Rijndael). See Section 11.12, “Encryption and Compression Functions”.

• Added --single-transaction option to mysqldump, allowing a consistent dump of InnoDB tables. See Section 4.5.4, “mysqldump — A Database Backup Program”.

• Fixed bug in innodb_log_group_home_dir in SHOW VARIABLES.

• Fixed a bug in optimizer with merge tables when nonunique values are used in summing up (causing crashes).

• Fixed a bug in optimizer when a range specified makes index grouping impossible (causing crashes).
Changes in Release 4.0.2 (01 July 2002)

- Fixed a rare bug when FULLTEXT index is present and no tables are used.
- Added privileges CREATE TEMPORARY TABLES, EXECUTE, LOCK TABLES, REPLICATION CLIENT, REPLICATION SLAVE, SHOW DATABASES and SUPER. To use these, you must run the mysql_fix_privilege_tables script after upgrading.
- Fixed query cache align data bug.
- Fixed mutex bug in replication when reading from master fails.
- Added missing mutex in TRUNCATE TABLE. This fixes some core dump/hangup problems when using TRUNCATE TABLE.
- Fixed bug in multiple-table DELETE when optimizer uses only indexes.
- Fixed that ALTER TABLE tbl_name RENAME new_tbl_name is as fast as RENAME TABLE.
- Fixed bug in GROUP BY with two or more columns, where at least one column can contain NULL values.
- Use Turbo Boyer-Moore algorithm to speed up LIKE "%keyword%" searches.
- Fixed bug in DROP DATABASE with symlink.
- Fixed crash in REPAIR ... USE_FRM.
- Fixed bug in EXPLAIN with LIMIT offset != 0.
- Fixed bug in phrase operator "..." in boolean full-text search.
- Fixed bug that caused duplicated rows when using truncation operator * in boolean full-text search.
- Fixed bug in truncation operator of boolean full-text search (incorrect results when there are only +word* in the query).
- Fixed bug in boolean full-text search that caused a crash when an identical MATCH expression that did not use an index appeared twice.
- Query cache is now automatically disabled in mysqldump.
- Fixed problem on Windows 98 that made sending of results very slow.
- Boolean full-text search weighting scheme changed to something more reasonable.
- Fixed bug in boolean full-text search that caused MySQL to ignore queries of ft_min_word_len characters.
- Boolean full-text search now supports "phrase searches."
- New configure option --without-query-cache.
- Memory allocation strategy for "root memory" changed. Block size now grows with number of allocated blocks.
- INET_NTOA() now returns NULL if you give it an argument that is too large (greater than the value corresponding to 255.255.255.255).
- Fix SQL_CALC_FOUND_ROWS to work with UNION. It works only if the first SELECT has this option and if there is global LIMIT for the entire statement. For the moment, this requires using parentheses for individual SELECT queries within the statement.
• Fixed bug in SQL_CALC_FOUND_ROWS and LIMIT.
• Do not give an error for CREATE TABLE ...( ... VARCHAR(0)).
• Fixed SIGINT and SIGQUIT problems in mysql.cc on Linux with some glibc versions.
• Fixed bug in convert.cc, which is caused by having an incorrect net_store_length() linked in the CONVERT::store() method.
• DOUBLE and FLOAT columns now honor the UNSIGNED flag on storage.
• InnoDB now retains foreign key constraints through ALTER TABLE and CREATE/DROP INDEX.
• InnoDB now enables foreign key constraints to be added through the ALTER TABLE syntax.
• InnoDB tables can now be set to automatically grow in size (auto-extend).
• Added --ignore-lines=n option to mysqlimport. This has the same effect as the IGNORE n LINES clause for LOAD DATA.
• Fixed bug in UNION with last offset being transposed to total result set.
• REPAIR ... USE_FRM added.
• Fixed that DEFAULT_SELECT_LIMIT is always imposed on UNION result set.
• Fixed that some SELECT options can appear only in the first SELECT.
• Fixed bug with LIMIT with UNION, where last select is in the braces.
• Fixed that full-text works fine with UNION operations.
• Fixed bug with indexless boolean full-text search.
• Fixed bug that sometimes appeared when full-text search was used with const tables.
• Fixed incorrect error value when doing a SELECT with an empty HEAP table.
• Use ORDER BY column DESC now sorts NULL values first. (In other words, NULL values sort first in all cases, whether or not DESC is specified.) This is changed back in 4.0.10.
• Fixed bug in WHERE key_name='constant' ORDER BY key_name DESC.
• Fixed bug in SELECT DISTINCT ... ORDER BY DESC optimization.
• Fixed bug in ... HAVING 'GROUP_FUNCTION' (xxx) IS [NOT] NULL.
• Fixed bug in truncation operator for boolean full-text search.
• Permit value of --user option for mysqld to be specified as a numeric user ID (--user=user_id).
• Fixed a bug where SQL_CALC_ROWS returned an incorrect value when used with one table and ORDER BY and with InnoDB tables.
• Fixed that SELECT 0 LIMIT 0 doesn't hang thread.
• Fixed some problems with USE/IGNORE INDEX when using many keys with the same start column.
• Do not use table scan with BerkeleyDB and InnoDB tables when we can use an index that covers the whole row.
Changes in Release 4.0.2 (01 July 2002)

- Optimized InnoDB sort-buffer handling to take less memory.
- Fixed bug in multiple-table DELETE and InnoDB tables.
- Fixed problem with TRUNCATE TABLE and InnoDB tables that produced the error Can't execute the given command because you have active locked tables or an active transaction.
- Added NO_UNSIGNED_SUBTRACTION to the set of flags that may be specified with the --sql-mode option for mysqld. It disables unsigned arithmetic rules when it comes to subtraction. (This makes MySQL 4.0 behave more like 3.23 with UNSIGNED columns).
- The result returned for all bit operators ( | [854], << [855], ...) is now of type unsigned integer.
- Added detection of nan values in MyISAM to make it possible to repair tables with nan in float or double columns.
- Fixed new bug in myisamchk where it didn't correctly update number of “parts” in the MyISAM index file.
- Changed to use autoconf 2.52 (from autoconf 2.13).
- Fixed optimization problem where the MySQL Server was in “preparing” state for a long time when selecting from an empty table which had contained a lot of rows.
- Fixed bug in complicated join with const tables. This fix also improves performance a bit when referring to another table from a const table.
- First pre-version of multiple-table UPDATE statement.
- Fixed bug in multiple-table DELETE.
- Fixed bug in SELECT CONCAT(argument_list) ... GROUP BY 1.
- INSERT ... SELECT did a full rollback in case of an error. Fixed so that we only roll back the last statement in the current transaction.
- Fixed bug with empty expression for boolean full-text search.
- Fixed core dump bug in updating full-text key from/to NULL.
- ODBC compatibility: Added BIT_LENGTH() [786] function.
- Fixed core dump bug in GROUP BY BINARY column.
- Added support for NULL keys in HEAP tables.
- Use index for ORDER BY in queries of type: SELECT * FROM t WHERE key_part1=1 ORDER BY key_part1 DESC, key_part2 DESC
- Fixed bug in FLUSH QUERY CACHE.
- Added CAST() [851] and CONVERT() [851] functions. The CAST and CONVERT functions are nearly identical and mainly useful when you want to create a column with a specific type in a CREATE ... SELECT statement. For more information, read Section 11.10, “Cast Functions and Operators”.
- CREATE ... SELECT on DATE and TIME functions now create columns of the expected type.
- Changed order in which keys are created in tables.
- Added new columns Null and Index_type to SHOW INDEX output.
Changes in Release 4.0.1 (23 December 2001)

- Added `--no-beep` and `--prompt` options to `mysql` command-line client.
- New feature: management of user resources.

```
GRANT ... WITH MAX_QUERIES_PER_HOUR N1
       MAX_UPDATES_PER_HOUR N2
       MAX_CONNECTIONS_PER_HOUR N3;
```

See Section 5.6.4, "Setting Account Resource Limits".

- Added `mysql_secure_installation` to the `scripts/` directory.

C.2.31 Changes in Release 4.0.1 (23 December 2001)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Added `system` command to `mysql`.
- Fixed bug when `HANDLER` was used with some unsupported table type.
- `mysqldump` now puts `ALTER TABLE tbl_name DISABLE KEYS` and `ALTER TABLE tbl_name ENABLE KEYS` in the sql dump.
- Added `mysql_fix_extensions` script.
- Fixed stack overrun problem with `LOAD DATA FROM MASTER` on OSF/1.
- Fixed shutdown problem on HP-UX.
- Added `DES_ENCRYPT()` [858] and `DES_DECRYPT()` [858] functions.
- Added `FLUSH DES_KEY_FILE` statement.
- Added `--des-key-file` option to `mysqld`.
- `HEX(str)` [788] now returns the characters in `str` converted to hexadecimal.
- Fixed problem with `GRANT` when using `lower_case_table_names = 1`.
- Changed `SELECT ... IN SHARE MODE` to `SELECT ... LOCK IN SHARE MODE` (as in MySQL 3.23).
- A new query cache to cache results from identical `SELECT` queries.
- Fixed core dump bug on 64-bit machines when it got an incorrect communication packet.
- `MATCH ... AGAINST(...) IN BOOLEAN MODE` can now work without `FULLTEXT` index.
- Fixed slave to replicate from 3.23 master.
- Miscellaneous replication fixes/cleanup.
- Got shutdown to work on Mac OS X.
- Added `myisam/ft_dump` utility for low-level inspection of `FULLTEXT` indexes.
Changes in Release 4.0.0 (October 2001: Alpha)

• Fixed bug in `DELETE ... WHERE ... MATCH ....`

• Added support for `MATCH ... AGAINST(... IN BOOLEAN MODE)`. Note that you must rebuild your tables with `ALTER TABLE tbl_name TYPE=MyISAM` to be able to use boolean full-text search.

• `LOCATE()` [790] and `INSTR()` [789] are now case sensitive if either argument is a binary string.

• Changed `RAND()` [814] initialization so that `RAND (N)` [814] and `RAND (N+1)` [814] are more distinct.

• Fixed core dump bug in `UPDATE ... ORDER BY`.

• In 3.23, `INSERT INTO ... SELECT` always had `IGNORE` enabled. Now MySQL stops (and possibly rolls back) by default in case of an error unless you specify `IGNORE`.

• Ignore `DATA DIRECTORY` and `INDEX DIRECTORY` directives on Windows.

• Added boolean full-text search code. It should be considered early alpha.

• Extended `MODIFY` and `CHANGE` in `ALTER TABLE` to accept the `FIRST` and `AFTER` keywords.

• Indexes are now used with `ORDER BY` on a whole InnoDB table.

C.2.32 Changes in Release 4.0.0 (October 2001: Alpha)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

• Added `--xml` option to `mysql` for producing XML output.

• Added full-text variables `ft_min_word_len`, `ft_max_word_len`, and `ft_max_word_len_for_sort` system variables.

• Added full-text variables `ft_min_word_len`, `ft_max_word_len`, and `ft_max_word_len_for_sort` variables to `myisamchk`.

• Added documentation for `libmysqld`, the embedded MySQL server library. Also added example programs (a `mysql` client and `mysqldtest` test program) which use `libmysqld`.

• Removed all Gemini hooks from MySQL server.

• Removed `my_thread_init()` and `my_thread_end()` from `mysql_com.h`, and added `mysql_thread_init()` and `mysql_thread_end()` to `mysql.h`.

• Support for communication packets > 16MB. In 4.0.1 we extended `MyISAM` to be able to handle these.

• Secure connections (with SSL).

• Unsigned `BIGINT` constants now work. `MIN()` [876] and `MAX()` [876] now handle signed and unsigned `BIGINT` numbers correctly.

• New character set `latin1_de` which provides correct German sorting.

• `STRCMP()` [799] now uses the current character set when doing comparisons, which means that the default comparison behavior now is case insensitive.

• `TRUNCATE TABLE` and `DELETE FROM tbl_name` are now separate functions. One bonus is that `DELETE FROM tbl_name` now returns the number of deleted rows, rather than zero.
Changes in Release 4.0.0 (October 2001: Alpha)

• **DROP DATABASE** now executes a **DROP TABLE** on all tables in the database, which fixes a problem with InnoDB tables.

• Added support for **UNION**.

• Added support for multiple-table **DELETE** operations.

• A new **HANDLER** interface to MyISAM tables.

• Added support for **INSERT** on **MERGE** tables. Patch from Benjamin Pflugmann.

• Changed **WEEK(date,0)** to match the calendar in the USA.

• **COUNT(DISTINCT)** is about 30% faster.

• Speed up all internal list handling.

• Speed up **IS NULL, ISNULL()** and some other internal primitives.

• Full-text index creation now is much faster.

• Tree-like cache to speed up bulk inserts and myisam_bulk_insert_tree_size variable.

• Searching on packed (CHAR/VARCHAR) keys is now much faster.

• Optimized queries of type: **SELECT DISTINCT * FROM tbl_name ORDER by key_part1 LIMIT row_count**.

• **SHOW CREATE TABLE** now shows all table attributes.

• **ORDER BY ... DESC** can now use keys.

• **LOAD DATA FROM MASTER** “automatically” sets up a slave.

• Renamed **safe_mysqld** to **mysql_safe** to make this name more in line with other MySQL scripts/commands.

• Added support for symbolic links to MyISAM tables. Symlink handling is now enabled by default for Windows.

• Added **SQL_CALC_FOUND_ROWS** and FOUND_ROWS() [864]. This makes it possible to know how many rows a query would have returned without a **LIMIT** clause.

• Changed output format of **SHOW OPEN TABLES**.

• Permit **SELECT expression LIMIT ...**

• Added the **identity** variable as a synonym for the **last_insert_id** variable (like Sybase).

• Added **ORDER BY** syntax to **UPDATE** and **DELETE**.

• **SHOW INDEXES** is now a synonym for **SHOW INDEX**.

• Added **ALTER TABLE tbl_name DISABLE KEYS** and **ALTER TABLE tbl_name ENABLE KEYS** commands.

• Permit use of **IN** as a synonym for **FROM** in **SHOW** commands.

• Implemented “repair by sort” for **FULLTEXT** indexes. **REPAIR TABLE, ALTER TABLE, and OPTIMIZE TABLE** for tables with **FULLTEXT** indexes are now up to 100 times faster.
Changes in Release 3.23.x (Lifecycle Support Ended)

- Permit standard SQL syntax \textit{X\'\text{hexadecimal-number}\'}.  
- Cleaned up global lock handling for \texttt{FLUSH TABLES WITH READ LOCK}.  
- Fixed problem with \texttt{DATETIME = constant} in \texttt{WHERE} optimization.  
- Added \texttt{--master-data} and \texttt{--no-autocommit} options to \texttt{mysqldump}. (Thanks to Brian Aker for this.)  
- Added script \texttt{mysql_explain_log.sh} to distribution. (Thanks to mobile.de).

C.3 Changes in Release 3.23.x (Lifecycle Support Ended)

\textbf{End of Product Lifecycle.}  Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see \url{http://www.mysql.com/about/legal/lifecycle/#calendar}. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

The 3.23 release has several major features that are not present in previous versions. We have added three new table types:

- \textbf{MyISAM}
  A new \textit{ISAM} library which is tuned for SQL and supports large files.

- \textbf{InnoDB}
  A transaction-safe storage engine that supports row level locking, and many Oracle-like features.

- \textbf{BerkeleyDB} or \textit{BDB}
  Uses the Berkeley DB library from Sleepycat Software to implement transaction-safe tables.

Note that only \textbf{MyISAM} is available in the standard binary distribution.

The 3.23 release also includes support for database replication between a master and many slaves, full-text indexing, and much more.

C.3.1 Changes in Release 3.23.59 (Not released)

\textbf{End of Product Lifecycle.}  Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see \url{http://www.mysql.com/about/legal/lifecycle/#calendar}. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Fixed an old bug in concurrent accesses to \texttt{MERGE} tables (even one \texttt{MERGE} table and \textbf{MyISAM} tables), that could've resulted in a crash or hang of the server. (Bug #2408, CVE-2004-0837)

- Fixed incorrect destruction of expression which led to crash of server on complex \texttt{AND [779]/OR [779]} expressions if query was ignored (either by a replication server because of \texttt{--replicate-*table} rules, or by any MySQL server because of a syntax error). (Bug #3969, Bug #4494)

- Fixed problem with parsing complex queries on 64-bit architectures. (Bug #4204)
Changes in Release 3.23.58 (11 September 2003)

• Fixed a symlink vulnerability in the mysqlbug script. (Bug #3284, CVE-2004-0381)

• Fixed bug in privilege checking of ALTER TABLE RENAME. (Bug #3270, CVE-2004-0835)

• Fixed bugs in ACOS() [809], ASIN() [810] (Bug #2338) and in FLOOR() [812] (Bug #3051). The cause of the problem is an overly strong optimization done by gcc in this case.

• Fixed bug in INSERT ... SELECT statements where, if a NOT NULL column is assigned a value of NULL, the following columns in the row might be assigned a value of zero. (Bug #2012)

• If a query was ignored on the slave (because of --replicate-ignore-table and other similar rules), the slave still checked if the query got the same error code (0, no error) as on the master. So if the master had an error on the query (for example, “Duplicate entry” in a multiple-row insert), then the slave stopped and warned that the error codes didn't match. This is a backport of the fix for MySQL 4.0. (Bug #797)

• mysqlbinlog now asks for a password at console when the -p/--password option is used with no argument. This is how the other clients (mysqladmin, mysqldump..) behave. Note that one now has to use mysqlbinlog -p<my_password>;mysqlbinlog -p <my_password> does not work anymore (in other words, put no space after -p). (Bug #1595)

• On some 64-bit machines (some HP-UX and Solaris machines), a slave installed with the 64-bit MySQL binary could not connect to its master (it connected to itself instead). (Bug #1256, Bug #1381)

• Fixed a Windows-specific bug present since MySQL 3.23.57 and 3.23.58 that caused Windows slaves to crash when they started replication if a master.info file existed. (Bug #1720)

• Fixed table/column grant handling: The proper sort order (from most specific to less specific, see Section 5.5.5, “Access Control, Stage 2: Request Verification”) was not honored. (Bug #928)

• Fixed overflow bug in MyISAM and ISAM when a row is updated in a table with a large number of columns and at least one BLOB/TEXT column.

• Fixed MySQL so that field length (in C API) for the second column in SHOW CREATE TABLE is always larger than the data length. The only known application that was affected by the old behavior was Borland dbExpress, which truncated the output from the command. (Bug #1064)

C.3.2 Changes in Release 3.23.58 (11 September 2003)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

• Fixed buffer overflow in password handling which could potentially be exploited by MySQL users with ALTER privilege on the mysql.user table to execute random code or to gain shell access with the UID of the mysqld process (thanks to Jedi/Sector One for spotting and reporting this bug). (CVE-2003-0780)

• mysqldump now correctly quotes all identifiers when communicating with the server. This assures that during the dump process, mysqldump never sends queries to the server that result in a syntax error. This problem is not related to the mysqldump program’s output, which was not changed. (Bug #1148)

• Fixed table/column grant handling: The proper sort order (from most specific to less specific, see Section 5.5.5, “Access Control, Stage 2: Request Verification”) was not honored. (Bug #928)

• Fixed overflow bug in MyISAM and ISAM when a row is updated in a table with a large number of columns and at least one BLOB/TEXT column.

• Fixed MySQL so that field length (in C API) for the second column in SHOW CREATE TABLE is always larger than the data length. The only known application that was affected by the old behavior was Borland dbExpress, which truncated the output from the command. (Bug #1064)
Changes in Release 3.23.57 (06 June 2003)

• Fixed **ISAM** bug in **MAX()** [876] optimization.

• Fixed **Unknown error** when doing **ORDER BY** on reference table which was used with **NULL** value on **NOT NULL** column. (Bug #479)

C.3.3 Changes in Release 3.23.57 (06 June 2003)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

• Fixed problem in alarm handling that could cause problems when getting a packet that is too large.

• Fixed problem when installing MySQL as a service on Windows when two arguments were specified to **mysqld** (option file group name and service name).

• Fixed **kill pid-of-mysqld** to work on Mac OS X.

• **SHOW TABLE STATUS** displayed incorrect **Row_format** value for tables that have been compressed with **myisampack**. (Bug #427)

• **SHOW VARIABLES LIKE 'innodb_data_file_path'** displayed only the name of the first data file. (Bug #468)

• Fixed security problem where **mysqld** didn’t allow one to **UPDATE** rows in a table even if one had a global **UPDATE** privilege and a database **SELECT** privilege.

• Fixed a security problem with **SELECT** and wildcarded select list, when user only had partial column **SELECT** privileges on the table.

• Fixed unlikely problem in optimizing **WHERE** clause with a constant expression such as in **WHERE 1 AND (a=1 AND b=1).**

• Fixed problem on IA-64 with timestamps that caused **mysqlbinlog** to fail.

• The default option for **innodb_flush_log_at_trx_commit** was changed from 0 to 1 to make **InnoDB** tables **ACID** by default. See [Section 13.2.4, "InnoDB Startup Options and System Variables"](#).

• Fixed problem with too many allocated alarms on slave when connecting to master many times (normally not a very critical error).

• Fixed a bug in replication of temporary tables. (Bug #183)

• Fixed 64-bit bug that affected at least AMD hammer systems.

• Fixed a bug when doing **LOAD DATA INFILE IGNORE:** When reading the binary log, **mysqlbinlog** and the replication code read **REPLACE** instead of **IGNORE**. This could make the slave’s table become different from the master’s table. (Bug #218)

• Fixed overflow bug in **MyISAM** when a row is inserted into a table with a large number of columns and at least one **BLOB/TEXT** column. Bug was caused by incorrect calculation of the needed buffer to pack data.

• The binary log was not locked during **TRUNCATE tbl_name** or **DELETE FROM tbl_name** statements, which could cause an **INSERT to tbl_name** to be written to the log before the **TRUNCATE TABLE** or **DELETE** statements.
Changes in Release 3.23.56 (13 March 2003)

- Fixed rare bug in **UPDATE** of InnoDB tables where one row could be updated multiple times.
- Produce an error for empty table and column names.
- Changed **PROCEDURE ANALYSE()** to report **DATE** instead of **NEWDATE**.
- Changed **PROCEDURE ANALYSE(#)** to restrict the number of values in an **ENUM** column to # also for string values.
- mysqladmin no longer silently deletes the binary logs when invoked with the **--master-data** or **--first-slave** option; while this behavior was convenient for some users, others may suffer from it. Now you must explicitly ask for binary logs to be deleted by using the new **--delete-master-logs** option.
- Fixed a bug in mysqladmin when it was invoked with the **--master-data** option: The **CHANGE MASTER TO** statements that were appended to the SQL dump had incorrect coordinates. (Bug #159)

C.3.4 Changes in Release 3.23.56 (13 March 2003)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Fixed **mysqld** crash on extremely small values of **sort_buffer** variable.
- Fixed a bug in privilege system for **GRANT UPDATE** on the column level.
- Fixed a rare bug when using a date in **HAVING** with **GROUP BY**.
- Fixed checking of random part of **WHERE** clause. (Bug #142)
- Fixed MySQL (and **myisamchk**) crash on artificially corrupted .MYI files.
- Security enhancement: **mysqld** no longer reads options from world-writable config files. (CVE-2003-0150)
- Security enhancement: **mysqld** and **safe_mysqld** now use only the first **--user** option specified on the command line. Normally this comes from /etc/my.cnf. (CVE-2003-0150)
- Security enhancement: Do not allow **BACKUP TABLE** to overwrite existing files.
- Fixed unlikely deadlock bug when one thread did a **LOCK TABLE** and another thread did a **DROP TABLE**. In this case one could do a **KILL** on one of the threads to resolve the deadlock.
- **LOAD DATA INFILE** was not replicated by slave if **replicate_*_table** was set on the slave.
- Fixed a bug in handling **CHAR(0)** columns that could cause incorrect results from the query.
- Fixed a bug in **SHOW VARIABLES** on 64-bit platforms. The bug was caused by incorrect declaration of variable **server_id**.
- The **Comment** column in **SHOW TABLE STATUS** now reports that it can contain **NULL** values (which is the case for a crashed .frm file).
- Fixed the **rpl_rotate_logs** test to not fail on certain platforms (such as Mac OS X) due to a too-long file name (changed **slave-master-info.opt** to **.slave-mi**).
- Fixed a problem with **BLOB NOT NULL** columns used with **IS NULL** [775].
Changes in Release 3.23.55 (23 January 2003)

- Fixed bug in **MAX()** [876] optimization in **MERGE** tables.
- Fixed bug with connect timeout. This bug was manifested on OS's with **poll()** system call, which resulted in timeout the value specified as it was executed in both **select()** and **poll()**.
- Fixed bug in **SELECT * FROM table WHERE datetime1 IS NULL OR datetime2 IS NULL**.
- Fixed bug in using aggregate functions as argument for **INTERVAL()** [777], **CASE** [782], **FIELD()** [788], **CONCAT_WS()** [787], **ELT()** [787] and **MAKE_SET()** [791] functions.
- When running with **--lower-case-table-names=1** (default on Windows) and you had tables or databases with mixed case on disk, then executing **SHOW TABLE STATUS** followed with **DROP DATABASE** or **DROP TABLE** could fail with **Errcode 13**.
- Fixed bug in logging to binary log (which affects replication) a query that inserts a **NULL** in an **auto_increment** field and also uses **LAST_INSERT_ID()** [866].
- Fixed bug in **mysqladmin --relative**.
- On some 64-bit systems, **show status** reported a strange number for **Open_files** and **Open_streams**.

C.3.5 Changes in Release 3.23.55 (23 January 2003)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Fixed double **free'd** pointer bug in **mysql_change_user()** handling, that enabled a specially hacked version of MySQL client to crash **mysqld**. Note that you must log in to the server by using a valid user account to be able to exploit this bug. (CVE-2003-0073)
- Fixed bug with the **--log-slow-queries** when logging an administrator command (like **FLUSH TABLES**).
- Fixed bug in **GROUP BY** when used on BLOB column with **NULL** values.
- Fixed a bug in handling **NULL** values in **CASE ... WHEN ....**
- Bugfix for **--chroot** (see [Section C.3.6, “Changes in Release 3.23.54 (05 December 2002)’’](#)) is reverted. Unfortunately, there is no way to make it to work, without introducing backward-incompatible changes in **my.cnf**. Those who need **--chroot** functionality, should upgrade to MySQL 4.0. (The fix in the 4.0 branch did not break backward-compatibility).
- Make **--lower-case-table-names** default on Mac OS X as the default file system (HFS+) is case insensitive.
- Fixed a bug in **scripts/mysql_safe.sh** in **NOHUP_NICENESS** testing.
- Transactions in **autocommit = 0** mode didn't rotate the binary log.
- Fixed a bug in **scripts/make_binary_distribution** that resulted in a remaining **@HOSTNAME@** variable instead of replacing it with the correct path to the **hostname** binary.
- Fixed a very unlikely bug that could cause **SHOW PROCESSLIST** to core dump in **pthread_mutex_unlock()** if a new thread was connecting.
• Forbid `SLAVE STOP` if the thread executing the query has locked tables. This removes a possible deadlock situation.

**C.3.6 Changes in Release 3.23.54 (05 December 2002)**

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

• Fixed a bug, that enabled a specially crafted packet to crash `mysqld`. (CVE-2002-1373)

• Fixed a rare crash (double `free`ed pointer) when altering a temporary table.

• Fixed buffer overrun in `libmysqlclient` library that permitted a malicious MySQL server to crash the client application. (CVE-2002-1376)

• Fixed security-related bug in `mysql_change_user()` handling. All users are strongly recommended to upgrade to the version 3.23.54. (CVE-2002-1374, CVE-2002-1375)

• Fixed bug that prevented `--chroot` command-line option of `mysqld` from working.

• Fixed bug that made `OPTIMIZE TABLE` to corrupt the table under some rare circumstances.

• Fixed `mysqlcheck` so it can deal with table names containing dashes.

• Fixed shutdown problem on Mac OS X.

• Fixed bug with comparing an indexed `NULL` field with `<=> NULL`.

• Fixed bug that caused `IGNORE INDEX` and `USE INDEX` sometimes to be ignored.

• Fixed rare core dump problem in complicated `GROUP BY` queries that didn't return any result.

• Fixed a bug where `MATCH ... AGAINST () >=0` was treated as if it was `> .`

• Fixed core dump in `SHOW PROCESSLIST` when running with an active slave (unlikely timing bug).

• Make it possible to use multiple MySQL servers on Windows (code backported from 4.0.2).

• One can create `TEMPORARY MERGE` tables now.

• Fixed that `--core-file` works on Linux (at least on kernel 2.4.18).

• Fixed a problem with `BDB` and `ALTER TABLE`.

• Fixed reference to freed memory when doing complicated `GROUP BY ... ORDER BY` queries. Symptom was that `mysqld` died in function `send_fields`.

• Allocate heap rows in smaller blocks to get better memory usage.

• Fixed memory allocation bug when storing `BLOB` values in internal temporary tables used for some (unlikely) `GROUP BY` queries.

• Fixed a bug in key optimizing handling where the expression `WHERE col_name = key_col_name` was calculated as true for `NULL` values.

• Fixed core dump bug when doing `LEFT JOIN ... WHERE key_column=NULL`. 

1787
Changes in Release 3.23.53 (09 October 2002)

- Fixed MyISAM crash when using dynamic-row tables with huge numbers of packed fields.
- Updated source tree to be built using automake 1.5 and libtool 1.4.

C.3.7 Changes in Release 3.23.53 (09 October 2002)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Fixed crash when SHOW INNODB STATUS was used and skip-innodb was defined.
- Fixed possible memory corruption bug in binary log file handling when slave rotated the logs (only affected 3.23, not 4.0).
- Fixed problem in LOCK TABLES on Windows when one connects to a database that contains uppercase letters.
- Fixed that --skip-show-database doesn't reset the --port option.
- Small fix in safe_mysqld for some shells.
- Fixed that FLUSH STATUS doesn't reset delayed_insert_threads.
- Fixed core dump bug when using the BINARY cast on a NULL value.
- Fixed race condition when someone did a GRANT at the same time a new user logged in or did a USE database.
- Fixed bug in ALTER TABLE and RENAME TABLE when running with --O lower_case_table_names=1 (typically on Windows) when giving the table name in uppercase.
- Fixed that --O lower_case_table_names=1 also converts database names to lowercase.
- Fixed unlikely core dump with SELECT ... ORDER BY ... LIMIT.
- Changed AND [779] OR [779] to report that they can return NULL. This fixes a bug in GROUP BY on AND [779] OR [779] expressions that return NULL.
- Fixed a bug that OPTIMIZE TABLE of locked and modified MyISAM table, reported table corruption.
- Fixed a BDB-related ALTER TABLE bug with dropping a column and shutting down immediately thereafter.
- Fixed problem with configure ... --localstatedir=....
- Fixed problem with UNSIGNED BIGINT on AIX (again).
- Fixed bug in pthread_mutex_trylock() on HPUX 11.0.
- Multi-threaded stress tests for InnoDB.

C.3.8 Changes in Release 3.23.52 (14 August 2002)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.
• Wrap \texttt{BEGIN/COMMIT} around transaction in the binary log. This makes replication honor transactions.

• Fixed security bug when having an empty database name in the user.db table.

• Changed initialization of \texttt{RAND()} [814] to make it less predictable.

• Fixed problem with \texttt{GROUP BY} on result with expression that created a BLOB field.

• Fixed problem with \texttt{GROUP BY} on columns that have NULL values. To solve this we now create an MyISAM temporary table when doing a \texttt{GROUP BY} on a possible NULL item. From MySQL 4.0.5 we can use in memory HEAP tables for this case.

• Fixed problem with privilege tables when downgrading from 4.0.2 to 3.23.

• Fixed thread bug in \texttt{SLAVE START}, \texttt{SLAVE STOP} and automatic repair of MyISAM tables that could cause table cache to be corrupted.

• Fixed possible thread related key-cache-corruption problem with \texttt{OPTIMIZE TABLE} and \texttt{REPAIR TABLE}.

• Added name of ‘administrator command’ logs.

• Fixed bug with creating an auto-increment value on second part of a UNIQUE key where first part could contain NULL values.

• Do not write slave-timeout reconnects to the error log.

• Fixed bug with slave net read timeouting

• Fixed a core-dump bug with \texttt{MERGE} tables and \texttt{MAX()} [876] function.

• Fixed bug in \texttt{ALTER TABLE} with BDB tables.

• Fixed bug when logging \texttt{LOAD DATA INFILE} to binary log with no active database.

• Fixed a bug in range optimizer (causing crashes).

• Fixed possible problem in replication when doing \texttt{DROP DATABASE} on a database with InnoDB tables.

• Fixed \texttt{mysql_info()} to return 0 for Duplicates value when using INSERT DELAYED IGNORE.

• Added \texttt{--HAVE_BROKEN_REALPATH} to the Mac OS X (darwin) compile options in configure.in to fix a failure under high load.

C.3.9 Changes in Release 3.23.51 (31 May 2002)

\textbf{End of Product Lifecycle.}  Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see \url{http://www.mysql.com/about/legal/lifecycle/#calendar}. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

• Fix bug with closing tags missing slash for \texttt{mysqldump} XML output.

• Remove endspace from ENUM values. (This fixed a problem with \texttt{SHOW CREATE TABLE}.)

• Fixed bug in \texttt{CONCAT_WS()} [787] that cut the result.

• Changed name of server variables \texttt{Com\_show\_master\_stat} to \texttt{Com\_show\_master\_status} and \texttt{Com\_show\_slave\_stat} to \texttt{Com\_show\_slave\_status}.  

1789
Changes in Release 3.23.50 (21 April 2002)

- Changed handling of `gethostbyname()` to make the client library thread-safe even if `gethostbyname_r` doesn't exist.
- Fixed core-dump problem when giving a wrong password string to `GRANT`.
- Fixed bug in `DROP DATABASE` with symlinked directory.
- Fixed optimization problem with `DATETIME` and value outside `DATETIME` range.
- Removed Sleepycat's BDB doc files from the source tree, as they're not needed (MySQL covers BDB in its own documentation).
- Fixed MIT-pthreads to compile with glibc 2.2 (needed for `make dist`).
- Fixed the `FLOAT(X+1,X)` is not converted to `FLOAT(X+2,X)` (This also affected `DECIMAL`, `DOUBLE` and `REAL` types)
- Fixed optimization bug with `ISNULL(expression_which_cannot_be_null)` [777] and `ISNULL(constant_expression)` [777].
- Fixed host lookup bug in the glibc library that we used with the 3.23.50 Linux-x86 binaries.

C.3.10 Changes in Release 3.23.50 (21 April 2002)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Fixed buffer overflow problem if someone specified a too-long `--datadir` option to `mysqld`. (CVE-2002-0969)
- Add missing `<row>` tags for `mysqldump` XML output.
- Fixed problem with `crash-me` and gcc 3.0.4.
- Fixed that `@@unknown_variable` doesn't hang server.
- Added `@@VERSION` as a synonym for `VERSION()` [868].
- `SHOW VARIABLES LIKE 'xxx'` is now case-insensitive.
- Fixed timeout for `GET_LOCK()` [869] on HP-UX with DCE threads.
- Fixed memory allocation bug in the glibc library used to build Linux binaries, which caused `mysqld` to die in `free()`.
- Fixed `SIGINT` and `SIGQUIT` problems in `mysql`.
- Fixed bug in character table converts when used with big (larger than 64KB) strings.
• **InnoDB** now retains foreign key constraints through `ALTER TABLE` and `CREATE/DROP INDEX`.

• **InnoDB** now enables foreign key constraints to be added through the `ALTER TABLE` syntax.

• **InnoDB** tables can now be set to automatically grow in size (auto-extend).

• Our Linux RPMS and binaries are now compiled with `gcc` 3.0.4, which should make them a bit faster.

• Fixed some buffer overflow problems when reading startup parameters.

• Because of problems on shutdown we have now disabled named pipes on Windows by default. One can enable named pipes by starting `mysqld` with `--enable-named-pipe`.

• Fixed bug when using `WHERE key_column = 'J' or key_column='j'`.

• Fixed core-dump bug when using `--log-bin` with `LOAD DATA INFILE` without an active database.

• Fixed bug in `RENAME TABLE` when used with `lower_case_table_names=1` (default on Windows).

• Fixed unlikely core-dump bug when using `DROP TABLE` on a table that was in use by a thread that also used queries on only temporary tables.

• Fixed problem with `SHOW CREATE TABLE` and `PRIMARY KEY` when using 32 indexes.

• Fixed that one can use `SET PASSWORD` for the anonymous user.

• Fixed core dump bug when reading client groups from option files using `mysql_options()`.

• Memory leak (16 bytes per every `corrupted` table) closed.

• Fixed binary builds to use `--enable-local-infile`.

• Update source to work with new version of `bison`.

• Updated shell scripts to now agree with new POSIX standard.

• Fixed bug where `DATE_FORMAT()` returned empty string when used with `GROUP BY`.

### C.3.11 Changes in Release 3.23.49 (14 February 2002)

**End of Product Lifecycle.**  Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

• For a `MERGE` table, `DELETE FROM merge_table` used without a `WHERE` clause no longer clears the mapping for the table by emptying the `.MRG` file. Instead, it deletes records from the mapped tables.

• Do not give warning for a statement that is only a comment; this is needed for `mysqldump --disable-keys` to work.

• Fixed unlikely caching bug when doing a join without keys. In this case, the last used field for a table always returned `NULL`.

• Added options to make `LOAD DATA LOCAL INFILE` more secure.

• MySQL binary release 3.23.48 for Linux contained a new `glibc` library, which has serious problems under high load and Red Hat 7.2. The 3.23.49 binary release doesn't have this problem.

• Fixed shutdown problem on NT.
C.3.12 Changes in Release 3.23.48 (07 February 2002)

End of Product Lifecycle.  Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Added --xml option to mysqldump for producing XML output.
- Changed to use autoconf 2.52 (from autoconf 2.13)
- Fixed bug in complicated join with const tables.
- Added internal safety checks for InnoDB.
- Some InnoDB variables were always shown in SHOW VARIABLES as OFF on high-byte-first systems (like SPARC).
- Fixed problem with one thread using an InnoDB table and another thread doing an ALTER TABLE on the same table. Before that, mysqld could crash with an assertion failure in row0row.c, line 474.
- Tuned the InnoDB SQL optimizer to favor index searches more often over table scans.
- Fixed a performance problem with InnoDB tables when several large SELECT queries are run concurrently on a multiprocessor Linux computer. Large CPU-bound SELECT queries now also generally run faster on all platforms.
- If MySQL binary logging is used, InnoDB now prints after crash recovery the latest MySQL binary log name and the offset InnoDB was able to recover to. This is useful, for example, when resynchronizing a master and a slave database in replication.
- Added better error messages to help in installation problems of InnoDB tables.
- It is now possible to recover MySQL temporary tables that have become orphaned inside the InnoDB tablespace.
- InnoDB now prevents a FOREIGN KEY declaration where the signedness is not the same in the referencing and referenced integer columns.
- Calling SHOW CREATE TABLE or SHOW TABLE STATUS could cause memory corruption and make mysqld crash. Especially at risk was mysqldump, because it frequently calls SHOW CREATE TABLE.
- If inserts to several tables containing an AUTO_INCREMENT column were wrapped inside one LOCK TABLES, InnoDB asserted in lock0lock.c.
- In 3.23.47 we permitted several NULL values in a UNIQUE secondary index for an InnoDB table. But CHECK TABLE was not relaxed: it reports the table as corrupt. CHECK TABLE no longer complains in this situation.
- SHOW GRANTS now shows REFERENCES instead of REFERENCE.

C.3.13 Changes in Release 3.23.47 (27 December 2001)

End of Product Lifecycle.  Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.
Changes in Release 3.23.46 (29 November 2001)

- Fixed bug when using the following construct: `SELECT ... WHERE key=@var_name OR key=@var_name2`
- Restrict InnoDB keys to 500 bytes.
- InnoDB now supports NULL in keys.
- Fixed shutdown problem on HP-UX. (Introduced in 3.23.46)
- Fixed core dump bug in replication when using `SELECT RELEASE_LOCK()`.
- Added new statement: `DO expr[,expr]...`
- Added `slave-skip-errors` option.
- Added statistics variables for all MySQL commands. (`SHOW STATUS` is now much longer.)
- Fixed default values for InnoDB tables.
- Fixed that `GROUP BY expr DESC` works.
- Fixed bug when using `t1 LEFT JOIN t2 ON t2.key=constant`.
- `mysql_config` now also works with binary (relocated) distributions.

C.3.14 Changes in Release 3.23.46 (29 November 2001)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Fixed problem with aliased temporary table replication.
- InnoDB and BDB tables now use index when doing an `ORDER BY` on the whole table.
- Fixed bug where one got an empty set instead of a DEADLOCK error when using BDB tables.
- One can now kill `ANALYZE TABLE`, `REPAIR TABLE`, and `OPTIMIZE TABLE` when the thread is waiting to get a lock on the table.
- Fixed race condition in `ANALYZE TABLE`.
- Fixed bug when joining with caching (unlikely to happen).
- Fixed race condition when using the binary log and `INSERT DELAYED` which could cause the binary log to have rows that were not yet written to MyISAM tables.
- Changed caching of binary log to make replication slightly faster.
- Fixed bug in replication on Mac OS X.

C.3.15 Changes in Release 3.23.45 (22 November 2001)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- `(UPDATE|DELETE) ...WHERE MATCH bugfix.`
Changes in Release 3.23.44 (31 October 2001)

- Shutdown should now work on Darwin (Mac OS X).
- Fixed core dump when repairing corrupted packed MyISAM files.
- `--core-file` now works on Solaris.
- Fix a bug which could cause InnoDB to complain if it cannot find free blocks from the buffer cache during recovery.
- Fixed bug in InnoDB insert buffer B-tree handling that could cause crashes.
- Fixed bug in InnoDB lock timeout handling.
- Fixed core dump bug in `ALTER TABLE` on a TEMPORARY InnoDB table.
- Fixed bug in `OPTIMIZE TABLE` that reset index cardinality if it was up to date.
- Fixed problem with `t1 LEFT JOIN t2 ... WHERE t2.date_column IS NULL` when `date_column` was declared as `NOT NULL`.
- Fixed bug with BDB tables and keys on BLOB columns.
- Fixed bug in `MERGE` tables on OS with 32-bit file pointers.
- Fixed bug in `TIME_TO_SEC()` [833] when using negative values.

C.3.16 Changes in Release 3.23.44 (31 October 2001)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Fixed `Rows_examined` count in slow query log.
- Fixed bug when using a reference to an `AVG()` [873] column in `HAVING`.
- Fixed that date functions that require correct dates, like `DAYOFYEAR(column)` [826], return `NULL` for `0000-00-00` dates.
- Fixed bug in const-propagation when comparing columns of different types. (`SELECT * FROM date_col="2001-01-01" and date_col=time_col`)
- Fixed bug that caused error message `Can't write, because of unique constraint` with some `GROUP BY` queries.
- Fixed bug when doing `sjis` character strings used within quoted table names.
- Fixed core dump when using `CREATE ... FULLTEXT` keys with other storage engines than MyISAM.
- Do not use `signal()` on Windows because this appears to not be 100% reliable.
- Fixed bug when doing `WHERE col_name=NULL` on an indexed column that had `NULL` values.
- Fixed bug when doing `LEFT JOIN ... ON (col_name = constant) WHERE col_name = constant`.
- When using replications, aborted queries that contained `%` could cause a core dump.
- `TCP_NODELAY` was not used on some systems. (Speed problem.)
Changes in Release 3.23.43 (04 October 2001)

- Applied portability fixes for OS/2. (Patch by Yuri Dario.)

The following changes are for InnoDB tables:

- Add missing InnoDB variables to SHOW VARIABLES.

- Foreign key checking is now done for InnoDB tables.

- DROP DATABASE now works also for InnoDB tables.

- InnoDB now supports data files and raw disk partitions bigger than 4GB on those operating systems that have big files.

- InnoDB calculates better table cardinality estimates for the MySQL optimizer.

- Accent characters in the default character set latin1 are ordered according to the MySQL ordering.

  Note: If you are using latin1 and have inserted characters whose code is greater than 127 into an indexed CHAR column, you should run CHECK TABLE on your table when you upgrade to 3.23.44, and drop and reimport the table if CHECK TABLE reports an error!

- A new my.cnf parameter, innodb_thread_concurrency, helps in performance tuning in heavily concurrent environments.

- A new my.cnf parameter, innodb_fast_shutdown, speeds up server shutdown.

- A new my.cnf parameter, innodb_force_recovery, helps to save your data in case the disk image of the database becomes corrupt.

- innodb_monitor has been improved and a new innodb_table_monitor added.

- Increased maximum key length from 500 to 7000 bytes.

- Fixed a bug in replication of AUTO_INCREMENT columns with multiple-line inserts.

- Fixed a bug when the case of letters changes in an update of an indexed secondary column.

- Fixed a hang when there are more than 24 data files.

- Fixed a crash when MAX(col) [876] is selected from an empty table, and col is not the first column in a multi-column index.

- Fixed a bug in purge which could cause crashes.

C.3.17 Changes in Release 3.23.43 (04 October 2001)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Fixed a bug in INSERT DELAYED and FLUSH TABLES introduced in 3.23.42.

- Fixed unlikely bug, which returned nonmatching rows, in SELECT with many tables and multi-column indexes and 'range' type.

- Fixed an unlikely core dump bug when doing EXPLAIN SELECT when using many tables and ORDER BY.

- Fixed bug in LOAD DATA FROM MASTER when using table with CHECKSUM=1.
Changes in Release 3.23.42 (08 September 2001)

- Added unique error message when a DEADLOCK occurs during a transaction with BDB tables.
- Fixed problem with BDB tables and UNIQUE columns defined as NULL.
- Fixed problem with myisampack when using pre-space filled CHAR columns.
- Applied patch from Yuri Dario for OS/2.
- Fixed bug in --safe-user-create.

C.3.18 Changes in Release 3.23.42 (08 September 2001)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Fixed problem when using LOCK TABLES and BDB tables.
- Fixed problem with REPAIR TABLE on MyISAM tables with row lengths in the range from 65517 to 65520 bytes.
- Fixed rare hang when doing mysqladmin shutdown when there was a lot of activity in other threads.
- Fixed problem with INSERT DELAYED where delayed thread could be hanging on upgrading locks for no apparent reason.
- Fixed problem with myisampack and BLOB.
- Fixed problem when one edited .MRG tables by hand. (Patch from Benjamin Pflugmann).
- Enforce that all tables in a MERGE table come from the same database.
- Fixed bug with LOAD DATA INFILE and transactional tables.
- Fix bug when using INSERT DELAYED with wrong column definition.
- Fixed core dump during REPAIR TABLE of some particularly broken tables.
- Fixed bug in InnoDB and AUTO_INCREMENT columns.
- Fixed bug in InnoDB and RENAME TABLE columns.
- Fixed critical bug in InnoDB and BLOB columns. If you have used BLOB columns larger than 8000 bytes in an InnoDB table, it is necessary to dump the table with mysqldump, drop it and restore it from the dump.
- Applied large patch for OS/2 from Yuri Dario.
- Fixed problem with InnoDB when one could get the error Can't execute the given command... even when no transaction was active.
- Applied some minor fixes that concern Gemini.
- Use real arithmetic operations even in integer context if not all arguments are integers. (Fixes uncommon bug in some integer contexts).
- Do not force everything to lowercase on Windows. (To fix problem with Windows and ALTER TABLE.) Now --lower_case_table_names also works on Unix.
Changes in Release 3.23.41 (11 August 2001)

• Fixed that automatic rollback is done when thread end doesn't lock other threads.

C.3.19 Changes in Release 3.23.41 (11 August 2001)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

• Added --sql-mode=value[,value[,value]] option to mysql. See Section 5.1.2, “Server Command Options”.

• Fixed possible problem with shutdown on Solaris where the .pid file wasn't deleted.

• InnoDB now supports < 4GB rows. The former limit was 8000 bytes.

• The doublewrite file flush method is used in InnoDB. It reduces the need for Unix fsync() calls to a fraction and improves performance on most Unix flavors.

• You can now use the InnoDB Monitor to print a lot of InnoDB state information, including locks, to the standard output. This is useful in performance tuning.

• Several bugs which could cause hangs in InnoDB have been fixed.

• Split record_buffer to record_buffer and record_rnd_buffer. To make things compatible to previous MySQL versions, if record_rnd_buffer is not set, then it takes the value of record_buffer.

• Fixed optimizing bug in ORDER BY where some ORDER BY parts where wrongly removed.

• Fixed overflow bug with ALTER TABLE and MERGE tables.

• Added prototypes for my_thread_init() and my_thread_end() to mysql_com.h

• Added --safe-user-create option to mysqld.

• Fixed bug in SELECT DISTINCT ... HAVING that caused error message Can't find record in #...

C.3.20 Changes in Release 3.23.40 (18 July 2001)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

• Fixed problem with --low-priority-updates and INSERT statements.

• Fixed bug in slave thread when under some rare circumstances it could get 22 bytes ahead on the offset in the master.

• Added slave_net_timeout for replication.

• Fixed problem with UPDATE and BDB tables.

• Fixed hard bug in BDB tables when using key parts.

• Fixed problem when using GRANT FILE ON database.* ...; previously we added the DROP privilege for the database.
Changes in Release 3.23.39 (12 June 2001)

- Fixed DELETE FROM `tbl_name` ... LIMIT 0 and UPDATE FROM `tbl_name` ... LIMIT 0, which acted as though the LIMIT clause was not present (they deleted or updated all selected rows).
- CHECK TABLE now checks whether an AUTO_INCREMENT column contains the value 0.
- Sending a SIGHUP to mysqld now only flushes the logs, but does not reset the replication.
- Fixed parser to allow floats of type 1.0e1 (no sign after e).
- Option --force to myisamchk now also updates states.
- Added option --warnings to mysqld. Now mysqld prints the error Aborted connection only if this option is used.
- Fixed problem with SHOW CREATE TABLE when you didn’t have a PRIMARY KEY.
- Properly fixed the rename of innodb_unix_file_flush_method variable to innodb_flush_method.
- Fixed bug when converting BIGINT UNSIGNED to DOUBLE. This caused a problem when doing comparisons with BIGINT values outside of the signed range.
- Fixed bug in BDB tables when querying empty tables.
- Fixed a bug when using COUNT(DISTINCT) [874] with LEFT JOIN and there weren’t any matching rows.
- Removed all documentation referring to the GEMINI table type. GEMINI is not released under an Open Source license.

C.3.21 Changes in Release 3.23.39 (12 June 2001)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- The AUTO_INCREMENT sequence wasn’t reset when dropping and adding an AUTO_INCREMENT column.
- CREATE ... SELECT now creates nonunique indexes delayed.
- Fixed problem where LOCK TABLES `tbl_name` READ followed by FLUSH TABLES put an exclusive lock on the table.
- REAL @variable values were represented with only 2 digits when converted to strings.
- Fixed problem that client “hung” when LOAD TABLE FROM MASTER failed.
- myisamchk --fast --force no longer repairs tables that only had the open count wrong.
- Added functions to handle symbolic links to make life easier in 4.0.
- We are now using the -lcma thread library on HP-UX 10.20 so that MySQL is more stable on HP-UX.
- Fixed problem with IF() [782] and number of decimals in the result.
- Fixed date-part extraction functions to work with dates where day or month is 0.
- Extended argument length in option files from 256 to 512 chars.
Changes in Release 3.23.38 (09 May 2001)

• Fixed problem with shutdown when INSERT DELAYED was waiting for a LOCK TABLE.
• Fixed core dump bug in InnoDB when tablespace was full.
• Fixed problem with MERGE tables and big tables (larger than 4GB) when using ORDER BY.

C.3.22 Changes in Release 3.23.38 (09 May 2001)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

• Fixed a bug when SELECT from MERGE table sometimes results in incorrectly ordered rows.
• Fixed a bug in REPLACE() [792] when using the ujis character set.
• Applied Sleepycat BDB patches 3.2.9.1 and 3.2.9.2.
• Added --skip-stack-trace option to mysqld.
• CREATE TEMPORARY now works with InnoDB tables.
• InnoDB now promotes sub keys to whole keys.
• Added option CONCURRENT to LOAD DATA.
• Better error message when slave max_allowed_packet is too low to read a very long log event from the master.
• Fixed bug when too many rows were removed when using SELECT DISTINCT ... HAVING.
• SHOW CREATE TABLE now returns TEMPORARY for temporary tables.
• Added Rows_examined to slow query log.
• Fixed problems with function returning empty string when used together with a group function and a WHERE that didn’t match any rows.
• New program mysqlcheck.
• Added database name to output for administrative commands like CHECK TABLE, REPAIR TABLE, OPTIMIZE TABLE.
• Lots of portability fixes for InnoDB.
• Changed optimizer so that queries like SELECT * FROM tbl_name, tbl_name2 ... ORDER BY key_part1 LIMIT row_count use an index on key_part1 instead of filesort.
• Fixed bug when doing LOCK TABLE to_table WRITE,...; INSERT INTO to_table... SELECT ... when to_table was empty.

C.3.23 Changes in Release 3.23.37 (17 April 2001)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.
Changes in Release 3.23.36 (27 March 2001)

- Fixed a bug when using MATCH() [837] in HAVING clause.
- Fixed a bug when using HEAP tables with LIKE [796].
- Added --mysql-version option to safe_mysqld
- Changed INNODB to InnoDB (because the INNOBASE name was in use). All configure options and mysqld start options now use innodb instead of innobase. This means that before upgrading to this version, you have to change any configuration files where you have used innobase options!
- Fixed bug when using indexes on CHAR(255) NULL columns.
- Slave threads now start even if master-host is not set, as long as server-id is set and valid master.info is present.
- Partial updates (terminated with kill) are now logged with a special error code to the binary log. Slave refuses to execute them if the error code indicates the update was terminated abnormally, and has to be recovered with SET SQL_SLAVE_SKIP_COUNTER=1; SLAVE START after a manual sanity check/correction of data integrity.
- Fixed bug that erroneously logged a drop of internal temporary table on thread termination to the binary log --- this bug affected replication.
- Fixed a bug in REGEXP on 64-bit machines.
- UPDATE and DELETE with WHERE unique_key_part IS NULL didn’t update/delete all rows.
- Disabled INSERT DELAYED for tables that support transactions.
- Fixed bug when using date functions on TEXT/BLOB column with wrong date format.
- UDFs now also work on Windows. (Patch by Ralph Mason.)
- Fixed bug in ALTER TABLE and LOAD DATA INFILE that disabled key-sorting. These commands should now be faster in most cases.
- Fixed performance bug where reopened tables (tables that had been waiting for FLUSH or REPAIR TABLE) would not use indexes for the next query.
- Fixed problem with ALTER TABLE to InnoDB tables on FreeBSD.
- Added mysqld variables myisam_max_sort_file_size and myisam_max_extra_sort_file_size.
- Initialize signals early to avoid problem with signals in InnoDB.
- Applied patch for the tis620 character set to make comparisons case-independent and to fix a bug in LIKE [796] for this character set.

Note

All tables that use the tis620 character set must be fixed with myisamchk -r or REPAIR TABLE!

- Added --skip-safemalloc option to mysqld.

C.3.24 Changes in Release 3.23.36 (27 March 2001)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please
Changes in Release 3.23.35 (15 March 2001)

C.3.25 Changes in Release 3.23.35 (15 March 2001)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Fixed a bug that permitted use of database names containing a "." character. This fixes a serious security issue when mysqld is run as root. (CVE-2001-0407)

- Fixed bug when thread creation failed (could happen when doing a lot of connections in a short time).

- Fixed some problems with FLUSH TABLES and TEMPORARY tables. (Problem with freeing the key cache and error Can't reopen table....)

- Fixed a problem in InnoDB with other character sets than latin1 and another problem when using many columns.

- Fixed bug that caused a core dump when using a very complex query involving DISTINCT and summary functions.

- Added the SET TRANSACTION ISOLATION LEVEL statement.

- Added FOR UPDATE for SELECT statements.

- Fixed a bug where the number of affected rows was not returned when MySQL was compiled without transaction support.

- Fixed a bug in UPDATE where keys were not always used to find the rows to be updated.

- Fixed a bug in CONCAT_WS() where it returned incorrect results.

- Changed CREATE ... SELECT and INSERT ... SELECT to not allow concurrent inserts as this could make the binary log hard to repeat. (Concurrent inserts are enabled if you are not using the binary or update log.)

- Changed some macros to be able to use fast mutex with glibc 2.2.

C.3.26 Changes in Release 3.23.34a (11 March 2001)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please
C.3.27 Changes in Release 3.23.34 (10 March 2001)

End of Product Lifecycle.  Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Added the INNODB storage engine and the BDB storage engine to the MySQL source distribution.
- Updated the documentation about GEMINI tables.
- Fixed a bug in INSERT DELAYED that caused threads to hang when inserting NULL into an AUTO_INCREMENT column.
- Fixed a bug in CHECK TABLE / REPAIR TABLE that could cause a thread to hang.
- Fixed problem that REPLACE would not replace a row that conflicts with an AUTO_INCREMENT generated key.

mysqld now only sets CLIENT_TRANSACTIONS in mysql->server_capabilities if the server supports a transaction-safe storage engine.

- Fixed LOAD DATA INFILE to allow numeric values to be read into ENUM and SET columns.
- Improved error diagnostic for slave thread exit.
- Fixed bug in ALTER TABLE ... ORDER BY.
- Added max_user_connections variable to mysqld.
- Limit query length for replication by max_allowed_packet, not the arbitrary limit of 4MB.
- Permit space around = in argument to --set-variable.
- Fixed problem in automatic repair that could leave some threads in state Waiting for table.
- SHOW CREATE TABLE now displays the UNION=() for MERGE tables.
- ALTER TABLE now remembers the old UNION=() definition.
- Fixed bug when replicating timestamps.
- Fixed bug in bidirectional replication.
- Fixed bug in the BDB storage engine that occurred when using an index on multiple-part key where a key part may be NULL.
- Fixed MAX() [876] optimization on sub-key for BDB tables.
- Fixed problem where garbage results were returned when using BDB tables and BLOB or TEXT fields when joining many tables.
- Fixed a problem with BDB tables and TEXT columns.
- Fixed bug when using a BLOB key where a const row wasn't found.
Changes in Release 3.23.33 (09 February 2001)

- Fixed that `mysqlbinlog` writes the timestamp value for each query. This ensures that one gets same values for date functions like `NOW()` [829] when using `mysqlbinlog` to pipe the queries to another server.

- Permit `--skip-gemini`, `--skip-bdb`, and `--skip-innodb` options to be specified when invoking `mysqld`, even if these storage engines are not compiled in to `mysqld`.

- You can now use `ASC` and `DESC` with `GROUP BY` columns to specify a sort order.

- Fixed a deadlock in the `SET` code, when one ran `SET @foo=bar`, where `bar` is a column reference, an error was not properly generated.

C.3.28 Changes in Release 3.23.33 (09 February 2001)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Fixed DNS lookups not to use the same mutex as the host name cache. This enables known hosts to be quickly resolved even if a DNS lookup takes a long time.

- Added `--character-sets-dir` option to `myisampack`.

- Removed warnings when running `REPAIR TABLE ... EXTENDED`.

- Fixed a bug that caused a core dump when using `GROUP BY` on an alias, where the alias was the same as an existing column name.

- Added `SEQUENCE()` as an example user-defined function.

- Changed `mysql_install_db` to use `BINARY` for `CHAR` columns in the privilege tables.

- Changed `TRUNCATE tbl_name` to `TRUNCATE TABLE tbl_name` to use the same syntax as Oracle. Until 4.0 we also allow `TRUNCATE tbl_name` to not crash old code.

- Fixed “no found rows” bug in `MyISAM` tables when a `BLOB` was first part of a multiple-part key.

- Fixed bug where `CASE` [782] didn’t work with `GROUP BY`.

- Added `--sort-recover` option to `myisamchk`.

- `myisamchk -S` and `OPTIMIZE TABLE` now work on Windows.

- Fixed bug when using `DISTINCT` on results from functions that referred to a group function, like:

```
SELECT a, DISTINCT SEC_TO_TIME(SUM(a))
FROM tbl_name GROUP BY a, b;
```

- Fixed buffer overrun in `libmysqlclient` library. Fixed bug in handling `STOP` event after `ROTATE` event in replication.

- Fixed another buffer overrun in `DROP DATABASE`.

- Added `Table_locks_immediate` and `Table_locks_waited` status variables.

- Fixed bug in replication that broke slave server start with existing `master.info`. This fixes a bug introduced in 3.23.32.
Changes in Release 3.23.32 (22 January 2001)

- Added `SET SQL_SLAVE_SKIP_COUNTER=n` command to recover from replication glitches without a full database copy.

- Added `max_binlog_size` variable; the binary log is rotated automatically when the size crosses the limit.

- Added `Last_Error`, `Last_Errno`, and `Slave_skip_counter` variables to `SHOW SLAVE STATUS`.

- Fixed bug in `MASTER_POS_WAIT()` [871] function.

- Execute core dump handler on `SIGILL`, and `SIGBUS` in addition to `SIGSEGV`.

- On x86 Linux, print the current query and thread (connection) id, if available, in the core dump handler.

- Fixed several timing bugs in the test suite.

- Extended `mysqltest` to take care of the timing issues in the test suite.

- `ALTER TABLE` can now be used to change the definition for a `MERGE` table.

- Fixed creation of `MERGE` tables on Windows.

- Portability fixes for OpenBSD and OS/2.

- Added `--temp-pool` option to `mysqld`. Using this option causes most temporary files created to use a small set of names, rather than a unique name for each new file. This is to work around a problem in the Linux kernel dealing with creating a bunch of new files with different names. With the old behavior, Linux seems to "leak" memory, as it is being allocated to the directory entry cache instead of the disk cache.

C.3.29 Changes in Release 3.23.32 (22 January 2001)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Changed code to get around compiler bug in Compaq C++ on OSF/1, that broke `BACKUP TABLE`, `RESTORE TABLE`, `CHECK TABLE`, `REPAIR TABLE`, and `ANALYZE TABLE`.

- Added option `FULL` to `SHOW COLUMNS`. Now we show the privilege list for the columns only if this option is given.

- Fixed bug in `SHOW LOGS` when there weren't any `BDB` logs.

- Fixed a timing problem in replication that could delay sending an update to the client until a new update was done.

- Do not convert field names when using `mysql_list_fields()`. This is to keep this code compatible with `SHOW FIELDS`.

- `MERGE` tables didn't work on Windows.

- Fixed problem with `SET PASSWORD=...` on Windows.

- Added missing `my_config.h` to RPM distribution.

- `TRIM("foo" from "foo")` [795] didn't return an empty string.

- Added `--with-version-suffix` option to `configure`.
Changes in Release 3.23.31 (17 January 2001: Production)

- Fixed core dump when client aborted connection without `mysql_close()`.
- Fixed a bug in `RESTORE TABLE` when trying to restore from a nonexistent directory.
- Fixed a bug which caused a core dump on the slave when replicating `SET PASSWORD`.
- Added `MASTER_POS_WAIT()` [871] function.

C.3.30 Changes in Release 3.23.31 (17 January 2001: Production)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- The test suite now tests all reachable BDB interface code. During testing we found and fixed many errors in the interface code.
- Using `HAVING` on an empty table could produce one result row when it shouldn't.
- Fixed the MySQL RPM so it no longer depends on Perl5.
- Fixed some problems with `HEAP` tables on Windows.
- `SHOW TABLE STATUS` didn't show correct average row length for tables larger than 4GB.
- `CHECK TABLE ... EXTENDED` didn't check row links for fixed size tables.
- Added option `MEDIUM` to `CHECK TABLE`.
- Fixed problem when using `DECIMAL()` keys on negative numbers.
- `HOUR()` [828] (and some other `TIME` functions) on a `CHAR` column always returned `NULL`.
- Fixed security bug in `SHOW GRANT` (please upgrade if you are using an earlier MySQL 3.23 version). (CVE-2001-1275)
- Fixed buffer overflow bug when writing a certain error message. (CVE-2001-1274)
- Added usage of `setrlimit()` on Linux to get `-O --open_files_limit=val` to work on Linux.
- Added `bdb_version` variable to `mysqld`.
- Fixed bug when using expression of type:

```sql
SELECT ... FROM t1 LEFT JOIN t2 ON (t1.a=t2.a) WHERE t1.a=t2.a
```

In this case the test in the `WHERE` clause was wrongly optimized away.

- Fixed bug in `MyISAM` when deleting keys with possible `NULL` values, but the first key-column was not a prefix-compressed text column.
- Fixed `mysql.server` to read the `[mysql.server]` option file group rather than the `[mysql_server]` group.
- Fixed `safe_mysqld` and `mysql.server` to also read the `server` option section.
- Added `Threads_created` status variable to `mysqld`. 
C.3.31 Changes in Release 3.23.30 (04 January 2001)

End of Product Lifecycle.  Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Added SHOW OPEN TABLES statement.
- Fixed that myisamdump works against old mysql servers.
- Fixed myisamchk -kN so that it works again.
- Fixed a problem with replication when the binary log file went over 2G on 32-bit systems.
- LOCK TABLES now automatically starts a new transaction.
- Changed BDB tables to not use internal subtransactions and reuse open files to get more speed.
- Added --mysqld=path option to safe_mysqld.
- Permit hex constants in the --fields-*--by and --lines-terminated-by options to mysqldump and mysqlimport.
- Added --safe-show-database option to mysqld.
- Added have_bdb, have_gemini, have_innodb, have_raid and have_openssl to SHOW VARIABLES to make it easy to test for supported extensions.
- Added --open-files-limit option to mysqld.
- Changed --open-files option to --open-files-limit in safe_mysqld.
- Fixed a bug where some rows were not found with HEAP tables that had many keys.
- Fixed that --bdb-no-sync works.
- Changed --bdb-recover to --bdb-no-recover as recover should be on by default.
- Changed the default number of BDB locks to 10000.
- Fixed a bug from 3.23.29 when allocating the shared structure needed for BDB tables.
- Changed mysqld_multi.sh to use configure variables. Patch by Christopher McCrory.
- Added fixing of include files for Solaris 2.8.
- Fixed bug with --skip-networking on Debian Linux.
- Fixed problem that some temporary files where reported as having the name UNOPENED in error messages.
- Fixed bug when running two simultaneous SHOW LOGS queries.

C.3.32 Changes in Release 3.23.29 (16 December 2000)

End of Product Lifecycle.  Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.
Changes in Release 3.23.29 (16 December 2000)

- Configure updates for Tru64, large file support, and better TCP wrapper support. By Albert Chin-A-Young.
- Fixed bug in `<>` operator.
- Fixed bug in `REPLACE` with `BDB` tables.
- `LPAD()` [790] and `RPAD()` [792] shortens the result string if it is longer than the length argument.
- Added `SHOW LOGS` statement.
- Remove unused `BDB` logs on shutdown.
- When creating a table, put `PRIMARY` keys first, followed by `UNIQUE` keys.
- Fixed a bug in `UPDATE` involving multiple-part keys where you specified all key parts both in the update and the `WHERE` part. In this case MySQL could try to update a record that didn't match the whole `WHERE` part.
- Changed drop table to first drop the tables and then the `.frm` file.
- Fixed a bug in the host name cache which caused `mysqld` to report the host name as '' in some error messages.
- Fixed a bug with `HEAP` type tables; the variable `max_heap_table_size` wasn't used. Now either `MAX_ROWS` or `max_heap_table_size` can be used to limit the size of a `HEAP` type table.
- Changed the default `server-id` value to 1 for masters and 2 for slaves to make it easier to use the binary log.
- Renamed `bdb_lock_max` variable to `bdb_max_lock`.
- Added support for `AUTO_INCREMENT` on sub-fields for `BDB` tables.
- Added `ANALYZE TABLE` of `BDB` tables.
- In `BDB` tables, we now store the number of rows; this helps to optimize queries when we need an approximation of the number of rows.
- If we get an error in a multiple-row statement, we now only roll back the last statement, not the entire transaction.
- If you do a `ROLLBACK` when you have updated a nontransactional table you get an error as a warning.
- Added `--bdb-shared-data` option to `mysqld`.
- Added `Slave_open_temp_tables` status variable to `mysqld`.
- Added `binlog_cache_size` and `max_binlog_cache_size` variables to `mysqld`.
- `DROP TABLE`, `RENAME TABLE`, `CREATE INDEX` and `DROP INDEX` are now transaction endpoints.
- If you do a `DROP DATABASE` on a symbolically linked database, both the link and the original database are deleted.
- Fixed `DROP DATABASE` to work on OS/2.
- Fixed bug when doing a `SELECT DISTINCT ... table1 LEFT JOIN table2 ... when table2 was empty.`
Changes in Release 3.23.28 (22 November 2000: Gamma)

- Added `--abort-slave-event-count` and `--disconnect-slave-event-count` options to `mysqld` for debugging and testing of replication.
- `SHOW KEYS` now shows whether key is `FULLTEXT`.
- New script `mysqld_multi`. See Section 4.3.4, “`mysqld_multi` — Manage Multiple MySQL Servers”.
- Added new script, `mysql-multi.server.sh`. Thanks to Tim Bunce <Tim.Bunce@ig.co.uk> for modifying `mysql.server` to easily handle hosts running many `mysqld` processes.
- `safe_mysqld`, `mysql.server`, and `mysql_install_db` have been modified to use `my_print_defaults` instead of various hacks to read the `my.cnf` files. In addition, the handling of various paths has been made more consistent with how `mysqld` handles them by default.

- Automatically remove Berkeley DB transaction logs that no longer are in use.
- Fixed bug with several `FULLTEXT` indexes in one table.
- Added a warning if number of rows changes on `REPAIR TABLE/OPTIMIZE TABLE`.
- Applied patches for OS/2 by Yuri Dario.
- `FLUSH TABLES tbl_name` didn't always flush the index tree to disk properly.
- `--bootstrap` is now run in a separate thread. This fixes a problem that caused `mysql_install_db` to core dump on some Linux machines.
- Changed `mi_create()` to use less stack space.
- Fixed bug with optimizer trying to over-optimize `MATCH() [837]` when used with `UNIQUE` key.
- Changed `crash-me` and the MySQL benchmarks to also work with FrontBase.
- Reset status variable which could cause problem if one used `--log-slow-queries`.
- Added `connect_timeout` variable to `mysql` and `mysqladmin`.
- Added `connect-timeout` as an alias for `timeout` for option files read by `mysql_options()`.

C.3.33 Changes in Release 3.23.28 (22 November 2000: Gamma)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Added new options `--pager[=...],--no-pager,--tee=...` and `--no-tee` to the `mysql` client. The new corresponding interactive commands are `pager`, `nopager`, `tee` and `notee`. See Section 4.5.1, “`mysql` — The MySQL Command-Line Tool”, `mysql` `--help` and the interactive help for more information.
- Fixed crash when automatic repair of `MyISAM` table failed.
- Fixed a major performance bug in the table locking code when a lot of `SELECT, UPDATE and INSERT` statements constantly were running. The symptom was that the `UPDATE` and `INSERT` queries were locked for a long time while new `SELECT` statements were executed before the updates.
• When reading options_files with mysql_options() the return-found-rows option was ignored.

• You can now specify interactive-timeout in the option file that is read by mysql_options(). This makes it possible to force programs that run for a long time (like mysqlhotcopy) to use the interactive_timeout time instead of the wait_timeout time.

• Added to the slow query log the time and the user name for each logged query. If you are using --log-long-format then also queries that do not use an index are logged, even if the query takes less than long_query_time seconds.

• Fixed a problem in LEFT JOIN which caused all columns in a reference table to be NULL.

• Fixed a problem when using NATURAL JOIN without keys.

• Fixed a bug when using a multiple-part keys where the first part was of type TEXT or BLOB.

• DROP of temporary tables wasn't stored in the update log or binary log.

• Fixed a bug where SELECT DISTINCT * ... LIMIT row_count only returned one row.

• Fixed a bug in the assembler code in strstr() for SPARC and cleaned up the global.h header file to avoid a problem with bad aliasing with the compiler submitted with Red Hat 7.0. (Reported by Trond Eivind Glomsrød)

• The --skip-networking option now works properly on NT.

• Fixed a long outstanding bug in the ISAM tables when a row with a length of more than 65KB was shortened by a single byte.

• Fixed a bug in MyISAM when running multiple updating processes on the same table.

• Permit FLUSH TABLES with a tbl_name option.

• Added --replicate-ignore-table, --replicate-do-table, --replicate-wild-ignore-table, and --replicate-wild-do-table options to mysqld.

• Changed all log files to use our own IO_CACHE mechanism instead of FILE to avoid OS problems when there are many files open.

• Added --open-files and --timezone options to safe_mysqld.

• Fixed a fatal bug in CREATE TEMPORARY TABLE ... SELECT ....

• Fixed a problem with CREATE TABLE ... SELECT NULL.

• Added variables large_file_support, net_read_timeout, net_write_timeout and query_buffer_size to SHOW VARIABLES.

• Added status variables Created_tmp_files and Sort_merge_passes to SHOW STATUS.

• Fixed a bug where we didn't allow an index name after the FOREIGN KEY definition.

• Added TRUNCATE tbl_name as a synonym for DELETE FROM tbl_name.

• Fixed a bug in a BDB key compare function when comparing part keys.

• Added bdb_lock_max variable to mysqld.

• Added more tests to the benchmark suite.
• Fixed an overflow bug in the client code when using overly long database names.

• `mysql_connect()` now aborts on Linux if the server doesn't answer in timeout seconds.

• `SLAVE START` did not work if you started with `--skip-slave-start` and had not explicitly run `CHANGE MASTER TO`.

• Fixed the output of `SHOW MASTER STATUS` to be consistent with `SHOW SLAVE STATUS`. (It now has no directory in the log name.)

• Added `PURGE BINARY LOGS TO`.

• Added `SHOW MASTER LOGS` statement to display a list of binary log files.

• Added `--safemalloc-mem-limit` option to `mysqld` to simulate memory shortage when compiled with the `--with-debug=full` option.

• Fixed several core dumps in out-of-memory conditions.

• `SHOW SLAVE STATUS` was using an uninitialized mutex if the slave had not been started yet.

• Fixed bug in `ELT()` and `MAKE_SET()` when the query used a temporary table.

• `CHANGE MASTER TO` without specifying `MASTER_LOG_POS` would set it to 0 instead of 4 and hit the magic number in the master binary log.

• `ALTER TABLE ... ORDER BY ...` syntax added. This creates the new table with the rows in a specific order.

C.3.34 Changes in Release 3.23.27 (24 October 2000)

**End of Product Lifecycle.**  Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

• Fixed a bug where the automatic repair of `MyISAM` tables sometimes failed when the data file was corrupt.

• Fixed a bug in `SHOW CREATE` when using `AUTO_INCREMENT` columns.

• Changed `BDB` tables to use new compare function in Berkeley DB 3.2.3.

• You can now use Unix socket files with MIT-pthreads.

• Added the `latin5` (turkish) character set.

• Small portability fixes.

C.3.35 Changes in Release 3.23.26 (18 October 2000)

**End of Product Lifecycle.**  Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

• Renamed `FLUSH MASTER` and `FLUSH SLAVE` to `RESET MASTER` and `RESET SLAVE`.

• Fixed `<>` to work properly with `NULL`.
Changes in Release 3.23.25 (29 September 2000)

• Fixed a problem with `SUBSTRING_INDEX()` [794] and `REPLACE()` [792]. (Patch by Alexander Ignitchev)

• Fix `CREATE TEMPORARY TABLE IF NOT EXISTS` not to produce an error if the table exists.

• If you don't create a `PRIMARY KEY` in a `BDB` table, a hidden `PRIMARY KEY` is created.

• Added read-only-key optimization to `BDB` tables.

• `LEFT JOIN` in some cases preferred a full table scan when there was no `WHERE` clause.

• When using `--log-slow-queries`, don't count the time waiting for a lock.

• Fixed bug in lock code on Windows which could cause the key cache to report that the key file was crashed even if it was okay.

• Automatic repair of `MyISAM` tables if you start `mysqld` with `--myisam-recover`.

• Removed the `TYPE=` keyword from `CHECK TABLE` and `REPAIR TABLE`. Permit `CHECK TABLE` options to be combined. (You can still use `TYPE=`, but this usage is deprecated.)

• Fixed mutex bug in the binary replication log --- long update queries could be read only in part by the slave if it did it at the wrong time, which was not fatal, but resulted in a performance-degrading reconnect and a scary message in the error log.

• Changed the format of the binary log --- added magic number, server version, binary log version. Added the server ID and query error code for each query event.

• Replication thread from the slave now kills all the stale threads from the same server.

• Long replication user names were not being handled properly.

• Added `--replicate-rewrite-db` option to `mysqld`.

• Added `--skip-slave-start` option to `mysqld`.

• Updates that generated an error code (such as `INSERT INTO foo(some_key) values (1),(1)`) erroneously terminated the slave thread.

• Added optimization of queries where `DISTINCT` is used only on columns from some of the tables.

• Permit floating-point numbers where there is no sign after the exponent (like `1e1`).

• `SHOW GRANTS` didn't always show all column grants.

• Added `--defaults-extra-file=file_name` option to all MySQL clients.

• Columns referenced in `INSERT` statements now are initialized properly.

• `UPDATE` didn't always work when used with a range on a timestamp that was part of the key that was used to find rows.

• Fixed a bug in `FULLTEXT` index when inserting a `NULL` column.

• Changed to use `mkstemp()` instead of `tempnam()`. Based on a patch from John Jones.

C.3.36 Changes in Release 3.23.25 (29 September 2000)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see `http://www.mysql.com/about/legal/lifecycle/#calendar`. Please
consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

• Fixed that `databasename` works as second argument to `mysqlhotcopy`.

• The values for the `UMASK` and `UMASK_DIR` environment variables now can be specified in octal by beginning the value with a zero.

• Added `RIGHT JOIN`. This makes `RIGHT` a reserved word.

• Added `@@identity` as a synonym for `LAST_INSERT_ID()` [866]. (This is for MSSQL compatibility.)

• Fixed a bug in `myisamchk` and `REPAIR TABLE` when using `FULLTEXT` index.

• `LOAD DATA INFILE` now works with FIFOs. (Patch by Toni L. Harbaugh-Blackford.)

• `FLUSH LOGS` broke replication if you specified a log name with an explicit extension as the value of the `log-bin` option.

• Fixed a bug in `MyISAM` with packed multiple-part keys.

• Fixed crash when using `CHECK TABLE` on Windows.

• Fixed a bug where `FULLTEXT` index always used the `koi8_ukr` character set.

• Fixed privilege checking for `CHECK TABLE`.

• The `MyISAM` repair/reindex code didn't use the `--tmpdir` option for its temporary files.

• Added `BACKUP TABLE` and `RESTORE TABLE`.

• Fixed core dump on `CHANGE MASTER TO` when the slave did not have the master to start with.

• Fixed incorrect `Time` in the processlist for `Connect` of the slave thread.

• The slave now logs when it connects to the master.

• Fixed a core dump bug when doing `FLUSH MASTER` if you didn't specify a file name argument to `--log-bin`.

• Added missing `ha_berkeley.x` files to the MySQL Windows distribution.

• Fixed some mutex bugs in the log code that could cause thread blocks if new log files couldn't be created.

• Added lock time and number of selected processed rows to slow query log.

• Added `--memlock` option to `mysql` to lock `mysqld` in memory on systems with the `mlockall()` call (as in Solaris).

• `HEAP` tables didn't use keys properly. (Bug from 3.23.23.)

• Added better support for `MERGE` tables (keys, mapping, creation, documentation...). See Section 13.3, “The MERGE Storage Engine”.

• Fixed bug in `mysqldump` from 3.23 which caused some `CHAR` columns not to be quoted.

• Merged `analyze`, `check`, `optimize` and repair code.

• `OPTIMIZE TABLE` is now mapped to `REPAIR TABLE` with statistics and sorting of the index tree. This means that for the moment it only works on `MyISAM` tables.
Changes in Release 3.23.24 (08 September 2000)

- Added a pre-allocated block to root_malloc to get fewer mallocs.
- Added a lot of new statistics variables.
- Fixed ORDER BY bug with BDB tables.
- Removed warning that mysqld couldn't remove the .pid file under Windows.
- Changed --log-isam to log MyISAM tables instead of isam tables.
- Fixed CHECK TABLE to work on Windows.
- Added file mutexes to make fwrite() safe on Windows.

C.3.37 Changes in Release 3.23.24 (08 September 2000)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Added Created_tmp_disk_tables variable to mysqld.
- To make it possible to reliably dump and restore tables with TIMESTAMP(X) columns, MySQL now reports columns with X other than 14 or 8 to be strings.
- Changed sort order for latin1 as it was before MySQL 3.23.23. Any table that was created or modified with 3.23.22 must be repaired if it has CHAR columns that may contain characters with ASCII values greater than 128!
- Fixed small memory leak introduced from 3.23.22 when creating a temporary table.
- Fixed problem with BDB tables and reading on a unique (not primary) key.
- Restored the win1251 character set (it is now only marked deprecated).

C.3.38 Changes in Release 3.23.23 (01 September 2000)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Changed sort order for 'German'; all tables created with 'German' sortorder must be repaired with REPAIR TABLE or myisamchk before use!
- Added --core-file option to mysqld to get a core file on Linux if mysqld dies on the SIGSEGV signal.
- MySQL client mysql now starts with option --no-named-commands (-g) by default. This option can be disabled with --enable-named-commands (-G). This may cause incompatibility problems in some cases, for example, in SQL scripts that use named commands without a semicolon! Long format commands still work from the first line.
- Fixed a problem when using many pending DROP TABLE statements at the same time.
- Optimizer didn't use keys properly when using LEFT JOIN on an empty table.
- Added shorter help text when invoking mysqld with incorrect options.
Changes in Release 3.23.23 (01 September 2000)

- Fixed nonfatal `free()` bug in `mysqlimport`.
- Fixed bug in `MyISAM` index handling of `DECIMAL/NUMERIC` keys.
- Fixed a bug in concurrent insert in `MyISAM` tables. In some contexts, usage of `MIN(key_part)` [876] or `MAX(key_part)` [876] returned an empty set.
- Updated `mysqlhotcopy` to use the new `FLUSH TABLES table_list` syntax. Only tables which are being backed up are flushed now.
- Changed behavior of `--enable-thread-safe-client` so that both nonthreaded (-`lmysqlclient`) and threaded (-`lmysqlclient_r`) libraries are built. Users who linked against a threaded `-lmysqlclient` need to link against `-lmysqlclient_r` now.
- Added atomic `RENAME TABLE` command.
- Do not count `NULL` values in `COUNT(DISTINCT ...)` [874].
- Changed `ALTER TABLE`, `LOAD DATA INFILE` on empty tables and `INSERT ... SELECT ...` on empty tables to create nonunique indexes in a separate batch with sorting. This makes these statements much faster when you have many indexes.
- `ALTER TABLE` now logs the first used `insert_id` correctly.
- Fixed crash when adding a default value to a `BLOB` column.
- Fixed a bug with `DATE_ADD/DATE_SUB` where it returned a datetime instead of a date.
- Fixed a problem with the thread cache which made some threads show up as ***DEAD*** in `SHOW PROCESSLIST`.
- Fixed a lock in our thr_rwlock code, which could make selects that run at the same time as concurrent inserts crash. This affects only systems that don't have the pthread_rwlock_rdlock code.
- When deleting rows with a nonunique key in a `HEAP` table, all rows weren't always deleted.
- Fixed bug in range optimizer for `HEAP` tables, all rows weren't always deleted.
- Fixed `SELECT` on part keys to work with `BDB` tables.
- Fixed `INSERT INTO bdb_table ... SELECT` to work with `BDB` tables.
- `CHECK TABLE` now updates key statistics for the table.
- `ANALYZE TABLE` now only updates tables that have been changed since the last `ANALYZE TABLE`. Note that this is a new feature and tables are not marked to be analyzed until they are updated in any way with 3.23.23 or newer. For older tables, you have to do `CHECK TABLE` to update the key distribution.
- Fixed some minor privilege problems with `CHECK TABLE`, `ANALYZE TABLE`, `REPAIR TABLE` and `SHOW CREATE` statements.
- Added `CHANGE MASTER TO` statement.
- Added `FAST, QUICK EXTENDED` check types to `CHECK TABLES`.
- Changed `myisamchk` so that `--fast` and `--check-only-changed` are also honored with `--sort-index` and `--analyze`.
- Fixed fatal bug in `LOAD TABLE FROM MASTER` that did not lock the table during index re-build.
Changes in Release 3.23.22 (31 July 2000)

• **LOAD DATA INFILE** broke replication if the database was excluded from replication.

• More variables in **SHOW SLAVE STATUS** and **SHOW MASTER STATUS**.

• **SLAVE STOP** now does not return until the slave thread actually exits.

• Full-text search using the **MATCH()** function and **FULLTEXT** index type (for **MyISAM** files). This makes **FULLTEXT** a reserved word.

C.3.39 Changes in Release 3.23.22 (31 July 2000)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

• Fixed that **lex_hash.h** is created properly for each MySQL distribution.

• Fixed that **MASTER** and **COLLECTION** are not reserved words.

• The log generated by **--log-slow-queries** didn't contain the whole queries.

• Fixed that open transactions in **BDB** tables are rolled back if the connection is closed unexpectedly.

• Added workaround for a bug in **gcc 2.96 (intel)** and **gcc 2.9 (IA-64)** in **gen_lex_hash.c**.

• Fixed memory leak in the client library when using **host=** in the **my.cnf** file.

• Optimized functions that manipulate the hours/minutes/seconds.

• Fixed bug when comparing the result of **DATE_ADD() [821]/DATE_SUB() [825]** against a number.

• Changed the meaning of **-F, --fast** for **myisamchk**. Added **-C, --check-only-changed** option to **myisamchk**.

• Added **ANALYZE tbl_name** to update key statistics for tables.

• Changed binary items **0x...** to be regarded as integers by default.

• Fix for SCO and **SHOW PROCESSLIST**.

• Added **auto-rehash** on reconnect for the **mysql** client.

• Fixed a newly introduced bug in **MyISAM**, where the index file couldn't get bigger than 64MB.

• Added **SHOW MASTER STATUS** and **SHOW SLAVE STATUS**.

C.3.40 Changes in Release 3.23.21 (04 July 2000)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

• Added **mysql_character_set_name()** function to the MySQL C API.

• Made the update log ASCII 0 safe.

• Added the **mysql_config** script.
• Fixed problem when using `<` or `>` with a char column that was only partly indexed.

• One would get a core dump if the log file was not readable by the MySQL user.

• Changed `mysqladmin` to use `CREATE DATABASE` and `DROP DATABASE` statements instead of the old deprecated API calls.

• Fixed `chown` warning in `safe_mysqld`.

• Fixed a bug in `ORDER BY` that was introduced in 3.23.19.

• Only optimize the `DELETE FROM tbl_name` to do a drop+create of the table if we are in `autocommit` mode (needed for `BDB` tables).

• Added extra checks to avoid index corruption when the `ISAM/MyISAM` index files get full during an `INSERT/UPDATE`.

• `myisamchk` didn't correctly update row checksum when used with `-ro` (this only gave a warning in subsequent runs).

• Fixed bug in `REPAIR TABLE` so that it works with tables without indexes.

• Fixed buffer overrun in `DROP DATABASE`.

• `LOAD TABLE FROM MASTER` is sufficiently bug-free to announce it as a feature.

• `MATCH` and `AGAINST` are now reserved words.

C.3.41 Changes in Release 3.23.20 (28 June 2000: Beta)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

• Fixed bug in 3.23.19; `DELETE FROM tbl_name` removed the `.frm` file.

• Added `SHOW CREATE TABLE`.

C.3.42 Changes in Release 3.23.19

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

• Changed copyright for all files to GPL for the server code and utilities and to LGPL for the client libraries. See [http://www.fsf.org/licenses/](http://www.fsf.org/licenses/).

• Fixed bug where all rows matching weren't updated on a `MyISAM` table when doing update based on key on a table with many keys and some key changed values.

• The Linux MySQL RPMs and binaries are now statically linked with a linuxthread version that has faster mutex handling when used with MySQL.

• `ORDER BY` can now use `REF` keys to find subsets of the rows that need to be sorted.

• Changed name of `print_defaults` program to `my_print_defaults` to avoid name confusion.
Changes in Release 3.23.18 (11 June 2000)

- Fixed `NULLIF()` [783] to work as required by standard SQL.
- Added `net_read_timeout` and `net_write_timeout` as startup parameters to `mysqld`.
- Fixed bug that destroyed index when doing `myisamchk --sort-records` on a table with prefix compressed index.
- Added `pack_isam` and `myisampack` to the standard MySQL distribution.
- Added the syntax `BEGIN WORK` (the same as `BEGIN`).
- Fixed core dump bug when using `ORDER BY` on a `CONV()` [810] expression.
- Added `LOAD TABLE FROM MASTER`.
- Added `FLUSH TABLES WITH READ LOCK` to make a global lock suitable for making a copy of MySQL data files.
- `CREATE TABLE ... SELECT ... PROCEDURE` now works.
- Internal temporary tables now use compressed index when using `GROUP BY` on `VARCHAR/CHAR` columns.
- Fixed a problem when locking the same table with both a `READ` and a `WRITE` lock.
- Fixed problem with `myisamchk` and RAID tables.

C.3.43 Changes in Release 3.23.18 (11 June 2000)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Fixed a problem from 3.23.17 when choosing character set on the client side.
- Added `FLUSH TABLES WITH READ LOCK` to make a global lock suitable for making a copy of MySQL data files.
- `CREATE TABLE ... SELECT ... PROCEDURE` now works.
- Internal temporary tables now use compressed index when using `GROUP BY` on `VARCHAR/CHAR` columns.
- Fixed a problem when locking the same table with both a `READ` and a `WRITE` lock.
- Fixed problem with `myisamchk` and RAID tables.

C.3.44 Changes in Release 3.23.17 (07 June 2000)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Fixed a bug in `FIND_IN_SET()` [788] when the first argument was `NULL`.
- Added table locks to Berkeley DB.
- Fixed a bug with `LEFT JOIN` and `ORDER BY` where the first table had only one matching row.
- Added 4 sample `my.cnf` example files in the `support-files` directory.
- Fixed duplicated key problem when doing big `GROUP BY` operations. (This bug was probably introduced in 3.23.15.)
- Changed syntax for `INNER JOIN` to match standard SQL.
Changes in Release 3.23.16 (16 May 2000)

- Added **NATURAL JOIN** syntax.
- A lot of fixes in the **BDB** interface.
- Added handling of `--no-defaults` and `--defaults-file` to `safe_mysqld.sh` and `mysql_install_db.sh`.
- Fixed bug in reading compressed tables with many threads.
- Fixed that **USE INDEX** works with **PRIMARY** keys.
- Added **BEGIN** statement to start a transaction in **autocommit** mode.
- Added support for symbolic links for Windows.
- Changed protocol to let client know if the server is in **autocommit** mode and if there is a pending transaction. If there is a pending transaction, the client library gives an error before reconnecting to the server to let the client know that the server did a rollback. The protocol is still backward-compatible with old clients.
- **KILL** now works on a thread that is locked on a 'write' to a dead client.
- Fixed memory leak in the replication slave thread.
- Added new **log-slave-updates** option to **mysqld**, to allow daisy-chaining the slaves.
- Fixed compile error on FreeBSD and other systems where **pthread_t** is not the same as **int**.
- Fixed master shutdown aborting the slave thread.
- Fixed a race condition in **INSERT DELAYED** code when doing **ALTER TABLE**.
- Added deadlock detection sanity checks to **INSERT DELAYED**.

C.3.45 Changes in Release 3.23.16 (16 May 2000)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Added **SLAVE START** and **SLAVE STOP** statements.
- Added **TYPE=QUICK** option to **CHECK TABLE** and to **REPAIR TABLE**.
- Fixed bug in **REPAIR TABLE** when the table was in use by other threads.
- Added a thread cache to make it possible to debug MySQL with **gdb** when one does a lot of reconnects. This also improves systems where you can't use persistent connections.
- Lots of fixes in the Berkeley DB interface.
- **UPDATE IGNORE** does not abort if an update results in a **DUPLICATE_KEY** error.
- Put **CREATE TEMPORARY TABLE** statements in the update log.
- Fixed bug in handling of masked IP addresses in the privilege tables.
- Fixed bug with **delay_key_write** tables and **CHECK TABLE**.
Changes in Release 3.23.15 (08 May 2000)

• Added `--replicate-do-db` and `--replicate-ignore-db` options to `mysqld`, to restrict which databases get replicated.

• Added `sql_log_bin` option.

C.3.46 Changes in Release 3.23.15 (08 May 2000)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

• To start `mysqld` as `root`, you must now use the `--user=root` option.

• Added interface to Berkeley DB. (This is not yet functional; play with it at your own risk!)

• Replication interface to Berkeley DB. (This is not yet functional; play with it at your own risk!)

• Fixed bug that other threads could steal a lock when a thread had a lock on a table and did a `FLUSH TABLES` command.

• Added the `slow_launch_time` variable and the `Slow_launch_threads` status variable to `mysqld`. These can be examined with `mysqladmin variables` and `mysqladmin extended-status`.

• Added functions `INET_NTOA()` [870] and `INET_ATON()` [870].

• The default type of `IF()` [782] now depends on the second and third arguments and not only on the second argument.

• Fixed case when `myisamchk` could go into a loop when trying to repair a crashed table.

• Do not write `INSERT DELAYED` to update log if `sql_log_update = 0`.

• Fixed problem with `REPLACE` on `HEAP` tables.

• Added possible character sets and time zone to `SHOW VARIABLES` output.

• Fixed bug in locking code that could result in locking problems with concurrent inserts under high load.

• Fixed a problem with `DELETE` of many rows on a table with compressed keys where MySQL scanned the index to find the rows.

• Fixed problem with `CHECK TABLE` on table with deleted keyblocks.

• Fixed a bug in reconnect (at the client side) where it didn't free memory properly in some contexts.

• Fixed problems in update log when using `LAST_INSERT_ID()` [866] to update a table with an `AUTO_INCREMENT` key.

• Added `NULLIF()` [783] function.

• Fixed bug when using `LOAD DATA INFILE` on a table with `BLOB/TEXT` columns.

• Optimized `MyISAM` to be faster when inserting keys in sorted order.

• `EXPLAIN SELECT ...` now also prints out whether MySQL needs to create a temporary table or use file sorting when resolving the `SELECT`.

• Added optimization to skip `ORDER BY` parts where the part is a constant expression in the `WHERE` part. Indexes can now be used even if the `ORDER BY` doesn't match the index exactly, as long as all
the unused index parts and all the extra ORDER BY columns are constants in the WHERE clause. See Section 7.4.3, “How MySQL Uses Indexes”.

• UPDATE and DELETE on a whole unique key in the WHERE part are now faster than before.
• Changed RAID_CHUNKSIZE to be in 1024-byte increments.
• Fixed core dump in LOAD_FILE(NULL) [790].

C.3.47 Changes in Release 3.23.14 (09 April 2000)

C.3.48 Changes in Release 3.23.13 (14 March 2000)
Changes in Release 3.23.12 (07 March 2000)

consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Fixed problem when doing locks on the same table more than 2 times in the same `LOCK TABLE` statement; this fixed the problem one got when running the test-ATIS test with `--fast` or `--check-only-changed`.

- Added `SQL_BUFFER_RESULT` option to `SELECT`.

- Removed endspace from double/float numbers in results from temporary tables.

- Added `CHECK TABLE` statement.

- Added changes for `MyISAM` in 3.23.12 that didn't get into the source distribution because of CVS problems.

- Fixed bug so that `mysqladmin shutdown` waits for the local server to close down.

- Fixed a possible endless loop when calculating timestamp.

- Added `print_defaults` program to the `.rpm` files. Removed `mysqlbug` from the client `.rpm` file.

C.3.49 Changes in Release 3.23.12 (07 March 2000)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Fixed bug in `MyISAM` involving `REPLACE ... SELECT ...` which could give a corrupted table.

- Fixed bug in `myisamchk` where it incorrectly reset the `AUTO_INCREMENT` value.

- LOTS of patches for Linux Alpha. MySQL now appears to be relatively stable on Alpha.

- Changed `DISTINCT` on `HEAP` temporary tables to use hashed keys to quickly find duplicated rows. This mostly concerns queries of type `SELECT DISTINCT ... GROUP BY ...`. This fixes a problem where not all duplicates were removed in queries of the above type. In addition, the new code is MUCH faster.

- Added patches to make MySQL compile on Mac OS X.

- Added `IF NOT EXISTS` clause to `CREATE DATABASE`.

- Added `--all-databases` and `--databases` options to `mysqldump` to allow dumping of many databases at the same time.

- Fixed bug in compressed `DECIMAL()` index in `MyISAM` tables.

- Fixed bug when storing 0 into a timestamp.

- When doing `mysqladmin shutdown` on a local connection, `mysqladmin` now waits until the PID file is gone before terminating.

- Fixed core dump with some `COUNT(DISTINCT ...) [874]` queries.

- Fixed that `myisamchk` works properly with RAID tables.

- Fixed problem with `LEFT JOIN` and `key_col IS NULL`.

- Fixed bug in `net_clear()` which could give the error `Aborted connection` in the MySQL clients.
• Added options `USE INDEX (index_list)` and `IGNORE INDEX (index_list)` as parameters in `SELECT`.

• `DELETE` and `RENAME` should now work on `RAID` tables.

C.3.50 Changes in Release 3.23.11 (16 February 2000)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

• Added `HIGH_PRIORITY` option to `INSERT`. This overrides the effect of the `--low-priority-updates` server option and does not perform concurrent inserts.

• Permit the `ALTER TABLE tbl_name ADD (field_list)` syntax.

• Fixed problem with optimizer that could sometimes use incorrect keys.

• Fixed that `GRANT/REVOKE ALL PRIVILEGES` doesn't affect `GRANT OPTION`.

• Removed extra “)" from the output of `SHOW GRANTS`.

• Fixed problem when storing numbers in timestamps.

• Fix problem with time zones that have half hour offsets.

• Permit the syntax `UNIQUE INDEX` in `CREATE` statements.

• `mysqlhotcopy` - fast online hot-backup utility for local MySQL databases. By Tim Bunce.

• New more secure `mysqlaccess`. Thanks to Steve Harvey for this.

• Added `--i-am-a-dummy` and `--safe-updates` options to `mysql`.

• Added `select_limit` and `max_join_size` variables to `mysql`.

• Added `sql_max_join_size` and `sql_safe_updates` options.

• Added `READ LOCAL` lock that doesn't lock the table for concurrent inserts. (This is used by `mysqldump`.)

• Changed that `LOCK TABLES ... READ` no longer permits concurrent inserts.

• Added `--skip-delay-key-write` option to `mysqld`.

• Fixed security problem in the protocol regarding password checking.

• `_rowid` can now be used as an alias for an integer type unique indexed column.

• Added back blocking of `SIGPIPE` when compiling with `--thread-safe-clients` to make things safe for old clients.

C.3.51 Changes in Release 3.23.10 (30 January 2000)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.
Changes in Release 3.23.9 (29 January 2000)

- Fixed bug in 3.23.9 where memory wasn't properly freed when using LOCK TABLES.

C.3.52 Changes in Release 3.23.9 (29 January 2000)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Fixed problem that affected queries that did arithmetic on group functions.
- Fixed problem with timestamps and INSERT DELAYED.
- Fixed that `date_col BETWEEN const_date AND const_date` works.
- Fixed problem when only changing a 0 to NULL in a table with BLOB/TEXT columns.
- Fixed bug in range optimizer when using many key parts and or on the middle key parts: `WHERE K1=1 and K3=2 and (K2=2 and K4=4 or K2=3 and K4=5)`
- Added source command to `mysql` to allow reading of batch files inside the `mysql` client. Original patch by Matthew Vanek.
- Fixed critical problem with the WITH GRANT OPTION option.
- Do not give an unnecessary GRANT error when using tables from many databases in the same query.
- Added VIO wrapper (needed for SSL support; by Andrei Errapart and Tõnu Samuel).
- Fixed optimizer problem on SELECT when using many overlapping indexes. MySQL should now be able to choose keys even better when there are many keys to choose from.
- Changed optimizer to prefer a range key instead of a ref key when the range key can uses more columns than the ref key (which only can use columns with =). For example, the following type of queries should now be faster: `SELECT * from key_part_1=const and key_part_2 > const2`
- Fixed bug that a change of all VARCHAR columns to CHAR columns didn't change row type from dynamic to fixed.
- Disabled floating-point exceptions for FreeBSD to fix core dump when doing `SELECT FLOOR(POW(2,63))`.
- Renamed mysqld startup option from `--delay-key-write` to `--delay-key-write-for-all-tables`.
- Added read-next-on-key to HEAP tables. This should fix all problems with HEAP tables when using non-UNIQUE keys.
- Added option to print default arguments to all clients.
- Added `--log-slow-queries` option to mysql to log all queries that take a long time to a separate log file with a time indicating how long the query took.
- Fixed core dump when doing `WHERE key_col=RAND(...)`.  
- Fixed optimization bug in `SELECT ... LEFT JOIN ... key_col IS NULL`, when `key_col` could contain NULL values.
- Fixed problem with 8-bit characters as separators in LOAD DATA INFILE.
C.3.53 Changes in Release 3.23.8 (02 January 2000)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Fixed problem when handling indexfiles larger than 8GB.
- Added latest patches to MIT-pthreads for NetBSD.
- Fixed problem with time zones that are < GMT - 11.
- Fixed a bug when deleting packed keys in NISAM.
- Fixed problem with ISAM when doing some ORDER BY ... DESC queries.
- Fixed bug when doing a join on a text key which didn't cover the whole key.
- Option `--delay-key-write` didn't enable delayed key writing.
- Fixed update of TEXT column which involved only case changes.
- Fixed that `INSERT DELAYED` doesn't update timestamps that are given.
- Added function `YEARWEEK()` [836] and options `x`, `X`, `v` and `V` to `DATE_FORMAT()` [824].
- Fixed problem with `MAX(indexed_column)` [876] and `HEAP` tables.
- Fixed problem with `BLOB NULL` keys and `LIKE "prefix%"` [796].
- Fixed problem with MyISAM and fixed-length rows < 5 bytes.
- Fixed problem that could cause MySQL to touch freed memory when doing very complicated `GROUP BY` queries.
- Fixed core dump if you got a crashed table where an ENUM field value was too big.

C.3.54 Changes in Release 3.23.7 (10 December 1999)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Fixed workaround under Linux to avoid problems with `pthread_mutex_timedwait()`, which is used with `INSERT DELAYED`. See Section 2.12.1, "Linux Notes".
- Fixed that one get a 'disk full' error message if one gets disk full when doing sorting (instead of waiting until we got more disk space).
- Fixed a bug in MyISAM with keys > 250 characters.
- In MyISAM one can now do an `INSERT` at the same time as other threads are reading from the table.
- Added `max_write_lock_count` variable to mysqld to force a `READ` lock after a certain number of WRITE locks.
- Inverted flag `delay_key_write` on `show variables`. 

1824
Changes in Release 3.23.6 (15 December 1999)

• Renamed `concurrency` variable to `thread_concurrency`.

• The following functions are now multi-byte-safe: `LOCATE(substr, str)` [790], `POSITION(substr IN str)` [791], `LOCATE(substr, str, pos)` [790], `INSTR(str, substr)` [789], `LEFT(str, len)` [789], `RIGHT(str, len)` [792], `SUBSTRING(str, pos, len)` [794], `SUBSTRING(str FROM pos FOR len)` [794], `MID(str, pos, len)` [791], `SUBSTRING(str, pos)` [794], `SUBSTRING(str FROM pos)` [794], `SUBSTRING_INDEX(str, delim, count)` [794], `RTRIM(str)` [793], `TRIM([\both | TRAILING] \remstr FROM) str)` [795], `REPLACE(str, FROM_str, to_str)` [792], `REVERSE(str)` [792], `INSERT(str, pos, len, newstr)` [789], `LCASE(str)` [789], `LOWER(str)` [790], `UCASE(str)` [795] and `UPPER(str)` [796]; patch by Wei He.

• Fix core dump when releasing a lock from a nonexistent table.

• Remove locks on tables before starting to remove duplicates.

• Added option `FULL` to `SHOW PROCESSLIST`.

• Added option `--verbose` to `mysqladmin`.

• Fixed problem when automatically converting `HEAP` to `MyISAM`.

• Fixed bug in `HEAP` tables when doing insert + delete + insert + scan the table.

• Fixed bugs on Alpha with `REPLACE()` [792] and `LOAD DATA INFILE`.

• Added `interactive_timeout` variable to `mysqld`.

• Changed the argument to `mysql_data_seek()` from `ulong` to `ulonglong`.

C.3.55 Changes in Release 3.23.6 (15 December 1999)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

• Added `-O lower_case_table_names={0|1}` option to `mysqld` to allow users to force table names to lowercase.

• Added `SELECT ... INTO DUMPFILE`.

• Added `--ansi` option to `mysqld` to make some functions standard SQL compatible.

• Temporary table names now start with `#sql`.

• Added quoting of identifiers with `"`(* in `--ansi` mode).

• Changed to use `snprintf()` when printing floats to avoid some buffer overflows on FreeBSD.

• Made `FLOOR()` [812] overflow safe on FreeBSD.

• Added `--quote-names` option to `mysqldump`.

• Fixed bug that one could make a part of a `PRIMARY KEY NOT NULL`.

• Fixed `encrypt()` to be thread-safe and not reuse buffer.

• Added `mysql_odbc_escape_string()` function to support big5 characters in MyODBC.
Changes in Release 3.23.5 (20 October 1999)

- Rewrote the storage engine to use classes. This introduces a lot of new code, but make table handling faster and better.
- Added patch by Sasha for user-defined variables.
- Changed that `FLOAT` and `DOUBLE` (without any length modifiers) no longer are fixed decimal point numbers.
- Changed the meaning of `FLOAT(X)`: Now this is the same as `FLOAT` if $X \leq 24$ and a `DOUBLE` if $24 < X \leq 53$.
- `DECIMAL(X)` is now an alias for `DECIMAL(X, 0)` and `DECIMAL` is now an alias for `DECIMAL(10, 0)`. The same goes for `NUMERIC`.
- Added option `ROW_FORMAT={DEFAULT | DYNAMIC | FIXED | COMPRESSED}` to `CREATE_TABLE`.
- `DELETE FROM tbl_name` didn't work on temporary tables.
- Changed function `CHAR_LENGTH()` to be multi-byte character safe.
- Added function `ORD(string)`.

C.3.56 Changes in Release 3.23.5 (20 October 1999)

**End of Product Lifecycle.** Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see [http://www.mysql.com/about/legal/lifecycle/#calendar](http://www.mysql.com/about/legal/lifecycle/#calendar). Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Fixed some Y2K problems in the new date handling in 3.23.
- Fixed problem with `SELECT DISTINCT ... ORDER BY RAND()`.
- Added patches by Sergei A. Golubchik for text searching on the `MyISAM` level.
- Fixed cache overflow problem when using full joins without keys.
- Fixed some configure issues.
- Some small changes to make parsing faster.
- Adding a column after the last field with `ALTER TABLE` didn't work.
- Fixed problem when using an `AUTO_INCREMENT` column in two keys.
- With `MyISAM`, you now can have an `AUTO_INCREMENT` column as a key sub part: `CREATE TABLE foo (a INT NOT NULL AUTO_INCREMENT, b CHAR(5), PRIMARY KEY (b, a))`.
- Fixed bug in `MyISAM` with packed char keys that could be `NULL`.
- `AS` on field name with `CREATE TABLE tbl_name SELECT ...` didn't work.
- Permit use of `NATIONAL` and `NCHAR` when defining character columns. This is the same as not using `BINARY`.
- Do not allow `NULL` columns in a `PRIMARY KEY` (only in `UNIQUE` keys).
- Clear `LAST_INSERT_ID()` if one uses this in ODBC: `WHERE auto_increment_column IS NULL`. This seems to fix some problems with Access.
• SET sql_auto_is_null = {0|1} now turns on/off the handling of searching for the last inserted row with WHERE auto_increment_column IS NULL.

• Added new variable concurrency to mysqld for Solaris.

• Added --relative option to mysqladmin to make extended-status more useful to monitor changes.

• Fixed bug when using COUNT(DISTINCT ...) [874] on an empty table.

• Added support for the Chinese character set GBK.

• Fixed problem with LOAD DATA INFILE and BLOB columns.

• Added bit operator ~ [855] (negation).

• Fixed problem with user-defined functions.

C.3.57 Changes in Release 3.23.4 (28 September 1999)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

• Inserting a DATETIME into a TIME column no longer try to store ‘days’ in it.

• Fixed problem with storage of float/double on little endian machines. (This affected SUM() [876].)

• Added connect timeout on TCP/IP connections.

• Fixed problem with LIKE "%" [796] on an index that may have NULL values.

• REVOKE ALL PRIVILEGES didn't revoke all privileges.

• Permit creation of temporary tables with same name as the original table.

• When granting an account a GRANT option for a database, the account couldn't grant privileges to other users.

• New statement: SHOW GRANTS FOR user (by Sinisa).

• New date_add syntax: date/datetime + INTERVAL # interval_type. By Joshua Chamas.

• Fixed privilege check for LOAD DATA REPLACE.

• Automatic fixing of broken include files on Solaris 2.7

• Some configure issues to fix problems with big file system detection.

• REGEXP is now case-insensitive if you use nonbinary strings.

C.3.58 Changes in Release 3.23.3 (13 September 1999)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.
Changes in Release 3.23.2 (09 August 1999)

- Added patches for MIT-pthreads on NetBSD.
- Fixed range bug in MyISAM.
- ASC is now the default again for ORDER BY.
- Added LIMIT to UPDATE.
- Added mysql_change_user() function to the MySQL C API.
- Added character set to SHOW VARIABLES.
- Added support of --[whitespace] comments.
- Permit INSERT INTO tbl_name VALUES (), that is, you may now specify an empty value list to insert a row in which each column is set to its default value.
- Changed SUBSTRING(text FROM pos) [794] to conform to standard SQL. (Before this construct returned the rightmost pos characters.)
- SUM() [876] with GROUP BY returned 0 on some systems.
- Changed output for SHOW TABLE STATUS.
- Added DELAY_KEYWRITE option to CREATE TABLE.
- Permit AUTO_INCREMENT on any key part.
- Fixed problem with YEAR(NOW()) [836] and YEAR(CURDATE()) [836].
- Added CASE [782] construct.
- New COALESCE() [776] function.

C.3.59 Changes in Release 3.23.2 (09 August 1999)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Fixed range optimizer bug: SELECT * FROM tbl_name WHERE key_part1 >= const AND (key_part2 = const OR key_part2 = const). The bug was that some rows could be duplicated in the result.
- Running myisamchk without -a updated the index distribution incorrectly.
- SET sql_low_priority_updates = 1 was causing a parse error.
- You can now update index columns that are used in the WHERE clause. UPDATE tbl_name SET KEY=KEY+1 WHERE KEY > 100
- Date handling should now be a bit faster.
- Added handling of fuzzy dates (dates where day or month is 0), such as '1999-01-00'.
- Fixed optimization of SELECT ... WHERE key_part1=const1 AND key_part2=const2 AND key_part1=const4 AND key_part2=const4; indextype should be range instead of ref.
Changes in Release 3.23.1 (08 July 1999)

- Fixed `egcs` 1.1.2 optimizer bug (when using BLOB values) on Linux Alpha.
- Fixed problem with LOCK TABLES combined with DELETE FROM table.
- MyISAM tables now allow keys on NULL and BLOB/TEXT columns.
- The following join is now much faster: SELECT ... FROM t1 LEFT JOIN t2 ON ... WHERE t2.not_null_column IS NULL.
- ORDER BY and GROUP BY can be done on functions.
- Changed handling of `const_item` to allow handling of ORDER BY RAND().
- Indexes are now used for WHERE key_column = function.
- Indexes are now used for WHERE key_column = col_name even if the columns are not identically packed.
- Indexes are now used for WHERE col_name IS NULL.
- Changed heap tables to be stored in low_byte_first order (to make it easy to convert to MyISAM tables)
- Automatic change of HEAP temporary tables to MyISAM tables in case of “table is full” errors.
- Added --init-file=file_name option to mysqld.
- Added COUNT(DISTINCT value, [value, ...]) [874].
- CREATE TEMPORARY TABLE now creates a temporary table, in its own namespace, that is automatically deleted if connection is dropped.
- New reserved words (required for CASE [782]): CASE, THEN, WHEN, ELSE and END.
- New functions EXPORT_SET() [787] and MD5() [860].
- Support for the GB2312 Chinese character set.

C.3.60 Changes in Release 3.23.1 (08 July 1999)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- Fixed some compilation problems.

C.3.61 Changes in Release 3.23.0 (05 July 1999: Alpha)

End of Product Lifecycle. Active development and support for MySQL Database Server versions 3.23, 4.0, and 4.1 has ended. For details, see http://www.mysql.com/about/legal/lifecycle/#calendar. Please consider upgrading to a recent version. Further updates to the content of this manual will be minimal. All formats of this manual will continue to be available until 31 Dec 2010.

- A new storage engine library (MyISAM) with a lot of new features. See Section 13.1, “The MyISAM Storage Engine”.
- You can create in-memory HEAP tables which are extremely fast for lookups.
- Support for big files (63-bit) on OSs that support big files.
Changes in Release 3.23.0 (05 July 1999: Alpha)

- New function `LOAD_FILE(filename)` [790] to get the contents of a file as a string value.
- New `<=>` operator that acts as `=` but returns TRUE if both arguments are NULL. This is useful for comparing changes between tables.
- Added the ODBC 3.0 `EXTRACT(interval FROM datetime)` [826] function.
- Columns defined as `FLOAT(X)` are not rounded on storage and may be in scientific notation (1.0 E+10) when retrieved.
- `REPLACE` is now faster than before.
- Changed `LIKE` [796] character comparison to behave as `=` [774]; This means that 'e' LIKE 'é' is now true. (If the line doesn't display correctly, the latter 'e' is a French 'e' with an acute accent above.)
- `SHOW TABLE STATUS` returns a lot of information about the tables.
- Added `LIKE` [796] to the `SHOW STATUS` statement.
- Added `Privileges` column to `SHOW COLUMNS`.
- Added `Packed` and `Comment` columns to `SHOW INDEX`.
- Added comments to tables (with `CREATE TABLE ... COMMENT 'xxx'`).
- Added `UNIQUE`, as in `CREATE TABLE tbl_name (col INT NOT NULL UNIQUE)`
- New create syntax: `CREATE TABLE tbl_name SELECT ...`
- New create syntax: `CREATE TABLE IF NOT EXISTS ...`
- Permit creation of `CHAR(0)` columns.
- `DATE_FORMAT()` [824] now requires "%" before any format character.
- `DELAYED` is now a reserved word (sorry about that :( ).
- An example procedure is added: `analyse`, file: `sql_analyse.c`. This describes the data in your query. Try the following:

```
SELECT ... FROM ...
WHERE ... PROCEDURE ANALYSE([max_elements,[max_memory]])
```

This procedure is extremely useful when you want to check the data in your table!
- `BINARY` cast to force a string to be compared in case-sensitive fashion.
- Added `--skip-show-database` option to `mysqld`.
- Check whether a row has changed in an `UPDATE` now also works with `BLOB/TEXT` columns.
- Added the `INNER` join syntax. Note that this change makes `INNER` a reserved word!
- Added support for netmasks to the host name in the MySQL grant tables. You can specify a netmask using the `IP/NETMASK` syntax.
- If you compare a `NOT NULL DATE/DATETIME` column with `IS NULL` [775], this is changed to a compare against 0 to satisfy some ODBC applications. (By <shreeve@uci.edu>.)
Changes in Release 3.23.0 (05 July 1999: Alpha)

- **NULL IN (...)** now returns NULL instead of 0. This ensures that `null_column NOT IN (...)` doesn't match NULL values.

- Fix storage of floating-point values in **TIME** columns.

- Changed parsing of **TIME** strings to be more strict. Now the fractional second part is detected (and currently skipped). The following formats are supported:
  - `[[[DAYS] [H]H:]MM:]SS[.fraction]`

- Detect (and ignore) fractional second part from **DATETIME**.

- Added the **LOW_PRIORITY** attribute to **LOAD DATA INFILE**.

- The default index name now uses the same case as the column name on which the index name is based.

- Changed default number of connections to 100.

- Use bigger buffers when using **LOAD DATA INFILE**.

- **DECIMAL(x,y)** now works according to standard SQL.

- Added aggregate user-defined functions. Thanks to Andreas F. Bobak (<bobak@relog.ch>) for this!

- **LAST_INSERT_ID()** [866] is now updated for `INSERT INTO ... SELECT`.

- Some small changes to the join table optimizer to make some joins faster.

- **SELECT DISTINCT** is much faster; it uses the new **UNIQUE** functionality in **MyISAM**. One difference compared to MySQL 3.22 is that the output of **DISTINCT** is no longer sorted.

- All C client API macros are now functions to make shared libraries more reliable. Because of this, you can no longer call `mysql_num_fields()` on a **MYSQL** object, you must use `mysql_field_count()` instead.

- Added use of **LIBWRAP**; patch by Henning P. Schmiedehausen.

- Do not allow **AUTO_INCREMENT** for other than numeric columns.

- Using **AUTO_INCREMENT** now automatically makes the column **NOT NULL**.

- Show **NULL** as the default value for **AUTO_INCREMENT** columns.

- Added **SQL_BIG_RESULT; SQL_SMALL_RESULT** is now default.

- Added a shared library RPM. This enhancement was contributed by David Fox (<dsfox@cogsci.ucsd.edu>).

- Added **--enable-large-files and --disable-large-files** options to **configure**. See **configure.in** for some systems where this is automatically turned off because of broken implementations.

- Upgraded **readline** to 4.0.

- New **CREATE TABLE** options: **PACK_KEYS** and **CHECKSUM**.

- Added the **--default-table-type** option to **mysql**.
C.4 Changes in InnoDB

Starting from 4.0.22 and 4.1.5, all InnoDB changes are included in the MySQL Change History, and this manual section is no longer separately maintained.

C.4.1 Changes in MySQL/InnoDB-4.0.21, September 10, 2004

Functionality added or changed:

- Renamed the `innodb.status.<pid>` files (created in the data directory) to `innodb_status.<pid>`. This avoids problems on file systems that do not allow multiple periods in file names.

- Added `innodb-status-file` option to `mysqld` to control whether output from `SHOW INNODB STATUS` is written to a `innodb_status.<pid>` file in the data directory. By default, the file is not created. To create it, start `mysqld` with the `--innodb-status-file=1` option.

- Changes for NetWare to exit InnoDB gracefully on NetWare even in a case of an assertion failure, instead of intentionally crashing the `mysqld` server process.

Bugs fixed:

- Fixed a bug in `ON DELETE CASCADE` and `ON UPDATE CASCADE` foreign key constraints: long chains of cascaded operations would cause a stack overflow and crash the server. Cascaded operations are now limited to 15 levels. (Bug #4446)

- Fixed a possible bug in `LOCK TABLES` introduced in MySQL/InnoDB-4.0.19: The count of tables explicitly locked by a transaction was incremented only after the locks were granted, but decremented when the lock structures were destroyed.

- Fixed a bug in `UNLOCK TABLES` in `autocommit = 0` mode, introduced in MySQL/InnoDB-4.0.19: The memory allocated for some locks acquired by the transaction could be deallocated before those locks were released. The bug can lead to crashes and memory corruption of the buffer pool when the transaction acquires a large number of locks (table locks or row-level locks).

- Increment the InnoDB watchdog timeout during `CHECK TABLE`. A long-running `CHECK TABLE` would cause InnoDB to complain about a 'long semaphore wait', and crash the server, if a query had to wait more than 600 seconds behind that `CHECK TABLE` operation. (Bug #2694)

- If you configure `innodb_additional_mem_pool_size` so small that InnoDB memory allocation spills over from it, then every 4 billionth spill may cause memory corruption. A symptom is a printout like the one following in the `.err` log. The workaround is to make `innodb_additional_mem_pool_size` big enough to hold all memory allocation. Use `SHOW INNODB STATUS` to determine that there is plenty of free space available in the additional mem pool, and the total allocated memory stays rather constant.

```
InnoDB: Error: Mem area size is 0. Possibly a memory overrun of the
InnoDB: previous allocated area!
InnoDB: Apparent memory corruption: mem dump  len 500; hex
```

- The special meaning of the table names `innodb_monitor`, `innodb_lock_monitor`, `innodb_tablespace_monitor`, `innodb_table_monitor`, and `innodb_validate` in `CREATE TABLE` and `DROP TABLE` statements was accidentally removed in MySQL/InnoDB-4.0.19. The diagnostic functions attached to these special table names (see Section 13.2.14.2, “SHOW ENGINE INNODB STATUS and the InnoDB Monitors”) are accessible again in MySQL/InnoDB-4.0.21.

- When the private SQL parser of InnoDB was modified in MySQL/InnoDB-4.0.19 to allow the use of the apostrophe (‘’) in table and column names, the fix relied on a previously unused function
Changes in MySQL/InnoDB-4.1.4, August 31, 2004

mem_realloc(), whose implementation was incorrect. As a result, InnoDB can incorrectly parse column and table names as the empty string. The InnoDB realloc() implementation has been corrected in MySQL/InnoDB-4.0.21.

• Fixed a glitch introduced in 4.0.18 and 4.1.2: in SHOW TABLE STATUS InnoDB systematically overestimated the row count by 1 if the table fit on a single 16 kB data page.

• InnoDB created temporary files with the C library function tmpfile(). On Windows, the files would be created in the root directory of the current file system. To correct this behavior, the invocations of tmpfile() were replaced with code that uses the function create_temp_file() in the MySQL portability layer. (Bug #3998)

• If ALTER TABLE ... DROP FOREIGN KEY ... fails because of a wrong constraint name, return a table handler error number 150 instead of 152.

• If there was little file I/O in InnoDB, but the insert buffer was used, it could happen that ‘Pending normal aio reads’ was bigger than 0, but the I/O handler thread did not get waken up in 600 seconds. This resulted in a hang, and crashing of InnoDB.

• If we RENAMEd a table, InnoDB forgot to load the FOREIGN KEY constraints that reference the new table name, and forgot to check that they are compatible with the table.

C.4.2 Changes in MySQL/InnoDB-4.1.4, August 31, 2004

Functionality added or changed:

• **Important**

  Made internal representation of TIMESTAMP values in InnoDB in 4.1 to be the same as in 4.0. This difference resulted in incorrect datetime values in TIMESTAMP columns in InnoDB tables after an upgrade from 4.0 to 4.1. (Bug #4492) **Warning: extra steps during upgrade required!** This means that if you are upgrading from 4.1.x, where x <= 3, to 4.1.4 you should use mysqldump for saving and then restoring your InnoDB tables with TIMESTAMP columns. No conversion is needed if you upgrade from 3.23 or 4.0 to 4.1.4 or later.

• Added a new startup option innodb_locks_unsafe_for_binlog. This option forces InnoDB not to use next-key locking in searches and index scans.

• Added innodb-status-file option to mysqld to control whether output from SHOW INNODB STATUS is written to a innodb_status.<pid> file in the data directory. By default, the file is not created. To create it, start mysqld with the --innodb-status-file=1 option.

• Changes for NetWare to exit InnoDB gracefully on NetWare even in a case of an assertion failure, instead of intentionally crashing the mysqld server process.

• “Gap” type row locks without the LOCK_INSERT_INTENTION flag do not need to wait for anything. This is because different users can have conflicting lock types on gaps. This change reduces unnecessary deadlocks.

Bugs fixed:

• Fixed a bug in ON DELETE CASCADE and ON UPDATE CASCADE foreign key constraints: long chains of cascaded operations would cause a stack overflow and crash the server. Cascaded operations are now limited to 15 levels. (Bug #4446)

• Increment the InnoDB watchdog timeout during CHECK TABLE. (Bug #2694)
Changes in MySQL/InnoDB-4.1.3, June 28, 2004

• If you configure `innodb_additional_mem_pool_size` so small that InnoDB memory allocation spills over from it, then every 4 billionth spill may cause memory corruption. A symptom is a printout like the one following in the `.err` log.

```plaintext
InnoDB: Error: Mem area size is 0. Possibly a memory overrun of the
InnoDB: previous allocated area!
InnoDB: Apparent memory corruption: mem dump len 500; hex
```

• Fixed a glitch introduced in 4.0.18 and 4.1.2: in `SHOW TABLE STATUS` InnoDB systematically overestimated the row count by 1 if the table fit on a single 16 kB data page.

• InnoDB created temporary files with the C library function `tmpfile()`. On Windows, the files would be created in the root directory of the current file system. To correct this behavior, the invocations of `tmpfile()` were replaced with code that uses the function `create_temp_file()` in the MySQL portability layer. (Bug #3998)

• If we `RENAME`d a table, InnoDB forgot to load the foreign key constraints that reference the new table name, and forgot to check that they are compatible with the table.

• If there was little file I/O in InnoDB, but the insert buffer was used, it could happen that 'Pending normal aio reads' was bigger than 0, but the I/O handler thread did not get waken up in 600 seconds. This resulted in a hang, and an intentional crashing of `mysqld`.

C.4.3 Changes in MySQL/InnoDB-4.1.3, June 28, 2004

Functionality added or changed:

• **Important**

  Starting from MySQL 4.1.3, InnoDB uses the same character set comparison functions as MySQL for non-`latin1_swedish_ci` character strings that are not `BINARY`. This changes the sorting order of space and characters < ASCII(32) in those character sets. For `latin1_swedish_ci` character strings and `BINARY` strings, InnoDB uses its own pad-spaces-at-end comparison method, which stays unchanged. If you have an InnoDB table created with MySQL 4.1.2 or earlier, with an index on a non-`latin1` character set (in the case of 4.1.0 and 4.1.1 with any character set) `CHAR/VARCHAR/TEXT` column that is not `BINARY` but may contain characters < ASCII(32), then you should do `ALTER TABLE` or `OPTIMIZE TABLE` on it to regenerate the index, after upgrading to MySQL 4.1.3 or later.

• `OPTIMIZE TABLE` for InnoDB tables is now mapped to `ALTER TABLE` rather than to `ANALYZE TABLE`.

• Added an interface for storing the binlog offset in the InnoDB log and flushing the log.

Bugs fixed:

• The **critical bug in 4.1.2** (crash recovery skipping all `.ibd` files if you specify `innodb_file_per_table` on Unix) has been fixed. The bug was a combination of two bugs. Crash recovery ignored the files, because the attempt to lock them in the wrong mode failed. From now on, locks are only obtained for regular files opened in read/write mode, and crash recovery stops if an `.ibd` file for a table exists in a database directory but is unaccessible.

• Do not remember the original `select_lock_type` inside `LOCK TABLES`. (Bug #4047)

• The special meaning of the table names `innodb_monitor, innodb_lock_monitor, innodb_tablespace_monitor, innodb_table_monitor, and innodb_validate` in `CREATE`
TABLE and DROP TABLE statements was accidentally removed in MySQL/InnoDB-4.1.2. The diagnostic functions attached to these special table names (see Section 13.2.14.2, “SHOW ENGINE INNODB STATUS and the InnoDB Monitors”) are accessible again in MySQL/InnoDB-4.1.3.

- When the private SQL parser of InnoDB was modified in MySQL/InnoDB-4.0.19 to allow the use of the apostrophe ("'") in table and column names, the fix relied on a previously unused function mem realloc(), whose implementation was incorrect. As a result, InnoDB can incorrectly parse column and table names as the empty string. The InnoDB realloc() implementation has been corrected in MySQL/InnoDB-4.1.3.

- In a clean-up of MySQL/InnoDB-4.1.2, the code for invalidating the query cache was broken. Now the query cache should be correctly invalidated for tables affected by ON UPDATE CASCADE or ON DELETE CASCADE constraints.

- Fixed a bug: in LIKE 'abc%' [796], the '%' did not match the empty string if the character set was not latin1_swedish_ci. This bug was fixed by changing the sorting order in these character sets. See the above note about data conversion in 4.1.3.

C.4.4 Changes in MySQL/InnoDB-4.1.2, May 30, 2004

Note

CRITICAL BUG in 4.1.2 if you specify innodb file per table in my.cnf on Unix. In crash recovery InnoDB skips the crash recovery for all .ibd files and those tables become CORRUPT! The symptom is a message Unable to lock ...ibd with lock 1, error: 9: fcntl: Bad file descriptor in the .err log in crash recovery.

Functionality added or changed:

- Support multiple character sets. Note that tables created in other collations than latin1_swedish_ci cannot be accessed in MySQL/InnoDB 4.0.

- Automatically create a suitable index on a FOREIGN KEY, if the user does not create one. Removes most of the cases of Error 1005 (errno 150) in table creation.

- Do not assert in log0log.c, line 856 if ib_logfiles are too small for innodb_thread_concurrency. Instead, print instructions how to adjust my.cnf and call exit(1).

- If MySQL tries to SELECT from an InnoDB table without setting any table locks, print a descriptive error message and assert; some subquery bugs were of this type.

- Permit a key-part length in InnoDB to be up to 3,500 bytes; this is needed so that you can create an index on a column with 255 UTF-8 characters.

- All new features from InnoDB-4.0.17, InnoDB-4.0.18, InnoDB-4.0.19 and InnoDB-4.0.20.

Bugs fixed:

- If you configure innodb additional mem pool size so small that InnoDB memory allocation spills over from it, then every 4 billionth spill may cause memory corruption. A symptom is a printout like the one following in the .err log.
- Improved portability to 64-bit platforms, especially Win64.
- Fixed an assertion failure when a purge of a table was not possible because of missing `.ibd` file.
- Fixed a bug: do not retrieve all columns in a table if we only need the 'ref' of the row (usually, the PRIMARY KEY) to calculate an ORDER BY. (Bug #1942)
- On Unix-like systems, obtain an exclusive advisory lock on InnoDB files, to prevent corruption when multiple instances of MySQL are running on the same set of data files. The Windows version of InnoDB currently takes a mandatory lock on the files. (Bug #3608)
- Added a missing space to the output format of SHOW INNODB STATUS; reported by Jocelyn Fournier.
- All bugfixes from InnoDB-4.0.17, InnoDB-4.0.18, InnoDB-4.0.19 and InnoDB-4.0.20.

### C.4.5 Changes in MySQL/InnoDB-4.0.20, May 18, 2004

**Bugs fixed:**

- Apostrophe characters now are recognized by the internal InnoDB parser and can be used within quoted table and column identifiers in FOREIGN KEY clauses.
- Make LOCK TABLE aware of InnoDB row-level locks and InnoDB aware of locks set with LOCK TABLE. (Bug #3299)
- Fixed race conditions in SHOW INNODB STATUS. (Bug #3596)

### C.4.6 Changes in MySQL/InnoDB-4.0.19, May 4, 2004

**Functionality added or changed:**

- Better error message when the server has to crash because the buffer pool is exhausted by the lock table or the adaptive hash index.
- Print always the count of pending `pread()` and `pwrite()` calls if there is a long semaphore wait.
- Improve space utilization when rows of 1,500 to 8,000 bytes are inserted in the order of the primary key.
- Remove potential buffer overflow errors by sending diagnostic output to stderr or files instead of stdout or fixed-size memory buffers. As a side effect, the output of SHOW INNODB STATUS is written to a file `<datadir>/innodb.status.<pid>` every 15 seconds.

**Bugs fixed:**

- Fixed a bug: DROP DATABASE did not work if FOREIGN KEY references were defined within the database. (Bug #3058)
- Remove unnecessary files, functions and variables. Many of these were needed in the standalone version of InnoDB. Remove debug functions and variables from nondebug build.
- Add diagnostic code to analyze an assertion failure in ha_innodb.cc on line 2020 reported by a user. (Bug #2903)
- Fixed a bug: in a FOREIGN KEY, ON UPDATE CASCADE was not triggered if the update changed a string to another value identical in alphabetic ordering, for example, "abc" -> "aBc".
- Protect the reading of the latest foreign key error explanation buffer with a mutex; in theory, a race condition could cause SHOW INNODB STATUS print garbage characters after the error info.
Changes in MySQL/InnoDB-4.0.18, February 13, 2004

- Fixed a bug: The row count and key cardinality estimate was grossly too small if each clustered index page only contained one record.

- Parse `CONSTRAINT FOREIGN KEY` correctly. (Bug #3332)

- Fixed a memory corruption bug on Windows. The bug is present in all InnoDB versions in Windows, but it depends on how the linker places a static array in `srv0srv.c`, whether the bug shows itself. 4 bytes were overwritten with a pointer to a statically allocated string 'get windows aio return value'.

- Fix a glitch reported by Philippe Lewicki on the general mailing list: do not print a warning to the `.err` log if `read_key` fails with a lock wait timeout error 146.

- Permit quotation marks to be embedded in strings in the private SQL parser of InnoDB, so that “"'" can be used in InnoDB table and column names. Display quotation marks within identifiers properly.

- Debugging: Permit `UNIV_SYNC_DEBUG` to be disabled while `UNIV_DEBUG` is enabled.

- Debugging: Handle magic numbers in a more consistent way.

C.4.7 Changes in MySQL/InnoDB-4.0.18, February 13, 2004

- Do not allow dropping a table referenced by a `FOREIGN KEY` constraint, unless the user does `SET foreign_key_checks = 0`. The error message here is somewhat misleading “Cannot delete or update a parent row...,” and must be changed in a future version 4.1.x.

- Make InnoDB to remember the `CONSTRAINT` name given by a user for a `FOREIGN KEY`.

- Change the print format of `FOREIGN KEY` constraints spanning multiple databases to `db_name.tbl_name`. But when parsing them, we must also accept `db_name.tbl_name`, because that was the output format in < 4.0.18.

- An optimization in locking: If `autocommit = 1`, then we do not need to make a plain `SELECT` set shared locks even on the `SERIALIZABLE` isolation level, because we know that the transaction is read only. A read-only transaction can always be performed on the `REPEATABLE READ` level, and that does not endanger the serializability.

- Implement an automatic downgrade from >= 4.1.1 -> 4.0.18 if the user has not created tables in `.ibd` files or used other 4.1.x features. Consult the manual section on `multiple tablespaces` carefully if you want to downgrade!

- Fixed a bug: MySQL should not allow `REPLACE` to internally perform an `UPDATE` if the table is referenced by a `FOREIGN KEY`. The MySQL manual states that `REPLACE` must resolve a duplicate-key error semantically with `DELETE + INSERT`, and not by an `UPDATE`. In versions < 4.0.18 and < 4.1.2, MySQL could resolve a duplicate key conflict in `REPLACE` by doing an `UPDATE` on the existing row, and `FOREIGN KEY` checks could behave in a semantically wrong way. (Bug #2418)

- Fixed a bug: generate `FOREIGN KEY` constraint identifiers locally for each table, in the form `db_name.tbl_name_ibfk_number`. If the user gives the constraint name explicitly, then remember it. These changes should ensure that foreign key id's in a slave are the same as in the master, and DROP `FOREIGN KEY` does not break replication. (Bug #2167)

- Fixed a bug: allow quoting of identifiers in InnoDB's `FOREIGN KEY` definitions with a backtick ('`) and a double quote (`"`). You can now use also spaces in table and column names, if you quote the identifiers. (Bug #1725, Bug #2424)

- Fixed a bug: `FOREIGN KEY ... ON UPDATE/DELETE NO ACTION` must check the foreign key constraint, not ignore it. Since we do not have deferred constraints in InnoDB, this bugfix makes InnoDB to check `NO ACTION` constraints immediately, like it checks `RESTRICT` constraints.
Changes in MySQL/InnoDB-5.0.0, December 24, 2003

- **Fixed a bug:** InnoDB crashed in RENAME TABLE if `db_name.tbl_name` is shorter than 5 characters. (Bug #2689)

- **Fixed a bug:** In SHOW TABLE STATUS, InnoDB row count and index cardinality estimates wrapped around at 512 million in 32-bit computers. Note that unless MySQL is compiled with the `big_tables` option, they still wrap around at 4 billion.

- **Fixed a bug:** If there was a UNIQUE secondary index, and NULL values in that unique index, then with the IS NULL [775] predicate, InnoDB returned only the first matching row, though there can be many. This bug was introduced in 4.0.16. (Bug #2483)

C.4.8 Changes in MySQL/InnoDB-5.0.0, December 24, 2003

- **Important note:** If you upgrade to MySQL 4.1.1 or higher, it is difficult to downgrade back to 4.0 or 4.1.0! That is because, for earlier versions, InnoDB is not aware of multiple tablespaces.

- InnoDB in 5.0.0 is essentially the same as InnoDB-4.1.1 with the bugfixes of InnoDB-4.0.17 included.

C.4.9 Changes in MySQL/InnoDB-4.0.17, December 17, 2003

- Fixed a bug: If you created a column prefix secondary index and updated it so that the last characters in the column prefix were spaces, InnoDB would assert in `row0upd.c`, line 713. The same assertion failed if you updated a column in an ordinary secondary index so that the new value was alphabetically equivalent, but had a different length. This could happen, for example, in the UTF8 character set if you updated a letter to its accented or umlaut form.

- Fixed a bug: InnoDB could think that a secondary index record was not locked though it had been updated to an alphabetically equivalent value, for example, 'abc' -> 'aBc'.

- Fixed a bug: If you updated a secondary index column to an alphabetically equivalent value, and rolled back your update, InnoDB failed to restore the field in the secondary index to its original value.

- There are still several outstanding noncritical bugs reported in the MySQL bugs database. Their fixing has been delayed, because resources were allocated to the 4.1.1 release.

C.4.10 Changes in MySQL/InnoDB-4.1.1, December 4, 2003

- **Important note:** If you upgrade to MySQL 4.1.1 or higher, you cannot downgrade to a version lower than 4.1.1 any more! That is because, for earlier versions, InnoDB is not aware of multiple tablespaces.

- Multiple tablespaces now available for InnoDB. You can store each InnoDB type table and its indexes into a separate .ibd file into a MySQL database directory, into the same directory where the .frm file is stored.

- The MySQL query cache now works for InnoDB tables also if `autocommit` = 0, or the statements are enclosed inside BEGIN ... COMMIT.

- Reduced InnoDB memory consumption by a few megabytes if one sets the buffer pool size < 8MB.

- You can use raw disk partitions also in Windows.

C.4.11 Changes in MySQL/InnoDB-4.0.16, October 22, 2003

- Fixed a bug: in contrary to what was said in the manual, in a locking read InnoDB set two record locks if a unique exact match search condition was used on a multi-column unique key. For a single column unique key it worked right.
Changes in MySQL/InnoDB-3.23.58, September 15, 2003

• Fixed a bug: If you used the rename trick `#sql... -> rsql...` to recover a temporary table, InnoDB asserted in `row_mysql_lock_data_dictionary()`.

• There are several outstanding noncritical bugs reported in the MySQL bugs database. Their fixing has been delayed, because resources are allocated to the upcoming 4.1.1 release.

C.4.12 Changes in MySQL/InnoDB-3.23.58, September 15, 2003

• Fixed a bug: InnoDB could make the index page directory corrupt in the first B-tree page splits after `mysqld` startup. A symptom would be an assertion failure in `page0page.c`, in function `page_dir_find_slot()`.

• Fixed a bug: InnoDB could in rare cases return an extraneous row if a rollback, purge, and a `SELECT` coincided.

• Fixed a possible hang over the `btr0sea.c` latch if `SELECT` was used inside `LOCK TABLES`.

• Fixed a bug: If a single `DELETE` statement first managed to delete some rows and then failed in a `FOREIGN KEY` error or a `Table is full` error, MySQL did not roll back the whole SQL statement as it should.

C.4.13 Changes in MySQL/InnoDB-4.0.15, September 10, 2003

• Fixed a bug: If you updated a row so that the 8000 byte maximum length (without BLOB and TEXT) was exceeded, InnoDB simply removed the record from the clustered index. In a similar insert, InnoDB would leak reserved file space extents, which would only be freed at the next `mysqld` startup.

• Fixed a bug: If you used big BLOB values, and your log files were relatively small, InnoDB could in a big BLOB operation temporarily write over the log produced after the latest checkpoint. If InnoDB would crash at that moment, then the crash recovery would fail, because InnoDB would not be able to scan the log even up to the latest checkpoint. Starting from this version, InnoDB tries to ensure the latest checkpoint is young enough. If that is not possible, InnoDB prints a warning to the .err log of MySQL and advises you to make the log files bigger.

• Fixed a bug: setting `innodb_fast_shutdown = 0` had no effect.

• Fixed a bug introduced in 4.0.13: If a `CREATE TABLE` ended in a comment, that could cause a memory overrun.

• Fixed a bug: If InnoDB printed `Operating system error number .. in a file operation` to the .err log in Windows, the error number explanation was wrong. Workaround: See Section 13.2.13.2, “Operating System Error Codes”, about Windows error numbers.

• Fixed a bug: If you created a column prefix PRIMARY KEY like in `t(a CHAR(200), PRIMARY KEY (a(10)))` on a fixed-length CHAR column, InnoDB would crash even in a simple `SELECT`. A CHECK TABLE would report the table as corrupt, also in the case where the created key was not PRIMARY.

• InnoDB now supports the `SAVEPOINT` and `ROLLBACK TO SAVEPOINT` SQL statements. For the syntax, see Section 12.3.4, “SAVEPOINT and ROLLBACK TO SAVEPOINT Syntax”, and Section 12.3.1, “START TRANSACTION, COMMIT, and ROLLBACK Syntax”.

• You can now create column prefix keys like in `CREATE TABLE t (a BLOB, INDEX (a(10)))`.

• You can also use `O_DIRECT` as the `innodb_flush_method` on the latest versions of Linux and FreeBSD. Beware of possible bugs in those operating systems, though.
• Fixed the checksum calculation of data pages. Previously most OS file system corruption went unnoticed. Note that if you downgrade from version 4.0.14 or up to a version earlier than 4.0.14, InnoDB prints warnings in the first startup:

```
InnoDB: Warning: An inconsistent page in the doublewrite buffer
InnoDB: space id 2552202359 page number 8245, 127'th page in dblwr buf.
```

but that is not dangerous and can be ignored.

• Modified the buffer pool replacement algorithm so that it tries to flush modified pages if there are no replaceable pages in the last 10% of the LRU list. This can reduce disk I/O if the workload is a mixture of reads and writes.

• The buffer pool checkpoint flush algorithm now tries to flush also close neighbors of the page at the end of the flush list. This can speed up database shutdown, and can also speed up disk writes if InnoDB log files are very small compared to the buffer pool size.

• In 4.0.13 we made `SHOW INNODB STATUS` to print detailed info on the latest UNIQUE KEY error, but storing that information could slow down REPLACE significantly. We no longer store or print the info.

• Fixed a bug: `SET foreign_key_checks = 0` was not replicated properly in the MySQL replication. The fix will not be backported to 3.23.

• Fixed a bug: the parameter `innodb_max_dirty_pages_pct` forgot to take into account the free pages in the buffer pool. This could lead to excessive flushing even though there were lots of free pages in the buffer pool. Workaround: `SET GLOBAL innodb_max_dirty_pages_pct = 100`.

• Fixed a bug: If there were big index scans then a file read request could starve and InnoDB could assert because of a very long semaphore wait.

• Fixed a bug: If `autocommit = 1` then inside `LOCK TABLES` MySQL failed to do the commit after an updating SQL statement if binary logging was not on, and for `SELECT` statements did not commit regardless of binary logging state.

• Fixed a bug: InnoDB could make the index page directory corrupt in the first B-tree page splits after a `mysqlld` startup. A symptom would be an assertion in page0page.c, in function page_dir_find_slot().

• Fixed a bug: If in a FOREIGN KEY with an UPDATE CASCADE clause the parent column was of a different internal storage length than the child column, then a cascaded update would make the column length wrong in the child table and corrupt the child table. Because of MySQL's 'silent column specification changes' a fixed-length CHAR column can change internally to a VARCHAR and cause this error.

• Fixed a bug: If a non-latin1 character set was used and if in a FOREIGN KEY the parent column was of a different internal storage length than the child column, then all inserts to the child table would fail in a foreign key error.

• Fixed a bug: InnoDB could complain that it cannot find the clustered index record, or in rare cases return an extraneous row if a rollback, purge, and a `SELECT` coincided.

• Fixed a possible hang over the btr0sea.c latch if `SELECT was used inside LOCK TABLES`.

• Fixed a bug: contrary to what the release note of 4.0.13 said, the group commit still did not work if the MySQL binary logging was on.

• Fixed a bug: os_event_wait() did not work properly in Unix, which might have caused starvation in various log operations.
• Fixed a bug: If a single `DELETE` statement first managed to delete some rows and then failed in a `FOREIGN KEY` error or a `Table is full` error, MySQL did not roll back the whole SQL statement as it should, and also wrote the failed statement to the binary log, reporting there a nonzero `error_code`.

• Fixed a bug: the maximum permitted number of columns in a table is 1000, but InnoDB did not check that limit in `CREATE TABLE`, and a subsequent `INSERT` or `SELECT` from that table could cause an assertion.

C.4.15 Changes in MySQL/InnoDB-3.23.57, June 20, 2003

• Changed the default value of `innodb_flush_log_at_trx_commit` from 0 to 1. If you have not specified it explicitly in your `my.cnf`, and your application runs much slower with this new release, it is because the value 1 causes a log flush to disk at each transaction commit.

• Fixed a bug: InnoDB forgot to call `pthread_mutex_destroy()` when a table was dropped. That could cause memory leakage on FreeBSD and other non-Linux Unixes.

• Fixed a bug: MySQL could erroneously return 'Empty set' if InnoDB estimated an index range size to 0 records though the range was not empty; MySQL also failed to do the next-key locking in the case of an empty index range.

• Fixed a bug: `GROUP BY` and `DISTINCT` could treat NULL values unequal.

C.4.16 Changes in MySQL/InnoDB-4.0.13, May 20, 2003

• InnoDB now supports `ALTER TABLE DROP FOREIGN KEY`. You have to use `SHOW CREATE TABLE` to find the internally generated foreign key ID when you want to drop a foreign key.

• `SHOW INNODB STATUS` now prints detailed information of the latest detected `FOREIGN KEY` and `UNIQUE KEY` errors. If you do not understand why InnoDB gives the error 150 from a `CREATE TABLE`, you can use this statement to study the reason.

• `ANALYZE TABLE` now works also for InnoDB type tables. It makes eight random dives to each of the index trees and updates index cardinality estimates accordingly. Note that because these are only estimates, repeated runs of `ANALYZE TABLE` may produce different numbers. MySQL uses index cardinality estimates only in join optimization. If some join is not optimized in the right way, you may try using `ANALYZE TABLE`.

• InnoDB group commit capability now works also when MySQL binary logging is switched on. There have to be > 2 client threads for the group commit to become active.

• Changed the default value of `innodb_flush_log_at_trx_commit` from 0 to 1. If you have not specified it explicitly in your `my.cnf`, and your application runs much slower with this new release, it is because the value 1 causes a log flush to disk at each transaction commit.

• Added a new global settable MySQL system variable `innodb_max_dirty_pages_pct`. It is an integer in the range 0 - 100. The default is 90. The main thread in InnoDB tries to flush pages from the buffer pool so that at most this many percents are not yet flushed at any time.

• If `innodb_force_recovery=6`, do not let InnoDB do repair of corrupt pages based on the doublewrite buffer.

• InnoDB startup now happens faster because it does not set the memory in the buffer pool to zero.

• Fixed a bug: The InnoDB parser for `FOREIGN KEY` definitions was confused by the keywords ‘foreign key’ inside MySQL comments.
• Fixed a bug: If you dropped a table to which there was a FOREIGN KEY reference, and later created the same table with nonmatching data types, InnoDB could assert in dict0load.c, in function dict_load_table().

• Fixed a bug: GROUP BY and DISTINCT could treat NULL values as not equal. MySQL also failed to do the next-key locking in the case of an empty index range.

• Fixed a bug: Do not commit the current transaction when a MyISAM table is updated; this also makes CREATE TABLE not to commit an InnoDB transaction, even when binary logging is enabled.

• Fixed a bug: We did not allow ON DELETE SET NULL to modify the same table where the delete was made; we can allow it because that cannot produce infinite loops in cascaded operations.

• Fixed a bug: Enable HANDLER PREV and NEXT also after positioning the cursor with a unique search on the primary key.

• Fixed a bug: If MIN() or MAX() resulted in a deadlock or a lock wait timeout, MySQL did not return an error, but returned NULL as the function value.

• Fixed a bug: InnoDB forgot to call pthread_mutex_destroy() when a table was dropped. That could cause memory leakage on FreeBSD and other non-Linux Unix systems.

C.4.17 Changes in MySQL/InnoDB-4.1.0, April 3, 2003

• InnoDB now supports up to 64GB of buffer pool memory in a Windows 32-bit Intel computer. This is possible because InnoDB can use the AWE extension of Windows to address memory over the 4GB limit of a 32-bit process. A new startup variable innodb_buffer_pool_awe_mem_mb enables AWE and sets the size of the buffer pool in megabytes.

• Reduced the size of buffer headers and the lock table. InnoDB uses 2% less memory.

C.4.18 Changes in MySQL/InnoDB-3.23.56, March 17, 2003

• Fixed a major bug in InnoDB query optimization: queries of type SELECT ... WHERE indexcolumn < x and SELECT ... WHERE indexcolumn > x could cause a table scan even if the selectivity would have been very good.

• Fixed a potential bug if MySQL calls store_lock with TL_IGNORE in the middle of a query.

C.4.19 Changes in MySQL/InnoDB-4.0.12, March 18, 2003

• In crash recovery InnoDB now prints the progress in percents of a transaction rollback.

• Fixed a bug/feature: If your application program used mysql_use_result(), and used >= 2 connections to send SQL queries, it could deadlock on the adaptive hash S-latch in btr0sea.c. Now mysqld releases the S-latch whenever it passes data from a SELECT to the client.

• Fixed a bug: MySQL could erroneously return 'Empty set' if InnoDB estimated an index range size to 0 records though the range was not empty; MySQL also failed to do the next-key locking in the case of an empty index range.

C.4.20 Changes in MySQL/InnoDB-4.0.11, February 25, 2003

• Fixed a bug introduced in 4.0.10: SELECT ... FROM ... ORDER BY ... DESC could hang in an infinite loop.

• An outstanding bug: SET foreign_key_checks = 0 is not replicated properly in the MySQL replication.
C.4.21 Changes in MySQL/InnoDB-4.0.10, February 4, 2003

• In INSERT INTO t1 SELECT ... FROM t2 WHERE ... MySQL previously set a table level read lock on t2. This lock is now removed.

• Increased SHOW INNODB STATUS maximum printed length to 200KB.

• Fixed a major bug in InnoDB query optimization: queries of type SELECT ... WHERE indexcolumn < x and SELECT ... WHERE indexcolumn > x could cause a table scan even if the selectivity would have been very good.

• Fixed a bug: purge could cause a hang in a BLOB table where the primary key index tree was of height 1. Symptom: semaphore waits caused by an X-latch set in btr_free_externally_stored_field().

• Fixed a bug: using InnoDB HANDLER commands on a fresh handle crashed mysqld in ha_innodb::change_active_index().

• Fixed a bug: If MySQL estimated a query in the middle of a SELECT statement, InnoDB could hang on the adaptive hash index latch in btr0sea.c.

• Fixed a bug: InnoDB could report table corruption and assert in page_dir_find_owner_slot() if an adaptive hash index search coincided with purge or an insert.

• Fixed a bug: some file system snapshot tool in Windows 2000 could cause an InnoDB file write to fail with error 33 ERROR_LOCK_VIOLATION. In synchronous writes InnoDB now retries the write 100 times at 1 second intervals.

• Fixed a bug: REPLACE INTO t1 SELECT ... did not work if t1 has an AUTO_INCREMENT column.

• An outstanding bug: SET foreign_key_checks = 0 is not replicated properly in the MySQL replication.

C.4.22 Changes in MySQL/InnoDB-3.23.55, January 24, 2003

• In INSERT INTO t1 SELECT ... FROM t2 WHERE ... MySQL previously set a table level read lock on t2. This lock is now removed.

• Fixed a bug: If the combined size of InnoDB log files was >= 2GB in a 32-bit computer, InnoDB would write log in a wrong position. That could make crash recovery and InnoDB Hot Backup to fail in log scan.

• Fixed a bug: index cursor restoration could theoretically fail.

• Fixed a bug: an assertion in btr0sea.c, in function btr_search_info_update_slow could theoretically fail in a race of 3 threads.

• Fixed a bug: purge could cause a hang in a BLOB table where the primary key index tree was of height 1. Symptom: semaphore waits caused by an X-latch set in btr_free_externally_stored_field().

• Fixed a bug: If MySQL estimated a query in the middle of a SELECT statement, InnoDB could hang on the adaptive hash index latch in btr0sea.c.

• Fixed a bug: InnoDB could report table corruption and assert in page_dir_find_owner_slot() if an adaptive hash index search coincided with purge or an insert.

• Fixed a bug: some file system snapshot tool in Windows 2000 could cause an InnoDB file write to fail with error 33 ERROR_LOCK_VIOLATION. In synchronous writes InnoDB now retries the write 100 times at 1 second intervals.
• An outstanding bug: `SET foreign_key_checks = 0` is not replicated properly in the MySQL replication. The fix appears in 4.0.11 and probably will not be backported to 3.23.

• Fixed bug in `InnoDB page0cur.c` file in function `page_cur_search_with_match` which caused `InnoDB` to remain on the same page forever. This bug is evident only in tables with more than one page.

C.4.23 Changes in MySQL/InnoDB-4.0.9, January 14, 2003

• Removed the warning message: ‘InnoDB: Out of memory in additional memory pool.’

• Fixed a bug: If the combined size of `InnoDB` log files was >= 2GB in a 32-bit computer, `InnoDB` would write log in a wrong position. That could make crash recovery and `InnoDB Hot Backup` to fail.

• Fixed a bug: index cursor restoration could theoretically fail.

C.4.24 Changes in MySQL/InnoDB-4.0.8, January 7, 2003

• `InnoDB` now supports also `FOREIGN KEY (...) REFERENCES ...(...) [ON UPDATE CASCADE | ON UPDATE SET NULL | ON UPDATE RESTRICT | ON UPDATE NO ACTION].`

• Tables and indexes now reserve 4% less space in the tablespace. Also existing tables reserve less space. By upgrading to 4.0.8 you should see more free space in “InnoDB free” in SHOW TABLE STATUS.

• Fixed bugs: updating the PRIMARY KEY of a row would generate a foreign key error on all FOREIGN KEYS which referenced secondary keys of the row to be updated. Also, if a referencing FOREIGN KEY constraint only referenced the first columns in an index, and there were more columns in that index, updating the additional columns generated a foreign key error.

• Fixed a bug: If an index contains some column twice, and that column is updated, the table becomes corrupt. From now on `InnoDB` prevents creation of such indexes.

• Fixed a bug: removed superfluous error 149 and 150 printouts from the .err log when a locking SELECT caused a deadlock or a lock wait timeout.

• Fixed a bug: an assertion in btr0sea.c, in function `btr_search_info_update_slow` could theoretically fail in a race of 3 threads.

• Fixed a bug: one could not switch a session transaction isolation level back to REPEATABLE READ after setting it to something else.

C.4.25 Changes in MySQL/InnoDB-4.0.7, December 26, 2002

• `InnoDB` in 4.0.7 is essentially the same as in 4.0.6.

C.4.26 Changes in MySQL/InnoDB-4.0.6, December 19, 2002

• Since `innodb_log_arch_dir` has no relevance under MySQL, there is no need to specify it any more in `my.cnf`.

• `LOAD DATA INFILE` in `autocommit = 1` mode no longer does implicit commits for each 1MB of written binary log.

• Fixed a bug introduced in 4.0.4: `LOCK TABLES ... READ LOCAL` should not set row locks on the rows read. This caused deadlocks and lock wait timeouts in `mysqldump`.

• Fixed two bugs introduced in 4.0.4: in `AUTO_INCREMENT`, REPLACE could cause the counter to be left 1 too low. A deadlock or a lock wait timeout could cause the same problem.
Changes in MySQL/InnoDB-3.23.54, December 12, 2002

• Fixed a bug: TRUNCATE on a TEMPORARY table crashed InnoDB.

• Fixed a bug introduced in 4.0.5: If binary logging was not switched on, INSERT INTO ... SELECT ... or CREATE TABLE ... SELECT ... could cause InnoDB to hang on a semaphore created in btr0sea.c, line 128. Workaround: switch binary logging on.

• Fixed a bug: in replication issuing STOP SLAVE in the middle of a multiple-statement transaction could cause that START SLAVE would only perform a part of the transaction. A similar error could occur if the slave crashed and was restarted.

C.4.27 Changes in MySQL/InnoDB-3.23.54, December 12, 2002

• Fixed a bug: the InnoDB range estimator greatly exaggerated the size of a short index range if the paths to the endpoints of the range in the index tree happened to branch in the root. This could cause unnecessary table scans in SQL queries.

• Fixed a bug: ORDER BY could fail if you had not created a primary key to a table, but had defined several indexes of which at least one was a UNIQUE index with all its columns declared as NOT NULL.

• Fixed a bug: a lock wait timeout in connection with ON DELETE CASCADE could cause corruption in indexes.

• Fixed a bug: If a SELECT was done with a unique key from a primary index, and the search matched to a delete-marked record, InnoDB could erroneously return the NEXT record.

• Fixed a bug introduced in 3.23.53: LOCK TABLES ... READ LOCAL should not set row locks on the rows read. This caused deadlocks and lock wait timeouts in mysqldump.

• Fixed a bug: If an index contains some column twice, and that column is updated, the table becomes corrupt. From now on InnoDB prevents creation of such indexes.

C.4.28 Changes in MySQL/InnoDB-4.0.5, November 18, 2002

• InnoDB now supports also transaction isolation levels READ COMMITTED and READ UNCOMMITTED. READ COMMITTED more closely emulates Oracle and makes porting of applications from Oracle to MySQL easier.

• Deadlock resolution is now selective: we try to pick as victims transactions with less modified or inserted rows.

• FOREIGN KEY definitions are now aware of the lower_case_table_names setting in my.cnf.

• SHOW CREATE TABLE does not output the database name to a FOREIGN KEY definition if the referred table is in the same database as the table.

• InnoDB does a consistency check to most index pages before writing them to a data file.

• If you set innodb_force_recovery > 0, InnoDB tries to jump over corrupt index records and pages when doing SELECT * FROM table. This helps in dumping.

• InnoDB now again uses asynchronous unbuffered I/O in Windows 2000 and XP; only unbuffered simulated async I/O in NT, 95/98/ME.

• Fixed a bug: the InnoDB range estimator greatly exaggerated the size of a short index range if the paths to the endpoints of the range in the index tree happened to branch in the root. This could cause unnecessary table scans in SQL queries. The fix is also backported to 3.23.54.

• Fixed a bug present in 3.23.52, 4.0.3, 4.0.4: InnoDB startup could take very long or even crash on some Windows 95/98/ME computers.
Changes in MySQL/InnoDB-3.23.53, October 9, 2002

- Fixed a bug: the AUTO-INC lock was held to the end of the transaction if it was granted after a lock wait. This could cause unnecessary deadlocks.

- Fixed a bug: If SHOW INNODB STATUS, innodb_monitor, or innodb_lock_monitor had to print several hundred transactions in one report, and the output became truncated, InnoDB would hang, printing to the error log many waits for a mutex created at srv0srv.c, line 1621.

- Fixed a bug: SHOW INNODB STATUS on Unix always reported average file read size as 0 bytes.

- Fixed a potential bug in 4.0.4: InnoDB now does ORDER BY ... DESC like MyISAM.

- Fixed a bug: DROP TABLE could cause crash or a hang if there was a rollback concurrently running on the table. The fix will be backported to 3.23 only if this appears a real problem for users.

- Fixed a bug: ORDER BY could fail if you had not created a primary key to a table, but had defined several indexes of which at least one was a UNIQUE index with all its columns declared as NOT NULL.

- Fixed a bug: a lock wait timeout in connection with ON DELETE CASCADE could cause corruption in indexes.

- Fixed a bug: If a SELECT was done with a unique key from a primary index, and the search matched to a delete-marked record, InnoDB could return the NEXT record.

- Outstanding bugs: in 4.0.4 two bugs were introduced to AUTO_INCREMENT. REPLACE can cause the counter to be left 1 too low. A deadlock or a lock wait timeout can cause the same problem. These are fixed in 4.0.6.

C.4.29 Changes in MySQL/InnoDB-3.23.53, October 9, 2002

- We again use unbuffered disk I/O to data files in Windows. Windows XP and Windows 2000 read performance seems to be very poor with normal I/O.

- Tuned range estimator so that index range scans are preferred over full index scans.

- Enable dropping and creating a table even if innodb_force_recovery is set. One can use this to drop a table which would cause a crash in rollback or purge, or if a failed table import causes a runaway rollback in recovery.

- Fixed a bug present in 3.23.52, 4.0.3, 4.0.4: InnoDB startup could take very long or even crash on some Windows 95/98/ME computers.

- Fixed a bug: fast shutdown (which is the default) sometimes was slowed down by purge and insert buffer merge.

- Fixed a bug: doing a big SELECT from a table where no rows were visible in a consistent read could cause a very long (> 600 seconds) semaphore wait in btr0cur.c line 310.

- Fixed a bug: the AUTO-INC lock was held to the end of the transaction if it was granted after a lock wait. This could cause unnecessary deadlocks.

- Fixed a bug: If you created a temporary table inside LOCK TABLES, and used that temporary table, that caused an assertion failure in ha_innobase.cc.

- Fixed a bug: If SHOW INNODB STATUS, innodb_monitor, or innodb_lock_monitor had to print several hundred transactions in one report, and the output became truncated, InnoDB would hang, printing to the error log many waits for a mutex created at srv0srv.c, line 1621.

- Fixed a bug: SHOW INNODB STATUS on Unix always reported average file read size as 0 bytes.
### C.4.30 Changes in MySQL/InnoDB-4.0.4, October 2, 2002

- We again use unbuffered disk I/O in Windows. Windows XP and Windows 2000 read performance seems to be very poor with normal I/O.

- Increased the maximum key length of InnoDB tables from 500 to 1024 bytes.

- Increased the table comment field in SHOW TABLE STATUS so that up to 16000 characters of foreign key definitions can be printed there.

- The auto-increment counter is no longer incremented if an insert of a row immediately fails in an error.

- Enable dropping and creating a table even if innodb_force_recovery is set. One can use this to drop a table which would cause a crash in rollback or purge, or if a failed table import causes a runaway rollback in recovery.

- Fixed a bug: Using ORDER BY primarykey DESC in 4.0.3 causes an assertion failure in btr0pcur.c, line 203.

- Fixed a bug: fast shutdown (which is the default) sometimes was slowed down by purge and insert buffer merge.

- Fixed a bug: doing a big SELECT from a table where no rows were visible in a consistent read could cause a very long (> 600 seconds) semaphore wait in btr0cur.c line 310.

- Fixed a bug: If the MySQL query cache was used, it did not get invalidated by a modification done by ON DELETE CASCADE or ...SET NULL.

- Fixed a bug: If you created a temporary table inside LOCK TABLES, and used that temporary table, that caused an assertion failure in ha_innodb.cc.

- Fixed a bug: If you set innodb_flush_log_at_trx_commit to 1, SHOW VARIABLES would show its value as 16 million.

### C.4.31 Changes in MySQL/InnoDB-4.0.3, August 28, 2002

- Removed unnecessary deadlocks when inserts have to wait for a locking read, update, or delete to release its next-key lock.

- The MySQL HANDLER SQL statements now work also for InnoDB type tables. InnoDB does the HANDLER reads always as consistent reads. HANDLER is a direct access path to read individual indexes of tables. In some cases, HANDLER can be used as a substitute of server-side cursors.

- Fixed a bug in 4.0.2: even a simple insert could crash the AIX version.

- Fixed a bug: If you used in a table name characters whose code is > 127, in DROP TABLE InnoDB could assert on line 155 of pars0sym.c.

- Compilation from source now provides a working version both on HP-UX-11 and HP-UX-10.20. The source of 4.0.2 worked only on 11, and the source of 3.23.52 only on 10.20.

- Fixed a bug: If compiled on 64-bit Solaris, InnoDB produced a bus error at startup.

### C.4.32 Changes in MySQL/InnoDB-3.23.52, August 16, 2002

- The feature set of 3.23 is frozen from this version on. New features go the 4.0 branch, and only bugfixes are made to the 3.23 branch.
Changes in MySQL/InnoDB-3.23.52, August 16, 2002

- Many CPU-bound join queries now run faster. On Windows also many other CPU-bound queries run faster.

- A new SQL statement SHOW INNODB STATUS returns the output of the InnoDB Monitor to the client. The InnoDB Monitor now prints detailed information on the latest detected deadlock.

- InnoDB made the SQL query optimizer to avoid too much index-only range scans and choose full table scans instead. This is now fixed.

- BEGIN and COMMIT are now added in the binary log around transactions. The MySQL replication now respects transaction borders: a user no longer sees half transactions in replication slaves.

- A replication slave now prints in crash recovery the last master binary log position it was able to recover to.

- A new setting innodb_flush_log_at_trx_commit=2 makes InnoDB to write the log to the operating system file cache at each commit. This is almost as fast as the setting innodb_flush_log_at_trx_commit = 0, and the setting 2 also has the nice feature that in a crash where the operating system does not crash, no committed transaction is lost. If the operating system crashes or there is a power outage, then the setting 2 is no safer than the setting 0.

- Added checksum fields to log blocks.

- SET foreign_key_checks = 0 helps in importing tables in an arbitrary order which does not respect the foreign key rules.

- SET unique_checks = 0 speeds up table imports into InnoDB if you have UNIQUE constraints on secondary indexes. This flag should be used only if you are certain that the input records contain no UNIQUE constraint violations.

- SHOW TABLE STATUS now lists also possible ON DELETE CASCADE or ON DELETE SET NULL in the comment field of the table.

- When CHECK TABLE is run on any InnoDB type table, it now checks also the adaptive hash index for all tables.

- If you defined ON DELETE CASCADE or SET NULL and updated the referenced key in the parent row, InnoDB deleted or updated the child row. This is now changed to conform to standard SQL: you get the error 'Cannot delete parent row'.

- Improved the auto-increment algorithm: now the first insert or SHOW TABLE STATUS initializes the auto-increment counter for the table. This removes almost all surprising deadlocks caused by SHOW TABLE STATUS.

- Aligned some buffers used in reading and writing to data files. This enables using unbuffered raw devices as data files in Linux.

- Fixed a bug: If you updated the primary key of a table so that only the case of characters changed, that could cause assertion failures, mostly in page0page.ic line 515.

- Fixed a bug: If you delete or update a row referenced in a foreign key constraint and the foreign key check has to wait for a lock, then the check may report an erroneous result. This affects also the ON DELETE... operation.

- Fixed a bug: A deadlock or a lock wait timeout error in InnoDB causes InnoDB to roll back the whole transaction, but MySQL could still write the earlier SQL statements to the binary log, even though InnoDB rolled them back. This could, for example, cause replicated databases to get out-of-sync.
• Fixed a bug: If the database happened to crash in the middle of a commit, then the recovery might leak tablespace pages.

• Fixed a bug: If you specified a non-\texttt{latin1} character set in my.cnf, then, in contrary to what is stated in the manual, in a foreign key constraint a string type column had to have the same length specification in the referencing table and the referenced table.

• Fixed a bug: DROP TABLE or DROP DATABASE could fail if there simultaneously was a CREATE TABLE running.

• Fixed a bug: If you configured the buffer pool bigger than 2GB in a 32-bit computer, \texttt{InnoDB} would assert in \texttt{buf0buf.ic} line 214.

• Fixed a bug: on 64-bit computers updating rows which contained the SQL NULL in some column could cause the undo log and the ordinary log to become corrupt.

• Fixed a bug: \texttt{innodb\_log\_monitor} caused a hang if it suppressed lock prints for a page.

• Fixed a bug: in the HP-UX-10.20 version mutexes would leak and cause race conditions and crashes in any part of \texttt{InnoDB} code.

• Fixed a bug: If you ran in the \texttt{autocommit} mode, executed a SELECT, and immediately after that a RENAME TABLE, then RENAME would fail and MySQL would complain about error 1192.

• Fixed a bug: If compiled on 64-bit Solaris, \texttt{InnoDB} produced a bus error at startup.

\textbf{C.4.33 Changes in MySQL/InnoDB-4.0.2, July 10, 2002}

• \texttt{InnoDB} is essentially the same as InnoDB-3.23.51.

• If no \texttt{innodb\_data\_file\_path} is specified, \texttt{InnoDB} at the database creation now creates a 10MB auto-extending data file \texttt{ibdata1} to the datadir of MySQL. In 4.0.1 the file was 64MB and not auto-extending.

\textbf{C.4.34 Changes in MySQL/InnoDB-3.23.51, June 12, 2002}

• Fixed a bug: a join could result in a segmentation fault in copying of a BLOB or TEXT column if some of the BLOB or TEXT columns in the table contained SQL NULL values.

• Fixed a bug: If you added self-referential foreign key constraints with ON DELETE CASCADE to tables and a row deletion caused \texttt{InnoDB} to attempt the deletion of the same row twice because of a cascading delete, then you got an assertion failure.

• Fixed a bug: If you use MySQL 'user-level locks' and close a connection, then \texttt{InnoDB} may assert in \texttt{ha\_innobase.cc}, line 302.

\textbf{C.4.35 Changes in MySQL/InnoDB-3.23.50, April 23, 2002}

• \texttt{InnoDB} now supports an auto-extending last data file. You do not need to preallocate the whole data file at the database startup.

• Made several changes to facilitate the use of the \texttt{InnoDB Hot Backup} tool. It is a separate nonfree tool you can use to take online backups of your database without shutting down the server or setting any locks.

• If you want to run the \texttt{InnoDB Hot Backup} tool on an auto-extending data file you have to upgrade it to version ibbackup-0.35.

• The log scan phase in crash recovery now runs much faster.
Starting from this server version, the hot backup tool truncates unused ends in the backup InnoDB data files.

To allow the hot backup tool to work, on Windows we no longer use unbuffered I/O or native async I/O; instead we use the same simulated async I/O as on Unix.

You can now define the ON DELETE CASCADE or ON DELETE SET NULL clause on foreign keys.

FOREIGN KEY constraints now survive ALTER TABLE and CREATE INDEX.

We suppress the FOREIGN KEY check if any of the column values in the foreign key or referenced key to be checked is the SQL NULL. This is compatible with Oracle, for example.

SHOW CREATE TABLE now lists also foreign key constraints. Also mysqldump no longer forgets about foreign keys in table definitions.

You can now add a new foreign key constraint with ALTER TABLE ... ADD CONSTRAINT FOREIGN KEY (...) REFERENCES ... (...).

FOREIGN KEY definitions now allow backticks around table and column names.

MySQL command SET TRANSACTION ISOLATION LEVEL ... has now the following effect on InnoDB tables: If a transaction is defined as SERIALIZABLE then InnoDB conceptually adds LOCK IN SHARE MODE to all consistent reads. If a transaction is defined to have any other isolation level, then InnoDB obeys its default locking strategy which is REPEATABLE READ.

SHOW TABLE STATUS no longer sets an x-lock at the end of an auto-increment index if the auto-increment counter has been initialized. This removes in almost all cases the surprising deadlocks caused by SHOW TABLE STATUS.

Fixed a bug: in a CREATE TABLE statement the string ‘foreign’ followed by a nonspace character confused the FOREIGN KEY parser and caused table creation to fail with errno 150.

C.4.36 Changes in MySQL/InnoDB-3.23.49, February 17, 2002

Fixed a bug: If you called DROP DATABASE for a database on which there simultaneously were running queries, the MySQL server could crash or hang. Crashes fixed, but a full fix has to wait some changes in the MySQL layer of code.

Fixed a bug: on Windows one had to put the database name in lowercase for DROP DATABASE to work. Fixed in 3.23.49: case no longer matters on Windows. On Unix, the database name remains case sensitive.

Fixed a bug: If one defined a non-latin1 character set as the default character set, then definition of foreign key constraints could fail in an assertion failure in dict0crea.c, reporting an internal error 17.

C.4.37 Changes in MySQL/InnoDB-3.23.48, February 9, 2002

Tuned the SQL optimizer to favor more often index searches over table scans.

Fixed a performance problem when several large SELECT queries are run concurrently on a multiprocessor Linux computer. Large CPU-bound SELECT queries now also generally run faster on all platforms.

If MySQL binary logging is used, InnoDB now prints after crash recovery the latest MySQL binary log file name and the position in that file (= byte offset) InnoDB was able to recover to. This is useful, for example, when resynchronizing a master and a slave database in replication.
Changes in MySQL/InnoDB-3.23.47, December 28, 2001

- Added better error messages to help in installation problems.
- One can now recover also MySQL temporary tables which have become orphaned inside the InnoDB tablespace.
- InnoDB now prevents a FOREIGN KEY declaration where the signedness is not the same in the referencing and referenced integer columns.
- Fixed a bug: calling SHOW CREATE TABLE or SHOW TABLE STATUS could cause memory corruption and make mysqld to crash. Especially at risk was mysqldump, because it calls frequently SHOW CREATE TABLE.
- Fixed a bug: If on Unix you did an ALTER TABLE to an InnoDB table and simultaneously did queries to it, mysqld could crash with an assertion failure in row0row.c, line 474.
- Fixed a bug: If inserts to several tables containing an AUTO_INCREMENT column were wrapped inside one LOCK TABLES, InnoDB asserted in lock0lock.c.
- In 3.23.47 we permitted several NULLS in a UNIQUE secondary index. But CHECK TABLE was not relaxed: it reports the table as corrupt. CHECK TABLE no longer complains in this situation.
- Fixed a bug: on Sparc and other high-endian processors SHOW VARIABLES showed innodb_flush_log_at_trx_commit and other boolean-valued startup parameters always OFF even if they were switched on.
- Fixed a bug: If you ran mysqld-max-nt as a service on Windows NT/2000, the service shutdown did not always wait long enough for the InnoDB shutdown to finish.

- Recovery happens now faster, especially in a lightly loaded system, because background checkpointing has been made more frequent.
- InnoDB now permits several similar key values in a UNIQUE secondary index if those values contain SQL NULL values. Thus the convention is now the same as in MyISAM tables.
- InnoDB gives a better row count estimate for a table which contains BLOB values.
- In a FOREIGN KEY constraint, InnoDB is now case-insensitive to column names, and in Windows also to table names.
- InnoDB permits a FOREIGN KEY column of CHAR type to refer to a column of VARCHAR type, and vice versa. MySQL silently changes the type of some columns between CHAR and VARCHAR, and these silent changes do not hinder FOREIGN KEY declaration any more.
- Recovery has been made more resilient to corruption of log files.
- Unnecessary statistics calculation has been removed from queries which generate a temporary table. Some ORDER BY and DISTINCT queries now run much faster.
- MySQL now knows that the table scan of an InnoDB table is done through the primary key. This saves a sort in some ORDER BY queries.
- The maximum key length of InnoDB tables is again restricted to 500 bytes. The MySQL interpreter is not able to handle longer keys.
- The default value of innodb_lock_wait_timeout was changed from infinite to 50 seconds, the default value of innodb_file_io_threads from 9 to 4.
C.4.39 Changes in MySQL/InnoDB-4.0.1, December 23, 2001

- InnoDB is the same as in 3.23.47.
- In 4.0.0 the MySQL interpreter did not know the syntax LOCK IN SHARE MODE. This has been fixed.
- In 4.0.0 multiple-table delete did not work for transactional tables. This has been fixed.

C.4.40 Changes in MySQL/InnoDB-3.23.46, November 30, 2001

- This is the same as 3.23.45.

- This is a bugfix release.
- In versions 3.23.42-.44 when creating a table on Windows, you have to use lowercase letters in the database name to be able to access the table. Fixed in 3.23.45.
- InnoDB now flushes stdout and stderr every 10 seconds: If these are redirected to files, the file contents can be better viewed with an editor.
- Fixed an assertion failure in .44, in trx0trx.c, line 178 when you drop a table which has the .frm file but does not exist inside InnoDB.
- Fixed a bug in the insert buffer. The insert buffer tree could get into an inconsistent state, causing a crash, and also crashing the recovery. This bug could appear especially in large table imports or alterations.
- Fixed a bug in recovery: InnoDB could go into an infinite loop constantly printing a warning message that it cannot find free blocks from the buffer pool.
- Fixed a bug: when you created a temporary table of the InnoDB type, and then used ALTER TABLE to it, the MySQL server could crash.
- Prevented creation of MySQL system tables 'mysql.user', 'mysql.host', or 'mysql.db', in the InnoDB type.
- Fixed a bug which can cause an assertion failure in 3.23.44 in srv0srv.c, line 1728.

C.4.42 Changes in MySQL/InnoDB-3.23.44, November 2, 2001

- You can define foreign key constraints on InnoDB tables. An example: FOREIGN KEY (col1) REFERENCES table2(col2).
- You can create data files larger than 4GB in those file systems that allow it.
- Improved InnoDB monitors, including a new innodb_table_monitor which enables you to print the contents of the InnoDB internal data dictionary.
- DROP DATABASE now works also for InnoDB tables.
- Accent characters in the default character set latin1 are ordered according to the MySQL ordering.
  NOTE: If you are using latin1 and have inserted characters whose code is > 127 to an indexed CHAR column, you should run CHECK TABLE on your table when you upgrade to 3.23.43, and drop and reimport the table if CHECK TABLE reports an error!
- InnoDB calculates better table cardinality estimates.
Changes in MySQL/InnoDB-3.23.43, October 4, 2001

- Change in deadlock resolution: in .43 a deadlock rolls back only the SQL statement, in .44 it rolls back the whole transaction.

- Deadlock, lock wait timeout, and foreign key constraint violations (no parent row, child rows exist) now return native MySQL error codes 1213, 1205, 1216, 1217, respectively.

- A new my.cnf parameter `innodb_thread_concurrency` helps in performance tuning in high concurrency environments.

- A new my.cnf option `innodb_force_recovery` helps you in dumping tables from a corrupted database.

- A new my.cnf option `innodb_fast_shutdown` speeds up shutdown. Normally InnoDB does a full purge and an insert buffer merge at shutdown.

- Raised maximum key length to 7000 bytes from a previous limit of 500 bytes.

- Fixed a bug in replication of `AUTO_INCREMENT` columns with multiline inserts.

- Fixed a bug when the case of letters changes in an update of an indexed secondary column.

- Fixed a hang when there are more than 24 data files.

- Fixed a crash when `MAX(col)` is selected from an empty table, and `col` is not the first column in a multi-column index.

- Fixed a bug in purge which could cause crashes.

C.4.43 Changes in MySQL/InnoDB-3.23.43, October 4, 2001

- This is essentially the same as InnoDB-3.23.42.

- Fixed a bug which corrupted the table if the primary key of a > 8000-byte row was updated.

- There are now 3 types of InnoDB Monitors: `innodb_monitor`, `innodb_lock_monitor`, and `innodb_tablespace_monitor`. `innodb_monitor` now prints also buffer pool hit rate and the total number of rows inserted, updated, deleted, read.

- Fixed a bug in RENAME TABLE.

- Fixed a bug in replication with an auto-increment column.

C.4.45 Changes in MySQL/InnoDB-3.23.41, August 13, 2001

- Support for < 4GB rows. The previous limit was 8000 bytes.

- Use the doublewrite file flush method.

- Raw disk partitions supported as data files.

- InnoDB Monitor.

- Several hang bugs fixed and an ORDER BY bug (“Sort aborted”) fixed.

C.4.46 Changes in MySQL/InnoDB-3.23.40, July 16, 2001

- Only a few rare bugs fixed.

- \texttt{CHECK TABLE} now works for InnoDB tables.
- A new \texttt{my.cnf} parameter \texttt{innodb_unix_file_flush_method} introduced. It can be used to tune disk write performance.
- An auto-increment column now gets new values past the transaction mechanism. This saves CPU time and eliminates transaction deadlocks in new value assignment.
- Several bugfixes, most notably the rollback bug in 3.23.38.

C.4.48 Changes in MySQL/InnoDB-3.23.38, May 12, 2001

- The new syntax \texttt{SELECT ... LOCK IN SHARE MODE} is introduced.
- InnoDB now calls \texttt{fsync()} after every disk write and calculates a checksum for every database page it writes or reads, which reveals disk defects.
- Several bugfixes.

C.5 MySQL Cluster Change History

Beginning with MySQL 4.1.14, MySQL Cluster changes for MySQL 4.1 Server releases can be found in the MySQL 4.1 Server Release Notes. For release notes for older releases of MySQL Cluster (before 4.1.14), see MySQL Cluster 4.1 Release Notes.

C.6 MySQL Connector/ODBC Change History

MySQL Connector/ODBC release notes are no longer published in the MySQL Reference Manual.

Release notes for the changes in each release of MySQL Connector/ODBC are located at MySQL Connector/ODBC Release Notes.

C.7 MySQL Connector/Net Change History

MySQL Connector/Net release notes are no longer published in the MySQL Reference Manual.

Release notes for the changes in each release of MySQL Connector/Net are located at MySQL Connector/Net Release Notes.

C.8 MySQL Connector/J Change History

Release notes for the changes in each release of MySQL Connector/J are located at MySQL Connector/J Release Notes.
Appendix D Restrictions and Limits

Table of Contents

    D.3.3 Windows Platform Limitations ...................................................... 1860

The discussion here describes restrictions that apply to the use of MySQL features such as subqueries.

D.1 Restrictions on Subqueries

- Known bug: If you compare a NULL value to a subquery using ALL, ANY, or SOME, and the subquery returns an empty result, the comparison might evaluate to the nonstandard result of NULL rather than to TRUE or FALSE. This is fixed in MySQL 5.0.36 and 5.1.16.

- A subquery's outer statement can be any one of: SELECT, INSERT, UPDATE, DELETE, SET, or DO.

- Subquery optimization for IN is not as effective as for the = operator or for the IN(value_list) [776] operator.

A typical case for poor IN subquery performance is when the subquery returns a small number of rows but the outer query returns a large number of rows to be compared to the subquery result.

The problem is that, for a statement that uses an IN subquery, the optimizer rewrites it as a correlated subquery. Consider the following statement that uses an uncorrelated subquery:

```
SELECT ... FROM t1 WHERE t1.a IN (SELECT b FROM t2);
```

The optimizer rewrites the statement to a correlated subquery:

```
SELECT ... FROM t1 WHERE EXISTS (SELECT 1 FROM t2 WHERE t2.b = t1.a);
```

If the inner and outer queries return $M$ and $N$ rows, respectively, the execution time becomes on the order of $O(M \times N)$, rather than $O(M+N)$ as it would be for an uncorrelated subquery.

An implication is that an IN subquery can be much slower than a query written using an IN(value_list) [776] operator that lists the same values that the subquery would return.

- In general, you cannot modify a table and select from the same table in a subquery. For example, this limitation applies to statements of the following forms:

```
DELETE FROM t WHERE ... (SELECT ... FROM t ...);
UPDATE t ... WHERE col = (SELECT ... FROM t ...);
{INSERT|REPLACE} INTO t (SELECT ... FROM t ...);
```

Exception: The preceding prohibition does not apply if you are using a subquery for the modified table in the FROM clause. Example:

```
UPDATE t ... WHERE col = (SELECT * FROM (SELECT ... FROM t...) AS _t ...);
```
Restrictions on Subqueries

Here the result from the subquery in the FROM clause is stored as a temporary table, so the relevant rows in t have already been selected by the time the update to t takes place.

• Row comparison operations are only partially supported:
  - For expr IN (subquery), expr can be an n-tuple (specified using row constructor syntax) and the subquery can return rows of n-tuples.
  - For expr op {ALL|ANY|SOME} (subquery), expr must be a scalar value and the subquery must be a column subquery; it cannot return multiple-column rows.

In other words, for a subquery that returns rows of n-tuples, this is supported:

\[(val_1, ..., val_n) \text{ IN (subquery)}\]

But this is not supported:

\[(val_1, ..., val_n) \text{ op } \{\text{ALL|ANY|SOME}\} (\text{subquery})\]

The reason for supporting row comparisons for IN but not for the others is that IN is implemented by rewriting it as a sequence of \(=\) comparisons and AND operations. This approach cannot be used for ALL, ANY, or SOME.

• Row constructors are not well optimized. The following two expressions are equivalent, but only the second can be optimized:

\[(\text{col1, col2, ...}) = (\text{val1, val2, ...})\]
\[\text{col1} = \text{val1} \text{ AND col2} = \text{val2} \text{ AND ...}\]

• Subqueries in the FROM clause cannot be correlated subqueries. They are materialized (executed to produce a result set) before evaluating the outer query, so they cannot be evaluated per row of the outer query.

• MySQL does not support LIMIT in subqueries for certain subquery operators:

```
mysql> SELECT * FROM t1
  -> WHERE s1 IN (SELECT s2 FROM t2 ORDER BY s1 LIMIT 1);
ERROR 1235 (42000): This version of MySQL doesn't yet support 'LIMIT & IN/ALL/ANY/SOME subquery'
```

• The optimizer is more mature for joins than for subqueries, so in many cases a statement that uses a subquery can be executed more efficiently if you rewrite it as a join.

An exception occurs for the case where an IN subquery can be rewritten as a SELECT DISTINCT join. Example:

```
SELECT col FROM t1 WHERE id_col IN (SELECT id_col2 FROM t2 WHERE \text{condition})
```

That statement can be rewritten as follows:

```
SELECT DISTINCT col FROM t1, t2 WHERE t1.id_col = t2.id_col AND \text{condition}
```

But in this case, the join requires an extra DISTINCT operation and is not more efficient than the subquery.
Restrictions on Subqueries

• MySQL permits a subquery to refer to a stored function that has data-modifying side effects such as inserting rows into a table. For example, if \( f() \) inserts rows, the following query can modify data:

```
SELECT ... WHERE x IN (SELECT f() ...);
```

This behavior is nonstandard (not permitted by the SQL standard). In MySQL, it can produce indeterminate results because \( f() \) might be executed a different number of times for different executions of a given query depending on how the optimizer chooses to handle it.

For replication, one implication of this indeterminism is that such a query can produce different results on the master and its slaves.

• Possible future optimization: MySQL does not rewrite the join order for subquery evaluation. In some cases, a subquery could be executed more efficiently if MySQL rewrote it as a join. This would give the optimizer a chance to choose between more execution plans. For example, it could decide whether to read one table or the other first.

Example:

```
SELECT a FROM outer_table AS ot
WHERE a IN (SELECT a FROM inner_table AS it WHERE ot.b = it.b);
```

For that query, MySQL always scans `outer_table` first and then executes the subquery on `inner_table` for each row. If `outer_table` has a lot of rows and `inner_table` has few rows, the query probably will not be as fast as it could be.

The preceding query could be rewritten like this:

```
SELECT a FROM outer_table AS ot, inner_table AS it
WHERE ot.a = it.a AND ot.b = it.b;
```

In this case, we can scan the small table (`inner_table`) and look up rows in `outer_table`, which will be fast if there is an index on \((ot.a,ot.b)\).

• Possible future optimization: A correlated subquery is evaluated for each row of the outer query. A better approach is that if the outer row values do not change from the previous row, do not evaluate the subquery again. Instead, use its previous result.

• Possible future optimization: A subquery in the `FROM` clause is evaluated by materializing the result into a temporary table, and this table does not use indexes. This does not allow the use of indexes in comparison with other tables in the query, although that might be useful.

• Possible future optimization: If a subquery in the `FROM` clause resembles a view to which the merge algorithm can be applied, rewrite the query and apply the merge algorithm so that indexes can be used. The following statement contains such a subquery:

```
SELECT * FROM (SELECT * FROM t1 WHERE t1.t1_col) AS _t1, t2 WHERE t2.t2_col;
```

The statement can be rewritten as a join like this:

```
SELECT * FROM t1, t2 WHERE t1.t1_col AND t2.t2_col;
```

This type of rewriting would provide two benefits:
• It avoids the use of a temporary table for which no indexes can be used. In the rewritten query, the optimizer can use indexes on $t_1$.

• It gives the optimizer more freedom to choose between different execution plans. For example, rewriting the query as a join enables the optimizer to use $t_1$ or $t_2$ first.

• Possible future optimization: For $\text{IN}$, $\text{ANY}$, $\text{<> ANY}$, $\text{= ALL}$, and $\text{<> ALL}$ with uncorrelated subqueries, use an in-memory hash for a result or a temporary table with an index for larger results. Example:

```sql
SELECT a FROM big_table AS bt
WHERE non_key_field IN (SELECT non_key_field FROM table WHERE condition)
```

In this case, we could create a temporary table:

```sql
CREATE TABLE t (key (non_key_field))
(SELECT non_key_field FROM table WHERE condition)
```

Then, for each row in `big_table`, do a key lookup in `t` based on `bt.non_key_field`.

### D.2 Restrictions on Character Sets

• Identifiers are stored in `mysql` database tables (`user`, `db`, and so forth) using `utf8`, but identifiers can contain only characters in the Basic Multilingual Plane (BMP). Supplementary characters are not permitted in identifiers.

• The `ucs2` character sets has the following restrictions:

  • It cannot be used as a client character set, which means that it does not work for `SET NAMES` or `SET CHARACTER SET`. (See Section 9.1.4, “Connection Character Sets and Collations”.)

  • It is currently not possible to use `LOAD DATA INFILE` to load data files that use this character set.

  • `FULLTEXT` indexes cannot be created on a column that this character set. However, you can perform `IN BOOLEAN MODE` searches on the column without an index.

  • The `REGEXP [800]` and `RLIKE [800]` operators work in byte-wise fashion, so they are not multi-byte safe and may produce unexpected results with multi-byte character sets. In addition, these operators compare characters by their byte values and accented characters may not compare as equal even if a given collation treats them as equal.

### D.3 Limits in MySQL

This section lists current limits in MySQL 4.1.

#### D.3.1 Limits of Joins

In MySQL 4.1, the maximum number of tables that can be referenced in a single join is 61. This also applies to the number of tables that can be referenced in the definition of a view.

#### D.3.2 The Maximum Number of Columns Per Table

There is a hard limit of 4096 columns per table, but the effective maximum may be less for a given table. The exact limit depends on several interacting factors, listed in the following discussion.
Every table has a maximum row size of 65,535 bytes. This maximum applies to all storage engines, but a given engine might have additional constraints that result in a lower effective maximum row size.

The maximum row size constrains the number of columns because the total width of all columns cannot exceed this size. For example, utf8 characters require up to three bytes per character, so for a \texttt{CHAR(255) CHARACTER SET utf8} column, the server must allocate \(255 \times 3 = 765\) bytes per value. Consequently, a table cannot contain more than \(65,535 / 765 = 85\) such columns.

Storage for variable-length columns includes length bytes, which are assessed against the row size. For example, a \texttt{VARCHAR(255) CHARACTER SET utf8} column takes two bytes to store the length of the value, so each value can take up to 767 bytes.

\texttt{BLOB} and \texttt{TEXT} columns count from one to four plus eight bytes each toward the row-size limit because their contents are stored separately.

Declaring columns \texttt{NULL} can reduce the maximum number of columns permitted. \texttt{NULL} columns require additional space in the row to record whether their values are \texttt{NULL}.

For \texttt{MyISAM} and \texttt{ISAM} tables, each \texttt{NULL} column takes one bit extra, rounded up to the nearest byte. The maximum row length in bytes can be calculated as follows:

\[
\text{row length} = 1 + \text{(sum of column lengths)} + \text{(number of NULL columns + delete_flag + 7)/8} + \text{(number of variable-length columns)}
\]

\texttt{delete_flag} is 1 for tables with static row format. Static tables use a bit in the row record for a flag that indicates whether the row has been deleted. \texttt{delete_flag} is 0 for dynamic tables because the flag is stored in the dynamic row header.

These calculations do not apply for InnoDB tables, for which storage size is no different for \texttt{NULL} columns than for \texttt{NOT NULL} columns.

Each table has an \texttt{.frm} file that contains the table definition. The server uses the following expression to check some of the table information stored in the file against an upper limit of 64KB:

\[
\text{if (info_length+(ulong) create_fields.elements*FCOMP+288+ n_length+int_length+com_length > 65535L || int_count > 255)}
\]

The portion of the information stored in the \texttt{.frm} file that is checked against the expression cannot grow beyond the 64KB limit, so if the table definition reaches this size, no more columns can be added.

The relevant factors in the expression are:

- \texttt{info_length} is space needed for “screens.” This is related to MySQL’s Unireg heritage.
- \texttt{create_fields.elements} is the number of columns.
- \texttt{FCOMP} is 17.
- \texttt{n_length} is the total length of all column names, including one byte per name as a separator.
- \texttt{int_length} is related to the list of values for \texttt{ENUM} and \texttt{SET} columns.
- \texttt{com_length} is the total length of column comments.
Windows Platform Limitations

Thus, using long column names can reduce the maximum number of columns, as can the inclusion of \texttt{ENUM} or \texttt{SET} columns, or use of column comments.

- Individual storage engines might impose additional restrictions that limit table column count. Examples:
  - \texttt{InnoDB} permits no more than 1000 columns.
  - \texttt{InnoDB} restricts row size to something less than half a database page (approximately 8000 bytes), not including \texttt{VARBINARY}, \texttt{VARCHAR}, \texttt{BLOB}, or \texttt{TEXT} columns.

D.3.3 Windows Platform Limitations

The following limitations apply to use of MySQL on the Windows platform:

- **Number of file descriptors**
  The number of open file descriptors on Windows is limited to a maximum of 2048, which may limit the ability to open a large number of tables simultaneously. This limit is due not to Windows but to C runtime library compatibility functions used to open files on Windows that use the POSIX compatibility layer.

  This limitation will also cause problems if you try to set \texttt{open_files_limit} to a value greater than the 2048 file limit.

- **Process memory**
  On Windows 32-bit platforms it is not possible by default to use more than 2GB of RAM within a single process, including MySQL. This is because the physical address limit on Windows 32-bit is 4GB and the default setting within Windows is to split the RAM between kernel (2GB) and user/applications (2GB).

  You can increase this limit to 3GB by specifying the \texttt{/3GB} option in the \texttt{boot.ini} file. This changes the kernel/application memory split to 1GB and 3GB respectively. This boot option is available on Windows XP, Windows Server 2003, and Windows Server 2008.

  Some versions of Windows have a boot time setting to enable larger applications by reducing the kernel application. Alternatively, to use more than 2GB, use a 64-bit version of Windows.

- **File system aliases**
  When using \texttt{MyISAM} tables, you cannot use aliases within Windows link to the data files on another volume and then link back to the main MySQL \texttt{datadir} location.

  This facility is often used to move the data and index files to a RAID or other fast solution, while retaining the main \texttt{.frm} files in the default data directory configured with the \texttt{datadir} option.

- **Limited number of ports**
  Windows systems have about 4,000 ports available for client connections, and after a connection on a port closes, it takes two to four minutes before the port can be reused. In situations where clients connect to and disconnect from the server at a high rate, it is possible for all available ports to be used up before closed ports become available again. If this happens, the MySQL server appears to be unresponsive even though it is running. Note that ports may be used by other applications running on the machine as well, in which case the number of ports available to MySQL is lower.

  For more information about this problem, see http://support.microsoft.com/default.aspx?scid=kb;en-us;196271.

- **Concurrent reads**
MySQL depends on the `pread()` and `pwrite()` calls to be able to mix `INSERT` and `SELECT`. Currently, we use mutexes to emulate `pread()`/`pwrite()`. We will, in the long run, replace the file level interface with a virtual interface so that we can use the `readfile()`/`writefile()` interface on NT, 2000, and XP to get more speed. The current implementation limits the number of open files that MySQL can use to 2,048 (1,024 before MySQL 4.0.19), which means that you cannot run as many concurrent threads on NT, 2000, XP, and 2003 as on Unix.

This problem is fixed in MySQL 5.5.

- **Blocking read**

MySQL uses a blocking read for each connection. That has the following implications if named-pipe connections are enabled:

- A connection is not disconnected automatically after eight hours, as happens with the Unix version of MySQL.
- If a connection hangs, it is impossible to break it without killing MySQL.
- `mysqladmin kill` does not work on a sleeping connection.
- `mysqladmin shutdown` cannot abort as long as there are sleeping connections.

These problems are fixed in MySQL 5.1. (Bug #31621)

- **ALTER TABLE**

While you are executing an `ALTER TABLE` statement, the table is locked from being used by other threads. This has to do with the fact that on Windows, you cannot delete a file that is in use by another thread. In the future, we may find some way to work around this problem.

- **DROP TABLE**

`DROP TABLE` on a table that is in use by a `MERGE` table does not work on Windows because the `MERGE` handler does the table mapping hidden from the upper layer of MySQL. Because Windows does not permit you to drop files that are open, you first must flush all `MERGE` tables (with `FLUSH TABLES`) or drop the `MERGE` table before dropping the table. We will fix this at the same time we introduce views.

- **DATA DIRECTORY and INDEX DIRECTORY**

The `DATA DIRECTORY` and `INDEX DIRECTORY` options for `CREATE TABLE` are ignored on Windows, because MySQL does not support Windows symbolic links. These options also are ignored on systems that have a nonfunctional `realpath()` call.

- **DROP DATABASE**

You cannot drop a database that is in use by another session.

- **Case-insensitive names**

File names are not case sensitive on Windows, so MySQL database and table names are also not case sensitive on Windows. The only restriction is that database and table names must be specified using the same case throughout a given statement. See Section 8.2.2, “Identifier Case Sensitivity”.

- **Directory and file names**
Windows Platform Limitations

On Windows, MySQL Server supports only directory and file names that are compatible with the current ANSI code pages. For example, the following Japanese directory name will not work in the Western locale (code page 1252):

datadir="C:/私たちのプロジェクトのデータ"

The same limitation applies to directory and file names referred to in SQL statements, such as the data file path name in `LOAD DATA INFILE`.

- **The “\” path name separator character**

  Path name components in Windows are separated by the “\” character, which is also the escape character in MySQL. If you are using `LOAD DATA INFILE` or `SELECT ... INTO OUTFILE`, use Unix-style file names with “/” characters:

  ```
  mysql> LOAD DATA INFILE 'C:/tmp/skr.txt' INTO TABLE skr;
  mysql> SELECT * INTO OUTFILE 'C:/tmp/skr.txt' FROM skr;
  ```

  Alternatively, you must double the “\” character:

  ```
  mysql> LOAD DATA INFILE 'C:\tmp\skr.txt' INTO TABLE skr;
  mysql> SELECT * INTO OUTFILE 'C:\tmp\skr.txt' FROM skr;
  ```

- **Problems with pipes**

  Pipes do not work reliably from the Windows command-line prompt. If the pipe includes the character ^Z / CHAR(24), Windows thinks that it has encountered end-of-file and aborts the program.

  This is a problem mainly when you try to apply a binary log as follows:

  ```
  shell> mysqlbinlog binary_log_file | mysql --user=root
  ```

  If you have a problem applying the log and suspect that it is because of a ^Z / CHAR(24) character, you can use the following workaround:

  ```
  shell> mysqlbinlog binary_log_file --result-file=/tmp/bin.sql
  shell> mysql --user=root --execute "source /tmp/bin.sql"
  ```

  The latter command also can be used to reliably read in any SQL file that may contain binary data.

- **Killing MySQL from the Task Manager**

  On Windows 95, you cannot kill MySQL from the Task Manager or with the shutdown utility. You must stop it with `mysqladmin shutdown` or the `NET STOP ...` command.

- **Windows 95 and threads**

  Windows 95 leaks about 200 bytes of main memory for each thread creation. Each connection in MySQL creates a new thread, so you should not run `mysqld` for an extended time on Windows 95 if your server handles many connections! Newer versions of Windows do not suffer from this bug.

## A

### ABS()

- Section 18.2, “Adding New Functions to MySQL”
- Section C.1.12, “Changes in MySQL 4.1.14 (2005-08-17)”
- Section 12.4.3.1, “CREATE FUNCTION Syntax for User-Defined Functions”
- Section 8.2.3, “Function Name Parsing and Resolution”
- Section 11.6.2, “Mathematical Functions”

### ACOS()

- Section C.3.1, “Changes in Release 3.23.59 (Not released)”
- Section 11.6.2, “Mathematical Functions”

### ADDDATE()

- Section C.1.25, “Changes in MySQL 4.1.1 (2003-12-01)”
- Section 11.7, “Date and Time Functions”

### addslashes()

- Section 5.4.1, “General Security Guidelines”

### ADDTIME()

- Section C.1.25, “Changes in MySQL 4.1.1 (2003-12-01)”
- Section C.1.10, “Changes in MySQL 4.1.16 (2005-11-29)”
- Section 11.7, “Date and Time Functions”

### AES_DECRYPT()

- Section C.1.15, “Changes in MySQL 4.1.11 (2005-04-01)”
- Section C.2.30, “Changes in Release 4.0.2 (01 July 2002)”
- Section C.2.28, “Changes in Release 4.0.24 (04 March 2005)”

### AES_ENCRYPT()

- Section C.2.28, “Changes in Release 4.0.4 (29 September 2002)”
- Section 11.12, “Encryption and Compression Functions”

### Area()

- Section 16.5.2, “Geometry Functions”
- Section 16.5.2.6, “MultiPolygon Functions”
- Section 16.5.2.5, “Polygon Functions”

### AsBinary()

- Section 16.4.5, “Fetching Spatial Data”
- Section 16.5.1, “Geometry Format Conversion Functions”

### ASCII()

- Section C.1.24, “Changes in MySQL 4.1.2 (2004-05-28)”
- Section 12.7.3, “HELP Syntax”
- Section 11.5, “String Functions”

### ASIN()

- Section C.3.1, “Changes in Release 3.23.59 (Not released)”
- Section 11.6.2, “Mathematical Functions”

### AsText()

- Section 16.4.5, “Fetching Spatial Data”
- Section 16.5.1, “Geometry Format Conversion Functions”

### AsWKB()

- Section 16.5.1, “Geometry Format Conversion Functions”

### AsWKT()

- Section 16.5.1, “Geometry Format Conversion Functions”

### ATAN()

- Section 11.6.2, “Mathematical Functions”

### ATAN2()

- Section 11.6.2, “Mathematical Functions”

### AVG()

- Section C.1.4, “Changes in MySQL 4.1.22 (2006-11-02)”
- Section C.3.16, “Changes in Release 3.23.44 (31 October 2001)”
- Section 10.1.2, “Date and Time Type Overview”
- Section 11.15.1, “GROUP BY (Aggregate) Functions”
Section 10.4.4, “The ENUM Type”
Section 1.3.2, “The Main Features of MySQL”
Section 10.4.5, “The SET Type”
