Abstract

This is the MySQL™ Reference Manual. It documents MySQL 5.1 through 5.1.73, as well as MySQL Cluster releases based on versions 6.1, 6.2, 6.3, 7.0, and 7.1 of the NDB storage engine through 5.1.15-ndb-6.1.23, 5.1.51-ndb-6.2.19, 5.1.73-ndb-6.3.55, 5.1.73-ndb-7.0.42, and 5.1.77-ndb-7.1.37.

End of Product Lifecycle. Active development for MySQL Database Server version 5.1 has ended. Oracle offers various support offerings which may be of interest. For details and more information, see the MySQL section of the Lifetime Support Policy for Oracle Technology Products (http://www.oracle.com/us/support/lifetime-support/index.html). Please consider upgrading to a recent version.

MySQL 5.1 features. This manual describes features that are not included in every edition of MySQL 5.1; such features may not be included in the edition of MySQL 5.1 licensed to you. If you have any questions about the features included in your edition of MySQL 5.1, refer to your MySQL 5.1 license agreement or contact your Oracle sales representative.

For notes detailing the changes in each release, see the MySQL 5.1 Release Notes.

For legal information, see the Legal Notices.

For help with using MySQL, please visit either the MySQL Forums or MySQL Mailing Lists, where you can discuss your issues with other MySQL users.

For additional documentation on MySQL products, including translations of the documentation into other languages, and downloadable versions in variety of formats, including HTML and PDF formats, see the MySQL Documentation Library.

Licensing information—MySQL 5.1. This product may include third-party software, used under license. If you are using a Commercial release of MySQL 5.1, see this document for licensing information, including licensing information relating to third-party software that may be included in this Commercial release. If you are using a Community release of MySQL 5.1, see this document for licensing information, including licensing information relating to third-party software that may be included in this Community release.

Licensing information—MySQL Cluster. This product may include third-party software, used under license. If you are using a Commercial release of MySQL Cluster, see this document for licensing information, including licensing information relating to third-party software that may be included in this Commercial release. If you are using a Community release of MySQL Cluster, see this document for licensing information, including licensing information relating to third-party software that may be included in this Community release.

Preface and Legal Notices ........................................................................................................... xix  
1 General Information .............................................................................................................. 1  
   1.1 About This Manual ........................................................................................................... 2  
   1.2 Typographical and Syntax Conventions ........................................................................ 3  
   1.3 Overview of the MySQL Database Management System .............................................. 4  
       1.3.1 What is MySQL? .................................................................................................... 4  
       1.3.2 The Main Features of MySQL .............................................................................. 6  
       1.3.3 History of MySQL ................................................................................................. 8  
   1.4 What Is New in MySQL 5.1 ............................................................................................ 9  
   1.5 MySQL Development History ....................................................................................... 11  
   1.6 MySQL Information Sources .......................................................................................... 12  
       1.6.1 MySQL Mailing Lists ............................................................................................... 12  
       1.6.2 MySQL Community Support at the MySQL Forums ........................................... 14  
       1.6.3 MySQL Community Support on Internet Relay Chat (IRC) .................................. 14  
       1.6.4 MySQL Enterprise ................................................................................................. 15  
   1.7 How to Report Bugs or Problems .................................................................................. 15  
   1.8 MySQL Standards Compliance ....................................................................................... 19  
       1.8.1 MySQL Extensions to Standard SQL ..................................................................... 20  
       1.8.2 MySQL Differences from Standard SQL ............................................................... 23  
       1.8.3 How MySQL Deals with Constraints .................................................................... 27  
   1.9 Credits ........................................................................................................................... 31  
       1.9.1 Contributors to MySQL .......................................................................................... 31  
       1.9.2 Documenters and translators ................................................................................ 35  
       1.9.3 Packages that support MySQL .............................................................................. 36  
       1.9.4 Tools that were used to create MySQL ................................................................. 37  
       1.9.5 Supporters of MySQL ............................................................................................ 37  
2 Installing and Upgrading MySQL .............................................................................................. 39  
   2.1 General Installation Guidance ........................................................................................ 42  
       2.1.1 Choosing Which MySQL Distribution to Install .................................................... 42  
       2.1.2 How to Get MySQL ............................................................................................... 45  
       2.1.3 Verifying Package Integrity Using MD5 Checksums or GnuPG ................................. 45  
       2.1.4 Installation Layouts ................................................................................................ 54  
       2.1.5 Compiler-Specific Build Characteristics .................................................................. 54  
   2.2 Installing MySQL on Unix/Linux Using Generic Binaries .............................................. 54  
   2.3 Installing MySQL on Microsoft Windows ....................................................................... 57  
       2.3.1 MySQL Installation Layout on Microsoft Windows .................................................. 58  
       2.3.2 Choosing the Installation Package for Microsoft Windows .................................. 59  
       2.3.3 MySQL Notifier ........................................................................................................ 62  
       2.3.4 Installing MySQL on Microsoft Windows Using an MSI Package ......................... 72  
       2.3.5 Using the MySQL Server Instance Config Wizard .............................................. 78  
       2.3.6 Installing MySQL on Microsoft Windows Using a noinstall Zip Archive ................ 95  
       2.3.7 Troubleshooting a Microsoft Windows MySQL Server Installation ...................... 103  
       2.3.8 Windows Postinstallation Procedures ..................................................................... 105  
   2.4 Installing MySQL on OS X ............................................................................................. 107  
       2.4.1 General Notes on Installing MySQL on OS X ....................................................... 109  
       2.4.2 Installing MySQL on OS X Using Native Packages ............................................ 110  
       2.4.3 Installing a MySQL Launch Daemon ....................................................................... 113  
       2.4.4 Installing the MySQL Startup Item ......................................................................... 114  
       2.4.5 Installing and Using the MySQL Preference Pane ............................................... 117  
       2.4.6 Using the Bundled MySQL on OS X Server ............................................................ 120  
   2.5 Installing MySQL on Linux ............................................................................................. 120  
       2.5.1 Installing MySQL on Linux Using RPM Packages ............................................... 121  
       2.5.2 Installing MySQL on Linux Using Native Package Managers ............................... 125  
   2.6 Installing MySQL on Solaris and OpenSolaris ................................................................. 128
2.11 Installing MySQL from Source ........................................... 137
  2.11.1 MySQL Layout for Source Installation ......................... 137
  2.11.2 Installing MySQL Using a Standard Source Distribution ...... 138
  2.11.3 Installing MySQL Using a Development Source Tree ........... 140
  2.11.4 MySQL Source-Configuration Options .............................. 143
  2.11.5 Dealing with Problems Compiling MySQL .......................... 152
  2.11.6 Compiling and Linking an Optimized mysqld Server ............ 155
  2.11.7 Installing MySQL from Source on Windows ..................... 156
  2.11.8 Notes on Installing MySQL on Solaris from Source .......... 160
  2.11.9 Notes on Installing MySQL on AIX from Source ............... 161
  2.11.10 Notes on Installing MySQL on HP-UX from Source .......... 162
2.12 Postinstallation Setup and Testing .................................... 162
  2.12.1 Initializing the Data Directory ................................... 163
  2.12.2 Starting the Server .................................................. 166
  2.12.3 Testing the Server .................................................. 169
  2.12.4 Securing the Initial MySQL Accounts ............................ 172
  2.12.5 Starting and Stopping MySQL Automatically ..................... 176
2.13 Upgrading or Downgrading MySQL ..................................... 177
  2.13.1 Upgrading MySQL ..................................................... 177
  2.13.2 Downgrading MySQL .................................................. 191
  2.13.3 Checking Whether Tables or Indexes Must Be Rebuilt .......... 196
  2.13.4 Rebuilding or Repairing Tables or Indexes ...................... 197
  2.13.5 Copying MySQL Databases to Another Machine .................. 199
2.14 Environment Variables .................................................. 200
2.15 Perl Installation Notes .................................................. 201
  2.15.1 Installing Perl on Unix ............................................. 202
  2.15.2 Installing ActiveState Perl on Windows ......................... 203
  2.15.3 Problems Using the Perl DBI/DBD Interface ...................... 203
3 Tutorial ........................................................................ 205
  3.1 Connecting to andDisconnecting from the Server .................... 205
  3.2 Entering Queries .......................................................... 206
  3.3 Creating and Using a Database ........................................... 209
      3.3.1 Creating and Selecting a Database ............................... 210
      3.3.2 Creating a Table .................................................... 211
      3.3.3 Loading Data into a Table ....................................... 212
      3.3.4 Retrieving Information from a Table .......................... 213
  3.4 Getting Information About Databases and Tables .................... 226
  3.5 Using mysql in Batch Mode .............................................. 227
  3.6 Examples of Common Queries ............................................ 229
      3.6.1 The Maximum Value for a Column ............................... 229
      3.6.2 The Row Holding the Maximum of a Certain Column .......... 229
      3.6.3 Maximum of Column per Group ................................... 230
      3.6.4 The Rows Holding the Group-wise Maximum of a Certain Column ... 230
      3.6.5 Using User-Defined Variables .................................... 231
      3.6.6 Using Foreign Keys ................................................. 231
      3.6.7 Searching on Two Keys ............................................. 233
      3.6.8 Calculating Visits Per Day ....................................... 233
      3.6.9 Using AUTO_INCREMENT .......................................... 234
  3.7 Using MySQL with Apache .............................................. 236
4 MySQL Programs ...................................................................................................................... 237
  4.1 Overview of MySQL Programs .......................................................................................... 238
  4.2 Using MySQL Programs .................................................................................................... 243
    4.2.1 Invoking MySQL Programs ......................................................................................... 243
    4.2.2 Connecting to the MySQL Server ................................................................................. 243
    4.2.3 Specifying Program Options ....................................................................................... 247
    4.2.4 Using Options on the Command Line ......................................................................... 247
    4.2.5 Program Option Modifiers .......................................................................................... 249
    4.2.6 Using Option Files ....................................................................................................... 250
    4.2.7 Command-Line Options that Affect Option-File Handling ....................................... 254
    4.2.8 Using Options to Set Program Variables ..................................................................... 255
    4.2.9 Option Defaults, Options Expecting Values, and the = Sign ..................................... 256
    4.2.10 Setting Environment Variables ................................................................................. 259
  4.3 MySQL Server and Server-Startup Programs ..................................................................... 260
    4.3.1 mysql — The MySQL Server ....................................................................................... 260
    4.3.2 mysql_safe — MySQL Server Startup Script ............................................................. 261
    4.3.3 mysql.server — MySQL Server Startup Script ......................................................... 265
    4.3.4 mysql_multi — Manage Multiple MySQL Servers ...................................................... 268
  4.4 MySQL Installation-Related Programs ............................................................................... 272
    4.4.1 comp_err — Compile MySQL Error Message File ....................................................... 272
    4.4.2 make_win_bin_dist — Package MySQL Distribution as Zip Archive .......................... 273
    4.4.3 mysqlbug — Generate Bug Report .............................................................................. 274
    4.4.4 mysql_fix_privilege_tables — Upgrade MySQL System Tables .............................. 274
    4.4.5 mysql_install_db — Initialize MySQL Data Directory ........................................... 275
    4.4.6 mysql_secure_installation — Improve MySQL Installation Security ...................... 277
    4.4.7 mysql_tzinfo_to_sql — Load the Time Zone Tables .................................................. 277
    4.4.8 mysql_upgrade — Check and Upgrade MySQL Tables ............................................. 278
  4.5 MySQL Client Programs .................................................................................................... 282
    4.5.1 mysql — The MySQL Command-Line Tool ............................................................... 282
    4.5.2 mysqladmin — Client for Administering a MySQL Server ........................................ 302
    4.5.3 mysqlcheck — A Table Maintenance Program ........................................................... 309
    4.5.4 mysqldump — A Database Backup Program .............................................................. 315
    4.5.5 mysqlimport — A Data Import Program ..................................................................... 332
    4.5.6 mysqlshow — Display Database, Table, and Column Information ........................... 337
    4.5.7 mysqldumpslow — Load Emulation Client .................................................................. 341
    4.5.8 mysql_upgrade — Check and Upgrade MySQL Tables ............................................. 278
  4.6 MySQL Administrative and Utility Programs ..................................................................... 348
    4.6.1 innochecksum — Offline InnoDB File Checksum Utility ........................................... 348
    4.6.2 myisam_ftdump — Display Full-Text Index information ........................................... 349
    4.6.3 myisamchk — MyISAM Table-Maintenance Utility .................................................... 350
    4.6.4 myisamlog — Display MyISAM Log File Contents .................................................... 367
    4.6.5 myisampack — Generate Compressed, Read-Only MyISAM Tables .......................... 368
    4.6.6 mysqlaccess — Client for Checking Access Privileges ............................................. 373
    4.6.7 mysqlbinlog — Utility for Processing Binary Log Files ................................................ 376
    4.6.8 mysqldumpslow — Summarize Slow Query Log Files .............................................. 390
    4.6.9 mysqlhotcopy — A Database Backup Program .......................................................... 392
    4.6.10 mysqlmanager — The MySQL Instance Manager ..................................................... 395
    4.6.11 mysql_convert_table_format — Convert Tables to Use a Given Storage Engine .......... 409
    4.6.12 mysql_find_rows — Extract SQL Statements from Files ........................................ 409
    4.6.13 mysql_fix_extensions — Normalize Table File Name Extensions ............................ 410
    4.6.14 mysql_setpermission — Interactively Set Permissions in Grant Tables .................... 410
    4.6.15 mysql_waitpid — Kill Process and Wait for Its Termination .................................... 411
    4.6.16 mysql_zap — Kill Processes That Match a Pattern ................................................... 412
  4.7 MySQL Program Development Utilities .......................................................................... 412
    4.7.1 mysql2mysql — Convert mSQL Programs for Use with MySQL ............................... 413
    4.7.2 mysql_config — Display Options for Compiling Clients .......................................... 413
    4.7.3 my_print_defaults — Display Options from Option Files ........................................ 414
    4.7.4 resolve_stack_dump — Resolve Numeric Stack Trace Dump to Symbols ................... 415
8.6.4 Bulk Data Loading for InnoDB Tables .......................................................... 797
8.6.5 Optimizing InnoDB Queries ................................................................. 797
8.6.6 Optimizing InnoDB DDL Operations ..................................................... 798
8.6.7 Optimizing InnoDB Disk I/O .................................................................. 798
8.6.8 Optimizing InnoDB for Systems with Many Tables ............................... 799
8.7 Optimizing for MEMORY Tables .............................................................. 799
8.8 Understanding the Query Execution Plan ................................................ 800
  8.8.1 Optimizing Queries with EXPLAIN ....................................................... 800
  8.8.2 EXPLAIN Output Format ...................................................................... 800
  8.8.3 EXPLAIN EXTENDED Output Format ................................................ 811
  8.8.4 Estimating Query Performance ............................................................ 813
8.9 Controlling the Query Optimizer .............................................................. 813
  8.9.1 Controlling Query Plan Evaluation ...................................................... 813
  8.9.2 Controlling Switchable Optimizations ................................................ 814
  8.9.3 Index Hints ......................................................................................... 815
8.10 Buffering and Caching ............................................................................ 817
  8.10.1 The MyISAM Key Cache ..................................................................... 817
  8.10.2 The InnoDB Buffer Pool ..................................................................... 822
  8.10.3 The MySQL Query Cache ................................................................. 824
8.11 Optimizing Locking Operations .............................................................. 830
  8.11.1 Internal Locking Methods ................................................................... 831
  8.11.2 Table Locking Issues .......................................................................... 833
  8.11.3 Concurrent Inserts ............................................................................. 834
  8.11.4 External Locking ................................................................................ 835
8.12 Optimizing the MySQL Server ............................................................... 836
  8.12.1 System Factors and Startup Parameter Tuning .................................... 836
  8.12.2 Tuning Server Parameters ................................................................ 836
  8.12.3 Optimizing Disk I/O .......................................................................... 838
  8.12.4 Using Symbolic Links ....................................................................... 839
  8.12.5 Optimizing Memory Use ................................................................... 842
  8.12.6 Optimizing Network Use ................................................................... 845
8.13 Measuring Performance (Benchmarking) ................................................. 847
  8.13.1 Measuring the Speed of Expressions and Functions ........................... 847
  8.13.2 The MySQL Benchmark Suite ........................................................... 848
  8.13.3 Using Your Own Benchmarks ............................................................ 848
8.14 Examining Thread Information ............................................................. 849
  8.14.1 Thread Command Values ................................................................... 850
  8.14.2 General Thread States ....................................................................... 852
  8.14.3 Delayed-Insert Thread States ............................................................. 857
  8.14.4 Query Cache Thread States ............................................................... 858
  8.14.5 Replication Master Thread States ...................................................... 859
  8.14.6 Replication Slave I/O Thread States .................................................. 859
  8.14.7 Replication Slave SQL Thread States ................................................. 860
  8.14.8 Replication Slave Connection Thread States ...................................... 861
  8.14.9 MySQL Cluster Thread States ............................................................ 861
  8.14.10 Event Scheduler Thread States .......................................................... 862
9 Language Structure .................................................................................. 863
  9.1 Literal Values ......................................................................................... 863
    9.1.1 String Literals ................................................................................... 863
    9.1.2 Number Literals ................................................................................ 866
    9.1.3 Date and Time Literals ...................................................................... 866
    9.1.4 Hexadecimal Literals ....................................................................... 868
    9.1.5 Boolean Literals ............................................................................... 868
    9.1.6 Bit-Field Literals .............................................................................. 869
    9.1.7 NULL Values ..................................................................................... 869
  9.2 Schema Object Names .......................................................................... 869
    9.2.1 Identifier Qualifiers .......................................................................... 871
    9.2.2 Identifier Case Sensitivity .................................................................. 872
16.4 Replication Notes and Tips ................................................................. 1751
16.4.1 Replication Features and Issues .................................................. 1751
16.4.2 Replication Compatibility Between MySQL Versions ....................... 1776
16.4.3 Upgrading a Replication Setup ...................................................... 1777
16.4.4 Troubleshooting Replication ........................................................... 1778
16.4.5 How to Report Replication Bugs or Problems ................................. 1779
17 MySQL Cluster NDB 6.1 - 7.1 ................................................................. 1781
17.1 MySQL Cluster Overview ................................................................. 1785
17.1.1 MySQL Cluster Core Concepts ....................................................... 1786
17.1.2 MySQL Cluster Nodes, Node Groups, Replicas, and Partitions ............. 1789
17.1.3 MySQL Cluster Hardware, Software, and Networking Requirements ..... 1791
17.1.4 MySQL Cluster Development History ............................................. 1793
17.1.5 MySQL Server Using InnoDB Compared with MySQL Cluster .......... 1817
17.1.6 Known Limitations of MySQL Cluster ............................................. 1820
17.2 MySQL Cluster Installation and Upgrades ........................................ 1834
17.2.1 Installing MySQL Cluster on Linux ............................................... 1836
17.2.2 Installing MySQL Cluster on Windows .......................................... 1842
17.2.3 Initial Configuration of MySQL Cluster .......................................... 1851
17.2.4 Initial Startup of MySQL Cluster .................................................. 1853
17.2.5 MySQL Cluster Example with Tables and Data ............................... 1854
17.2.6 Safe Shutdown and Restart of MySQL Cluster ................................. 1857
17.2.7 Upgrading and Downgrading MySQL Cluster ................................... 1858
17.3 Configuration of MySQL Cluster NDB 6.1-7.1 ..................................... 1867
17.3.1 Quick Test Setup of MySQL Cluster ............................................. 1867
17.3.2 Overview of MySQL Cluster Configuration Parameters, Options, and Variables ... 1870
17.3.3 MySQL Cluster Configuration Files .............................................. 1911
17.3.4 Using High-Speed Interconnects with MySQL Cluster ...................... 2041
17.4 MySQL Cluster Programs ............................................................... 2043
17.4.1 ndbd — The MySQL Cluster Data Node Daemon .............................. 2043
17.4.2 ndbinfo_select_all — Select From ndbinfo Tables ......................... 2050
17.4.3 ndbmtd — The MySQL Cluster Data Node Daemon (Multi-Threaded) .... 2052
17.4.4 ndb_mgm — The MySQL Cluster Management Server Daemon ........... 2053
17.4.5 ndb_mgm — The MySQL Cluster Management Client ....................... 2061
17.4.6 ndb_blob_tool — Check and Repair BLOB and TEXT columns of MySQL Cluster Tables .......................................................... 2062
17.4.7 ndb_config — Extract MySQL Cluster Configuration Information ...... 2065
17.4.8 ndb_cpcd — Automate Testing for NDB Development ...................... 2073
17.4.9 ndb_delete_all — Delete All Rows from an NDB Table .................... 2073
17.4.10 ndb_desc — Describe NDB Tables ............................................... 2073
17.4.11 ndb_drop_index — Drop Index from an NDB Table .......................... 2078
17.4.12 ndb_drop_table — Drop an NDB Table ....................................... 2079
17.4.13 ndb_error_reporter — NDB Error-Reporting Utility ....................... 2079
17.4.14 ndb_index_stat — NDB Index Statistics Utility ............................. 2081
17.4.15 ndb_print_backup_file — Print NDB Backup File Contents ............... 2086
17.4.16 ndb_print_file — Print NDB Disk Data File Contents ...................... 2087
17.4.17 ndb_print_schema_file — Print NDB Schema File Contents ............... 2087
17.4.18 ndb_print_sys_file — Print NDB System File Contents .................... 2088
17.4.19 ndbd_redo_log_reader — Check and Print Content of Cluster Redo Log .... 2088
17.4.20 ndb_restore — Restore a MySQL Cluster Backup ............................ 2089
17.4.21 ndb_select_all — Print Rows from an NDB Table ........................... 2104
17.4.22 ndb_select_count — Print Row Counts for NDB Tables ................... 2107
17.4.23 ndb_show_tables — Display List of NDB Tables ............................ 2107
17.4.24 ndb_size.pl — NDBCLUSTER Size Requirement Estimator .................. 2109
17.4.25 ndb_waiter — Wait for MySQL Cluster to Reach a Given Status ........ 2112
17.4.26 Options Common to MySQL Cluster Programs — Options Common to MySQL Cluster Programs .......................................................... 2114
17.5 Management of MySQL Cluster ...................................................... 2117
17.5.1 Summary of MySQL Cluster Start Phases ...................................... 2118
19 Stored Programs and Views ................................................................. 2317
18 Partitioning .................................................................................... 2263
  18.1 Overview of Partitioning in MySQL .............................................. 2265
  18.2 Partitioning Types ...................................................................... 2268
    18.2.1 RANGE Partitioning ............................................................ 2270
    18.2.2 LIST Partitioning ............................................................... 2273
    18.2.3 HASH Partitioning ............................................................. 2275
    18.2.4 KEY Partitioning .............................................................. 2278
    18.2.5 Subpartitioning ................................................................. 2280
    18.2.6 How MySQL Partitioning Handles NULL ............................... 2283
  18.3 Partition Management ................................................................. 2287
    18.3.1 Management of RANGE and LIST Partitions ......................... 2288
    18.3.2 Management of HASH and KEY Partitions ......................... 2294
    18.3.3 Maintenance of Partitions .................................................... 2295
    18.3.4 Obtaining Information About Partitions ................................. 2297
  18.4 Partition Pruning ......................................................................... 2299

  17.7.24 MySQL Cluster NDB 6.1 - 7.1 Features Addressing Storage Engines . 2286
Preface and Legal Notices

This is the Reference Manual for the MySQL Database System, version 5.1, through release 5.1.73. Differences between minor versions of MySQL 5.1 are noted in the present text with reference to release numbers (5.1.x). For license information, see the Legal Notices.

This manual is not intended for use with older versions of the MySQL software due to the many functional and other differences between MySQL 5.1 and previous versions. If you are using an earlier release of the MySQL software, please refer to the appropriate manual. For example, MySQL 5.0 Reference Manual covers the 5.0 series of MySQL software releases.

If you are using MySQL 5.5, please refer to the MySQL 5.5 Reference Manual.

Licensing information—MySQL 5.1. This product may include third-party software, used under license. If you are using a Commercial release of MySQL 5.1, see this document for licensing information, including licensing information relating to third-party software that may be included in this Commercial release. If you are using a Community release of MySQL 5.1, see this document for licensing information, including licensing information relating to third-party software that may be included in this Community release.

Licensing information—MySQL Cluster. This product may include third-party software, used under license. If you are using a Commercial release of MySQL Cluster, see this document for licensing information, including licensing information relating to third-party software that may be included in this Commercial release. If you are using a Community release of MySQL Cluster, see this document for licensing information, including licensing information relating to third-party software that may be included in this Community release.

Legal Notices

Copyright © 1997, 2016, Oracle and/or its affiliates. All rights reserved.

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.
Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

This documentation is NOT distributed under a GPL license. Use of this documentation is subject to the following terms:

You may create a printed copy of this documentation solely for your own personal use. Conversion to other formats is allowed as long as the actual content is not altered or edited in any way. You shall not publish or distribute this documentation in any form or on any media, except if you distribute the documentation in a manner similar to how Oracle disseminates it (that is, electronically for download on a Web site with the software) or on a CD-ROM or similar medium, provided however that the documentation is disseminated together with the software on the same medium. Any other use, such as any dissemination of printed copies or use of this documentation, in whole or in part, in another publication, requires the prior written consent from an authorized representative of Oracle. Oracle and/or its affiliates reserve any and all rights to this documentation not expressly granted above.

End of Product Lifecycle. Active development for MySQL Database Server version 5.1 has ended. Oracle offers various support offerings which may be of interest. For details and more information, see the MySQL section of the Lifetime Support Policy for Oracle Technology Products (http://www.oracle.com/us/support/lifetime-support/index.html). Please consider upgrading to a recent version.

The MySQL™ software delivers a very fast, multi-threaded, multi-user, and robust SQL (Structured Query Language) database server. MySQL Server is intended for mission-critical, heavy-load production systems as well as for embedding into mass-deployed software. Oracle is a registered trademark of Oracle Corporation and/or its affiliates. MySQL is a trademark of Oracle Corporation and/or its affiliates, and shall not be used by Customer without Oracle’s express written authorization. Other names may be trademarks of their respective owners.

The MySQL software is Dual Licensed. Users can choose to use the MySQL software as an Open Source product under the terms of the GNU General Public License (http://www.fsf.org/licenses/) or can purchase a standard commercial license from Oracle. See http://www.mysql.com/company/legal/licensing/ for more information on our licensing policies.

The following list describes some sections of particular interest in this manual:

• For a discussion of MySQL Database Server capabilities, see Section 1.3.2, “The Main Features of MySQL”.

• For an overview of new MySQL features, see Section 1.4, “What Is New in MySQL 5.1”. For information about the changes in each version, see the Release Notes.

• For installation instructions, see Chapter 2, Installing and Upgrading MySQL. For information about upgrading MySQL, see Section 2.13.1, “Upgrading MySQL”.

1
• For a tutorial introduction to the MySQL Database Server, see Chapter 3, Tutorial.

• For information about configuring and administering MySQL Server, see Chapter 5, MySQL Server Administration.

• For information about security in MySQL, see Chapter 6, Security.

• For information about setting up replication servers, see Chapter 16, Replication.

• For information about MySQL Enterprise, the commercial MySQL release with advanced features and management tools, see Chapter 23, MySQL Enterprise Edition.

• For answers to a number of questions that are often asked concerning the MySQL Database Server and its capabilities, see Appendix A, MySQL 5.1 Frequently Asked Questions.

• For a history of new features and bug fixes, see the Release Notes.

Important
To report problems or bugs, please use the instructions at Section 1.7, “How to Report Bugs or Problems”. If you find a sensitive security bug in MySQL Server, please let us know immediately by sending an email message to <secalert_us@oracle.com>. Exception: Support customers should report all problems, including security bugs, to Oracle Support.

1.1 About This Manual

This is the Reference Manual for the MySQL Database System, version 5.1, through release 5.1.73. Differences between minor versions of MySQL 5.1 are noted in the present text with reference to release numbers (5.1.x). For license information, see the Legal Notices.

This manual is not intended for use with older versions of the MySQL software due to the many functional and other differences between MySQL 5.1 and previous versions. If you are using an earlier release of the MySQL software, please refer to the appropriate manual. For example, MySQL 5.0 Reference Manual covers the 5.0 series of MySQL software releases.

If you are using MySQL 5.5, please refer to the MySQL 5.5 Reference Manual.

Because this manual serves as a reference, it does not provide general instruction on SQL or relational database concepts. It also does not teach you how to use your operating system or command-line interpreter.

The MySQL Database Software is under constant development, and the Reference Manual is updated frequently as well. The most recent version of the manual is available online in searchable form at http://dev.mysql.com/doc/. Other formats also are available there, including HTML, PDF, and EPUB versions.

The Reference Manual source files are written in DocBook XML format. The HTML version and other formats are produced automatically, primarily using the DocBook XSL stylesheets. For information about DocBook, see http://docbook.org/.

If you have questions about using MySQL, you can ask them using our mailing lists or forums. See Section 1.6.1, “MySQL Mailing Lists”, and Section 1.6.2, “MySQL Community Support at the MySQL Forums”. If you have suggestions concerning additions or corrections to the manual itself, please send them to the http://www.mysql.com/company/contact/.

This manual was originally written by David Axmark and Michael “Monty” Widenius. It is maintained by the MySQL Documentation Team, consisting of Chris Cole, Paul DuBois, Edward Gilmore, Stefan Hinz, David Moss, Philip Olson, Daniel Price, Daniel So, and Jon Stephens.
1.2 Typographical and Syntax Conventions

This manual uses certain typographical conventions:

- **Text in this style** is used for SQL statements; database, table, and column names; program listings and source code; and environment variables. Example: “To reload the grant tables, use the FLUSH PRIVILEGES statement.”

- **Text in this style** indicates input that you type in examples.

- **Text in this style** indicates the names of executable programs and scripts, examples being `mysql` (the MySQL command-line client program) and `mysqld` (the MySQL server executable).

- **Text in this style** is used for variable input for which you should substitute a value of your own choosing.

- **Text in this style** is used for emphasis.

- **Text in this style** is used in table headings and to convey especially strong emphasis.

- **Text in this style** is used to indicate a program option that affects how the program is executed, or that supplies information that is needed for the program to function in a certain way. Example: “The --host option (short form -h) tells the `mysql` client program the hostname or IP address of the MySQL server that it should connect to”.

- File names and directory names are written like this: “The global `my.cnf` file is located in the `/etc` directory.”

- Character sequences are written like this: “To specify a wildcard, use the ‘%’ character.”

When commands are shown that are meant to be executed from within a particular program, the prompt shown preceding the command indicates which command to use. For example, `shell>` indicates a command that you execute from your login shell, `root-shell>` is similar but should be executed as `root`, and `mysql>` indicates a statement that you execute from the `mysql` client program:

```
shell> type a shell command here
root-shell> type a shell command as root here
mysql> type a mysql statement here
```

In some areas different systems may be distinguished from each other to show that commands should be executed in two different environments. For example, while working with replication the commands might be prefixed with `master` and `slave`:

```
master> type a mysql command on the replication master here
slave> type a mysql command on the replication slave here
```

The “shell” is your command interpreter. On Unix, this is typically a program such as `sh`, `csh`, or `bash`. On Windows, the equivalent program is `command.com` or `cmd.exe`, typically run in a console window.

When you enter a command or statement shown in an example, do not type the prompt shown in the example.

Database, table, and column names must often be substituted into statements. To indicate that such substitution is necessary, this manual uses `db_name`, `tbl_name`, and `col_name`. For example, you might see a statement like this:

```
mysql> SELECT col_name FROM db_name.tbl_name;
```

This means that if you were to enter a similar statement, you would supply your own database, table, and column names, perhaps like this:
Overview of the MySQL Database Management System

1.3 Overview of the MySQL Database Management System

1.3.1 What is MySQL?

MySQL, the most popular Open Source SQL database management system, is developed, distributed, and supported by Oracle Corporation.

The MySQL Web site (http://www.mysql.com/) provides the latest information about MySQL software.

MySQL is a database management system.

A database is a structured collection of data. It may be anything from a simple shopping list to a picture gallery or the vast amounts of information in a corporate network. To add, access, and
process data stored in a computer database, you need a database management system such as MySQL Server. Since computers are very good at handling large amounts of data, database management systems play a central role in computing, as standalone utilities, or as parts of other applications.

• **MySQL databases are relational.**

A relational database stores data in separate tables rather than putting all the data in one big storeroom. The database structures are organized into physical files optimized for speed. The logical model, with objects such as databases, tables, views, rows, and columns, offers a flexible programming environment. You set up rules governing the relationships between different data fields, such as one-to-one, one-to-many, unique, required or optional, and “pointers” between different tables. The database enforces these rules, so that with a well-designed database, your application never sees inconsistent, duplicate, orphan, out-of-date, or missing data.

The SQL part of “MySQL” stands for “Structured Query Language”. SQL is the most common standardized language used to access databases. Depending on your programming environment, you might enter SQL directly (for example, to generate reports), embed SQL statements into code written in another language, or use a language-specific API that hides the SQL syntax.

SQL is defined by the ANSI/ISO SQL Standard. The SQL standard has been evolving since 1986 and several versions exist. In this manual, “SQL-92” refers to the standard released in 1992, “SQL:1999” refers to the standard released in 1999, and “SQL:2003” refers to the current version of the standard. We use the phrase “the SQL standard” to mean the current version of the SQL Standard at any time.

• **MySQL software is Open Source.**

Open Source means that it is possible for anyone to use and modify the software. Anybody can download the MySQL software from the Internet and use it without paying anything. If you wish, you may study the source code and change it to suit your needs. The MySQL software uses the GPL (GNU General Public License), http://www.fsf.org/licenses/, to define what you may and may not do with the software in different situations. If you feel uncomfortable with the GPL or need to embed MySQL code into a commercial application, you can buy a commercially licensed version from us. See the MySQL Licensing Overview for more information (http://www.mysql.com/company/legal/licensing/).

• **The MySQL Database Server is very fast, reliable, scalable, and easy to use.**

If that is what you are looking for, you should give it a try. MySQL Server can run comfortably on a desktop or laptop, alongside your other applications, web servers, and so on, requiring little or no attention. If you dedicate an entire machine to MySQL, you can adjust the settings to take advantage of all the memory, CPU power, and I/O capacity available. MySQL can also scale up to clusters of machines, networked together.

MySQL Server was originally developed to handle large databases much faster than existing solutions and has been successfully used in highly demanding production environments for several years. Although under constant development, MySQL Server today offers a rich and useful set of functions. Its connectivity, speed, and security make MySQL Server highly suited for accessing databases on the Internet.

• **MySQL Server works in client/server or embedded systems.**

The MySQL Database Software is a client/server system that consists of a multi-threaded SQL server that supports different backends, several different client programs and libraries, administrative tools, and a wide range of application programming interfaces (APIs).

We also provide MySQL Server as an embedded multi-threaded library that you can link into your application to get a smaller, faster, easier-to-manage standalone product.

• **A large amount of contributed MySQL software is available.**
MySQL Server has a practical set of features developed in close cooperation with our users. It is very likely that your favorite application or language supports the MySQL Database Server.

The official way to pronounce “MySQL” is “My Ess Que Ell” (not “my sequel”), but we do not mind if you pronounce it as “my sequel” or in some other localized way.

1.3.2 The Main Features of MySQL

This section describes some of the important characteristics of the MySQL Database Software. In most respects, the roadmap applies to all versions of MySQL. For information about features as they are introduced into MySQL on a series-specific basis, see the “In a Nutshell” section of the appropriate Manual:

- MySQL 8.0: What Is New in MySQL 8.0
- MySQL 5.7: What Is New in MySQL 5.7
- MySQL 5.6: What Is New in MySQL 5.6
- MySQL 5.5: What Is New in MySQL 5.5

Internals and Portability

- Written in C and C++.
- Tested with a broad range of different compilers.
- For portability, uses CMake in MySQL 5.5 and up. Previous series use GNU Automake, Autoconf, and Libtool.
- Tested with Purify (a commercial memory leakage detector) as well as with Valgrind, a GPL tool (http://developer.kde.org/~sewardj/).
- Uses multi-layered server design with independent modules.
- Designed to be fully multi-threaded using kernel threads, to easily use multiple CPUs if they are available.
- Provides transactional and nontransactional storage engines.
- Uses very fast B-tree disk tables (MyISAM) with index compression.
- Designed to make it relatively easy to add other storage engines. This is useful if you want to provide an SQL interface for an in-house database.
- Uses a very fast thread-based memory allocation system.
- Executes very fast joins using an optimized nested-loop join.
- Implements in-memory hash tables, which are used as temporary tables.
- Implements SQL functions using a highly optimized class library that should be as fast as possible. Usually there is no memory allocation at all after query initialization.
- Provides the server as a separate program for use in a client/server networked environment, and as a library that can be embedded (linked) into standalone applications. Such applications can be used in isolation or in environments where no network is available.
The Main Features of MySQL

Data Types

- Many data types: signed/unsigned integers 1, 2, 3, 4, and 8 bytes long, FLOAT, DOUBLE, CHAR, VARCHAR, BINARY, VARBINARY, TEXT, BLOB, DATE, TIME, DATETIME, TIMESTAMP, YEAR, SET, ENUM, and OpenGIS spatial types. See Chapter 11, Data Types.
- Fixed-length and variable-length string types.

Statements and Functions

- Full operator and function support in the SELECT list and WHERE clause of queries. For example:

```sql
mysql> SELECT CONCAT(first_name, ' ', last_name)
       -> FROM citizen
       -> WHERE income/dependents > 10000 AND age > 30;
```

- Full support for SQL GROUP BY and ORDER BY clauses. Support for group functions (COUNT(), AVG(), STD(), SUM(), MAX(), MIN(), and GROUP_CONCAT()).
- Support for LEFT OUTER JOIN and RIGHT OUTER JOIN with both standard SQL and ODBC syntax.
- Support for aliases on tables and columns as required by standard SQL.
- Support for DELETE, INSERT, REPLACE, and UPDATE to return the number of rows that were changed (affected), or to return the number of rows matched instead by setting a flag when connecting to the server.
- Support for MySQL-specific SHOW statements that retrieve information about databases, storage engines, tables, and indexes. Support for the INFORMATION_SCHEMA database, implemented according to standard SQL.
- An EXPLAIN statement to show how the optimizer resolves a query.
- Independence of function names from table or column names. For example, ABS is a valid column name. The only restriction is that for a function call, no spaces are permitted between the function name and the "()" that follows it. See Section 9.3, “Keywords and Reserved Words”.
- You can refer to tables from different databases in the same statement.

Security

- A privilege and password system that is very flexible and secure, and that enables host-based verification.
- Password security by encryption of all password traffic when you connect to a server.

Scalability and Limits

- Support for large databases. We use MySQL Server with databases that contain 50 million records. We also know of users who use MySQL Server with 200,000 tables and about 5,000,000,000 rows.
- Support for up to 64 indexes per table. Each index may consist of 1 to 16 columns or parts of columns. The maximum index width is 767 bytes for InnoDB tables, or 1000 for MyISAM. An index may use a prefix of a column for CHAR, VARCHAR, BLOB, or TEXT column types.

Connectivity

- Clients can connect to MySQL Server using several protocols:
- Clients can connect using TCP/IP sockets on any platform.
• On Windows systems, clients can connect using named pipes if the server is started with the `--enable-named-pipe` option. Windows servers also support shared-memory connections if started with the `--shared-memory` option. Clients can connect through shared memory by using the `--protocol=memory` option.

• On Unix systems, clients can connect using Unix domain socket files.

• MySQL client programs can be written in many languages. A client library written in C is available for clients written in C or C++, or for any language that provides C bindings.

• APIs for C, C++, Eiffel, Java, Perl, PHP, Python, Ruby, and Tcl are available, enabling MySQL clients to be written in many languages. See Chapter 21, Connectors and APIs.

• The Connector/ODBC (MyODBC) interface provides MySQL support for client programs that use ODBC (Open Database Connectivity) connections. For example, you can use MS Access to connect to your MySQL server. Clients can be run on Windows or Unix. Connector/ODBC source is available. All ODBC 2.5 functions are supported, as are many others. See MySQL Connector/ODBC Developer Guide.

• The Connector/J interface provides MySQL support for Java client programs that use JDBC connections. Clients can be run on Windows or Unix. Connector/J source is available. See MySQL Connector/J 5.1 Developer Guide.

• MySQL Connector/Net enables developers to easily create .NET applications that require secure, high-performance data connectivity with MySQL. It implements the required ADO.NET interfaces and integrates into ADO.NET aware tools. Developers can build applications using their choice of .NET languages. MySQL Connector/Net is a fully managed ADO.NET driver written in 100% pure C#. See MySQL Connector/Net Developer Guide.

Localization

• The server can provide error messages to clients in many languages. See Section 10.2, “Setting the Error Message Language”.

• Full support for several different character sets, including `latin1` (cp1252), `german`, `big5`, `ujis`, several Unicode character sets, and more. For example, the Scandinavian characters “å”, “ä” and “ö” are permitted in table and column names.

• All data is saved in the chosen character set.

• Sorting and comparisons are done according to the chosen character set and collation (using `latin1` and Swedish collation by default). It is possible to change this when the MySQL server is started. To see an example of very advanced sorting, look at the Czech sorting code. MySQL Server supports many different character sets that can be specified at compile time and runtime.

• The server time zone can be changed dynamically, and individual clients can specify their own time zone. See Section 10.6, “MySQL Server Time Zone Support”.

Clients and Tools

• MySQL includes several client and utility programs. These include both command-line programs such as `mysqldump` and `mysqladmin`, and graphical programs such as MySQL Workbench.

• MySQL Server has built-in support for SQL statements to check, optimize, and repair tables. These statements are available from the command line through the `mysqlcheck` client. MySQL also includes `myisamchk`, a very fast command-line utility for performing these operations on MyISAM tables. See Chapter 4, MySQL Programs.

• MySQL programs can be invoked with the `--help` or `?-` option to obtain online assistance.

1.3.3 History of MySQL
We started out with the intention of using the mSQL database system to connect to our tables using our own fast low-level (ISAM) routines. However, after some testing, we came to the conclusion that mSQL was not fast enough or flexible enough for our needs. This resulted in a new SQL interface to our database but with almost the same API interface as mSQL. This API was designed to enable third-party code that was written for use with mSQL to be ported easily for use with MySQL.

MySQL is named after co-founder Monty Widenius's daughter, My.

The name of the MySQL Dolphin (our logo) is "Sakila," which was chosen from a huge list of names suggested by users in our “Name the Dolphin” contest. The winning name was submitted by Ambrose Twebaze, an Open Source software developer from Swaziland, Africa. According to Ambrose, the feminine name Sakila has its roots in SiSwati, the local language of Swaziland. Sakila is also the name of a town in Arusha, Tanzania, near Ambrose's country of origin, Uganda.

1.4 What Is New in MySQL 5.1

This section summarizes what has been added to MySQL 5.1 and what has been deprecated for further use.

- **Added Features**
- **Deprecated Features**

### Added Features

The following features have been added to MySQL 5.1:

- **Partitioning.** This capability enables distributing portions of individual tables across a file system, according to rules which can be set when the table is created. In effect, different portions of a table are stored as separate tables in different locations, but from the user point of view, the partitioned table is still a single table. Syntactically, this implements a number of new extensions to the `CREATE TABLE`, `ALTER TABLE`, and `EXPLAIN ... SELECT` statements. As of MySQL 5.1.6, queries against partitioned tables can take advantage of partition pruning. In some cases, this can result in query execution that is an order of magnitude faster than the same query against a nonpartitioned version of the same table. See Chapter 18, Partitioning, for further information on this functionality. (Author: Mikael Ronström)

- **Row-based replication.** Replication capabilities in MySQL originally were based on propagation of SQL statements from master to slave. This is called statement-based replication. As of MySQL 5.1.5, another basis for replication is available. This is called row-based replication. Instead of sending SQL statements to the slave, the master writes events to its binary log that indicate how individual table rows are effected. As of MySQL 5.1.8, a third option is available: mixed. This will use statement-based replication by default, and only switch to row-based replication in particular cases. See Section 16.1.2, “Replication Formats”. (Authors: Lars Thalmann, Guilhem Bichot, Mats Kindahl)

- **Plugin API.** MySQL 5.1 adds support for a very flexible plugin API that enables loading and unloading of various components at runtime, without restarting the server. Although the work on this is not finished yet, plugin full-text parsers are a first step in this direction. This permits users to implement their own input filter on the indexed text, enabling full-text search capability on arbitrary data such as PDF files or other document formats. A pre-parser full-text plugin performs the actual parsing and extraction of the text and hands it over to the built-in MySQL full-text search. See Section 22.2, “The MySQL Plugin API”. (Author: Sergey Vojtovich)

- **Event scheduler.** MySQL Events are tasks that run according to a schedule. When you create an event, you are creating a named database object containing one or more SQL statements to be executed at one or more regular intervals, beginning and ending at a specific date and time. Conceptually, this is similar to the idea of the Unix `crontab` (also known as a “cron job”) or the Windows Task Scheduler. See Section 19.4, “Using the Event Scheduler”. (Author: Andrey Hristov)
• **Server log tables.** Before MySQL 5.1, the server writes general query log and slow query log entries to log files. As of MySQL 5.1, the server's logging capabilities for these logs are more flexible. Log entries can be written to log files (as before) or to the `general_log` and `slow_log` tables in the `mysql` database. If logging is enabled, either or both destinations can be selected. The `--log-output` option controls the destination or destinations of log output. See Section 5.4.1, “Selecting General Query and Slow Query Log Output Destinations”. (Author: Petr Chardin)

• **Upgrade program.** The `mysql_upgrade` program (available as of MySQL 5.1.7) checks all existing tables for incompatibilities with the current version of MySQL Server and repairs them if necessary. This program should be run for each MySQL upgrade. See Section 4.4.8, “mysql_upgrade — Check and Upgrade MySQL Tables”. (Authors: Alexey Botchkov, Mikael Widenius)

• **MySQL Cluster.** MySQL Cluster is now released as a separate product, based on MySQL 5.1 but with the addition of the `NDBCLUSTER` storage engine. Clustering support is no longer available in mainline MySQL 5.1 releases. MySQL Cluster releases are identified by a 3-part NDB version number; currently, the MySQL Cluster NDB 6.3, MySQL Cluster NDB 7.0, and MySQL Cluster NDB 7.1 release series are available for production use.

Some of the changes in MySQL Cluster since MySQL 5.0 are listed here:

• **MySQL Cluster replication.** Replication between MySQL Clusters is now supported. It is now also possible to replicate between a MySQL Cluster and a noncluster database. See Section 17.6, “MySQL Cluster Replication”.

• **MySQL Cluster disk data storage.** Formerly, the `NDBCLUSTER` storage engine was strictly in-memory; now, it is possible to store Cluster data (but not indexes) on disk. This enables MySQL Cluster to scale upward with fewer hardware (RAM) requirements than previously. In addition, the Disk Data implementation includes a new “no-steal” restoration algorithm for fast node restarts when storing very large amounts of data (terabyte range). See Section 17.5.12, “MySQL Cluster Disk Data Tables”, for more information.

• **Improved backups for MySQL Cluster.** A fault arising in a single data node during a Cluster backup no longer causes the entire backup to be aborted, as occurred in previous versions of MySQL Cluster.

Many other new features and improvements have been made to the `NDBCLUSTER` storage engine in MySQL Cluster NDB 7.0 and MySQL Cluster NDB 7.1; for more information about these, see Section 17.1.4, “MySQL Cluster Development History”.

• **Backup of tablespaces.** The `mysqldump` utility now supports an option for dumping tablespaces. Use `--Y` or `--all-tablespaces` to enable this functionality.

• **Improvements to INFORMATION_SCHEMA.** MySQL 5.1 provides much more information in its metadata database than was available in MySQL 5.0. New tables in the `INFORMATION_SCHEMA` database include `FILES`, `EVENTS`, `PARTITIONS`, `PROCESSLIST`, `ENGINES`, and `PLUGINS`.

• **XML functions with XPath support.** `ExtractValue()` returns the content of a fragment of XML matching a given XPath expression. `UpdateXML()` replaces the element selected from a fragment of XML by an XPath expression supplied by the user with a second XML fragment (also user-supplied), and returns the modified XML. See Section 12.11, “XML Functions”. (Author: Alexander Barkov)

• **Load emulator.** The `mysqlslap` program is designed to emulate client load for a MySQL server and report the timing of each stage. It works as if multiple clients were accessing the server. See Section 4.5.7, “mysqlslap — Load Emulation Client”. (Authors: Patrick Galbraith, Brian Aker)

### Deprecated Features

The following constructs are deprecated in MySQL 5.1 and are removed as of MySQL 5.5. Where alternatives are shown, applications should be updated to use them.
• The log_bin_trust_routine_creators system variable (use log_bin_trust_function_creators).

• The table_type system variable (use storage_engine).

• The TYPE table option to specify the storage engine for CREATE TABLE or ALTER TABLE (use ENGINE).

• The SHOW TABLE TYPES SQL statement (use SHOW ENGINES).

• The SHOW INNODB STATUS and SHOW MUTEX STATUS SQL statements (use SHOW ENGINE INNODB STATUS SHOW ENGINE INNODB MUTEX).

• The SHOW PLUGIN SQL statement (use SHOW PLUGINS).

• The LOAD TABLE ... FROM MASTER and LOAD DATA FROM MASTER SQL statements (use mysqldump or mysqlhotcopy to dump tables and mysql to reload dump files).

• The BACKUP TABLE and RESTORE TABLE SQL statements (use mysqldump or mysqlhotcopy to dump tables and mysql to reload dump files).

• TIMESTAMP(N) data type: The ability to specify a display width of N (use without N).

• The --master-xxx server options to set replication parameters (use the CHANGE MASTER TO statement instead): --master-host, --master-user, --master-password, --master-port, --master-connect-retry, --master-ssl, --master-ssl-ca, --master-ssl-capath, --master-ssl-cert, --master-ssl-cipher, --master-ssl-key.

1.5 MySQL Development History

This section describes the general MySQL development history, provides an overview about features that have been implemented in previous series and that are new in MySQL 5.1, the release series covered in this manual. The maturity level of this release series is general availability. Information about maturity levels can be found in Section 2.1.1.1, “Choosing Which Version of MySQL to Install”.

Before upgrading from one release series to the next, please see the notes in Section 2.13.1, “Upgrading MySQL”.

The most requested features and the versions in which they were implemented are summarized in the following table.

<table>
<thead>
<tr>
<th>Feature</th>
<th>MySQL Series</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unions</td>
<td>4.0</td>
</tr>
<tr>
<td>Subqueries</td>
<td>4.1</td>
</tr>
<tr>
<td>R-trees</td>
<td>4.1 (for the MyISAM storage engine)</td>
</tr>
<tr>
<td>Stored procedures and functions</td>

</table>
1.6 MySQL Information Sources

This section lists sources of additional information that you may find helpful, such as the MySQL mailing lists and user forums, and Internet Relay Chat.

1.6.1 MySQL Mailing Lists

This section introduces the MySQL mailing lists and provides guidelines as to how the lists should be used. When you subscribe to a mailing list, you receive all postings to the list as email messages. You can also send your own questions and answers to the list.

To subscribe to or unsubscribe from any of the mailing lists described in this section, visit http://lists.mysql.com/. For most of them, you can select the regular version of the list where you get individual messages, or a digest version where you get one large message per day.

Please do not send messages about subscribing or unsubscribing to any of the mailing lists, because such messages are distributed automatically to thousands of other users.

Your local site may have many subscribers to a MySQL mailing list. If so, the site may have a local mailing list, so that messages sent from lists.mysql.com to your site are propagated to the local list. In such cases, please contact your system administrator to be added to or dropped from the local MySQL list.

To have traffic for a mailing list go to a separate mailbox in your mail program, set up a filter based on the message headers. You can use either the List-ID: or Delivered-To: headers to identify list messages.

The MySQL mailing lists are as follows:

• announce

  The list for announcements of new versions of MySQL and related programs. This is a low-volume list to which all MySQL users should subscribe.

• mysql

  The main list for general MySQL discussion. Please note that some topics are better discussed on the more-specialized lists. If you post to the wrong list, you may not get an answer.

• bugs

  The list for people who want to stay informed about issues reported since the last release of MySQL or who want to be actively involved in the process of bug hunting and fixing. See Section 1.7, “How to Report Bugs or Problems”.

• internals

  The list for people who work on the MySQL code. This is also the forum for discussions on MySQL development and for posting patches.

• mysqlproc

  The list for people who work on the MySQL documentation.

• benchmarks
MySQL Mailing Lists

The list for anyone interested in performance issues. Discussions concentrate on database performance (not limited to MySQL), but also include broader categories such as performance of the kernel, file system, disk system, and so on.

- **packagers**
  The list for discussions on packaging and distributing MySQL. This is the forum used by distribution maintainers to exchange ideas on packaging MySQL and on ensuring that MySQL looks and feels as similar as possible on all supported platforms and operating systems.

- **java**
  The list for discussions about the MySQL server and Java. It is mostly used to discuss JDBC drivers such as MySQL Connector/J.

- **win32**
  The list for all topics concerning the MySQL software on Microsoft operating systems, such as Windows 9x, Me, NT, 2000, XP, and 2003.

- **myodbc**
  The list for all topics concerning connecting to the MySQL server with ODBC.

- **gui-tools**
  The list for all topics concerning MySQL graphical user interface tools such as MySQL Workbench.

- **cluster**
  The list for discussion of MySQL Cluster.

- **dotnet**
  The list for discussion of the MySQL server and the .NET platform. It is mostly related to MySQL Connector/Net.

- **plusplus**
  The list for all topics concerning programming with the C++ API for MySQL.

- **perl**
  The list for all topics concerning Perl support for MySQL with DBD::mysql.

If you’re unable to get an answer to your questions from a MySQL mailing list or forum, one option is to purchase support from Oracle. This puts you in direct contact with MySQL developers.

The following MySQL mailing lists are in languages other than English. These lists are not operated by Oracle.

- [mysql-france-subscribe@yahoogroups.com](mailto:mysql-france-subscribe@yahoogroups.com)
  A French mailing list.

- [list@tinc.net](mailto:list@tinc.net)
  A Korean mailing list. To subscribe, email subscribe mysql your@email.address to this list.

- [mysql-de-request@lists.4t2.com](mailto:mysql-de-request@lists.4t2.com)
  A German mailing list. To subscribe, email subscribe mysql-de your@email.address to this list. You can find information about this mailing list at [http://www.4t2.com/mysql/](http://www.4t2.com/mysql/).
MySQL Community Support at the MySQL Forums

1.6.1 Guidelines for Using the Mailing Lists

Please do not post mail messages from your browser with HTML mode turned on. Many users do not read mail with a browser.

When you answer a question sent to a mailing list, if you consider your answer to have broad interest, you may want to post it to the list instead of replying directly to the individual who asked. Try to make your answer general enough that people other than the original poster may benefit from it. When you post to the list, please make sure that your answer is not a duplication of a previous answer.

Try to summarize the essential part of the question in your reply. Do not feel obliged to quote the entire original message.

When answers are sent to you individually and not to the mailing list, it is considered good etiquette to summarize the answers and send the summary to the mailing list so that others may have the benefit of responses you received that helped you solve your problem.

1.6.2 MySQL Community Support at the MySQL Forums

The forums at http://forums.mysql.com are an important community resource. Many forums are available, grouped into these general categories:

• Migration
• MySQL Usage
• MySQL Connectors
• Programming Languages
• Tools
• 3rd-Party Applications
• Storage Engines
• MySQL Technology
• SQL Standards
• Business

1.6.3 MySQL Community Support on Internet Relay Chat (IRC)

In addition to the various MySQL mailing lists and forums, you can find experienced community people on Internet Relay Chat (IRC). These are the best networks/channels currently known to us:

freenode (see http://www.freenode.net/ for servers)

• #mysql is primarily for MySQL questions, but other database and general SQL questions are welcome. Questions about PHP, Perl, or C in combination with MySQL are also common.

• #workbench is primarily for MySQL Workbench related questions and thoughts, and it is also a good place to meet the MySQL Workbench developers.
If you are looking for IRC client software to connect to an IRC network, take a look at xChat. X-Chat (GPL licensed) is available for Unix as well as for Windows platforms (a free Windows build of X-Chat is available at http://www.silverex.org/download/).

1.6.4 MySQL Enterprise

Oracle offers technical support in the form of MySQL Enterprise. For organizations that rely on the MySQL DBMS for business-critical production applications, MySQL Enterprise is a commercial subscription offering which includes:

- MySQL Enterprise Server
- MySQL Enterprise Monitor
- Monthly Rapid Updates and Quarterly Service Packs
- MySQL Knowledge Base
- 24x7 Technical and Consultative Support

MySQL Enterprise is available in multiple tiers, giving you the flexibility to choose the level of service that best matches your needs. For more information, see MySQL Enterprise.

1.7 How to Report Bugs or Problems

Before posting a bug report about a problem, please try to verify that it is a bug and that it has not been reported already:

- Start by searching the MySQL online manual at http://dev.mysql.com/doc/. We try to keep the manual up to date by updating it frequently with solutions to newly found problems. In addition, the release notes accompanying the manual can be particularly useful since it is quite possible that a newer version contains a solution to your problem. The release notes are available at the location just given for the manual.

- If you get a parse error for an SQL statement, please check your syntax closely. If you cannot find something wrong with it, it is extremely likely that your current version of MySQL Server doesn’t support the syntax you are using. If you are using the current version and the manual doesn’t cover the syntax that you are using, MySQL Server doesn’t support your statement.

If the manual covers the syntax you are using, but you have an older version of MySQL Server, you should check the MySQL change history to see when the syntax was implemented. In this case, you have the option of upgrading to a newer version of MySQL Server.

- For solutions to some common problems, see Section B.5, “Problems and Common Errors”.

- Search the bugs database at http://bugs.mysql.com/ to see whether the bug has been reported and fixed.

- Search the MySQL mailing list archives at http://lists.mysql.com/. See Section 1.6.1, “MySQL Mailing Lists”.

- You can also use http://www.mysql.com/search/ to search all the Web pages (including the manual) that are located at the MySQL Web site.

If you cannot find an answer in the manual, the bugs database, or the mailing list archives, check with your local MySQL expert. If you still cannot find an answer to your question, please use the following guidelines for reporting the bug.

The normal way to report bugs is to visit http://bugs.mysql.com/, which is the address for our bugs database. This database is public and can be browsed and searched by anyone. If you log in to the system, you can enter new reports.
Bugs posted in the bugs database at http://bugs.mysql.com/ that are corrected for a given release are noted in the release notes.

If you find a sensitive security bug in MySQL Server, please let us know immediately by sending an email message to <secalert_us@oracle.com>. Exception: Support customers should report all problems, including security bugs, to Oracle Support at http://support.oracle.com/.

To discuss problems with other users, you can use one of the MySQL mailing lists. Section 1.6.1, “MySQL Mailing Lists”.

Writing a good bug report takes patience, but doing it right the first time saves time both for us and for yourself. A good bug report, containing a full test case for the bug, makes it very likely that we will fix the bug in the next release. This section helps you write your report correctly so that you do not waste your time doing things that may not help us much or at all. Please read this section carefully and make sure that all the information described here is included in your report.

Preferably, you should test the problem using the latest production or development version of MySQL Server before posting. Anyone should be able to repeat the bug by just using `mysql test < script_file` on your test case or by running the shell or Perl script that you include in the bug report. Any bug that we are able to repeat has a high chance of being fixed in the next MySQL release.

It is most helpful when a good description of the problem is included in the bug report. That is, give a good example of everything you did that led to the problem and describe, in exact detail, the problem itself. The best reports are those that include a full example showing how to reproduce the bug or problem. See Section 22.4, “Debugging and Porting MySQL”.

Remember that it is possible for us to respond to a report containing too much information, but not to one containing too little. People often omit facts because they think they know the cause of a problem and assume that some details do not matter. A good principle to follow is that if you are in doubt about stating something, state it. It is faster and less troublesome to write a couple more lines in your report than to wait longer for the answer if we must ask you to provide information that was missing from the initial report.

The most common errors made in bug reports are (a) not including the version number of the MySQL distribution that you use, and (b) not fully describing the platform on which the MySQL server is installed (including the platform type and version number). These are highly relevant pieces of information, and in 99 cases out of 100, the bug report is useless without them. Very often we get questions like, “Why doesn’t this work for me?” Then we find that the feature requested wasn’t implemented in that MySQL version, or that a bug described in a report has been fixed in newer MySQL versions. Errors often are platform-dependent. In such cases, it is next to impossible for us to fix anything without knowing the operating system and the version number of the platform.

If you compiled MySQL from source, remember also to provide information about your compiler if it is related to the problem. Often people find bugs in compilers and think the problem is MySQL-related. Most compilers are under development all the time and become better version by version. To determine whether your problem depends on your compiler, we need to know what compiler you used. Note that every compiling problem should be regarded as a bug and reported accordingly.

If a program produces an error message, it is very important to include the message in your report. If we try to search for something from the archives, it is better that the error message reported exactly matches the one that the program produces. (Even the lettercase should be observed.) It is best to copy and paste the entire error message into your report. You should never try to reproduce the message from memory.

If you have a problem with Connector/ODBC (MyODBC), please try to generate a trace file and send it with your report. See How to Report Connector/ODBC Problems or Bugs.

If your report includes long query output lines from test cases that you run with the `mysql` command-line tool, you can make the output more readable by using the `--vertical` option or the `\G` statement terminator. The `EXPLAIN SELECT` example later in this section demonstrates the use of `\G`. 
How to Report Bugs or Problems

Please include the following information in your report:

- The version number of the MySQL distribution you are using (for example, MySQL 5.7.10). You can find out which version you are running by executing `mysqladmin version`. The `mysqladmin` program can be found in the `bin` directory under your MySQL installation directory.

- The manufacturer and model of the machine on which you experience the problem.

- The operating system name and version. If you work with Windows, you can usually get the name and version number by double-clicking your My Computer icon and pulling down the “Help/About Windows” menu. For most Unix-like operating systems, you can get this information by executing the command `uname -a`.

- Sometimes the amount of memory (real and virtual) is relevant. If in doubt, include these values.

- If you are using a source distribution of the MySQL software, include the name and version number of the compiler that you used. If you have a binary distribution, include the distribution name.

- If the problem occurs during compilation, include the exact error messages and also a few lines of context around the offending code in the file where the error occurs.

- If `mysqld` died, you should also report the statement that crashed `mysqld`. You can usually get this information by running `mysqld` with query logging enabled, and then looking in the log after `mysqld` crashes. See Section 22.4, “Debugging and Porting MySQL”.

- If a database table is related to the problem, include the output from the `SHOW CREATE TABLE db_name.tbl_name` statement in the bug report. This is a very easy way to get the definition of any table in a database. The information helps us create a situation matching the one that you have experienced.

- The SQL mode in effect when the problem occurred can be significant, so please report the value of the `sql_mode` system variable. For stored procedure, stored function, and trigger objects, the relevant `sql_mode` value is the one in effect when the object was created. For a stored procedure or function, the `SHOW CREATE PROCEDURE` or `SHOW CREATE FUNCTION` statement shows the relevant SQL mode, or you can query `INFORMATION_SCHEMA` for the information:

```
SELECT ROUTINE_SCHEMA, ROUTINE_NAME, SQL_MODE
FROM INFORMATION_SCHEMA.ROUTINES;
```

For triggers, you can use this statement:

```
SELECT EVENT_OBJECT_SCHEMA, EVENT_OBJECT_TABLE, TRIGGER_NAME, SQL_MODE
FROM INFORMATION_SCHEMA.TRIGGERS;
```

- For performance-related bugs or problems with `SELECT` statements, you should always include the output of `EXPLAIN SELECT ...`, and at least the number of rows that the `SELECT` statement produces. You should also include the output from `SHOW CREATE TABLE tbl_name` for each table that is involved. The more information you provide about your situation, the more likely it is that someone can help you.

The following is an example of a very good bug report. The statements are run using the `mysql` command-line tool. Note the use of the \G statement terminator for statements that would otherwise provide very long output lines that are difficult to read.

```
mysql> SHOW VARIABLES;
mysql> SHOW COLUMNS FROM ...
   ...\G
   <output from SHOW COLUMNS>
mysql> EXPLAIN SELECT ...\G
   <output from EXPLAIN>
mysql> SELECT ...;
   <A short version of the output from SELECT,
```
How to Report Bugs or Problems

If a bug or problem occurs while running `mysqld`, try to provide an input script that reproduces the anomaly. This script should include any necessary source files. The more closely the script can reproduce your situation, the better. If you can make a reproducible test case, you should upload it to be attached to the bug report.

If you cannot provide a script, you should at least include the output from `mysqladmin variables extended-status processlist` in your report to provide some information on how your system is performing.

If you cannot produce a test case with only a few rows, or if the test table is too big to be included in the bug report (more than 10 rows), you should dump your tables using `mysqldump` and create a `README` file that describes your problem. Create a compressed archive of your files using `tar` and `gzip` or `zip`. After you initiate a bug report for our bugs database at `http://bugs.mysql.com/`, click the Files tab in the bug report for instructions on uploading the archive to the bugs database.

If you believe that the MySQL server produces a strange result from a statement, include not only the result, but also your opinion of what the result should be, and an explanation describing the basis for your opinion.

When you provide an example of the problem, it is better to use the table names, variable names, and so forth that exist in your actual situation than to come up with new names. The problem could be related to the name of a table or variable. These cases are rare, perhaps, but it is better to be safe than sorry. After all, it should be easier for you to provide an example that uses your actual situation, and it is by all means better for us. If you have data that you do not want to be visible to others in the bug report, you can upload it using the Files tab as previously described. If the information is really top secret and you do not want to show it even to us, go ahead and provide an example using other names, but please regard this as the last choice.

Include all the options given to the relevant programs, if possible. For example, indicate the options that you use when you start the `mysqld` server, as well as the options that you use to run any MySQL client programs. The options to programs such as `mysqld` and `mysql`, and to the `configure` script, are often key to resolving problems and are very relevant. It is never a bad idea to include them. If your problem involves a program written in a language such as Perl or PHP, please include the language processor’s version number, as well as the version for any modules that the program uses. For example, if you have a Perl script that uses the `DBI` and `DBD::mysql` modules, include the version numbers for Perl, `DBI`, and `DBD::mysql`.

If your question is related to the privilege system, please include the output of `mysqladmin reload`, and all the error messages you get when trying to connect. When you test your privileges, you should execute `mysqladmin reload version` and try to connect with the program that gives you trouble.

If you have a patch for a bug, do include it. But do not assume that the patch is all we need, or that we can use it, if you do not provide some necessary information such as test cases showing the bug that your patch fixes. We might find problems with your patch or we might not understand it at all. If so, we cannot use it.

If we cannot verify the exact purpose of the patch, we will not use it. Test cases help us here. Show that the patch handles all the situations that may occur. If we find a borderline case (even a rare one) where the patch will not work, it may be useless.

Guesses about what the bug is, why it occurs, or what it depends on are usually wrong. Even the MySQL team cannot guess such things without first using a debugger to determine the real cause of a bug.

Indicate in your bug report that you have checked the reference manual and mail archive so that others know you have tried to solve the problem yourself.
• If your data appears corrupt or you get errors when you access a particular table, first check your tables with `CHECK TABLE`. If that statement reports any errors:

  • The InnoDB crash recovery mechanism handles cleanup when the server is restarted after being killed, so in typical operation there is no need to “repair” tables. If you encounter an error with InnoDB tables, restart the server and see whether the problem persists, or whether the error affected only cached data in memory. If data is corrupted on disk, consider restarting with the `innodb_force_recovery` option enabled so that you can dump the affected tables.

  • For non-transactional tables, try to repair them with `REPAIR TABLE` or with `myisamchk`. See Chapter 5, *MySQL Server Administration*.

If you are running Windows, please verify the value of `lower_case_table_names` using the `SHOW VARIABLES LIKE 'lower_case_table_names'` statement. This variable affects how the server handles lettercase of database and table names. Its effect for a given value should be as described in Section 9.2.2, “Identifier Case Sensitivity”.

• If you often get corrupted tables, you should try to find out when and why this happens. In this case, the error log in the MySQL data directory may contain some information about what happened. (This is the file with the `.err` suffix in the name.) See Section 5.4.2, “The Error Log”. Please include any relevant information from this file in your bug report. Normally `mysqld` should *never* crash a table if nothing killed it in the middle of an update. If you can find the cause of `mysqld` dying, it is much easier for us to provide you with a fix for the problem. See Section B.5.1, “How to Determine What Is Causing a Problem”.

• If possible, download and install the most recent version of MySQL Server and check whether it solves your problem. All versions of the MySQL software are thoroughly tested and should work without problems. We believe in making everything as backward-compatible as possible, and you should be able to switch MySQL versions without difficulty. See Section 2.1.1, “Choosing Which MySQL Distribution to Install”.

1.8 MySQL Standards Compliance

This section describes how MySQL relates to the ANSI/ISO SQL standards. MySQL Server has many extensions to the SQL standard, and here you can find out what they are and how to use them. You can also find information about functionality missing from MySQL Server, and how to work around some of the differences.

The SQL standard has been evolving since 1986 and several versions exist. In this manual, “SQL-92” refers to the standard released in 1992, “SQL:1999” refers to the standard released in 1999, “SQL:2003” refers to the standard released in 2003, and “SQL:2008” refers to the most recent version of the standard, released in 2008. We use the phrase “the SQL standard” or “standard SQL” to mean the current version of the SQL Standard at any time.

One of our main goals with the product is to continue to work toward compliance with the SQL standard, but without sacrificing speed or reliability. We are not afraid to add extensions to SQL or support for non-SQL features if this greatly increases the usability of MySQL Server for a large segment of our user base. The `HANDLER` interface is an example of this strategy. See Section 13.2.4, “HANDLER Syntax”.

We continue to support transactional and nontransactional databases to satisfy both mission-critical 24/7 usage and heavy Web or logging usage.

MySQL Server was originally designed to work with medium-sized databases (10-100 million rows, or about 100MB per table) on small computer systems. Today MySQL Server handles terabyte-sized databases, but the code can also be compiled in a reduced version suitable for hand-held and embedded devices. The compact design of the MySQL server makes development in both directions possible without any conflicts in the source tree.

We are not targeting real-time support, although MySQL replication capabilities offer significant functionality.
MySQL supports ODBC levels 0 to 3.51.

MySQL supports high-availability database clustering using the NDBCLUSTER storage engine. See Chapter 17, MySQL Cluster NDB 6.1 - 7.1.

We are implementing XML functionality beginning in MySQL 5.1, which supports most of the W3C XPath standard. See Section 12.11, “XML Functions”.

### Selecting SQL Modes

The MySQL server can operate in different SQL modes, and can apply these modes differently for different clients, depending on the value of the `sql_mode` system variable. DBAs can set the global SQL mode to match site server operating requirements, and each application can set its session SQL mode to its own requirements.

Modes affect the SQL syntax MySQL supports and the data validation checks it performs. This makes it easier to use MySQL in different environments and to use MySQL together with other database servers.

For more information on setting the SQL mode, see Section 5.1.7, “Server SQL Modes”.

### Running MySQL in ANSI Mode

To run MySQL Server in ANSI mode, start `mysqld` with the `--ansi` option. Running the server in ANSI mode is the same as starting it with the following options:

```
--transaction-isolation=SERIALIZABLE --sql-mode=ANSI
```

To achieve the same effect at runtime, execute these two statements:

```
SET GLOBAL TRANSACTION ISOLATION LEVEL SERIALIZABLE;
SET GLOBAL sql_mode = 'ANSI';
```

You can see that setting the `sql_mode` system variable to 'ANSI' enables all SQL mode options that are relevant for ANSI mode as follows:

```
mysql> SET GLOBAL sql_mode='ANSI';
mysql> SELECT @@global.sql_mode;
-> 'REAL_AS_FLOAT,PIPES_AS_CONCAT,ANSI_QUOTES,IGNORE_SPACE,ANSI'
```

Running the server in ANSI mode with `--ansi` is not quite the same as setting the SQL mode to 'ANSI' because the `--ansi` option also sets the transaction isolation level.

See Section 5.1.3, “Server Command Options”.

### 1.8.1 MySQL Extensions to Standard SQL

MySQL Server supports some extensions that you probably won't find in other SQL DBMSs. Be warned that if you use them, your code won't be portable to other SQL servers. In some cases, you can write code that includes MySQL extensions, but is still portable, by using comments of the following form:

```
/*! MySQL-specific code */
```

In this case, MySQL Server parses and executes the code within the comment as it would any other SQL statement, but other SQL servers will ignore the extensions. For example, MySQL Server recognizes the STRAIGHT_JOIN keyword in the following statement, but other servers will not:

```
SELECT /*! STRAIGHT_JOIN */ col1 FROM table1,table2 WHERE ...
```
If you add a version number after the “!" character, the syntax within the comment is executed only if the MySQL version is greater than or equal to the specified version number. The TEMPORARY keyword in the following comment is executed only by servers from MySQL 3.23.02 or higher:

```
CREATE /*!32302 TEMPORARY */ TABLE t (a INT);
```

The following descriptions list MySQL extensions, organized by category.

- **Organization of data on disk**
  
  MySQL Server maps each database to a directory under the MySQL data directory, and maps tables within a database to file names in the database directory. This has a few implications:

  - Database and table names are case sensitive in MySQL Server on operating systems that have case-sensitive file names (such as most Unix systems). See Section 9.2.2, “Identifier Case Sensitivity”.
  
  - You can use standard system commands to back up, rename, move, delete, and copy tables that are managed by the MyISAM storage engine. For example, it is possible to rename a MyISAM table by renaming the .MYD, .MYI, and .frm files to which the table corresponds. (Nevertheless, it is preferable to use RENAME TABLE or ALTER TABLE ... RENAME and let the server rename the files.)

  Prior to MySQL 5.1.6, database and table names cannot contain path name separator characters ("/", "\").

- **General language syntax**
  
  - By default, strings can be enclosed by either "" or ", not just by "". (If the ANSI_QUOTES SQL mode is enabled, strings can be enclosed only by "" and the server interprets strings enclosed by "" as identifiers.)
  
  - "\" is the escape character in strings.
  
  - In SQL statements, you can access tables from different databases with the \texttt{db_name.tbl_name} syntax. Some SQL servers provide the same functionality but call this User space. MySQL Server doesn't support tablespaces such as used in statements like this: \texttt{CREATE TABLE ralph.my_table ... IN my_tablespace}.

- **SQL statement syntax**
  
  - The \texttt{ANALYZE TABLE}, \texttt{CHECK TABLE}, \texttt{OPTIMIZE TABLE}, and \texttt{REPAIR TABLE} statements.
  
  
  - The \texttt{DO} statement.
  
  - \texttt{EXPLAIN SELECT} to obtain a description of how tables are processed by the query optimizer.
  
  - The \texttt{FLUSH} and \texttt{RESET} statements.
  
  - The \texttt{SET} statement. See Section 13.7.4.1, “SET Syntax for Variable Assignment”.
  
  - The \texttt{SHOW} statement. See Section 13.7.5, “SHOW Syntax”. The information produced by many of the MySQL-specific \texttt{SHOW} statements can be obtained in more standard fashion by using \texttt{SELECT} to query \texttt{INFORMATION_SCHEMA}. See Chapter 20, \texttt{INFORMATION_SCHEMA Tables}.
  
  - Use of \texttt{LOAD DATA INFILE}. In many cases, this syntax is compatible with Oracle's \texttt{LOAD DATA INFILE}. See Section 13.2.6, “LOAD DATA INFILE Syntax”.

---

MySQL Extensions to Standard SQL
MySQL Extensions to Standard SQL

- Use of `RENAME TABLE`. See Section 13.1.33, “RENAME TABLE Syntax”.

- Use of `REPLACE` instead of `DELETE` plus `INSERT`. See Section 13.2.7, “REPLACE Syntax”.

- Use of `CHANGE col_name, DROP col_name, or DROP INDEX, IGNORE or RENAME in ALTER TABLE` statements. Use of multiple `ADD, ALTER, DROP, or CHANGE clauses in an ALTER TABLE` statement. See Section 13.1.7, “ALTER TABLE Syntax”.

- Use of index names, indexes on a prefix of a column, and use of `INDEX` or `KEY` in `CREATE TABLE` statements. See Section 13.1.17, “CREATE TABLE Syntax”.

- Use of `TEMPORARY` or `IF NOT EXISTS` with `CREATE TABLE`.

- Use of `IF EXISTS` with `DROP TABLE` and `DROP DATABASE`.

- The capability of dropping multiple tables with a single `DROP TABLE` statement.

- The `ORDER BY` and `LIMIT` clauses of the `UPDATE` and `DELETE` statements.

- `INSERT INTO tbl_name SET col_name = ... syntax`.

- The `DELAYED` clause of the `INSERT` and `REPLACE` statements.

- The `LOW_PRIORITY` clause of the `INSERT, REPLACE, DELETE, and UPDATE` statements.

- Use of `INTO OUTFILE` or `INTO DUMPFILE` in `SELECT` statements. See Section 13.2.8, “SELECT Syntax”.

- Options such as `STRAIGHT_JOIN` or `SQL_SMALL_RESULT` in `SELECT` statements.

- You don't need to name all selected columns in the `GROUP BY` clause. This gives better performance for some very specific, but quite normal queries. See Section 12.17, “Aggregate (GROUP BY) Functions”.

- You can specify `ASC` and `DESC` with `GROUP BY`, not just with `ORDER BY`.

- The ability to set variables in a statement with the `:=` assignment operator. See Section 9.4, “User-Defined Variables”.

Data types

- The `MEDIUMINT`, `SET`, and `ENUM` data types, and the various `BLOB` and `TEXT` data types.

- The `AUTO_INCREMENT, BINARY, NULL, UNSIGNED, and ZEROFILL` data type attributes.

Functions and operators

- To make it easier for users who migrate from other SQL environments, MySQL Server supports aliases for many functions. For example, all string functions support both standard SQL syntax and ODBC syntax.

- MySQL Server understands the `||` and `&&` operators to mean logical OR and AND, as in the C programming language. In MySQL Server, `||` and `OR` are synonyms, as are `&&` and `AND`. Because of this nice syntax, MySQL Server doesn't support the standard SQL `||` operator for string concatenation; use `CONCAT()` instead. Because `CONCAT()` takes any number of arguments, it is easy to convert use of the `||` operator to MySQL Server.

- Use of `COUNT(DISTINCT value_list)` where `value_list` has more than one element.

- String comparisons are case-insensitive by default, with sort ordering determined by the collation of the current character set, which is `latin1` (cp1252 West European) by default. If you don’t like
MySQL Differences from Standard SQL

We try to make MySQL Server follow the ANSI SQL standard and the ODBC SQL standard, but MySQL Server performs operations differently in some cases:

- There are several differences between the MySQL and standard SQL privilege systems. For example, in MySQL, privileges for a table are not automatically revoked when you delete a table. You must explicitly issue a `REVOKE` statement to revoke privileges for a table. For more information, see Section 13.7.1.5, “REVOKE Syntax”.

- The `CAST()` function does not support cast to `REAL` or `BIGINT`. See Section 12.10, “Cast Functions and Operators”.

1.8.2 MySQL Differences from Standard SQL

1.8.2.1 SELECT INTO TABLE

MySQL Server doesn’t support the `SELECT ... INTO TABLE` Sybase SQL extension. Instead, MySQL Server supports the `INSERT INTO ... SELECT` standard SQL syntax, which is basically the same thing. See Section 13.2.5.1, “INSERT ... SELECT Syntax”. For example:

```
INSERT INTO tbl_temp2 (fld_id)
SELECT tbl_temp1.fld_order_id
FROM tbl_temp1 WHERE tbl_temp1.fld_order_id > 100;
```

Alternatively, you can use `SELECT ... INTO OUTFILE` or `CREATE TABLE ... SELECT`.

You can use `SELECT ... INTO` with user-defined variables. The same syntax can also be used inside stored routines using cursors and local variables. See Section 13.2.8.1, “SELECT ... INTO Syntax”.

1.8.2.2 UPDATE
If you access a column from the table to be updated in an expression, `UPDATE` uses the current value of the column. The second assignment in the following statement sets `col2` to the current (updated) `col1` value, not the original `col1` value. The result is that `col1` and `col2` have the same value. This behavior differs from standard SQL.

```
UPDATE t1 SET col1 = col1 + 1, col2 = col1;
```

### 1.8.2.3 Transactions and Atomic Operations

MySQL Server (version 3.23-max and all versions 4.0 and above) supports transactions with the InnoDB transactional storage engine. InnoDB provides full ACID compliance. See Chapter 14, *Storage Engines*. For information about InnoDB differences from standard SQL with regard to treatment of transaction errors, see Section 14.6.12.4, “InnoDB Error Handling”.

The other nontransactional storage engines in MySQL Server (such as MyISAM) follow a different paradigm for data integrity called “atomic operations.” In transactional terms, MyISAM tables effectively always operate in `autocommit = 1` mode. Atomic operations often offer comparable integrity with higher performance.

Because MySQL Server supports both paradigms, you can decide whether your applications are best served by the speed of atomic operations or the use of transactional features. This choice can be made on a per-table basis.

As noted, the tradeoff for transactional versus nontransactional storage engines lies mostly in performance. Transactional tables have significantly higher memory and disk space requirements, and more CPU overhead. On the other hand, transactional storage engines such as InnoDB also offer many significant features. MySQL Server's modular design enables the concurrent use of different storage engines to suit different requirements and deliver optimum performance in all situations.

But how do you use the features of MySQL Server to maintain rigorous integrity even with the nontransactional MyISAM tables, and how do these features compare with the transactional storage engines?

- If your applications are written in a way that is dependent on being able to call `ROLLBACK` rather than `COMMIT` in critical situations, transactions are more convenient. Transactions also ensure that unfinished updates or corrupting activities are not committed to the database; the server is given the opportunity to do an automatic rollback and your database is saved.

  If you use nontransactional tables, you must resolve potential problems at the application level by including simple checks before updates and by running simple scripts that check the databases for inconsistencies and automatically repair or warn if such an inconsistency occurs. You can normally fix tables perfectly with no data integrity loss just by using the MySQL log or even adding one extra log.

- More often than not, critical transactional updates can be rewritten to be atomic. Generally speaking, all integrity problems that transactions solve can be done with `LOCK TABLES` or atomic updates, ensuring that there are no automatic aborts from the server, which is a common problem with transactional database systems.

- To be safe with MySQL Server, regardless of whether you use transactional tables, you only need to have backups and have binary logging turned on. When that is true, you can recover from any situation that you could with any other transactional database system. It is always good to have backups, regardless of which database system you use.

The transactional paradigm has its advantages and disadvantages. Many users and application developers depend on the ease with which they can code around problems where an abort appears to be necessary, or is necessary. However, even if you are new to the atomic operations paradigm, or more familiar with transactions, do consider the speed benefit that nontransactional tables can offer on the order of three to five times the speed of the fastest and most optimally tuned transactional tables.
In situations where integrity is of highest importance, MySQL Server offers transaction-level reliability and integrity even for nontransactional tables. If you lock tables with `LOCK TABLES`, all updates stall until integrity checks are made. If you obtain a `READ LOCAL` lock (as opposed to a write lock) for a table that enables concurrent inserts at the end of the table, reads are permitted, as are inserts by other clients. The newly inserted records are not be seen by the client that has the read lock until it releases the lock. With `INSERT DELAYED`, you can write inserts that go into a local queue until the locks are released, without having the client wait for the insert to complete. See Section 8.11.3, “Concurrent Inserts”, and Section 13.2.5.2, “INSERT DELAYED Syntax”.

“Atomic,” in the sense that we mean it, is nothing magical. It only means that you can be sure that while each specific update is running, no other user can interfere with it, and there can never be an automatic rollback (which can happen with transactional tables if you are not very careful). MySQL Server also guarantees that there are no dirty reads.

Following are some techniques for working with nontransactional tables:

- Loops that need transactions normally can be coded with the help of `LOCK TABLES`, and you don’t need cursors to update records on the fly.

- To avoid using `ROLLBACK`, you can employ the following strategy:
  1. Use `LOCK TABLES` to lock all the tables you want to access.
  2. Test the conditions that must be true before performing the update.
  3. Update if the conditions are satisfied.
  4. Use `UNLOCK TABLES` to release your locks.

This is usually a much faster method than using transactions with possible rollbacks, although not always. The only situation this solution doesn’t handle is when someone kills the threads in the middle of an update. In that case, all locks are released but some of the updates may not have been executed.

- You can also use functions to update records in a single operation. You can get a very efficient application by using the following techniques:
  
  - Modify columns relative to their current value.
  
  - Update only those columns that actually have changed.

For example, when we are updating customer information, we update only the customer data that has changed and test only that none of the changed data, or data that depends on the changed data, has changed compared to the original row. The test for changed data is done with the `WHERE` clause in the `UPDATE` statement. If the record wasn’t updated, we give the client a message: “Some of the data you have changed has been changed by another user.” Then we show the old row versus the new row in a window so that the user can decide which version of the customer record to use.

This gives us something that is similar to column locking but is actually even better because we only update some of the columns, using values that are relative to their current values. This means that typical `UPDATE` statements look something like these:

```
UPDATE tablename SET pay_back=pay_back+125;
UPDATE customer
SET    
    customer_date='current_date',
    address='new address',
    phone='new phone',
    money_owed_to_us=money_owed_to_us-125
WHERE
    customer_id=id AND address='old address' AND phone='old phone';
```
MySQL Differences from Standard SQL

This is very efficient and works even if another client has changed the values in the `pay_back` or `money_owed_to_us` columns.

- When managing unique identifiers, you can avoid statements such as `LOCK TABLES` or `ROLLBACK` by using an `AUTO_INCREMENT` column and either the `LAST_INSERT_ID()` SQL function or the `mysql_insert_id()` C API function. See Section 12.14, “Information Functions”, and Section 21.8.7.37, “mysql_insert_id()”.

For situations that require row-level locking, use InnoDB tables. Otherwise, with MyISAM tables, you can use a flag column in the table and do something like the following:

```sql
UPDATE tbl_name SET row_flag=1 WHERE id=ID;
```

MySQL returns 1 for the number of affected rows if the row was found and `row_flag` wasn't 1 in the original row. You can think of this as though MySQL Server changed the preceding statement to:

```sql
UPDATE tbl_name SET row_flag=1 WHERE id=ID AND row_flag <> 1;
```

### 1.8.2.4 Foreign Key Differences

MySQL's implementation of foreign keys differs from the SQL standard in the following key respects:

- If there are several rows in the parent table that have the same referenced key value, InnoDB acts in foreign key checks as if the other parent rows with the same key value do not exist. For example, if you have defined a `RESTRICT` type constraint, and there is a child row with several parent rows, InnoDB does not permit the deletion of any of those parent rows.

  InnoDB performs cascading operations through a depth-first algorithm, based on records in the indexes corresponding to the foreign key constraints.

- A `FOREIGN KEY` constraint that references a non-`UNIQUE` key is not standard SQL but rather an InnoDB extension.

- If `ON UPDATE CASCADE` or `ON UPDATE SET NULL` recurses to update the `same table` it has previously updated during the same cascade, it acts like `RESTRICT`. This means that you cannot use self-referential `ON UPDATE CASCADE` or `ON UPDATE SET NULL` operations. This is to prevent infinite loops resulting from cascaded updates. A self-referential `ON DELETE SET NULL`, on the other hand, is possible, as is a self-referential `ON DELETE CASCADE`. Cascading operations may not be nested more than 15 levels deep.

- In an SQL statement that inserts, deletes, or updates many rows, foreign key constraints (like unique constraints) are checked row-by-row. When performing foreign key checks, InnoDB sets shared row-level locks on child or parent records that it must examine. MySQL checks foreign key constraints immediately; the check is not deferred to transaction commit. According to the SQL standard, the default behavior should be deferred checking. That is, constraints are only checked after the `entire SQL statement` has been processed. This means that it is not possible to delete a row that refers to itself using a foreign key.

  For information about how the InnoDB storage engine handles foreign keys, see Section 14.6.6.6, “InnoDB and FOREIGN KEY Constraints”.

### 1.8.2.5 '--' as the Start of a Comment

Standard SQL uses the C syntax `/* this is a comment */` for comments, and MySQL Server supports this syntax as well. MySQL also support extensions to this syntax that enable MySQL-specific SQL to be embedded in the comment, as described in Section 9.6, “Comment Syntax”.

Standard SQL uses `"--"` as a start-comment sequence. MySQL Server uses `"#"` as the start comment character. MySQL Server 3.23.3 and up also supports a variant of the `"--"` comment style. That is,
the “--” start-comment sequence must be followed by a space (or by a control character such as a newline). The space is required to prevent problems with automatically generated SQL queries that use constructs such as the following, where we automatically insert the value of the payment for payment:

```sql
UPDATE account SET credit=credit-payment
```

Consider about what happens if payment has a negative value such as -1:

```sql
UPDATE account SET credit=credit--1
```

credit--1 is a valid expression in SQL, but “--” is interpreted as the start of a comment, part of the expression is discarded. The result is a statement that has a completely different meaning than intended:

```sql
UPDATE account SET credit=credit
```

The statement produces no change in value at all. This illustrates that permitting comments to start with “--” can have serious consequences.

Using our implementation requires a space following the “--” for it to be recognized as a start-comment sequence in MySQL Server 3.23.3 and newer. Therefore, credit--1 is safe to use.

Another safe feature is that the mysql command-line client ignores lines that start with “--”.

The following information is relevant only if you are running a MySQL version earlier than 3.23.3:

If you have an SQL script in a text file that contains “--” comments, you should use the replace utility as follows to convert the comments to use “#” characters before executing the script:

```bash
shell> replace " --" " #" < text-file-with-funny-comments.sql | mysql db_name
```

That is safer than executing the script in the usual way:

```bash
shell> mysql db_name < text-file-with-funny-comments.sql
```

You can also edit the script file “in place” to change the “--” comments to “#” comments:

```bash
shell> replace " --" " #" -- text-file-with-funny-comments.sql
```

Change them back with this command:

```bash
shell> replace " #" " --" -- text-file-with-funny-comments.sql
```

See Section 4.8.2, “replace — A String-Replacement Utility”.

1.8.3 How MySQL Deals with Constraints

MySQL enables you to work both with transactional tables that permit rollback and with nontransactional tables that do not. Because of this, constraint handling is a bit different in MySQL than in other DBMSs. We must handle the case when you have inserted or updated a lot of rows in a nontransactional table for which changes cannot be rolled back when an error occurs.

The basic philosophy is that MySQL Server tries to produce an error for anything that it can detect while parsing a statement to be executed, and tries to recover from any errors that occur while executing the statement. We do this in most cases, but not yet for all.
The options MySQL has when an error occurs are to stop the statement in the middle or to recover as well as possible from the problem and continue. By default, the server follows the latter course. This means, for example, that the server may coerce invalid values to the closest valid values.

Several SQL mode options are available to provide greater control over handling of bad data values and whether to continue statement execution or abort when errors occur. Using these options, you can configure MySQL Server to act in a more traditional fashion that is like other DBMSs that reject improper input. The SQL mode can be set globally at server startup to affect all clients. Individual clients can set the SQL mode at runtime, which enables each client to select the behavior most appropriate for its requirements. See Section 5.1.7, “Server SQL Modes”.

The following sections describe how MySQL Server handles different types of constraints.

### 1.8.3.1 PRIMARY KEY and UNIQUE Index Constraints

Normally, errors occur for data-change statements (such as INSERT or UPDATE) that would violate primary-key, unique-key, or foreign-key constraints. If you are using a transactional storage engine such as InnoDB, MySQL automatically rolls back the statement. If you are using a nontransactional storage engine, MySQL stops processing the statement at the row for which the error occurred and leaves any remaining rows unprocessed.

MySQL supports an IGNORE keyword for INSERT, UPDATE, and so forth. If you use it, MySQL ignores primary-key or unique-key violations and continues processing with the next row. See the section for the statement that you are using (Section 13.2.5, “INSERT Syntax”, Section 13.2.10, “UPDATE Syntax”, and so forth).

You can get information about the number of rows actually inserted or updated with the mysql_info() C API function. You can also use the SHOW WARNINGS statement. See Section 21.8.7.35, “mysql_info()”, and Section 13.7.5.42, “SHOW WARNINGS Syntax”.

Only InnoDB tables support foreign keys. See Section 14.6.6.6, “InnoDB and FOREIGN KEY Constraints”.

### 1.8.3.2 FOREIGN KEY Constraints

Foreign keys let you cross-reference related data across tables, and foreign key constraints help keep this spread-out data consistent.

MySQL supports ON UPDATE and ON DELETE foreign key references in CREATE TABLE and ALTER TABLE statements. The available referential actions are RESTRICT (the default), CASCADE, SET NULL, and NO ACTION.

SET DEFAULT is also supported by the MySQL Server but is currently rejected as invalid by InnoDB. Since MySQL does not support deferred constraint checking, NO ACTION is treated as RESTRICT. For the exact syntax supported by MySQL for foreign keys, see Section 13.1.17.3, “Using FOREIGN KEY Constraints”.

MATCH FULL, MATCH PARTIAL, and MATCH SIMPLE are allowed, but their use should be avoided, as they cause the MySQL Server to ignore any ON DELETE or ON UPDATE clause used in the same statement. MATCH options do not have any other effect in MySQL, which in effect enforces MATCH SIMPLE semantics full-time.

MySQL requires that foreign key columns be indexed; if you create a table with a foreign key constraint but no index on a given column, an index is created.

You can obtain information about foreign keys from the INFORMATION_SCHEMA.KEY_COLUMN_USAGE table. An example of a query against this table is shown here:
How MySQL Deals with Constraints

```sql
mysql> SELECT TABLE_SCHEMA, TABLE_NAME, COLUMN_NAME, CONSTRAINT_NAME
> FROM INFORMATION_SCHEMA.KEY_COLUMN_USAGE
> WHERE REFERENCED_TABLE_SCHEMA IS NOT NULL;

+--------------+---------------+-------------+-----------------+
| TABLE_SCHEMA | TABLE_NAME    | COLUMN_NAME | CONSTRAINT_NAME |
+--------------+---------------+-------------+-----------------+
| fk1          | myuser        | myuser_id   | f               |
| fk1          | product_order | customer_id | f2              |
| fk1          | product_order | product_id  | f1              |
+--------------+---------------+-------------+-----------------+
3 rows in set (0.01 sec)
```

Only InnoDB tables support foreign keys. See Section 14.6.6.6, "InnoDB and FOREIGN KEY Constraints", for information specific to foreign key support in InnoDB.

### 1.8.3.3 Constraints on Invalid Data

By default, MySQL is forgiving of invalid or improper data values and coerces them to valid values for data entry. However, you can enable strict SQL mode to select more traditional treatment of bad values such that the server rejects them and aborts the statement in which they occur. See Section 5.1.7, “Server SQL Modes”.

This section describes the default (forgiving) behavior of MySQL, as well as the strict SQL mode and how it differs.

If you are not using strict mode, then whenever you insert an “incorrect” value into a column, such as a `NULL` into a `NOT NULL` column or a too-large numeric value into a numeric column, MySQL sets the column to the “best possible value” instead of producing an error: The following rules describe in more detail how this works:

- If you try to store an out of range value into a numeric column, MySQL Server instead stores zero, the smallest possible value, or the largest possible value, whichever is closest to the invalid value.
- For strings, MySQL stores either the empty string or as much of the string as can be stored in the column.
- If you try to store a string that does not start with a number into a numeric column, MySQL Server stores 0.
- Invalid values for `ENUM` and `SET` columns are handled as described in Section 1.8.3.4, “ENUM and SET Constraints”.
- MySQL permits you to store certain incorrect date values into `DATE` and `DATETIME` columns (such as `'2000-02-31'` or `'2000-02-00'`). In this case, when an application has not enabled strict SQL mode, it up to the application to validate the dates before storing them. If MySQL can store a date value and retrieve exactly the same value, MySQL stores it as given. If the date is totally wrong (outside the server’s ability to store it), the special “zero” date value `'0000-00-00'` is stored in the column instead.
- If you try to store `NULL` into a column that doesn’t take `NULL` values, an error occurs for single-row `INSERT` statements. For multiple-row `INSERT` statements or for `INSERT INTO ... SELECT` statements, MySQL Server stores the implicit default value for the column data type. In general, this is 0 for numeric types, the empty string ("") for string types, and the “zero” value for date and time types. Implicit default values are discussed in Section 11.6, “Data Type Default Values”.
- If an `INSERT` statement specifies no value for a column, MySQL inserts its default value if the column definition includes an explicit `DEFAULT` clause. If the definition has no such `DEFAULT` clause, MySQL inserts the implicit default value for the column data type.

The reason for using the preceding rules in nonstrict mode is that we can't check these conditions until the statement has begun executing. We can't just roll back if we encounter a problem after updating a few rows, because the storage engine may not support rollback. The option of terminating the
How MySQL Deals with Constraints

statement is not that good; in this case, the update would be “half done,” which is probably the worst possible scenario. In this case, it is better to “do the best you can” and then continue as if nothing happened.

You can select stricter treatment of input values by using the `STRICT_TRANS_TABLES` or `STRICT_ALL_TABLES` SQL modes:

```sql
SET sql_mode = 'STRICT_TRANS_TABLES';
SET sql_mode = 'STRICT_ALL_TABLES';
```

`STRICT_TRANS_TABLES` enables strict mode for transactional storage engines, and also to some extent for nontransactional engines. It works like this:

- For transactional storage engines, bad data values occurring anywhere in a statement cause the statement to abort and roll back.

- For nontransactional storage engines, a statement aborts if the error occurs in the first row to be inserted or updated. (When the error occurs in the first row, the statement can be aborted to leave the table unchanged, just as for a transactional table.) Errors in rows after the first do not abort the statement, because the table has already been changed by the first row. Instead, bad data values are adjusted and result in warnings rather than errors. In other words, with `STRICT_TRANS_TABLES`, a wrong value causes MySQL to roll back all updates done so far, if that can be done without changing the table. But once the table has been changed, further errors result in adjustments and warnings.

For even stricter checking, enable `STRICT_ALL_TABLES`. This is the same as `STRICT_TRANS_TABLES` except that for nontransactional storage engines, errors abort the statement even for bad data in rows following the first row. This means that if an error occurs partway through a multiple-row insert or update for a nontransactional table, a partial update results. Earlier rows are inserted or updated, but those from the point of the error on are not. To avoid this for nontransactional tables, either use single-row statements or else use `STRICT_TRANS_TABLES` if conversion warnings rather than errors are acceptable. To avoid problems in the first place, do not use MySQL to check column content. It is safest (and often faster) to let the application ensure that it passes only valid values to the database.

With either of the strict mode options, you can cause errors to be treated as warnings by using `INSERT IGNORE` or `UPDATE IGNORE` rather than `INSERT` or `UPDATE` without `IGNORE`.

### 1.8.3.4 ENUM and SET Constraints

`ENUM` and `SET` columns provide an efficient way to define columns that can contain only a given set of values. See Section 11.4.4, “The ENUM Type”, and Section 11.4.5, “The SET Type”.

With strict mode enabled (see Section 5.1.7, “Server SQL Modes”), the definition of a `ENUM` or `SET` column acts as a constraint on values entered into the column. An error occurs for values that do not satisfy these conditions:

- An `ENUM` value must be one of those listed in the column definition, or the internal numeric equivalent thereof. The value cannot be the error value (that is, 0 or the empty string). For a column defined as `ENUM('a', 'b', 'c')`, values such as `' '`, `'d'`, or `'ax'` are invalid and are rejected.

- A `SET` value must be the empty string or a value consisting only of the values listed in the column definition separated by commas. For a column defined as `SET('a', 'b', 'c')`, values such as `'d'` or `'a,b,c,d'` are invalid and are rejected.

Errors for invalid values can be suppressed in strict mode if you use `INSERT IGNORE` or `UPDATE IGNORE`. In this case, a warning is generated rather than an error. For `ENUM`, the value is inserted as the error member (0). For `SET`, the value is inserted as given except that any invalid substrings are deleted. For example, `'a,x,b,y'` results in a value of `'a,b'`. 
1.9 Credits

The following sections list developers, contributors, and supporters that have helped to make MySQL what it is today.

1.9.1 Contributors to MySQL

Although Oracle Corporation and/or its affiliates own all copyrights in the MySQL server and the MySQL manual, we wish to recognize those who have made contributions of one kind or another to the MySQL distribution. Contributors are listed here, in somewhat random order:

• Gianmassimo Vigazzola <qwerg@mbox.vol.it> or <qwerg@tin.it>
  The initial port to Win32/NT.

• Per Eric Olsson
  For constructive criticism and real testing of the dynamic record format.

• Irena Pancirov <irena@mail.yacc.it>
  Win32 port with Borland compiler. mysqlshutdown.exe and mysqlwatch.exe.

• David J. Hughes
  For the effort to make a shareware SQL database. At TcX, the predecessor of MySQL AB, we started with mSQL, but found that it couldn't satisfy our purposes so instead we wrote an SQL interface to our application builder Unireg. mysqladmin and mysql client are programs that were largely influenced by their mSQL counterparts. We have put a lot of effort into making the MySQL syntax a superset of mSQL. Many of the API's ideas are borrowed from mSQL to make it easy to port free mSQL programs to the MySQL API. The MySQL software doesn't contain any code from mSQL. Two files in the distribution (client/insert_test.c and client/select_test.c) are based on the corresponding (noncopyrighted) files in the mSQL distribution, but are modified as examples showing the changes necessary to convert code from mSQL to MySQL Server. (mSQL is copyrighted David J. Hughes.)

• Patrick Lynch
  For helping us acquire http://www.mysql.com/.

• Fred Lindberg
  For setting up qmail to handle the MySQL mailing list and for the incredible help we got in managing the MySQL mailing lists.

• Igor Romanenko <igor@frog.kiev.ua>
  mysqldump (previously msqldump, but ported and enhanced by Monty).

• Yuri Dario
  For keeping up and extending the MySQL OS/2 port.

• Tim Bunce
  Author of mysqlhotcopy.

• Zarko Mocnik <zarko.mocnik@dem.si>
  Sorting for Slovenian language.

• "TAMITO" <tommy@valley.ne.jp>
The \_MB character set macros and the ujis and sjis character sets.

- **Joshua Chamas <joshua@chamas.com>**
  Base for concurrent insert, extended date syntax, debugging on NT, and answering on the MySQL mailing list.

- **Yves Carlier <Yves.Carlier@rug.ac.be>**
  mysqlaccess, a program to show the access rights for a user.

- **Rhys Jones <rhys@wales.com> (And GWE Technologies Limited)**
  For one of the early JDBC drivers.

- **Dr Xiaokun Kelvin ZHU <X.Zhu@brad.ac.uk>**
  Further development of one of the early JDBC drivers and other MySQL-related Java tools.

- **James Cooper <pixel@organic.com>**
  For setting up a searchable mailing list archive at his site.

- **Rick Mehalick <Rick_Mehalick@i-o.com>**
  For xmysql, a graphical X client for MySQL Server.

- **Doug Sisk <sisk@wix.com>**
  For providing RPM packages of MySQL for Red Hat Linux.

- **Diemand Alexander V. <axeld@vial.ethz.ch>**
  For providing RPM packages of MySQL for Red Hat Linux-Alpha.

- **Antoni Pamies Olive <toni@readysoft.es>**
  For providing RPM versions of a lot of MySQL clients for Intel and SPARC.

- **Jay Bloodworth <jay@pathways.sde.state.sc.us>**
  For providing RPM versions for MySQL 3.21.

- **David Sacerdote <davids@secnet.com>**
  Ideas for secure checking of DNS host names.

- **Wei-Jou Chen <jou@nematic.ieo.nctu.edu.tw>**
  Some support for Chinese(BIG5) characters.

- **Wei He <hewei@mail.ied.ac.cn>**
  A lot of functionality for the Chinese(GBK) character set.

- **Jan Pazdziora <adelton@fi.muni.cz>**
  Czech sorting order.

- **Zeev Suraski <bourbon@netvision.net.il>**
  FROM_UNIXTIME() time formatting, ENCRYPT() functions, and bison advisor. Active mailing list member.
Contributors to MySQL

- Luuk de Boer <luuk@wxs.nl>
  Ported (and extended) the benchmark suite to DBI/DBD. Have been of great help with crash-me and running benchmarks. Some new date functions. The mysql_setpermission script.

- Alexis Mikhailov <root@medinf.chuvashia.su>
  User-defined functions (UDFs); CREATE FUNCTION and DROP FUNCTION.

- Andreas F. Bobak <bobak@relog.ch>
  The AGGREGATE extension to user-defined functions.

- Ross Wakelin <R.Wakelin@march.co.uk>
  Help to set up InstallShield for MySQL-Win32.

- Jethro Wright III <jetman@li.net>
  The libmysql.dll library.

- James Pereria <jpereira@iafrica.com>
  Mysqlmanager, a Win32 GUI tool for administering MySQL Servers.

- Curt Sampson <cjs@portal.ca>
  Porting of MIT-pthreads to NetBSD/Alpha and NetBSD 1.3/i386.

- Martin Ramsch <m.ramsch@computer.org>
  Examples in the MySQL Tutorial.

- Steve Harvey
  For making mysqlaccess more secure.

- Konark IA-64 Centre of Persistent Systems Private Limited
  Help with the Win64 port of the MySQL server.

- Albert Chin-A-Young.
  Configure updates for Tru64, large file support and better TCP wrappers support.

- John Birrell
  Emulation of pthread_mutex() for OS/2.

- Benjamin Pflugmann
  Extended MERGE tables to handle INSERTS. Active member on the MySQL mailing lists.

- Jocelyn Fournier
  Excellent spotting and reporting innumerable bugs (especially in the MySQL 4.1 subquery code).

- Marc Liyanage
  Maintaining the OS X packages and providing invaluable feedback on how to create OS X packages.

- Robert Rutherford
  Providing invaluable information and feedback about the QNX port.
• Previous developers of NDB Cluster

Lots of people were involved in various ways: summer students, master thesis students, employees. In total more than 100 people so too many to mention here. Notable name is Ataullah Dabaghi who up until 1999 contributed around a third of the code base. A special thanks also to developers of the AXE system which provided much of the architectural foundations for NDB Cluster with blocks, signals and crash tracing functionality. Also credit should be given to those who believed in the ideas enough to allocate of their budgets for its development from 1992 to present time.

• Google Inc.

We wish to recognize Google Inc. for contributions to the MySQL distribution: Mark Callaghan’s SMP Performance patches and other patches.

Other contributors, bugfinders, and testers: James H. Thompson, Maurizio Menghini, Wojciech Tryc, Luca Berra, Zarko Mocnik, Wim Bonis, Elmar Haneke, <jehamby@lightside>, <psmith@BayNetworks.com>, <duane@connect.com.au>, Ted Deppner <ted@psyber.com>, Mike Simons, Jaakko Hyvatti.

And lots of bug report/patches from the folks on the mailing list.

A big tribute goes to those that help us answer questions on the MySQL mailing lists:

• Daniel Koch <dkoch@amcity.com>
  Irix setup.

• Luuk de Boer <luuk@wxs.nl>
  Benchmark questions.

• Tim Sailer <tps@users.buoy.com>
  DBD::mysql questions.

• Boyd Lynn Gerber <gerberb@zenez.com>
  SCO-related questions.

• Richard Mehalick <RM186061@shellus.com>
  xmysql-related questions and basic installation questions.

• Zeev Suraski <bourbon@netvision.net.il>
  Apache module configuration questions (log & auth), PHP-related questions, SQL syntax-related questions and other general questions.

• Francesc Guasch <frankie@citel.upc.es>
  General questions.

• Jonathan J Smith <jsmith@wtp.net>
  Questions pertaining to OS-specifics with Linux, SQL syntax, and other things that might need some work.

• David Sklar <sklar@student.net>
  Using MySQL from PHP and Perl.

• Alistair MacDonald <A.MacDonald@uel.ac.uk>
Is flexible and can handle Linux and perhaps HP-UX.

• John Lyon <jlyon@imag.net>

Questions about installing MySQL on Linux systems, using either .rpm files or compiling from source.

• Lorvid Ltd. <lorvid@WOLFENET.com>

Simple billing/license/support/copyright issues.

• Patrick Sherrill <patrick@coconet.com>

ODBC and VisualC++ interface questions.

• Randy Harmon <rjharmon@uptimecomputers.com>

DBD, Linux, some SQL syntax questions.

### 1.9.2 Documenters and translators

The following people have helped us with writing the MySQL documentation and translating the documentation or error messages in MySQL.

• Paul DuBois

Ongoing help with making this manual correct and understandable. That includes rewriting Monty’s and David’s attempts at English into English as other people know it.

• Kim Aldale

Helped to rewrite Monty’s and David’s early attempts at English into English.

• Michael J. Miller Jr. <mke@terrapin.turbolift.com>

For the first MySQL manual. And a lot of spelling/language fixes for the FAQ (that turned into the MySQL manual a long time ago).

• Yan Cailin

First translator of the MySQL Reference Manual into simplified Chinese in early 2000 on which the Big5 and HK coded versions were based.

• Jay Flaherty <fty@mediapulse.com>

Big parts of the Perl DBI/DBD section in the manual.

• Paul Southworth <pauls@etext.org>, Ray Loyzaga <yar@cs.su.oz.au>

• Therrien Gilbert <gilbert@ican.net>, Jean-Marc Pouyot <jmp@scalaire.fr>

French error messages.

• Petr Snajdr, <snajdr@pvt.net>

Czech error messages.

• Jaroslaw Lewandowski <jotel@itnet.com.pl>

Polish error messages.
• Miguel Angel Fernandez Roiz
  Spanish error messages.

• Roy-Magne Mo <rmo@www.hivolda.no>
  Norwegian error messages and testing of MySQL 3.21.xx.

• Timur I. Bakeyev <root@timur.tatarstan.ru>
  Russian error messages.

• <brenno@dewinter.com> & Filippo Grassilli <phil@hyppo.com>
  Italian error messages.

• Dirk Munzinger <dirk@trinity.saar.de>
  German error messages.

• Billik Stefan <billik@sun.uniag.sk>
  Slovak error messages.

• Stefan Saroiu <tzoompy@cs.washington.edu>
  Romanian error messages.

• Peter Feher
  Hungarian error messages.

• Roberto M. Serqueira
  Portuguese error messages.

• Carsten H. Pedersen
  Danish error messages.

• Arjen Lentz
  Dutch error messages, completing earlier partial translation (also work on consistency and spelling).

1.9.3 Packages that support MySQL

The following is a list of creators/maintainers of some of the most important API/packages/applications that a lot of people use with MySQL.

We cannot list every possible package here because the list would then be way to hard to maintain. For other packages, please refer to the software portal at http://solutions.mysql.com/software/.

• Tim Bunce, Alligator Descartes
  For the DBD (Perl) interface.

• Andreas Koenig <a.koenig@mind.de>
  For the Perl interface for MySQL Server.

• Jochen Wiedmann <wiedmann@neckar-alb.de>
  For maintaining the Perl DBD::mysql module.
Tools that were used to create MySQL

• Eugene Chan <eugene@acenet.com.sg>
  For porting PHP for MySQL Server.

• Georg Richter
  MySQL 4.1 testing and bug hunting. New PHP 5.0 mysqli extension (API) for use with MySQL 4.1 and up.

• Giovanni Maruzzelli <maruzz@matrice.it>
  For porting iODBC (Unix ODBC).

• Xavier Leroy <Xavier.Leroy@inria.fr>
  The author of LinuxThreads (used by the MySQL Server on Linux).

1.9.4 Tools that were used to create MySQL

The following is a list of some of the tools we have used to create MySQL. We use this to express our thanks to those that has created them as without these we could not have made MySQL what it is today.

• Free Software Foundation
  From whom we got an excellent compiler (gcc), an excellent debugger (gdb) and the libc library (from which we have borrowed strto.c to get some code working in Linux).

• Free Software Foundation & The XEmacs development team
  For a really great editor/environment.

• Julian Seward
  Author of valgrind, an excellent memory checker tool that has helped us find a lot of otherwise hard to find bugs in MySQL.

• Dorothea Lütkehaus and Andreas Zeller
  For DDD (The Data Display Debugger) which is an excellent graphical front end to gdb.

1.9.5 Supporters of MySQL

Although Oracle Corporation and/or its affiliates own all copyrights in the MySQL server and the MySQL manual, we wish to recognize the following companies, which helped us finance the development of the MySQL server, such as by paying us for developing a new feature or giving us hardware for development of the MySQL server.

• VA Linux / Andover.net
  Funded replication.

• NuSphere
  Editing of the MySQL manual.

• Stork Design studio

• Intel
  Contributed to development on Windows and Linux platforms.
• Compaq
  Contributed to Development on Linux/Alpha.

• SWSoft
  Development on the embedded `mysqld` version.

• FutureQuest
  The `--skip-show-database` option.

This chapter describes how to obtain and install MySQL. A summary of the procedure follows and later sections provide the details. If you plan to upgrade an existing version of MySQL to a newer version rather than install MySQL for the first time, see Section 2.13.1, “Upgrading MySQL”, for information about upgrade procedures and about issues that you should consider before upgrading.

If you are interested in migrating to MySQL from another database system, see Section A.8, “MySQL 5.1 FAQ: Migration”, which contains answers to some common questions concerning migration issues.

If you are migrating from MySQL Enterprise Edition to MySQL Community Server, see Section 2.13.2.2, “Downgrading from MySQL Enterprise Edition to MySQL Community Server”.

Installation of MySQL generally follows the steps outlined here:

1. **Determine whether MySQL runs and is supported on your platform.**
   
   Please note that not all platforms are equally suitable for running MySQL, and that not all platforms on which MySQL is known to run are officially supported by Oracle Corporation.

2. **Choose which distribution to install.**
   
   Several versions of MySQL are available, and most are available in several distribution formats. You can choose from pre-packaged distributions containing binary (precompiled) programs or source code. When in doubt, use a binary distribution. Oracle also provides access to the MySQL source code for those who want to see recent developments and test new code. To determine which version and type of distribution you should use, see Section 2.1.1, “Choosing Which MySQL Distribution to Install”.

3. **Download the distribution that you want to install.**
   
   For instructions, see Section 2.1.2, “How to Get MySQL”. To verify the integrity of the distribution, use the instructions in Section 2.1.3, “Verifying Package Integrity Using MD5 Checksums or GnuPG”.

4. **Install the distribution.**
   
   To install MySQL from a binary distribution, use the instructions in Section 2.2, “Installing MySQL on Unix/Linux Using Generic Binaries”.

   To install MySQL from a source distribution or from the current development source tree, use the instructions in Section 2.11, “Installing MySQL from Source”.

---

**End of Product Lifecycle.** Active development for MySQL Database Server version 5.1 has ended. Oracle offers various support offerings which may be of interest. For details and more information, see the MySQL section of the Lifetime Support Policy for Oracle Technology Products (http://www.oracle.com/us/support/lifetime-support/index.html). Please consider upgrading to a recent version.
5. **Perform any necessary postinstallation setup.**

After installing MySQL, see Section 2.12, “Postinstallation Setup and Testing” for information about making sure the MySQL server is working properly. Also refer to the information provided in Section 2.12.4, “Securing the Initial MySQL Accounts”. This section describes how to secure the initial MySQL user accounts, which have no passwords until you assign passwords. The section applies whether you install MySQL using a binary or source distribution.

6. If you want to run the MySQL benchmark scripts, Perl support for MySQL must be available. See Section 2.15, “Perl Installation Notes”.

Instructions for installing MySQL on different platforms and environments is available on a platform by platform basis:

- **Unix, Linux, FreeBSD**

  For instructions on installing MySQL on most Linux and Unix platforms using a generic binary (for example, a .tar.gz package), see Section 2.2, “Installing MySQL on Unix/Linux Using Generic Binaries”.

  For information on building MySQL entirely from the source code distributions or the source code repositories, see Section 2.11, “Installing MySQL from Source”.

  For specific platform help on installation, configuration, and building from source see the corresponding platform section:

  - Linux, including notes on distribution specific methods, see Section 2.5, “Installing MySQL on Linux”.
  - Solaris and OpenSolaris, including PKG and IPS formats, see Section 2.6, “Installing MySQL on Solaris and OpenSolaris”.
  - IBM AIX, see Section 2.6, “Installing MySQL on Solaris and OpenSolaris”.
  - Hewlett-Packard HP-UX, including the DEPOT package format, see Section 2.8, “Installing MySQL on HP-UX”.
  - FreeBSD, see Section 2.9, “Installing MySQL on FreeBSD”.

- **Microsoft Windows**

  For instructions on installing MySQL on Microsoft Windows, using either a Zipped binary or an MSI package, see Section 2.3, “Installing MySQL on Microsoft Windows”.

  For information on using the MySQL Server Instance Config Wizard, see Section 2.3.5, “Using the MySQL Server Instance Config Wizard”.

  For details and instructions on building MySQL from source code using Microsoft Visual Studio, see Section 2.11.7, “Installing MySQL from Source on Windows”.

- **OS X**

  For installation on OS X, including using both the binary package and native PKG formats, see Section 2.4, “Installing MySQL on OS X”.

  For information on making use of the MySQL Startup Item to automatically start and stop MySQL, see Section 2.4.4, “Installing the MySQL Startup Item”.

  For information on the MySQL Preference Pane, see Section 2.4.5, “Installing and Using the MySQL Preference Pane”.

- **IBM i5/OS**
For instructions on installing, starting, and stopping MySQL on i5/OS, see Section 2.10, “Installing MySQL on i5/OS”.

2.1 General Installation Guidance

The immediately following sections contain the information necessary to choose, download, and verify your distribution. The instructions in later sections of the chapter describe how to install the distribution that you choose. For binary distributions, see the instructions at Section 2.2, “Installing MySQL on Unix/Linux Using Generic Binaries” or the corresponding section for your platform if available. To build MySQL from source, use the instructions in Section 2.11, “Installing MySQL from Source”.

2.1.1 Choosing Which MySQL Distribution to Install

MySQL is available on a number of operating systems and platforms. For information about those platforms that are officially supported, see http://www.mysql.com/support/supportedplatforms/database.html on the MySQL Web site.

When preparing to install MySQL, you should decide which version to use. MySQL development occurs in several release series, and you can pick the one that best fits your needs. After deciding which version to install, you can choose a distribution format. Releases are available in binary or source format.

2.1.1.1 Choosing Which Version of MySQL to Install

The first decision to make is whether you want to use a production (stable) release or a development release. In the MySQL development process, multiple release series co-exist, each at a different stage of maturity.

Production Releases

- MySQL 5.7: Latest General Availability (Production) release
- MySQL 5.6: Previous General Availability (Production) release
- MySQL 5.5: Older General Availability (Production) release
- MySQL 5.1, 5.0: Older Production releases for which active development has ended

MySQL 4.1, 4.0, and 3.23 are old releases that are no longer supported.

See http://www.mysql.com/about/legal/lifecycle/ for information about support policies and schedules. For supported platform information, see http://www.mysql.com/support/supportedplatforms/database.html.

Normally, if you are beginning to use MySQL for the first time or trying to port it to some system for which there is no binary distribution, use the most recent General Availability series listed in the preceding descriptions. All MySQL releases, even those from development series, are checked with the MySQL benchmarks and an extensive test suite before being issued.

If you are running an older system and want to upgrade, but do not want to take the chance of having a nonseamless upgrade, you should upgrade to the latest version in the same release series you are using (where only the last part of the version number is newer than yours). We have tried to fix only fatal bugs and make only small, relatively “safe” changes to that version.

If you want to use new features not present in the production release series, you can use a version from a development series. Be aware that development releases are not as stable as production releases.

We do not use a complete code freeze because this prevents us from making bugfixes and other fixes that must be done. We may add small things that should not affect anything that currently works in a production release. Naturally, relevant bugfixes from an earlier series propagate to later series.
Choosing Which MySQL Distribution to Install

If you want to use the very latest sources containing all current patches and bugfixes, you can use one of our source code repositories (see Section 2.11.3, “Installing MySQL Using a Development Source Tree”). These are not “releases” as such, but are available as previews of the code on which future releases are to be based.

The naming scheme in MySQL 5.1 uses release names that consist of three numbers and a suffix; for example, mysql-5.1.29-rc. The numbers within the release name are interpreted as follows:

• The first number (5) is the major version and describes the file format. All MySQL 5 releases have the same file format.

• The second number (1) is the release level. Taken together, the major version and release level constitute the release series number.

• The third number (29) is the version number within the release series. This is incremented for each new release. Usually you want the latest version for the series you have chosen.

For each minor update, the last number in the version string is incremented. When there are major new features or minor incompatibilities with previous versions, the second number in the version string is incremented. When the file format changes, the first number is increased.

Release names also include a suffix that indicates the stability level of the release. Releases within a series progress through a set of suffixes to indicate how the stability level improves. The possible suffixes are:

• alpha indicates that the release is for preview purposes only. Known bugs should be documented in the Release Notes. Most alpha releases implement new commands and extensions. Active development that may involve major code changes can occur in an alpha release. However, we do conduct testing before issuing a release.

• beta indicates that the release is appropriate for use with new development. Within beta releases, the features and compatibility should remain consistent. However, beta releases may contain numerous and major unaddressed bugs.

All APIs, externally visible structures, and columns for SQL statements will not change during future beta, release candidate, or production releases.

• rc indicates a Release Candidate. Release candidates are believed to be stable, having passed all of MySQL's internal testing, and with all known fatal runtime bugs fixed. However, the release has not been in widespread use long enough to know for sure that all bugs have been identified. Only minor fixes are added. (A release candidate is what formerly was known as a gamma release.)

• If there is no suffix, it indicates that the release is a General Availability (GA) or Production release. GA releases are stable, having successfully passed through all earlier release stages and are believed to be reliable, free of serious bugs, and suitable for use in production systems. Only critical bugfixes are applied to the release.

All releases of MySQL are run through our standard tests and benchmarks to ensure that they are relatively safe to use. Because the standard tests are extended over time to check for all previously found bugs, the test suite keeps getting better.

All releases have been tested at least with these tools:

• An internal test suite. The mysql-test directory contains an extensive set of test cases. We run these tests for every server binary. See Section 22.1.2, “The MySQL Test Suite”, for more information about this test suite.

• The MySQL benchmark suite. This suite runs a range of common queries. It is also a test to determine whether the latest batch of optimizations actually made the code faster. See Section 8.13.2, “The MySQL Benchmark Suite”.

We also perform additional integration and nonfunctional testing of the latest MySQL version in our internal production environment. Integration testing is done with different connectors, storage engines,
replication modes, backup, partitioning, stored programs, and so forth in various combinations. Additional nonfunctional testing is done in areas of performance, concurrency, stress, high volume, upgrade and downgrade.

2.1.1.2 Choosing a Distribution Format

After choosing which version of MySQL to install, you should decide whether to use a binary distribution or a source distribution. In most cases, you should probably use a binary distribution, if one exists for your platform. Binary distributions are available in native format for many platforms, such as RPM packages for Linux, DMG packages for OS X, and PKG packages for Solaris. Distributions are also available in more generic formats such as Zip archives or compressed tar files.

Reasons to choose a binary distribution include the following:

- Binary distributions generally are easier to install than source distributions.
- To satisfy different user requirements, we provide several servers in binary distributions. `mysqld` is an optimized server that is a smaller, faster binary. `mysqld-debug` is compiled with debugging support.
- Each of these servers is compiled from the same source distribution, though with different configuration options. All native MySQL clients can connect to servers from either MySQL version.

Under some circumstances, you may be better off installing MySQL from a source distribution:

- You want to install MySQL at some explicit location. The standard binary distributions are ready to run at any installation location, but you might require even more flexibility to place MySQL components where you want.
- You want to configure `mysqld` to ensure that features are available that might not be included in the standard binary distributions. Here is a list of the most common extra options that you may want to use to ensure feature availability:
  - `--with-libwrap`
  - `--with-named-z-libs` (this is done for some of the binaries)
  - `--with-debug=[full]`
- For additional information, see Section 2.11.4, “MySQL Source-Configuration Options”.
- You want to configure `mysqld` without some features that are included in the standard binary distributions. For example, distributions normally are compiled with support for all character sets. If you want a smaller MySQL server, you can recompile it with support for only the character sets you need.
- You want to use the latest sources from one of the Bazaar repositories to have access to all current bugfixes. For example, if you have found a bug and reported it to the MySQL development team, the bugfix is committed to the source repository and you can access it there. The bugfix does not appear in a release until a release actually is issued.
- You want to read (or modify) the C and C++ code that makes up MySQL. For this purpose, you should get a source distribution, because the source code is always the ultimate manual.
- Source distributions contain more tests and examples than binary distributions.

2.1.1.3 How and When Updates Are Released

MySQL is evolving quite rapidly and we want to share new developments with other MySQL users. We try to produce a new release whenever we have new and useful features that others also seem to have a need for.
We also try to help users who request features that are easy to implement. We take note of what our licensed users want, and we especially take note of what our support customers want and try to help them in this regard.

No one is required to download a new release. The Release Notes help you determine whether the new release has something you really want.

We use the following policy when updating MySQL:

• Enterprise Server releases are meant to appear every 18 months, supplemented by quarterly service packs and monthly rapid updates. Community Server releases are meant to appear 2 to 3 times per year.

• Releases are issued within each series. For each release, the last number in the version is one more than the previous release within the same series.

• Binary distributions for some platforms are made by us for major releases. Other people may make binary distributions for other systems, but probably less frequently.

• We make fixes available as soon as we have identified and corrected small or noncritical but annoying bugs. The fixes are available in source form immediately from our public Bazaar repositories, and are included in the next release.

• If by any chance a security vulnerability or critical bug is found in a release, our policy is to fix it in a new release as soon as possible. (We would like other companies to do this, too!)

2.1.2 How to Get MySQL

Check our downloads page at http://dev.mysql.com/downloads/ for information about the current version of MySQL and for downloading instructions. For a complete up-to-date list of MySQL download mirror sites, see http://dev.mysql.com/downloads/mirrors.html. You can also find information there about becoming a MySQL mirror site and how to report a bad or out-of-date mirror.

To obtain the latest development source, see Section 2.11.3, “Installing MySQL Using a Development Source Tree”.

2.1.3 Verifying Package Integrity Using MD5 Checksums or GnuPG

After downloading the MySQL package that suits your needs and before attempting to install it, make sure that it is intact and has not been tampered with. There are three means of integrity checking:

• MD5 checksums

• Cryptographic signatures using GnuPG, the GNU Privacy Guard

• For RPM packages, the built-in RPM integrity verification mechanism

The following sections describe how to use these methods.

If you notice that the MD5 checksum or GPG signatures do not match, first try to download the respective package one more time, perhaps from another mirror site.

2.1.3.1 Verifying the MD5 Checksum

After you have downloaded a MySQL package, you should make sure that its MD5 checksum matches the one provided on the MySQL download pages. Each package has an individual checksum that you can verify against the package that you downloaded. The correct MD5 checksum is listed on the downloads page for each MySQL product, and you will compare it against the MD5 checksum of the file (product) that you download.

Each operating system and setup offers its own version of tools for checking the MD5 checksum. Typically the command is named md5sum, or it may be named md5, and some operating systems do not ship it at all. On Linux, it is part of the GNU Text Utilities package, which is available for a wide
Verifying Package Integrity Using MD5 Checksums or GnuPG

range of platforms. You can also download the source code from http://www.gnu.org/software/textutils/.
If you have OpenSSL installed, you can use the command openssl md5 package_name instead. A Windows implementation of the md5 command line utility is available from http://www.fourmilab.ch/md5/. winMd5Sum is a graphical MD5 checking tool that can be obtained from http://www.nullriver.com/index/products/winmd5sum. Our Microsoft Windows examples will assume the name md5.exe.

Linux and Microsoft Windows examples:

```
shell> md5sum mysql-standard-5.1.73-linux-i686.tar.gz
aaab65abbec65e09702dc04bf6699045 mysql-standard-5.1.73-linux-i686.tar.gz
```
```
shell> md5.exe mysql-installer-community-5.1.73.msi
aaab65abbec65e09702dc04bf6699045 mysql-installer-community-5.1.73.msi
```

You should verify that the resulting checksum (the string of hexadecimal digits) matches the one displayed on the download page below the respective package.

**Note**

Make sure to verify the checksum of the *archive file* (for example, the .zip, .tar.gz, or .msi file) and not of the files that are contained inside of the archive. In other words, verify the file before extracting its contents.

2.1.3.2 Signature Checking Using GnuPG

Another method of verifying the integrity and authenticity of a package is to use cryptographic signatures. This is more reliable than using MD5 checksums, but requires more work.

We sign MySQL downloadable packages with GnuPG (GNU Privacy Guard). GnuPG is an Open Source alternative to the well-known Pretty Good Privacy (PGP) by Phil Zimmermann. See http://www.gnupg.org/ for more information about GnuPG and how to obtain and install it on your system. Most Linux distributions ship with GnuPG installed by default. For more information about GnuPG, see http://www.openpgp.org/.

To verify the signature for a specific package, you first need to obtain a copy of our public GPG build key, which you can download from http://pgp.mit.edu/. The key that you want to obtain is named mysql-build@oss.oracle.com. Alternatively, you can cut and paste the key directly from the following text:

```

-----END PGP PUBLIC KEY BLOCK-----
To import the build key into your personal public GPG keyring, use `gpg --import`. For example, if you have saved the key in a file named `mysql_pubkey.asc`, the import command looks like this:

```
shell> gpg --import mysql_pubkey.asc
```

```
gpg: key 5072E1F5: public key "MySQL Release Engineering <mysql-build@oss.oracle.com>" imported
gpg: Total number processed: 1
gpg: imported: 1
```

You can also download the key from the public keyserv on using the public key id, `5072E1F5`:

```
shell> gpg --recv-keys 5072E1F5
```

```
gpg: requesting key 5072E1F5 from hkp server keys.gnupg.net
gpg: key 5072E1F5: "MySQL Release Engineering <mysql-build@oss.oracle.com>" 1 new user ID
```

If you want to import the key into your RPM configuration to validate RPM install packages, you should be able to import the key directly:

```
shell> rpm --import mysql_pubkey.asc
```

If you experience problems or require RPM specific information, see Section 2.1.3.4, “Signature Checking Using RPM”.

After you have downloaded and imported the public key, download your desired MySQL package and the corresponding signature, which also is available from the download page. The signature file has the same name as the distribution file with an `.asc` extension, as shown by the examples in the following table.

### Table 2.1 MySQL Package and Signature Files for Source files

<table>
<thead>
<tr>
<th>File Type</th>
<th>File Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Distribution file</td>
<td><code>mysql-standard-5.1.73-linux-i686.tar.gz</code></td>
</tr>
<tr>
<td>Signature file</td>
<td><code>mysql-standard-5.1.73-linux-i686.tar.gz.asc</code></td>
</tr>
</tbody>
</table>

Make sure that both files are stored in the same directory and then run the following command to verify the signature for the distribution file:

```
shell> gpg --verify package_name.asc
```

If the downloaded package is valid, you will see a "Good signature" similar to:

```
shell> gpg --verify mysql-standard-5.1.73-linux-i686.tar.gz.asc
```

```
gpg: Signature made Tue 01 Feb 2011 02:38:30 AM CST using DSA key ID 5072E1F5
```

The Good signature message indicates that the file signature is valid, when compared to the signature listed on our site. But you might also see warnings, like so:

```
shell> gpg --verify mysql-standard-5.1.73-linux-i686.tar.gz.asc
```

```
gpg: Signature made Wed 23 Jan 2013 02:25:45 AM PST using DSA key ID 5072E1F5
gpg: checking the trustdb
gpg: no ultimately trusted keys found
```
Verifying Package Integrity Using MD5 Checksums or GnuPG

That is normal, as they depend on your setup and configuration. Here are explanations for these warnings:

- **gpg: no ultimately trusted keys found**: This means that the specific key is not "ultimately trusted" by you or your web of trust, which is okay for the purposes of verifying file signatures.

- **WARNING: This key is not certified with a trusted signature! There is no indication that the signature belongs to the owner.**: This refers to your level of trust in your belief that you possess our real public key. This is a personal decision. Ideally, a MySQL developer would hand you the key in person, but more commonly, you downloaded it. Was the download tampered with? Probably not, but this decision is up to you. Setting up a web of trust is one method for trusting them.

See the GPG documentation for more information on how to work with public keys.

### 2.1.3.3 Signature Checking Using Gpg4win for Windows

The [Section 2.1.3.2, “Signature Checking Using GnuPG”](#) section describes how to verify MySQL downloads using GPG. That guide also applies to Microsoft Windows, but another option is to use a GUI tool like [Gpg4win](#). You may use a different tool but our examples are based on Gpg4win, and utilize its bundled [Kleopatra](#) GUI.

Download and install Gpg4win, and then load Kleopatra. The dialog should look similar to:

![Figure 2.1 Initial screen after loading Kleopatra](image)

Next, add the MySQL Release Engineering certificate. Do this by clicking **File, Lookup Certificates on Server**. Type "Mysql Release Engineering" into the search box and press **Search**.
Select the "MySQL Release Engineering" certificate. The Fingerprint and Key-ID must be "5072E1F5", or choose **Details...** to confirm the certificate is valid. Now, import it by clicking **Import**. An import dialog will be displayed, choose **Okay**, and this certificate will now be listed under the **Imported Certificates** tab.

Next, configure the trust level for our certificate. Select our certificate, then from the main menu select **Certificates, Change Owner Trust...**. We suggest choosing **I believe checks are very accurate** for our certificate, as otherwise you might not be able to verify our signature. Select **I believe checks are very accurate** and then press **OK**.

**Figure 2.3 Changing the Trust level**
Next, verify the downloaded MySQL package file. This requires files for both the packaged file, and the signature. The signature file must have the same name as the packaged file but with an appended .asc extension, as shown by the example in the following table. The signature is linked to on the downloads page for each MySQL product. You must create the .asc file with this signature.

### Table 2.2 MySQL Package and Signature Files for MySQL Installer for Microsoft Windows

<table>
<thead>
<tr>
<th>File Type</th>
<th>File Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Distribution file</td>
<td>mysql-installer-community-5.1.73.msi</td>
</tr>
<tr>
<td>Signature file</td>
<td>mysql-installer-community-5.1.73.msi.asc</td>
</tr>
</tbody>
</table>

Make sure that both files are stored in the same directory and then run the following command to verify the signature for the distribution file. Either drag and drop the signature (.asc) file into Kleopatra, or load the dialog from **File, Decrypt/Verify Files...**, and then choose either the .msi or .asc file.

**Figure 2.4 The Decrypt/Verify Files dialog**

Click **Decrypt/Verify** to check the file. The two most common results will look like the following, and although the yellow warning looks problematic, the following means that the file check passed with success. You may now run this installer.
Seeing a red "The signature is bad" error means the file is invalid. Do not execute the MSI file if you see this error.
Verifying Package Integrity Using MD5 Checksums or GnuPG

2.1.3.4 Signature Checking Using RPM

For RPM packages, there is no separate signature. RPM packages have a built-in GPG signature and MD5 checksum. You can verify a package by running the following command:

```
shell> rpm --checksig package_name.rpm
```

Example:

```
shell> rpm --checksig MySQL-server-5.1.73-0.glibc23.i386.rpm
MySQL-server-5.1.73-0.glibc23.i386.rpm: md5 gpg OK
```

Note

If you are using RPM 4.1 and it complains about (GPG) NOT OK (MISSING KEYS: GPG#5072e1f5), even though you have imported the MySQL public build key into your own GPG keyring, you need to import the key into the RPM keyring first. RPM 4.1 no longer uses your personal GPG keyring (or GPG itself). Rather, RPM maintains a separate keyring because it is a system-wide application and a user’s GPG public keyring is a user-specific file. To import the
MySQL public key into the RPM keyring, first obtain the key, then use `rpm --import` to import the key. For example:

```
shell> gpg --export --a 5072e1f5 > 5072e1f5.asc
shell> rpm --import 5072e1f5.asc
```

Alternatively, `rpm` also supports loading the key directly from a URL, and you can use this manual page:

```
```

If you need to obtain the MySQL public key, see Section 2.1.3.2, “Signature Checking Using GnuPG”.

### 2.1.4 Installation Layouts

The installation layout differs for different installation types (for example, native packages, binary tarballs, and source tarballs), which can lead to confusion when managing different systems or using different installation sources. The individual layouts are given in the corresponding installation type or platform chapter, as described following. Note that the layout of installations from vendors other than Oracle may differ from these layouts.

- Section 2.3.1, “MySQL Installation Layout on Microsoft Windows”
- Section 2.11.1, “MySQL Layout for Source Installation”
- Table 2.3, “MySQL Installation Layout for Generic Unix/Linux Binary Package”
- Table 2.15, “MySQL Installation Layout for Linux RPM Packages”
- Table 2.12, “MySQL Installation Layout on OS X”

### 2.1.5 Compiler-Specific Build Characteristics

In some cases, the compiler used to build MySQL affects the features available for use. The notes in this section apply for binary distributions provided by Oracle Corporation or that you compile yourself from source.

- **icc (Intel C++ Compiler) Builds**
  
  A server built with `icc` has these characteristics:
  
  - SSL support is not included.
  - `InnoDB Plugin` is not included.

### 2.2 Installing MySQL on Unix/Linux Using Generic Binaries

Oracle provides a set of binary distributions of MySQL. These include generic binary distributions in the form of compressed `tar` files (files with a `.tar.gz` extension) for a number of platforms, and binaries in platform-specific package formats for selected platforms.

This section covers the installation of MySQL from a compressed `tar` file binary distribution. For other platform-specific package formats, see the other platform-specific sections. For example, for Windows distributions, see Section 2.3, “Installing MySQL on Microsoft Windows”.

To obtain MySQL, see Section 2.1.2, “How to Get MySQL”.

MySQL compressed `tar` file binary distributions have names of the form `mysql-VERSION-OS.tar.gz`, where `VERSION` is a number (for example, 5.1.73), and `OS` indicates
the type of operating system for which the distribution is intended (for example, pc-linux-i686 or winx64).

Warning

If you have previously installed MySQL using your operating system native package management system, such as yum or apt-get, you may experience problems installing using a native binary. Make sure your previous MySQL installation has been removed entirely (using your package management system), and that any additional files, such as old versions of your data files, have also been removed. You should also check for configuration files such as /etc/my.cnf or the /etc/mysql directory and delete them.

If you run into problems and need to file a bug report, please use the instructions in Section 1.7, “How to Report Bugs or Problems”.

On Unix, to install a compressed tar file binary distribution, unpack it at the installation location you choose (typically /usr/local/mysql). This creates the directories shown in the following table.

<table>
<thead>
<tr>
<th>Directory</th>
<th>Contents of Directory</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin, scripts</td>
<td>mysql server, client and utility programs</td>
</tr>
<tr>
<td>data</td>
<td>Log files, databases</td>
</tr>
<tr>
<td>docs</td>
<td>MySQL manual in Info format</td>
</tr>
<tr>
<td>man</td>
<td>Unix manual pages</td>
</tr>
<tr>
<td>include</td>
<td>Include (header) files</td>
</tr>
<tr>
<td>lib</td>
<td>Libraries</td>
</tr>
<tr>
<td>share</td>
<td>Miscellaneous support files, including error messages, sample configuration files, SQL for database installation</td>
</tr>
<tr>
<td>sql-bench</td>
<td>Benchmarks</td>
</tr>
</tbody>
</table>

Debug versions of the mysqld binary are available as mysqld-debug. To compile your own debug version of MySQL from a source distribution, use the appropriate configuration options to enable debugging support. See Section 2.11, “Installing MySQL from Source”.

To install and use a MySQL binary distribution, the command sequence looks like this:

```
# Create group and user
shell> groupadd mysql
shell> useradd -r -g mysql -s /bin/false mysql
shell> cd /usr/local
shell> tar zxf /path/to/mysql-VERSION-OS.tar.gz
shell> ln -s full-path-to-mysql-VERSION-OS mysql
shell> cd mysql
shell> chown -R mysql .
shell> chgrp -R mysql .
shell> scripts/mysql_install_db --user=mysql
shell> chown -R root .
shell> chown -R mysql data
# Next command is optional
shell> cp support-files/my-medium.cnf /etc/my.cnf
shell> bin/mysql_safe --user=mysql &
# Next command is optional
shell> cp support-files/mysql.server /etc/init.d/mysql.server
```

Note

This procedure assumes that you have root (administrator) access to your system. Alternatively, you can prefix each command using the sudo (Linux) or pfexec (OpenSolaris) command.
Create a mysql User and Group

If your system does not already have a user and group to use for running mysqld, you may need to create one. The following commands add the mysql group and the mysql user. You might want to call the user and group something else instead of mysql. If so, substitute the appropriate name in the following instructions. The syntax for useradd and groupadd may differ slightly on different versions of Unix, or they may have different names such as adduser and addgroup.

```
shell> groupadd mysql
shell> useradd -r -g mysql -s /bin/false mysql
```

Note

Because the user is required only for ownership purposes, not login purposes, the useradd command uses the -r and -s /bin/false options to create a user that does not have login permissions to your server host. Omit these options if your useradd does not support them.

Obtain and Unpack the Distribution

Pick the directory under which you want to unpack the distribution and change location into it. The example here unpacks the distribution under /usr/local. The instructions, therefore, assume that you have permission to create files and directories in /usr/local. If that directory is protected, you must perform the installation as root.

```
shell> cd /usr/local
```

Obtain a distribution file using the instructions in Section 2.1.2, “How to Get MySQL”. For a given release, binary distributions for all platforms are built from the same MySQL source distribution.

Unpack the distribution, which creates the installation directory. Then create a symbolic link to that directory. tar can uncompress and unpack the distribution if it has z option support:

```
shell> tar zxfv /path/to/mysql-VERSION-OS.tar.gz
shell> ln -s full-path-to-mysql-VERSION-OS mysql
```

The tar command creates a directory named mysql-VERSION-OS. The ln command makes a symbolic link to that directory. This enables you to refer more easily to the installation directory as /usr/local/mysql.

To install MySQL from a compressed tar file binary distribution, your system must have GNU gunzip to uncompress the distribution and a reasonable tar to unpack it. If your tar program supports the z option, it can both uncompress and unpack the file.

GNU tar is known to work. The standard tar provided with some operating systems is not able to unpack the long file names in the MySQL distribution. You should download and install GNU tar, or if available, use a preinstalled version of GNU tar. Usually this is available as gnutar, gtar, or as tar within a GNU or Free Software directory, such as /usr/sfw/bin or /usr/local/bin. GNU tar is available from http://www.gnu.org/software/tar/.

If your tar does not have z option support, use gunzip to unpack the distribution and tar to unpack it. Replace the preceding tar command with the following alternative command to uncompress and extract the distribution:
Perform Postinstallation Setup

The remainder of the installation process involves setting distribution ownership and access permissions, initializing the data directory, starting the MySQL server, and setting up the configuration file. For instructions, see Section 2.12, “Postinstallation Setup and Testing”.

2.3 Installing MySQL on Microsoft Windows

Important

The MySQL server 5.1 branch is old and not recommended for new installations. Consider installing the latest stable branch, which today is MySQL server 5.7.

MySQL is available for Microsoft Windows, for both 32-bit and 64-bit versions. For supported Windows platform information, see http://www.mysql.com/support/supportedplatforms/database.html.

It is possible to run MySQL as a standard application or as a Windows service. By using a service, you can monitor and control the operation of the server through the standard Windows service management tools. For more information, see Section 2.3.6.7, “Starting MySQL Server as a Microsoft Windows Service”.

Generally, you should install MySQL on Windows using an account that has administrator rights. Otherwise, you may encounter problems with certain operations such as editing the PATH environment variable or accessing the Service Control Manager. Once installed, MySQL does not need to be executed using a user with Administrator privileges.

For a list of limitations on the use of MySQL on the Windows platform, see Section C.7.6, “Windows Platform Limitations”.

In addition to the MySQL Server package, you may need or want additional components to use MySQL with your application or development environment. These include, but are not limited to:

• To connect to the MySQL server using ODBC, you must have a Connector/ODBC driver. For more information, including installation and configuration instructions, see MySQL Connector/ODBC Developer Guide.

• To use MySQL server with .NET applications, you must have the Connector/Net driver. For more information, including installation and configuration instructions, see MySQL Connector/Net Developer Guide.

MySQL for Windows is available in several distribution formats, detailed here. Generally speaking, you should use a binary distribution that includes an installer. It is simpler to use than the others, and you need no additional tools to get MySQL up and running. The installer for the Windows version of MySQL, combined with a GUI Config Wizard, automatically installs MySQL, creates an option file, starts the server, and secures the default user accounts.

• Binary installer distribution. The installable distribution comes packaged as a Microsoft Windows Installer (MSI) package that you can install manually or automatically on your systems. Two formats are available, an essentials package that contains all the files you need to install and configure MySQL, but no additional components, and a complete package that includes MySQL, configuration tools, benchmarks and other components. For more information on the specific differences, see Section 2.3.2, “Choosing the Installation Package for Microsoft Windows”
For instructions on installing MySQL using one of the MSI installation packages, see Section 2.3.4, “Installing MySQL on Microsoft Windows Using an MSI Package”.

- The standard binary distribution (packaged as a Zip file) contains all of the necessary files that you unpack into your chosen location. This package contains all of the files in the full Windows MSI Installer package, but does not include an installation program.

For instructions on installing MySQL using the Zip file, see Section 2.3.6, “Installing MySQL on Microsoft Windows Using a noinstall Zip Archive”.

- The source distribution format contains all the code and support files for building the executables using the Visual Studio compiler system.

For instructions on building MySQL from source on Windows, see Section 2.11.7, “Installing MySQL from Source on Windows”.

MySQL on Windows considerations:

- **Large Table Support**

  If you need tables with a size larger than 4GB, install MySQL on an NTFS or newer file system. Do not forget to use `MAX_ROWS` and `AVG_ROW_LENGTH` when you create tables. See Section 13.1.17, “CREATE TABLE Syntax”.

- **MySQL and Virus Checking Software**

  Virus-scanning software such as Norton/Symantec Anti-Virus on directories containing MySQL data and temporary tables can cause issues, both in terms of the performance of MySQL and the virus-scanning software misidentifying the contents of the files as containing spam. This is due to the fingerprinting mechanism used by the virus-scanning software, and the way in which MySQL rapidly updates different files, which may be identified as a potential security risk.

  After installing MySQL Server, it is recommended that you disable virus scanning on the main directory (`datadir`) used to store your MySQL table data. There is usually a system built into the virus-scanning software to enable specific directories to be ignored.

  In addition, by default, MySQL creates temporary files in the standard Windows temporary directory. To prevent the temporary files also being scanned, configure a separate temporary directory for MySQL temporary files and add this directory to the virus scanning exclusion list. To do this, add a configuration option for the `tmpdir` parameter to your `my.ini` configuration file. For more information, see Section 2.3.6.2, “Creating an Option File”.

### 2.3.1 MySQL Installation Layout on Microsoft Windows

For MySQL 5.1 on Windows, the default installation directory is `C:\Program Files\MySQL\MySQL Server 5.1`. Some Windows users prefer to install in `C:\mysql`, the directory that formerly was used as the default. However, the layout of the subdirectories remains the same.

For MySQL 5.1.23 and earlier, all of the files are located within the parent directory, using the structure shown in the following table.

#### Table 2.4 Installation Layout for Windows Using MySQL 5.1.23 and Earlier

<table>
<thead>
<tr>
<th>Directory</th>
<th>Contents of Directory</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin</td>
<td>Client programs and the <code>mysql</code> server</td>
</tr>
<tr>
<td>data</td>
<td>Log files, databases</td>
</tr>
<tr>
<td>examples</td>
<td>Example programs and scripts</td>
</tr>
<tr>
<td>include</td>
<td>Include (header) files</td>
</tr>
</tbody>
</table>

</thead>
<tbody>
<tr>
<td>lib</td>
<td>Libraries</td>
</tr>
<tr>
<td>scripts</td>
<td>Utility scripts</td>
</tr>
<tr>
<td>share</td>
<td>Miscellaneous support files, including error messages, character set files, sample configuration files, SQL for database installation</td>
</tr>
</tbody>
</table>

For MySQL 5.1.24 and later, the default location of data directory was changed. The remainder of the directory structure remains the same.

Table 2.5 Installation Layout for Microsoft Windows using MySQL 5.1.24 and later

<table>
<thead>
<tr>
<th>Directory</th>
<th>Contents of Directory</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin, scripts</td>
<td>mysql server, client and utility programs</td>

<td>Miscellaneous support files, including error messages, character set files, sample configuration files, SQL for database installation</td>
<td></td>
</tr>
</tbody>
</table>

2.3.2 Choosing the Installation Package for Microsoft Windows

For MySQL 5.1, there are multiple installation package formats to choose from when installing MySQL on Windows.

Note

Using MySQL Installer is the recommended installation method for Microsoft Windows users. The MySQL Server 5.1 release does not include its own MySQL Installer release, but a MySQL Installer version 5.5 and above can optionally install MySQL Server 5.1. Follow the standard Installing MySQL on Microsoft Windows Using MySQL Installer documentation but choose Custom Install after executing it. A MySQL Server 5.1 option will be available, and choosing it will cause MySQL Installer to download it for you.

Table 2.6 Microsoft Windows MySQL Installation package comparison

<table>
<thead>
<tr>
<th>Packaging</th>
<th>Essentials</th>
<th>Complete</th>
<th>Zip (No-install)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Installer</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

</tr>
<tr>
<td>Embedded Server</td>
<td>No</td>
<td>Optional</td>
<td>Yes</td>
</tr>
<tr>
<td>Scripts and Examples</td>
<td>No</td>
<td>Optional</td>
<td>Yes</td>
</tr>
</tbody>
</table>

In the above table:

- **Yes** indicates that the component is installed by default.
- **No** indicates that the component is not installed or included.
- **Optional** indicates that the component is included with the package, but not installed unless explicitly requested using the Custom installation mode.

The workflow for installing using the MSI installer is shown here:

**Figure 2.7 Installation Workflow for Windows Using MSI**

The workflow for installing using the Zip package is shown here:
Choosing the Installation Package for Microsoft Windows

Figure 2.8 Installation Workflow for Windows Using Zip

Download Zip

Extract Zip

Move/Rename Directory

Post-install

Install MySQL as Service

Use MySQL

Note
For the Essentials and Complete packages in the MSI installer, you can select individual components to be installed by using the Custom mode, including disable the components configured for installation by default.

Full details on the components are suggested uses are provided here for reference:

- **Windows Essentials**: This package has a file name similar to `mysql-essential-5.1.73-win32.msi` and is supplied as a Microsoft Installer (MSI) package. The package includes the minimum set of files needed to install MySQL on Windows, including the MySQL Server Instance Config Wizard. This package does not include optional components such as the embedded server, developer headers and libraries or benchmark suite.

  To install using this package, see Section 2.3.4, “Installing MySQL on Microsoft Windows Using an MSI Package”.

- **Windows MSI Installer (Complete)**: This package has a file name similar to `mysql-5.1.73-win32.msi` and contains all files needed for a complete Windows installation, including the MySQL Server Instance Config Wizard. This package includes optional components such as the embedded server and benchmark suite.

  To install using this package, see Section 2.3.4, “Installing MySQL on Microsoft Windows Using an MSI Package”.

- **Without installer**: This package has a file name similar to `mysql-noinstall-5.1.73-win32.zip` and contains all the files found in the Complete install package, with the exception of the MySQL Server Instance Config Wizard. This package does not include an automated installer, and must be manually installed and configured.

The Essentials package is recommended for most users. Both the Essentials and Complete distributions are available as an `.msi` file for use with the Windows Installer. The Noinstall distribution is packaged as a Zip archive. To use a Zip archive, you must have a tool that can unpack `.zip` files.
When using the MSI installers you can automate the installation process. For more information, see Section 2.3.4.2, “Automating MySQL Installation on Microsoft Windows Using the MSI Package”. To automate the creation of a MySQL instance, see Section 2.3.5.13, “MySQL Server Instance Config Wizard: Creating an Instance from the Command Line”.

Your choice of install package affects the installation process you must follow. If you choose to install either an Essentials or Complete install package, see Section 2.3.4, “Installing MySQL on Microsoft Windows Using an MSI Package”. If you choose to install a Noinstall archive, see Section 2.3.6, “Installing MySQL on Microsoft Windows Using a noinstall Zip Archive”.

2.3.3 MySQL Notifier

MySQL Notifier is a tool that enables you to monitor and adjust the status of your local and remote MySQL server instances through an indicator that resides in the system tray. MySQL Notifier also gives quick access to MySQL Workbench through its context menu.

The MySQL Notifier is installed by MySQL Installer, and (by default) will start-up when Microsoft Windows is started.

To install, download and execute the MySQL Installer, be sure the MySQL Notifier product is selected, then proceed with the installation. See the MySQL Installer manual for additional details.

For notes detailing the changes in each release of MySQL Notifier, see the MySQL Notifier Release Notes.

Visit the MySQL Notifier forum for additional MySQL Notifier help and support.

Features include:

• Start, Stop, and Restart instances of the MySQL Server.
• Automatically detects (and adds) new MySQL Server services. These are listed under Manage Monitored Items, and may also be configured.
• The Tray icon changes, depending on the status. It’s green if all monitored MySQL Server instances are running, or red if at least one service is stopped. The Update MySQL Notifier tray icon based on service status option, which dictates this behavior, is enabled by default for each service.
• Links to other applications like MySQL Workbench, MySQL Installer, and the MySQL Utilities. For example, choosing Manage Instance will load the MySQL Workbench Server Administration window for that particular instance.
• If MySQL Workbench is also installed, then the Manage Instance and SQL Editor options are available for local (but not remote) MySQL instances.
• Monitors both local and remote MySQL instances.

2.3.3.1 MySQL Notifier Usage

MySQL Notifier resides in the system tray and provides visual status information for your MySQL server instances. A green icon is displayed at the top left corner of the tray icon if the current MySQL server is running, or a red icon if the service is stopped.

MySQL Notifier automatically adds discovered MySQL services on the local machine, and each service is saved and configurable. By default, the Automatically add new services whose name contains option is enabled and set to mysql. Related Notifications Options include being notified when new services are either discovered or experience status changes, and are also enabled by default. And uninstalling a service will also remove the service from MySQL Notifier.

Clicking the system tray icon will reveal several options, as the follow figures show:

The Service Instance menu is the main MySQL Notifier window, and enables you to Stop, Start, and Restart the MySQL server.
MySQL Notifier

Figure 2.9 MySQL Notifier Service Instance menu

The **Actions menu** includes several links to external applications (if they are installed), and a **Refresh Status option** to manually refresh the status of all monitored services (in both local and remote computers) and MySQL instances.

**Note**

The main menu will not show the **Actions menu** when there are no services being monitored by MySQL Notifier.

Figure 2.10 MySQL Notifier Actions menu

The **Actions**, **Options menu** configures MySQL Notifier and includes options to:

- **Use colorful status icons**: Enables a colorful style of icons for the tray of MySQL Notifier.
- **Run at Windows Startup**: Allows the application to be loaded when Microsoft Windows starts.
- **Automatically Check For Updates Every # Weeks**: Checks for a new version of MySQL Notifier, and runs this check every # weeks.
- **Automatically add new services whose name contains**: The text used to filter services and add them automatically to the monitored list of the local computer running MySQL Notifier, and on remote computers already monitoring Windows services.
- **Ping monitored MySQL Server instances every # seconds**: The interval (in seconds) to ping monitored MySQL Server instances for status changes. Longer intervals might be necessary if the list of monitored remote instances is large.
- **Notify me when a service is automatically added**: Will display a balloon notification from the taskbar when a newly discovered service is added to the monitored services list.
- **Notify me when a service changes status**: Will display a balloon notification from the taskbar when a monitored service changes its status.
- **Automatic connections migration delayed until**: When there are connections to migrate, postpone the migration by one hour, one day, one week, one month, or indefinitely.
The **Actions, Manage Monitored Items** menu enables you to configure the monitored services and MySQL instances. First, with the **Services** tab open:

**Figure 2.12 MySQL Notifier Manage Services menu**

<table>
<thead>
<tr>
<th>Name</th>
<th>Running On</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>MySQL55</td>
<td>localhost</td>
<td>Running</td>
</tr>
<tr>
<td>MySQL56</td>
<td>localhost</td>
<td>Running</td>
</tr>
</tbody>
</table>

The **Instances** tab is similar:
Adding a service or instance (after clicking Add in the Manage Monitored Items window) enables you to select a running Microsoft Windows service or instance connection, and configure MySQL Notifier to monitor it. Add a new service or instance by clicking service name from the list, then OK to accept. Multiple services and instances may be selected.
Figure 2.14 MySQL Notifier Adding new services

Add instances:
Troubleshooting

For issues that are not documented here, visit the MySQL Notifier Support Forum for MySQL Notifier help and support.

- **Problem**: attempting to start/stop/restart a MySQL service might generate an error similar to "The Service **MySQL VERSION** failed the most recent status change request with the message "The service **mysql VERSION** was not found in the Windows Services".

  **Explanation**: this is a case-sensitivity issue, in that the service name is **MySQL VERSION** compared to having **mysql VERSION** in the configuration file.

  **Solution**: either update your MySQL Notifier configuration file with the correct information, or stop MySQL Notifier and delete this configuration file. The MySQL Notifier configuration file is located at %APPDATA%\Oracle\MySQL Notifier\settings.config where %APPDATA% is a variable and depends on your system. A typical location is "C:\Users\YourUsername\AppData\Running\Oracle\MySQL Notifier\settings.config" where YourUsername is your system's user name. In this file, and within the ServerList section, change the ServerName values from lowercase to the actual service names. For example, change **mysql VERSION** to **MySQL VERSION**, save, and then restart MySQL Notifier. Alternatively, stop MySQL Notifier, delete this file, then restart MySQL Notifier.

- **Problem**: when connecting to a remote computer for the purpose of monitoring a remote Windows service, the Add Service dialog does not always show all the services shown in the Windows Services console.

  **Explanation**: this behavior is governed by the operating system and the outcome is expected when working with nondomain user accounts. For a complete description of the behavior, see the User Account Control and WMI article from Microsoft.
**Solution:** When the remote computer is in a compatible domain, it is recommended that domain user accounts are used to connect through WMI to a remote computer. For detailed setup instructions using WMI, see Section 2.3.3.2, “Setting Up Remote Monitoring in MySQL Notifier”.

Alternatively, when domain user accounts are not available, Microsoft provides a less secure workaround that should only be implemented with caution. For more information, see the Description of User Account Control and remote restrictions in Windows Vista KB article from Microsoft.

### 2.3.3.2 Setting Up Remote Monitoring in MySQL Notifier

MySQL Notifier uses Windows Management Instrumentation (WMI) to manage and monitor services on remote computers. This section explains how it works and how to set up your system to monitor remote MySQL instances.

In order to configure WMI, it is important to understand that the underlying Distributed Component Object Model (DCOM) architecture is doing the WMI work. Specifically, MySQL Notifier is using asynchronous notification queries on remote Microsoft Windows hosts as .NET events. These events send an asynchronous callback to the computer running MySQL Notifier so it knows when a service status has changed on the remote computer. Asynchronous notifications offer the best performance compared to semisynchronous notifications or synchronous notifications that use timers.

Asynchronous notification requires the remote computer to send a callback to the client computer (thus opening a reverse connection), so the Windows Firewall and DCOM settings must be properly configured for the communication to function properly.

![Figure 2.16 MySQL Notifier Distributed Component Object Model (DCOM)](image)

Most of the common errors thrown by asynchronous WMI notifications are related to Windows Firewall blocking the communication, or to DCOM / WMI settings not being set up properly. For a list of common errors with solutions, see Common Errors.

The following steps are required to make WMI function. These steps are divided between two machines. A single host computer that runs MySQL Notifier (Computer A), and multiple remote machines that are being monitored (Computer B).

#### Computer running MySQL Notifier (Computer A)

1. Enable remote administration by either editing the Group Policy Editor, or using **NETSH**:

   **Using the Group Policy Editor:**
   
   a. Click Start, click Run, type `GPEDIT.MSC`, and then click OK.
   
   
   c. Expand Administrative Templates, then Network, Network Connections, and then Windows Firewall.
   
   d. If the computer is in the domain, then double-click Domain Profile; otherwise, double-click Standard Profile.
MySQL Notifier

e. Double-click **Windows Firewall: Allow inbound remote administration exception** to open a configuration window.

f. Check the **Enabled** option button and then click **OK**.

Using the **NETSH** command:

```
Note
The "netsh firewall" command is deprecated as of Microsoft Server 2008 and Vista, and replaced with "netsh advfirewall firewall".
```

a. Open a command prompt window with Administrative rights (you can right-click the Command Prompt icon and select **Run as Administrator**).

b. Execute the following command:

```
NETSH advfirewall firewall set service RemoteAdmin enable
```

2. Open the DCOM port TCP 135:

a. Open a command prompt window with Administrative rights (you can right-click the Command Prompt icon and select **Run as Administrator**).

b. Execute the following command:

```
NETSH advfirewall firewall add rule name=DCOM_TCP135 protocol=TCP localport=135 dir=in action=allow
```

3. Add the client application that contains the sink for the callback (**MySqlNotifier.exe**) to the Windows Firewall Exceptions List (use either the Windows Firewall configuration or **NETSH**):

   Using the Windows Firewall configuration:

   a. In the Control Panel, double-click **Windows Firewall**.

   b. In the Windows Firewall window's left panel, click **Allow a program or feature through Windows Firewall**.

   c. In the Allowed Programs window, click **Change Settings** and do one of the following:

      - If **MySqlNotifier.exe** is in the Allowed programs and features list, make sure it is checked for the type of networks the computer connects to (Private, Public or both).
      - If **MySqlNotifier.exe** is not in the list, click **Allow another program...**

         i. In the **Add a Program** window, select the **MySqlNotifier.exe** if it exists in the Programs list, otherwise click **Browse...** and go to the directory where **MySqlNotifier.exe** was installed to select it, then click **Add**.

         ii. Make sure **MySqlNotifier.exe** is checked for the type of networks the computer connects to (Private, Public or both).

   Using the **NETSH** command:

   a. Open a command prompt window with Administrative rights (you can right-click the Command Prompt icon and click **Run as Administrator**).

   b. Execute the following command, where you change "**[YOUR_INSTALL_DIRECTORY]**":

```
NETSH advfirewall firewall add rule name=DCOM_TCP135 protocol=TCP localport=135 dir=in action=allow
```
NETSH advfirewall firewall add rule name=MySQLNotifier program=[YOUR_INSTALL_DIRECTORY]\MySqlNotifier.exe action=allow dir=in

4. If Computer B is either a member of WORKGROUP or is in a different domain that is untrusted by Computer A, then the callback connection (Connection 2) is created as an Anonymous connection. To grant Anonymous connections DCOM Remote Access permissions:
   a. Click Start, click Run, type DCOMCNFG, and then click OK.
   b. In the Component Services dialog box, expand Component Services, expand Computers, and then right-click My Computer and click Properties.
   c. In the My Computer Properties dialog box, click the COM Security tab.
   d. Under Access Permissions, click Edit Limits.
   e. In the Access Permission dialog box, select ANONYMOUS LOGON name in the Group or user names box. In the Allow column under Permissions for User, select Remote Access, and then click OK.

Monitored Remote Computer (Computer B)

If the user account that is logged on to the computer running the MySQL Notifier (Computer A) is a local administrator on the remote computer (Computer B), such that the same account is an administrator on Computer B, you can skip to the "Allow for remote administration" step.

Setting DCOM security to allow a non-administrator user to access a computer remotely:
1. Grant "DCOM remote launch" and activation permissions for a user or group:
   a. Click Start, click Run, type DCOMCNFG, and then click OK.
   b. In the Component Services dialog box, expand Component Services, expand Computers, and then right-click My Computer and click Properties.
   c. In the My Computer Properties dialog box, click the COM Security tab.
   d. Under Launch and Activation Permission, click Edit Limits.
   e. In the Launch and Activation Permission dialog box, follow these steps if your name or your group does not appear in the Groups or user names list:
      i. In the Launch and Activation Permission dialog box, click Add.
      ii. In the Select Users or Groups dialog box, add your name and the group in the Enter the object names to select box, and then click OK.
   f. In the Launch and Activation Permission dialog box, select your user and group in the Group or user names box. In the Allow column under Permissions for User, select Remote Launch, select Remote Activation, and then click OK.

Grant DCOM remote access permissions:
   a. Click Start, click Run, type DCOMCNFG, and then click OK.
   b. In the Component Services dialog box, expand Component Services, expand Computers, and then right-click My Computer and click Properties.
   c. In the My Computer Properties dialog box, click the COM Security tab.
   d. Under Access Permissions, click Edit Limits.
e. In the Access Permission dialog box, select **ANONYMOUS LOGON name** in the Group or user names box. In the Allow column under Permissions for User, select **Remote Access**, and then click **OK**.

2. Allowing non-administrator users access to a specific WMI namespace:
   a. In the Control Panel, double-click **Administrative Tools**.
   b. In the Administrative Tools window, double-click **Computer Management**.
   c. In the Computer Management window, expand the **Services and Applications** tree.
   d. Right-click the WMI Control icon and select **Properties**.
   e. In the WMI Control Properties window, click the **Security** tab.
   f. In the Security tab, select the namespace and click **Security**. Root/CIMV2 is a commonly used namespace.
   g. Locate the appropriate account and check **Remote Enable** in the Permissions list.

3. Allow for remote administration by either editing the **Group Policy Editor** or using **NETSH**:
   **Using the Group Policy Editor:**
   a. Click **Start**, click **Run**, type **GPEDIT.MSC**, and then click **OK**.
   b. Under the Local Computer Policy heading, double-click **Computer Configuration**.
   c. Double-click **Administrative Templates**, then **Network, Network Connections**, and then **Windows Firewall**.
   d. If the computer is in the domain, then double-click **Domain Profile**; otherwise, double-click **Standard Profile**.
   e. Click **Windows Firewall: Allow inbound remote administration exception**.
   f. On the Action menu either select **Edit**, or double-click the selection from the previous step.
   g. Check the **Enabled** radio button, and then click **OK**.
   **Using the NETSH command:**
   a. Open a command prompt window with Administrative rights (you can right-click the Command Prompt icon and click Run as Administrator).
   b. Execute the following command:
   ```bash
   NETSH advfirewall firewall set service RemoteAdmin enable
   ```

4. Confirm that the user account you are logging in with uses the **Name** value and not the **Full Name** value:
   a. In the **Control Panel**, double-click **Administrative Tools**.
   b. In the **Administrative Tools** window, double-click **Computer Management**.
   c. In the **Computer Management** window, expand the **System Tools** then **Local Users and Groups**.
d. Click the **Users** node, and on the right side panel locate your user and make sure it uses the **Name** value to connect, and not the **Full Name** value.

**Common Errors**

- **0x80070005**
  - DCOM Security was not configured properly (see Computer B, the **Setting DCOM security** step).

- The remote computer (Computer B) is a member of WORKGROUP or is in a domain that is untrusted by the client computer (Computer A) (see Computer A, the **Grant Anonymous connections DCOM Remote Access permissions** step).

- **0x8007000E**
  - The remote computer (Computer B) is a member of WORKGROUP or is in a domain that is untrusted by the client computer (Computer A) (see Computer A, the **Grant Anonymous connections DCOM Remote Access permissions** step).

- **0x80041003**
  - Access to the remote WMI namespace was not configured properly (see Computer B, the **Allowing non-administrator users access to a specific WMI namespace** step).

- **0x800706BA**
  - The DCOM port is not open on the client computers (Computer A) firewall. See the **Open the DCOM port TCP 135** step for Computer A.

- The remote computer (Computer B) is inaccessible because its network location is set to Public. Make sure you can access it through the Windows Explorer.

### 2.3.4 Installing MySQL on Microsoft Windows Using an MSI Package

The MSI package is designed to install and configure MySQL in such a way that you can immediately get started using MySQL.

The MySQL Installation Wizard and MySQL Configuration Wizard are available in the Essentials and Complete install packages. They are recommended for most standard MySQL installations. Exceptions include users who need to install multiple instances of MySQL on a single server host and advanced users who want complete control of server configuration.

- For information on installing using the GUI MSI installer process, see Section 2.3.4.1, “Using the MySQL Installation Wizard for Microsoft Windows”.

- For information on installing using the command line using the MSI package, see Section 2.3.4.2, “Automating MySQL Installation on Microsoft Windows Using the MSI Package”.

- If you have previously installed MySQL using the MSI package and want to remove MySQL, see Section 2.3.4.3, “Removing MySQL When Installed from the MSI Package”.

The workflow sequence for using the installer is shown in the figure below:
Microsoft Windows XP and later include a firewall which specifically blocks ports. If you plan on using MySQL through a network port then you should open and create an exception for this port before performing the installation. To check and if necessary add an exception to the firewall settings:

1. First ensure that you are logged in as an Administrator or a user with Administrator privileges.
2. Go to the Control Panel, and double click the Windows Firewall icon.
3. Choose the Allow a program through Windows Firewall option and click the Add port button.
4. Enter MySQL into the Name text box and 3306 (or the port of your choice) into the Port number text box.
5. Also ensure that the TCP protocol radio button is selected.
6. If you wish, you can also limit access to the MySQL server by choosing the Change scope button.
7. Confirm your choices by clicking the **OK** button.

Additionally, when running the MySQL Installation Wizard on Windows Vista or newer, ensure that you are logged in as a user with administrative rights.

**Note**

When using Windows Vista or newer, you may want to disable User Account Control (UAC) before performing the installation. If you do not do so, then MySQL may be identified as a security risk, which will mean that you need to enable MySQL. You can disable the security checking by following these instructions:

1. Open **Control Panel**.
2. Under the **User Accounts and Family Safety**, select **Add or remove user accounts**.
3. Click the **Got to the main User Accounts page** link.
4. Click on **Turn User Account Control on or off**. You may be prompted to provide permission to change this setting. Click **Continue**.
5. Deselect or uncheck the check box next to **Use User Account Control (UAC) to help protect your computer**. Click **OK** to save the setting.

You will need to restart to complete the process. Click **Restart Now** to reboot the machine and apply the changes. You can then follow the instructions below for installing Windows.

### 2.3.4.1 Using the MySQL Installation Wizard for Microsoft Windows

MySQL Installation Wizard is an installer for the MySQL server that uses the latest installer technologies for Microsoft Windows. The MySQL Installation Wizard, in combination with the MySQL Config Wizard, enables a user to install and configure a MySQL server that is ready for use immediately after installation.

The MySQL Installation Wizard uses the standard Microsoft Installer Engine (MSI) system is the standard installer for all MySQL server distributions. See **MySQL Installation Wizard: Upgrading MySQL**, for more information on upgrading from a previous version.

If you are upgrading an installation from MySQL 5.1.31 or earlier to MySQL 5.1.32 or later, read the notes provided in **MySQL Installation Wizard: Upgrading MySQL**.

The Microsoft Windows Installer Engine was updated with the release of Windows XP; those using a previous version of Windows can reference this Microsoft Knowledge Base article for information on upgrading to the latest version of the Windows Installer Engine.

In addition, Microsoft has introduced the WiX (Windows Installer XML) toolkit. This is the first highly acknowledged Open Source project from Microsoft. We have switched to WiX because it is an Open Source project and it enables us to handle the complete Windows installation process in a flexible manner using scripts.

Improving the MySQL Installation Wizard depends on the support and feedback of users like you. If you find that the MySQL Installation Wizard is lacking some feature important to you, or if you discover a bug, please report it in our bugs database using the instructions given in **Section 1.7, “How to Report Bugs or Problems”**.
MySQL Installation Wizard: Downloading and Starting

The MySQL installation packages can be downloaded from http://dev.mysql.com/downloads/. If the package you download is contained within a Zip archive, you need to extract the archive first.

The process for starting the wizard depends on the contents of the installation package you download. If there is a setup.exe file present, double-click it to start the installation process. If there is an .msi file present, double-click it to start the installation process.

MySQL Installation Wizard: Choosing an Install Type

There are three installation types available: Typical, Complete, and Custom.

The Typical installation type installs the MySQL server, the mysql command-line client, and the command-line utilities. The command-line clients and utilities include mysqldump, myisamchk, and several other tools to help you manage the MySQL server.

The Complete installation type installs all components included in the installation package. The full installation package includes components such as the embedded server library, the benchmark suite, support scripts, and documentation.

The Custom installation type gives you complete control over which packages you wish to install and the installation path that is used. See MySQL Installation Wizard: The Custom Install Dialog, for more information on performing a custom install.

If you choose the Typical or Complete installation types and click the Next button, you advance to the confirmation screen to verify your choices and begin the installation. If you choose the Custom installation type and click the Next button, you advance to the custom installation dialog, described in MySQL Installation Wizard: The Custom Install Dialog.

MySQL Installation Wizard: The Custom Install Dialog

If you wish to change the installation path or the specific components that are installed by the MySQL Installation Wizard, choose the Custom installation type.

A tree view on the left side of the custom install dialog lists all available components. Components that are not installed have a red X icon; components that are installed have a gray icon. To change whether a component is installed, click that component's icon and choose a new option from the drop-down list that appears.

You can change the default installation path by clicking the Change... button to the right of the displayed installation path.

After choosing your installation components and installation path, click the Next button to advance to the confirmation dialog.

MySQL Installation Wizard: The Confirmation Dialog

Once you choose an installation type and optionally choose your installation components, you advance to the confirmation dialog. Your installation type and installation path are displayed for you to review.

To install MySQL if you are satisfied with your settings, click the Install button. To change your settings, click the Back button. To exit the MySQL Installation Wizard without installing MySQL, click the Cancel button.

In MySQL 5.1.47 and earlier, after installation is complete, you have the option of registering with the MySQL web site. Registration gives you access to post in the MySQL forums at forums.mysql.com, along with the ability to report bugs at bugs.mysql.com and to subscribe to our newsletter.

The final screen of the installer provides a summary of the installation and gives you the option to launch the MySQL Config Wizard, which you can use to create a configuration file, install the MySQL service, and configure security settings.
Installing MySQL on Microsoft Windows Using an MSI Package

MySQL Installation Wizard: Changes Made

Once you click the Install button, the MySQL Installation Wizard begins the installation process and makes certain changes to your system which are described in the sections that follow.

Changes to the Registry

The MySQL Installation Wizard creates one Windows registry key in a typical install situation, located in HKEY_LOCAL_MACHINE\SOFTWARE\MySQL AB. For 64-bit Windows, the registry location is HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\MySQL AB. A server version specific entry will be created for each release series of MySQL that you install.

The MySQL Installation Wizard creates a key named after the release series of the server that is being installed, such as MySQL Server 5.1. It contains two string values, Location and Version. The Location string contains the path to the installation directory. In a default installation it contains C:\Program Files\MySQL\MySQL Server 5.1\. The Version string contains the release number. For example, for an installation of MySQL Server 5.1.73, the key contains a value of 5.1.73.

These registry keys are used to help external tools identify the installed location of the MySQL server, preventing a complete scan of the hard-disk to determine the installation path of the MySQL server. The registry keys are not required to run the server, and if you install MySQL using the noinstall Zip archive, the registry keys are not created.

Changes to the Start Menu

The MySQL Installation Wizard creates a new entry in the Windows Start menu under a common MySQL menu heading named after the release series of MySQL that you have installed. For example, if you install MySQL 5.1, the MySQL Installation Wizard creates a MySQL Server 5.1 section in the Start menu.

The following entries are created within the new Start menu section:

- **MySQL Command-Line Client**: This is a shortcut to the mysql command-line client and is configured to connect as the root user. The shortcut prompts for a root user password when you connect.

- **MySQL Server Instance Config Wizard**: This is a shortcut to the MySQL Config Wizard. Use this shortcut to configure a newly installed server, or to reconfigure an existing server.

- **MySQL Documentation**: This is a link to the MySQL server documentation that is stored locally in the MySQL server installation directory. This option is not available when the MySQL server is installed using the Essentials installation package.

Changes to the File System

The MySQL Installation Wizard by default installs the MySQL 5.1 server to C:\Program Files\MySQL\MySQL Server 5.1, where Program Files is the default location for applications in your system, and 5.1 is the release series of your MySQL server. This is the recommended location for the MySQL server, replacing the former default location C:\mysql.

By default, all MySQL applications are stored in a common directory at C:\Program Files\MySQL, where Program Files is the default location for applications in your Windows installation. A typical MySQL installation on a developer machine might look like this:

```
C:\Program Files\MySQL\MySQL Server 5.1
C:\Program Files\MySQL\MySQL Workbench 5.1 OSS
```

This approach makes it easier to manage and maintain all MySQL applications installed on a particular system.

In MySQL 5.1.23 and earlier, the default location for the data files used by MySQL is located within the corresponding MySQL Server installation directory. For MySQL 5.1.24 and later, the default
location of the data directory is the AppData directory configured for the user that installed the MySQL application.

MySQL Installation Wizard: Upgrading MySQL

The MySQL Installation Wizard can perform server upgrades automatically using the upgrade capabilities of MSI. That means you do not need to remove a previous installation manually before installing a new release. The installer automatically shuts down and removes the previous MySQL service before installing the new version.

Automatic upgrades are available only when upgrading between installations that have the same major and minor version numbers. For example, you can upgrade automatically from MySQL 5.1.5 to MySQL 5.1.6, but not from MySQL 5.0 to MySQL 5.1.

In MySQL 5.1.32 and later, the EXE version of the MSI installer packages were removed. When upgrading an existing MySQL installation from the old EXE based installer to the MSI based installer, please keep the following notes in mind:

• The MSI installer will not identify an existing installation that was installed using the old EXE installer. This means that the installer will not stop the existing server, or detect that the existing password is required before installing the new version. To work around this:

  1. Stop the current server manually using net stop or mysqladmin shutdown.
  2. Remove the existing installation manually by using the Add/Remove Programs control panel. This will keep the existing configuration and data files, as these are not removed automatically.
  3. Install the new version of MySQL using the MSI installer. When running the installation, skip updating the security by deselecting the check box on the security screen.
  4. Complete the installation, and then start the server again. You should be able to login with your existing user and password credentials.

• You can only upgrade the version and release using the MSI installer. For example, you can upgrade an open source installation with an open source installer. You cannot upgrade an open source installation using the enterprise installer.

See Section 2.3.9, “Upgrading MySQL Server on Microsoft Windows”.

2.3.4.2 Automating MySQL Installation on Microsoft Windows Using the MSI Package

The Microsoft Installer (MSI) supports a both a quiet and a passive mode that can be used to install MySQL automatically without requiring intervention. You can use this either in scripts to automatically install MySQL or through a terminal connection such as Telnet where you do not have access to the standard Windows user interface. The MSI packages can also be used in combination with Microsoft’s Group Policy system (part of Windows Server 2003 and Windows Server 2008) to install MySQL across multiple machines.

To install MySQL from one of the MSI packages automatically from the command line (or within a script), you need to use the msiexec.exe tool. For example, to perform a quiet installation (which shows no dialog boxes or progress):

```
shell> msiexec /i mysql-5.1.73.msi /quiet
```

The /i indicates that you want to perform an installation. The /quiet option indicates that you want no interactive elements.

To provide a dialog box showing the progress during installation, and the dialog boxes providing information on the installation and registration of MySQL, use /passive mode instead of /quiet:

```
shell> msiexec /i mysql-5.1.73.msi /passive
```
Regardless of the mode of the installation, installing the package in this manner performs a ‘Typical’ installation, and installs the default components into the standard location.

You can also use this method to uninstall MySQL by using the /uninstall or /x options:

```
shell> msiexec /x mysql-5.1.73.msi /uninstall
```

To install MySQL and configure a MySQL instance from the command line, see Section 2.3.5.13, “MySQL Server Instance Config Wizard: Creating an Instance from the Command Line”.

For information on using MSI packages to install software automatically using Group Policy, see How to use Group Policy to remotely install software in Windows Server 2003.

### 2.3.4.3 Removing MySQL When Installed from the MSI Package

To uninstall a MySQL where you have used the MSI packages, you must use the Add/Remove Programs tool within Control Panel. To do this:

1. Right-click the start menu and choose Control Panel.
2. If the Control Panel is set to category mode (you will see Pick a category at the top of the Control Panel window), double-click Add or Remove Programs. If the Control is set to classic mode, double-click the Add or Remove Programs icon.
3. Find MySQL in the list of installed software. MySQL Server is installed against release series numbers (MySQL 5.0, MySQL 5.1, etc.). Select the version that you want to remove and click Remove.
4. You will be prompted to confirm the removal. Click Yes to remove MySQL.

When MySQL is removed using this method, only the installed components are removed. Any database information (including the tables and data), import or export files, log files, and binary logs produced during execution are kept in their configured location.

If you try to install MySQL again the information will be retained and you will be prompted to enter the password configured with the original installation.

If you want to delete MySQL completely:

- Delete the associated data directory. On Windows XP and Windows Server 2003, before MySQL 5.1.24, the default data directory would be located within the MySQL installation directory. On MySQL 5.1.24 and later, the default data directory is the configured AppData directory, which is `C:\Documents and Settings\All Users\Application Data\MySQL` by default.
- On Windows 7 and Windows Server 2008, the default data directory location is `C:\ProgramData\Mysq`.

**Note**

The `C:\ProgramData` directory is hidden by default. You must change your folder options to view the hidden file. Choose Organize, Folder and search options, Show hidden folders.

### 2.3.5 Using the MySQL Server Instance Config Wizard

The MySQL Server Instance Config Wizard helps automate the process of configuring your server. It creates a custom MySQL configuration file (`my.ini` or `my.cnf`) by asking you a series of questions and then applying your responses to a template to generate the configuration file that is tuned to your installation.

The complete and essential MSI installation packages include the MySQL Server Instance Config Wizard in the MySQL 5.1 server. The MySQL Server Instance Config Wizard is only available for Windows.
The workflow sequence for using the MySQL Server Instance Config Wizard is shown in the figure below:

**Figure 2.18 MySQL Server Instance Config Wizard Workflow**
### 2.3.5.1 Starting the MySQL Server Instance Config Wizard

The MySQL Server Instance Config Wizard is normally started as part of the installation process. You should only need to run the MySQL Server Instance Config Wizard again when you need to change the configuration parameters of your server.

If you chose not to open a port prior to installing MySQL on Windows Vista or newer, you can choose to use the MySQL Server Instance Config Wizard after installation. However, you must open a port in the Windows Firewall. To do this see the instructions given in MySQL Installation Wizard: Downloading and Starting. Rather than opening a port, you also have the option of adding MySQL as a program that bypasses the Windows Firewall. One or the other option is sufficient—you need not do both. Additionally, when running the MySQL Server Config Wizard on Windows Vista or newer, ensure that you are logged in as a user with administrative rights.

You can launch the MySQL Config Wizard by clicking the **MySQL Server Instance Config Wizard** entry in the **MySQL** section of the Windows **Start** menu.

Alternatively, you can navigate to the **bin** directory of your MySQL installation and launch the **MySQLInstanceConfig.exe** file directly.

The MySQL Server Instance Config Wizard places the **my.ini** file in the installation directory for the MySQL server. This helps associate configuration files with particular server instances.

To ensure that the MySQL server knows where to look for the **my.ini** file, an argument similar to this is passed to the MySQL server as part of the service installation:

```
--defaults-file="C:\Program Files\MySQL\MySQL Server 5.1\my.ini"
```
Here, \texttt{C:\Program Files\MySQL\MySQL Server 5.1} is replaced with the installation path to the MySQL Server. The \texttt{--defaults-file} option instructs the MySQL server to read the specified file for configuration options when it starts.

Apart from making changes to the \texttt{my.ini} file by running the MySQL Server Instance Config Wizard again, you can modify it by opening it with a text editor and making any necessary changes. You can also modify the server configuration with the \url{http://www.mysql.com/products/administrator/} utility. For more information about server configuration, see Section 5.1.3, “Server Command Options”.

MySQL clients and utilities such as the \texttt{mysql} and \texttt{mysqldump} command-line clients are not able to locate the \texttt{my.ini} file located in the server installation directory. To configure the client and utility applications, create a new \texttt{my.ini} file in the Windows installation directory (for example, \texttt{C: \WINDOWS}).

Under Windows Server 2003, Windows Server 2000, Windows XP, and Windows Vista, MySQL Server Instance Config Wizard will configure MySQL to work as a Windows service. To start and stop MySQL you use the \texttt{Services} application that is supplied as part of the Windows Administrator Tools.

2.3.5.2 MySQL Server Instance Config Wizard: Choosing a Maintenance Option

If the MySQL Server Instance Config Wizard detects an existing configuration file, you have the option of either reconfiguring your existing server, or removing the server instance by deleting the configuration file and stopping and removing the MySQL service.

To reconfigure an existing server, choose the \texttt{Re-configure Instance} option and click the \texttt{Next} button. Any existing configuration file is not overwritten, but renamed (within the same directory) using a timestamp (Windows) or sequential number (Linux). To remove the existing server instance, choose the \texttt{Remove Instance} option and click the \texttt{Next} button.

If you choose the \texttt{Remove Instance} option, you advance to a confirmation window. Click the \texttt{Execute} button. The MySQL Server Config Wizard stops and removes the MySQL service, and then deletes the configuration file. The server installation and its \texttt{data} folder are not removed.

If you choose the \texttt{Re-configure Instance} option, you advance to the \texttt{Configuration Type} dialog where you can choose the type of installation that you wish to configure.

2.3.5.3 MySQL Server Instance Config Wizard: Choosing a Configuration Type

When you start the MySQL Server Instance Config Wizard for a new MySQL installation, or choose the \texttt{Re-configure Instance} option for an existing installation, you advance to the \texttt{Configuration Type} dialog.
There are two configuration types available: Detailed Configuration and Standard Configuration. The **Standard Configuration** option is intended for new users who want to get started with MySQL quickly without having to make many decisions about server configuration. The **Detailed Configuration** option is intended for advanced users who want more fine-grained control over server configuration.

If you are new to MySQL and need a server configured as a single-user developer machine, the **Standard Configuration** should suit your needs. Choosing the **Standard Configuration** option causes the MySQL Config Wizard to set all configuration options automatically with the exception of **Service Options** and **Security Options**.

The **Standard Configuration** sets options that may be incompatible with systems where there are existing MySQL installations. If you have an existing MySQL installation on your system in addition to the installation you wish to configure, the **Detailed Configuration** option is recommended.

To complete the **Standard Configuration**, please refer to the sections on **Service Options** and **Security Options** in Section 2.3.5.10, “MySQL Server Instance Config Wizard: The Service Options Dialog”, and Section 2.3.5.11, “MySQL Server Instance Config Wizard: The Security Options Dialog”, respectively.

### 2.3.5.4 MySQL Server Instance Config Wizard: The Server Type Dialog

There are three different server types available to choose from. The server type that you choose affects the decisions that the MySQL Server Instance Config Wizard makes with regard to memory, disk, and processor usage.
• **Developer Machine**: Choose this option for a typical desktop workstation where MySQL is intended only for personal use. It is assumed that many other desktop applications are running. The MySQL server is configured to use minimal system resources.

• **Server Machine**: Choose this option for a server machine where the MySQL server is running alongside other server applications such as FTP, email, and Web servers. The MySQL server is configured to use a moderate portion of the system resources.

• **Dedicated MySQL Server Machine**: Choose this option for a server machine that is intended to run only the MySQL server. It is assumed that no other applications are running. The MySQL server is configured to use all available system resources.

**Note**

By selecting one of the preconfigured configurations, the values and settings of various options in your `my.cnf` or `my.ini` will be altered accordingly. The default values and options as described in the reference manual may therefore be different to the options and values that were created during the execution of the Config Wizard.

### 2.3.5.5 MySQL Server Instance Config Wizard: The Database Usage Dialog

The **Database Usage** dialog enables you to indicate the storage engines that you expect to use when creating MySQL tables. The option you choose determines whether the InnoDB storage engine is available and what percentage of the server resources are available to InnoDB.
Using the MySQL Server Instance Config Wizard

**Multifunctional Database**: This option enables both the **InnoDB** and **MyISAM** storage engines and divides resources evenly between the two. This option is recommended for users who use both storage engines on a regular basis.

**Transactional Database Only**: This option enables both the **InnoDB** and **MyISAM** storage engines, but dedicates most server resources to the **InnoDB** storage engine. This option is recommended for users who use **InnoDB** almost exclusively and make only minimal use of **MyISAM**.

**Non-Transactional Database Only**: This option disables the **InnoDB** storage engine completely and dedicates all server resources to the **MyISAM** storage engine. This option is recommended for users who do not use **InnoDB**.

The Config Wizard uses a template to generate the server configuration file. The **Database Usage** dialog sets one of the following option strings:

- **Multifunctional Database**: MIXED
- **Transactional Database Only**: INNODB
- **Non-Transactional Database Only**: MYISAM

When these options are processed through the default template (my-template.ini) the result is:

```
Multifunctional Database:
default-storage-engine=InnoDB
    _myisam_pct=50

Transactional Database Only:
default-storage-engine=InnoDB
    _myisam_pct=5
```
Non-Transactional Database Only:
default-storage-engine=MyISAM
_myisam_pct=100
skip-innodb

The _myisam_pct value is used to calculate the percentage of resources dedicated to MyISAM. The remaining resources are allocated to InnoDB.

2.3.5.6 MySQL Server Instance Config Wizard: The InnoDB Tablespace Dialog

Some users may want to locate the InnoDB tablespace files in a different location than the MySQL server data directory. Placing the tablespace files in a separate location can be desirable if your system has a higher capacity or higher performance storage device available, such as a RAID storage system.

To change the default location for the InnoDB tablespace files, choose a new drive from the drop-down list of drive letters and choose a new path from the drop-down list of paths. To create a custom path, click the ... button.

If you are modifying the configuration of an existing server, you must click the Modify button before you change the path. In this situation you must move the existing tablespace files to the new location manually before starting the server.

2.3.5.7 MySQL Server Instance Config Wizard: The Concurrent Connections Dialog

To prevent the server from running out of resources, it is important to limit the number of concurrent connections to the MySQL server that can be established. The Concurrent Connections dialog enables you to choose the expected usage of your server, and sets the limit for concurrent connections accordingly. It is also possible to set the concurrent connection limit manually.
• **Decision Support (DSS)/OLAP**: Choose this option if your server does not require a large number of concurrent connections. The maximum number of connections is set at 100, with an average of 20 concurrent connections assumed.

• **Online Transaction Processing (OLTP)**: Choose this option if your server requires a large number of concurrent connections. The maximum number of connections is set at 500.

• **Manual Setting**: Choose this option to set the maximum number of concurrent connections to the server manually. Choose the number of concurrent connections from the drop-down box provided, or enter the maximum number of connections into the drop-down box if the number you desire is not listed.

### 2.3.5.8 MySQL Server Instance Config Wizard: The Networking and Strict Mode Options Dialog

Use the *Networking Options* dialog to enable or disable TCP/IP networking and to configure the port number that is used to connect to the MySQL server.
TCP/IP networking is enabled by default. To disable TCP/IP networking, uncheck the box next to the Enable TCP/IP Networking option.

Port 3306 is used by default. To change the port used to access MySQL, choose a new port number from the drop-down box or type a new port number directly into the drop-down box. If the port number you choose is in use, you are prompted to confirm your choice of port number.

Set the Server SQL Mode to either enable or disable strict mode. Enabling strict mode (default) makes MySQL behave more like other database management systems. If you run applications that rely on MySQL’s old “forgiving” behavior, make sure to either adapt those applications or to disable strict mode. For more information about strict mode, see Section 5.1.7, “Server SQL Modes”.

2.3.5.9 MySQL Server Instance Config Wizard: The Character Set Dialog

The MySQL server supports multiple character sets and it is possible to set a default server character set that is applied to all tables, columns, and databases unless overridden. Use the Character Set dialog to change the default character set of the MySQL server.
Using the MySQL Server Instance Config Wizard

- **Standard Character Set**: Choose this option if you want to use `latin1` as the default server character set. `latin1` is used for English and many Western European languages.

- **Best Support For Multilingualism**: Choose this option if you want to use `utf8` as the default server character set. This is a Unicode character set that can store characters from many different languages.

- **Manual Selected Default Character Set / Collation**: Choose this option if you want to pick the server's default character set manually. Choose the desired character set from the provided drop-down list.

2.3.5.10 MySQL Server Instance Config Wizard: The Service Options Dialog

On Windows platforms, the MySQL server can be installed as a Windows service. When installed this way, the MySQL server can be started automatically during system startup, and even restarted automatically by Windows in the event of a service failure.

The MySQL Server Instance Config Wizard installs the MySQL server as a service by default, using the service name `MySQL`. If you do not wish to install the service, uncheck the box next to the **Install As Windows Service** option. You can change the service name by picking a new service name from the drop-down box provided or by entering a new service name into the drop-down box.

**Note**

Service names can include any legal character except forward (`/`) or backward (`\`) slashes, and must be less than 256 characters long.
Warning

If you are installing multiple versions of MySQL onto the same machine, you must choose a different service name for each version that you install. If you do not choose a different service for each installed version then the service manager information will be inconsistent and this will cause problems when you try to uninstall a previous version.

If you have already installed multiple versions using the same service name, you must manually edit the contents of the \HKEY_LOCAL_MACHINE\SYSTEM \CurrentControlSet\Services parameters within the Windows registry to update the association of the service name with the correct server version.

Typically, when installing multiple versions you create a service name based on the version information. For example, you might install MySQL 5.x as mysql5, or specific versions such as MySQL 5.1.30 as mysql50130.

To install the MySQL server as a service but not have it started automatically at startup, uncheck the box next to the Launch the MySQL Server Automatically option.

2.3.5.11 MySQL Server Instance Config Wizard: The Security Options Dialog

The content of the security options portion of the MySQL Server Instance Configuration Wizard will depend on whether this is a new installation, or modifying an existing installation.

• Setting the root password for a new installation

It is strongly recommended that you set a root password for your MySQL server, and the MySQL Server Instance Config Wizard requires by default that you do so. If you do not wish to set a root password, uncheck the box next to the Modify Security Settings option.

Note

If you have previously installed MySQL, but not deleted the data directory associated with the previous installation, you may be prompted to provide the current root password. The password will be the one configured with your old data directory. If you do not want to use this data, or do not know the root password, you should cancel the installation, delete the previous installation data, and then restart the installation process. For more information on deleting MySQL data on Microsoft Windows, see Section 2.3.4.3, “Removing MySQL When Installed from the MSI Package”.
Using the MySQL Server Instance Config Wizard

To set the root password, enter the desired password into both the New root password and Confirm boxes.

Setting the root password for an existing installation

If you are modifying the configuration of an existing configuration, or you are installing an upgrade and the MySQL Server Instance Configuration Wizard has detected an existing MySQL system, then you must enter the existing password for root before changing the configuration information.
If you want to change the current root password, enter the desired new password into both the New root password and Confirm boxes.

To permit root logins from across the network, check the box next to the Enable root access from remote machines option. This decreases the security of your root account.

To create an anonymous user account, check the box next to the Create An Anonymous Account option. Creating an anonymous account can decrease server security and cause login and permission difficulties. For this reason, it is not recommended.

2.3.5.12 MySQL Server Instance Config Wizard: The Confirmation Dialog

The final dialog in the MySQL Server Instance Config Wizard is the Confirmation Dialog. To start the configuration process, click the Execute button. To return to a previous dialog, click the Back button. To exit the MySQL Server Instance Config Wizard without configuring the server, click the Cancel button.
After you click the **Execute** button, the MySQL Server Instance Config Wizard performs a series of tasks and displays the progress onscreen as the tasks are performed.

The MySQL Server Instance Config Wizard first determines configuration file options based on your choices using a template prepared by MySQL developers and engineers. This template is named `my-template.ini` and is located in your server installation directory.

The MySQL Config Wizard then writes these options to the corresponding configuration file.

If you chose to create a service for the MySQL server, the MySQL Server Instance Config Wizard creates and starts the service. If you are reconfiguring an existing service, the MySQL Server Instance Config Wizard restarts the service to apply your configuration changes.

If you chose to set a **root** password, the MySQL Config Wizard connects to the server, sets your new **root** password, and applies any other security settings you may have selected.

After the MySQL Server Instance Config Wizard has completed its tasks, it displays a summary. Click the **Finish** button to exit the MySQL Server Config Wizard.

### 2.3.5.13 MySQL Server Instance Config Wizard: Creating an Instance from the Command Line

In addition to using the GUI interface to the MySQL Server Instance Config Wizard, you can also create instances automatically from the command line.

To use the MySQL Server Instance Config Wizard on the command line, you need to use the `MySQLInstanceConfig.exe` command that is installed with MySQL in the `bin` directory within the installation directory. `MySQLInstanceConfig.exe` takes a number of command-line arguments the set the properties that would normally be selected through the GUI interface, and then creates a new...
configuration file (my.ini) by combining these selections with a template configuration file to produce
the working configuration file.

The main command line options are provided in the table below. Some of the options are required,
while some options are optional.

Table 2.7 MySQL Server Instance Config Wizard Command Line Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required Parameters</td>
<td></td>
</tr>
<tr>
<td>-nPRODUCTNAME</td>
<td>The name of the instance when installed</td>
</tr>
<tr>
<td>-pPATH</td>
<td>Path of the base directory for installation. This is equivalent to the directory</td>
</tr>
<tr>
<td></td>
<td>when using the basedir configuration parameter</td>
</tr>
<tr>
<td>-vVERSION</td>
<td>The version tag to use for this installation</td>
</tr>
<tr>
<td>Action to Perform</td>
<td></td>
</tr>
<tr>
<td>-i</td>
<td>Install an instance</td>
</tr>
<tr>
<td>-r</td>
<td>Remove an instance</td>
</tr>
<tr>
<td>-s</td>
<td>Stop an existing instance</td>
</tr>
<tr>
<td>-q</td>
<td>Perform the operation quietly</td>
</tr>
<tr>
<td>-lFILENAME</td>
<td>Save the installation progress in a logfile</td>
</tr>
<tr>
<td>Config File to Use</td>
<td></td>
</tr>
<tr>
<td>-tFILENAME</td>
<td>Path to the template config file that will be used to generate the installed</td>
</tr>
<tr>
<td></td>
<td>configuration file</td>
</tr>
<tr>
<td>-cFILENAME</td>
<td>Path to a config file to be generated</td>
</tr>
</tbody>
</table>

The -t and -c options work together to set the configuration parameters for a new instance. The -t option specifies the template configuration file to use as the basic configuration, which are then merged with the configuration parameters generated by the MySQL Server Instance Config Wizard into the configuration file specified by the -c option.

A sample template file, my-template.ini is provided in the toplevel MySQL installation directory. The file contains elements are replaced automatically by the MySQL Server Instance Config Wizard during configuration.

If you specify a configuration file that already exists, the existing configuration file will be saved in the file with the original, with the date and time added. For example, the mysql.ini will be copied to mysql 2009-10-27 1646.ini.bak.

The parameters that you can specify on the command line are listed in the table below.

Table 2.8 MySQL Server Instance Config Wizard Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ServiceName=$</td>
<td>Specify the name of the service to be created</td>
</tr>
<tr>
<td>AddBinToPath={yes</td>
<td>Specifies whether to add the binary directory of MySQL to the standard</td>
</tr>
<tr>
<td></td>
<td>no}</td>
</tr>
<tr>
<td></td>
<td>PATH environment variable</td>
</tr>
<tr>
<td>ServerType={DEVELOPMENT</td>
<td>SERVER</td>
</tr>
<tr>
<td></td>
<td>Server Type Dialog”</td>
</tr>
<tr>
<td>DatabaseType={MIXED</td>
<td>INNODB</td>
</tr>
<tr>
<td></td>
<td>Database Usage Dialog”</td>
</tr>
</tbody>
</table>
Using the MySQL Server Instance Config Wizard

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConnectionUsage={DSS</td>
<td>Specify the type of connection support, this automates the setting for the number of concurrent connections (see the ConnectionCount parameter). For more information, see Section 2.3.5.7, “MySQL Server Instance Config Wizard: The Concurrent Connections Dialog”</td>
</tr>
<tr>
<td>OLTP}</td>
<td></td>
</tr>
<tr>
<td>ConnectionCount(#)</td>
<td>Specify the number of concurrent connections to support. For more information, see Section 2.3.5.4, “MySQL Server Instance Config Wizard: The Server Type Dialog”</td>
</tr>
<tr>
<td>SkipNetworking={yes</td>
<td>Specify whether network support should be supported. Specifying yes disables network access altogether</td>
</tr>
<tr>
<td>no}</td>
<td></td>
</tr>
<tr>
<td>Port(#)</td>
<td>Specify the network port number to use for network connections. For more information, see Section 2.3.5.8, “MySQL Server Instance Config Wizard: The Networking and Strict Mode Options Dialog”</td>
</tr>
<tr>
<td>StrictMode={yes</td>
<td>Specify whether to use the strict SQL mode. For more information, see Section 2.3.5.8, “MySQL Server Instance Config Wizard: The Networking and Strict Mode Options Dialog”</td>
</tr>
<tr>
<td>no}</td>
<td></td>
</tr>
<tr>
<td>Charset($)</td>
<td>Specify the default character set. For more information, see Section 2.3.5.9, “MySQL Server Instance Config Wizard: The Character Set Dialog”</td>
</tr>
<tr>
<td>RootPassword($)</td>
<td>Specify the root password</td>
</tr>
<tr>
<td>RootCurrentPassword($)</td>
<td>Specify the current root password then stopping or reconfiguring an existing service</td>
</tr>
</tbody>
</table>

**Note**

When specifying options on the command line, you can enclose the entire command-line option and the value you are specifying using double quotation marks. This enables you to use spaces in the options. For example, "-c:\mysql.ini".

The following command installs a MySQL Server 5.1 instance from the directory C:\Program Files \MySQL\MySQL Server 5.1 using the service name MySQL51 and setting the root password to 1234.

```bash
shell> MySQLInstanceConfig.exe -i -q "-lC:\mysql_install_log.txt" » "$-MySQL Server 5.1" "$-C:\Program Files\MySQL\MySQL Server 5.1" "$-v5.1.73" » "$-my-template.ini" "$-C:\mytest.ini" ServerType=DEVELOPMENT DatabaseType=MIXED » ConnectionUsage=DSS Port=3311 ServiceName=MySQL51 RootPassword=1234
```

In the above example, a log file will be generated in mysql_install_log.txt containing the information about the instance creation process. The log file generated by the above example is shown below:

Welcome to the MySQL Server Instance Configuration Wizard 1.0.16.0
Date: 2009-10-27 17:07:21
Installing service ...
Product Name: MySQL Server 5.1
Version: 5.1.73
Installation Path: C:\Program Files\MySQL\MySQL Server 5.1\
Creating configuration file C:\mytest.ini using template my-template.ini.
Options:
DEVELOPMENT MIXED DSS STRICTMODE
Variables:
port: 3311
default-character-set: latin1
basedir: "C:/Program Files/MySQL/MySQL Server 5.1/"
datadir: "C:/Program Files/MySQL/MySQL Server 5.1/Data/"

Creating Windows service entry.
Service name: "MySQL51"
Parameters: "C:\Program Files\MySQL\MySQL Server 5.1\bin\mysqld" --defaults-file="C:\mytest.ini" MySQL51.
Windows service MySQL51 installed.

When using the command line, the return values in the following table indicate an error performing the specified option.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Configuration template file cannot be found</td>
</tr>
<tr>
<td>3</td>
<td>The Windows service entry cannot be created</td>
</tr>
<tr>

<td>The security settings cannot be applied</td>
</tr>
<tr>
<td>8</td>
<td>The configuration file cannot be written</td>
</tr>
<tr>
<td>9</td>
<td>The Windows service entry cannot be removed</td>
</tr>
</tbody>
</table>

You can perform an installation of MySQL automatically using the MSI package. For more information, see Section 2.3.4.2, "Automating MySQL Installation on Microsoft Windows Using the MSI Package".

2.3.6 Installing MySQL on Microsoft Windows Using a noinstall Zip Archive

Users who are installing from the noinstall package can use the instructions in this section to manually install MySQL. The process for installing MySQL from a Zip archive is as follows:

1. Extract the archive to the desired install directory
2. Create an option file
3. Choose a MySQL server type
4. Start the MySQL server
5. Secure the default user accounts

This process is described in the sections that follow.

2.3.6.1 Extracting the Install Archive

To install MySQL manually, do the following:

1. If you are upgrading from a previous version please refer to Section 2.3.9, "Upgrading MySQL Server on Microsoft Windows", before beginning the upgrade process.
2. Make sure that you are logged in as a user with administrator privileges.
3. Choose an installation location. Traditionally, the MySQL server is installed in C:\mysql. The MySQL Installation Wizard installs MySQL under C:\Program Files\MySQL. If you do not install MySQL at C:\mysql, you must specify the path to the install directory during startup or in an option file. See Section 2.3.6.2, "Creating an Option File".
4. Extract the install archive to the chosen installation location using your preferred Zip archive tool. Some tools may extract the archive to a folder within your chosen installation location. If this occurs, you can move the contents of the subfolder into the chosen installation location.

### 2.3.6.2 Creating an Option File

If you need to specify startup options when you run the server, you can indicate them on the command line or place them in an option file. For options that are used every time the server starts, you may find it most convenient to use an option file to specify your MySQL configuration. This is particularly true under the following circumstances:

- The installation or data directory locations are different from the default locations (`C:\Program Files\MySQL\MySQL Server 5.1` and `C:\Program Files\MySQL\MySQL Server 5.1\data`).
- You need to tune the server settings, such as memory, cache, or InnoDB configuration information.

When the MySQL server starts on Windows, it looks for option files in several locations, such as the Windows directory, `C:\`, and the MySQL installation directory (for the full list of locations, see Section 4.2.6, “Using Option Files”). The Windows directory typically is named something like `C:\WINDOWS`. You can determine its exact location from the value of the `WINDIR` environment variable using the following command:

```
C:> echo %WINDIR%
```

MySQL looks for options in each location first in the `my.ini` file, and then in the `my.cnf` file. However, to avoid confusion, it is best if you use only one file. If your PC uses a boot loader where `C:` is not the boot drive, your only option is to use the `my.ini` file. Whichever option file you use, it must be a plain text file.

You can also make use of the example option files included with your MySQL distribution; see Section 5.1.2, “Server Configuration Defaults”.

An option file can be created and modified with any text editor, such as Notepad. For example, if MySQL is installed in `E:\mysql` and the data directory is in `E:\mydata\data`, you can create an option file containing a `[mysqld]` section to specify values for the `basedir` and `datadir` options:

```
[mysqld]
# set basedir to your installation path
basedir=E:/mysql
# set datadir to the location of your data directory
datadir=E:/mydata/data
```

Microsoft Windows path names are specified in option files using (forward) slashes rather than backslashes. If you do use backslashes, double them:

```
[mysqld]
# set basedir to your installation path
basedir=E:\mysql
# set datadir to the location of your data directory
datadir=E:\mydata\data
```

The rules for use of backslash in option file values are given in Section 4.2.6, “Using Option Files”.

In MySQL 5.1.23 and earlier, the MySQL installer places the data directory directly under the directory where you install MySQL. On MySQL 5.1.24 and later, the data directory is located within the `AppData` directory for the user running MySQL.

If you would like to use a data directory in a different location, you should copy the entire contents of the `data` directory to the new location. For example, if you want to use `E:\mydata` as the data directory instead, you must do two things:
1. Move the entire `data` directory and all of its contents from the default location (for example `C:\Program Files\MySQL\MySQL Server 5.1\data`) to `E:\mydata`.

2. Use a `--datadir` option to specify the new data directory location each time you start the server.

### 2.3.6.3 Selecting a MySQL Server Type

The following table shows the available servers for Windows in MySQL 5.1.20 and earlier.

<table>
<thead>
<tr>
<th>Binary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>mysqld-nt</code></td>
<td>Optimized binary with named-pipe support</td>
</tr>
<tr>
<td><code>mysqld</code></td>
<td>Optimized binary without named-pipe support</td>
</tr>
<tr>
<td><code>mysqld-debug</code></td>
<td>Like <code>mysqld-nt</code>, but compiled with full debugging and automatic memory allocation checking</td>
</tr>
</tbody>
</table>

The following table shows the available servers for Windows in MySQL 5.1.21 and later.

**Table 2.10 `mysqld` binary types for Microsoft Windows MySQL 5.1.21 and later**

<table>
<thead>
<tr>
<th>Binary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>mysqld</code></td>
<td>Optimized binary with named-pipe support</td>
</tr>
<tr>
<td><code>mysqld-debug</code></td>
<td>Like <code>mysqld</code>, but compiled with full debugging and automatic memory allocation checking</td>
</tr>
</tbody>
</table>

All of the preceding binaries are optimized for modern Intel processors, but should work on any Intel i386-class or higher processor.

Each of the servers in a distribution support the same set of storage engines. The `SHOW ENGINES` statement displays which engines a given server supports.

All Windows MySQL 5.1 servers have support for symbolic linking of database directories.

MySQL supports TCP/IP on all Windows platforms. MySQL servers on Windows support named pipes as indicated in the following list. However, the default is to use TCP/IP regardless of platform. (Named pipes are slower than TCP/IP in many Windows configurations.)

Use of named pipes is subject to these conditions:

- Named pipes are enabled only if you start the server with the `--enable-named-pipe` option. It is necessary to use this option explicitly because some users have experienced problems with shutting down the MySQL server when named pipes were used.
- For MySQL 5.1.20 and earlier, named-pipe connections are permitted only by the `mysqld-nt` and `mysqld-debug` servers. For MySQL 5.1.21 and later, the `mysqld` and `mysqld-debug` servers both contain support for named-pipe connections.

**Note**

Most of the examples in this manual use `mysqld` as the server name. If you choose to use a different server, such as `mysqld-nt` or `mysqld-debug`, make the appropriate substitutions in the commands that are shown in the examples.

### 2.3.6.4 Starting MySQL Server on Microsoft Windows for the First Time

This section gives a general overview of starting the MySQL server. The following sections provide more specific information for starting the MySQL server from the command line or as a Windows service.
The information here applies primarily if you installed MySQL using the **Noinstall** version, or if you wish to configure and test MySQL manually rather than with the GUI tools.

**Note**

The **MySQL Notifier** GUI can be used to start/stop/restart the MySQL server at any time.

The examples in these sections assume that MySQL is installed under the default location of `C:\Program Files\MySQL\MySQL Server 5.1`. Adjust the path names shown in the examples if you have MySQL installed in a different location.

Clients have two options. They can use TCP/IP, or they can use a named pipe if the server supports named-pipe connections.

MySQL for Windows also supports shared-memory connections if the server is started with the **--shared-memory** option. Clients can connect through shared memory by using the **--protocol=MEMORY** option.

For information about which server binary to run, see Section 2.3.6.3, “Selecting a MySQL Server Type”.

Testing is best done from a command prompt in a console window (or “DOS window”). In this way you can have the server display status messages in the window where they are easy to see. If something is wrong with your configuration, these messages make it easier for you to identify and fix any problems.

To start the server, enter this command:

```
C:\> "C:\Program Files\MySQL\MySQL Server 5.1\bin\mysqld" --console
```

For a server that includes **InnoDB** support, you should see the messages similar to those following as it starts (the path names and sizes may differ):

```
InnoDB: The first specified datafile c:\ibdata\ibdata1 did not exist:
InnoDB: a new database to be created!
InnoDB: Setting file c:\ibdata\ibdata1 size to 209715200
InnoDB: Database physically writes the file full: wait...
InnoDB: Log file c:\iblogs\ib_logfile0 did not exist: new to be created
InnoDB: Setting log file c:\iblogs\ib_logfile0 size to 31457280
InnoDB: Log file c:\iblogs\ib_logfile1 did not exist: new to be created
InnoDB: Setting log file c:\iblogs\ib_logfile1 size to 31457280
InnoDB: Log file c:\iblogs\ib_logfile2 did not exist: new to be created
InnoDB: Setting log file c:\iblogs\ib_logfile2 size to 31457280
InnoDB: Doublewrite buffer not found: creating new
InnoDB: Doublewrite buffer created
InnoDB: creating foreign key constraint system tables
InnoDB: foreign key constraint system tables created
011024 10:58:25 InnoDB: Started
```

When the server finishes its startup sequence, you should see something like this, which indicates that the server is ready to service client connections:

```
mysqld: ready for connections
Version: '5.1.73' socket: '' port: 3306
```

The server continues to write to the console any further diagnostic output it produces. You can open a new console window in which to run client programs.

If you omit the **--console** option, the server writes diagnostic output to the error log in the data directory (`C:\Program Files\MySQL\MySQL Server 5.1\data` by default). The error log is the file with the **.err** extension, and may be set using the **--log-error** option.
2.3.6.5 Starting MySQL Server from the Windows Command Line

The MySQL server can be started manually from the command line. This can be done on any version of Windows.

Note
The MySQL Notifier GUI can also be used to start/stop/restart the MySQL server.

To start the mysqld server from the command line, you should start a console window (or “DOS window”) and enter this command:

```
C:\> "C:\Program Files\MySQL\MySQL Server 5.1\bin\mysqld"
```

The path to mysqld may vary depending on the install location of MySQL on your system.

You can stop the MySQL server by executing this command:

```
C:\> "C:\Program Files\MySQL\MySQL Server 5.1\bin\mysqladmin" -u root shutdown
```

Note
If the MySQL root user account has a password, you need to invoke mysqladmin with the -p option and supply the password when prompted.

This command invokes the MySQL administrative utility mysqladmin to connect to the server and tell it to shut down. The command connects as the MySQL root user, which is the default administrative account in the MySQL grant system.

Note
Users in the MySQL grant system are wholly independent from any login users under Microsoft Windows.

If mysqld doesn’t start, check the error log to see whether the server wrote any messages there to indicate the cause of the problem. By default, the error log is located in the C:\Program Files\MySQL\MySQL Server 5.1\data directory. It is the file with a suffix of .err, or may be specified by passing in the --log-error option. Alternatively, you can try to start the server with the --console option; in this case, the server may display some useful information on the screen that will help solve the problem.

The last option is to start mysqld with the --standalone and --debug options. In this case, mysqld writes a log file C:\mysqld.trace that should contain the reason why mysqld doesn’t start. See Section 22.4.3, “The DBUG Package”.

Use mysqld --verbose --help to display all the options that mysqld supports.

2.3.6.6 Customizing the PATH for MySQL Tools

To make it easier to invoke MySQL programs, you can add the path name of the MySQL bin directory to your Windows system PATH environment variable:

- On the Windows desktop, right-click the My Computer icon, and select Properties.
• Next select the **Advanced** tab from the **System Properties** menu that appears, and click the **Environment Variables** button.

• Under **System Variables**, select **Path**, and then click the **Edit** button. The **Edit System Variable** dialogue should appear.

• Place your cursor at the end of the text appearing in the space marked **Variable Value**. (Use the **End** key to ensure that your cursor is positioned at the very end of the text in this space.) Then enter the complete path name of your MySQL **bin** directory (for example, `C:\Program Files\MySQL \MySQL Server 5.1\bin`)

  **Note**
  There must be a semicolon separating this path from any values present in this field.

Dismiss this dialogue, and each dialogue in turn, by clicking **OK** until all of the dialogues that were opened have been dismissed. You should now be able to invoke any MySQL executable program by typing its name at the DOS prompt from any directory on the system, without having to supply the path. This includes the servers, the **mysql** client, and all MySQL command-line utilities such as **mysqladmin** and **mysqldump**.

You should not add the MySQL **bin** directory to your Windows **PATH** if you are running multiple MySQL servers on the same machine.

**Warning**
You must exercise great care when editing your system **PATH** by hand; accidental deletion or modification of any portion of the existing **PATH** value can leave you with a malfunctioning or even unusable system.

### 2.3.6.7 Starting MySQL Server as a Microsoft Windows Service

On Windows, the recommended way to run MySQL is to install it as a Windows service, so that MySQL starts and stops automatically when Windows starts and stops, and can be managed using the service manager framework. A MySQL server installed as a service can also be controlled from the command line using **NET** commands, or with the graphical **Services** utility. Generally, to install MySQL as a Windows service you should be logged in using an account that has administrator rights.

**Note**
The **MySQL Notifier** GUI can also be used to monitor the status of the MySQL service.

The **Services** utility (the Windows **Service Control Manager**) can be found in the Windows Control Panel (under **Administrative Tools** on Windows 2000, XP, Vista, and Server 2003). To avoid conflicts, it is advisable to close the **Services** utility while performing server installation or removal operations from the command line.

#### Installing the service

Before installing MySQL as a Windows service, you should first stop the current server if it is running by using the following command:

```
C:\> "C:\Program Files\MySQL\MySQL Server 5.1\bin\mysqladmin" -u root shutdown
```

**Note**
If the MySQL root user account has a password, you need to invoke **mysqladmin** with the **-p** option and supply the password when prompted.
This command invokes the MySQL administrative utility `mysqladmin` to connect to the server and tell it to shut down. The command connects as the MySQL `root` user, which is the default administrative account in the MySQL grant system.

Note

Users in the MySQL grant system are wholly independent from any login users under Windows.

Install the server as a service using this command:

C:\> "C:\Program Files\MySQL\MySQL Server 5.1\bin\mysqld" --install

The service-installation command does not start the server. Instructions for that are given later in this section.

To make it easier to invoke MySQL programs, you can add the path name of the MySQL `bin` directory to your Windows system `PATH` environment variable:

- On the Windows desktop, right-click the **My Computer** icon, and select **Properties**.
- Next select the **Advanced** tab from the **System Properties** menu that appears, and click the **Environment Variables** button.
- Under **System Variables**, select **Path**, and then click the **Edit** button. The **Edit System Variable** dialogue should appear.
- Place your cursor at the end of the text appearing in the space marked **Variable Value**. (Use the **End** key to ensure that your cursor is positioned at the very end of the text in this space.) Then enter the complete path name of your MySQL `bin` directory (for example, `C:\Program Files\MySQL\MySQL Server 5.1\bin`), and there should be a semicolon separating this path from any values present in this field. Dismiss this dialogue, and each dialogue in turn, by clicking **OK** until all of the dialogues that were opened have been dismissed. You should now be able to invoke any MySQL executable program by typing its name at the DOS prompt from any directory on the system, without having to supply the path. This includes the servers, the `mysql` client, and all MySQL command-line utilities such as `mysqladmin` and `mysqldump`.

You should not add the MySQL `bin` directory to your Windows `PATH` if you are running multiple MySQL servers on the same machine.

Warning

You must exercise great care when editing your system `PATH` by hand; accidental deletion or modification of any portion of the existing `PATH` value can leave you with a malfunctioning or even unusable system.

The following additional arguments can be used when installing the service:

- You can specify a service name immediately following the **--install** option. The default service name is **MySQL**.
- If a service name is given, it can be followed by a single option. By convention, this should be **--defaults-file=file_name** to specify the name of an option file from which the server should read options when it starts.

The use of a single option other than **--defaults-file** is possible but discouraged. **--defaults-file** is more flexible because it enables you to specify multiple startup options for the server by placing them in the named option file.

- You can also specify a **--local-service** option following the service name. This causes the server to run using the **LocalService** Windows account that has limited system privileges. This
account is available only for Windows XP or newer. If both `--defaults-file` and `--local-service` are given following the service name, they can be in any order.

For a MySQL server that is installed as a Windows service, the following rules determine the service name and option files that the server uses:

- If the service-installation command specifies no service name or the default service name (**MySQL**) following the `--install` option, the server uses the a service name of **MySQL** and reads options from the `[mysqld]` group in the standard option files.

- If the service-installation command specifies a service name other than **MySQL** following the `--install` option, the server uses that service name. It reads options from the `[mysqld]` group and the group that has the same name as the service in the standard option files. This enables you to use the `[mysqld]` group for options that should be used by all MySQL services, and an option group with the service name for use by the server installed with that service name.

- If the service-installation command specifies a `--defaults-file` option after the service name, the server reads options the same way as described in the previous item, except that it reads options only from the named file and ignores the standard option files.

As a more complex example, consider the following command:

```
C:\> "C:\Program Files\MySQL\MySQL Server 5.1\bin\mysqld" --install MySQL --defaults-file=C:\my-opts.cnf
```

Here, the default service name (**MySQL**) is given after the `--install` option. If no `--defaults-file` option had been given, this command would have the effect of causing the server to read the `[mysqld]` group from the standard option files. However, because the `--defaults-file` option is present, the server reads options from the `[mysqld]` option group, and only from the named file.

**Note**

On Windows, if the server is started with the `--defaults-file` and `--install` options, `--install` must be first. Otherwise, `mysqld.exe` will attempt to start the MySQL server.

You can also specify options as Start parameters in the Windows **Services** utility before you start the MySQL service.

### Starting the service

Once a MySQL server has been installed as a service, Windows starts the service automatically whenever Windows starts. The service also can be started immediately from the **Services** utility, or by using a `NET START MySQL` command. The `NET` command is not case sensitive.

When run as a service, `mysqld` has no access to a console window, so no messages can be seen there. If `mysqld` does not start, check the error log to see whether the server wrote any messages there to indicate the cause of the problem. The error log is located in the MySQL data directory (for example, `C:\Program Files\MySQL\MySQL Server 5.1\data`). It is the file with a suffix of `.err`.

When a MySQL server has been installed as a service, and the service is running, Windows stops the service automatically when Windows shuts down. The server also can be stopped manually by using the **Services** utility, the `NET STOP MySQL` command, or the `mysqladmin shutdown` command.

You also have the choice of installing the server as a manual service if you do not wish for the service to be started automatically during the boot process. To do this, use the `--install-manual` option rather than the `--install` option:
Troubleshooting a Microsoft Windows MySQL Server Installation

Removing the service

To remove a server that is installed as a service, first stop it if it is running by executing `NET STOP MySQL`. Then use the `--remove` option to remove it:

```
C:\> "C:\Program Files\MySQL\MySQL Server 5.1\bin\mysqld" --remove
```

If `mysqld` is not running as a service, you can start it from the command line. For instructions, see Section 2.3.6.5, “Starting MySQL Server from the Windows Command Line”.

If you encounter difficulties during installation, see Section 2.3.7, “Troubleshooting a Microsoft Windows MySQL Server Installation”.

For more information about stopping or removing a MySQL Windows service, see Section 5.5.2.2, “Starting Multiple MySQL Instances as Windows Services”.

2.3.6.8 Testing The MySQL Server Installation on Microsoft Windows

You can test whether the MySQL server is working by executing any of the following commands:

```
C:\> "C:\Program Files\MySQL\MySQL Server 5.1\bin\mysqlshow"
C:\> "C:\Program Files\MySQL\MySQL Server 5.1\bin\mysqlshow" -u root mysql
C:\> "C:\Program Files\MySQL\MySQL Server 5.1\bin\mysqladmin" version status proc
C:\> "C:\Program Files\MySQL\MySQL Server 5.1\bin\mysql" test
```

**Note**

By default, `mysqlshow` will try to connect using the ODBC user. This user is not created by default. You should specify a valid user, or `root` with the right password to check the operation of the server.

If `mysqld` is slow to respond to TCP/IP connections from client programs, there is probably a problem with your DNS. In this case, start `mysqld` with the `--skip-name-resolve` option and use only `localhost` and IP addresses in the `Host` column of the MySQL grant tables. (Be sure that an account exists that specifies an IP address or you may not be able to connect.)

You can force a MySQL client to use a named-pipe connection rather than TCP/IP by specifying the `--pipe` or `--protocol=PIPE` option, or by specifying `. (period)` as the host name. Use the `--socket` option to specify the name of the pipe if you do not want to use the default pipe name.

If you have set a password for the `root` account, deleted the anonymous account, or created a new user account, then to connect to the MySQL server you must use the appropriate `-u` and `-p` options with the commands shown previously. See Section 4.2.2, “Connecting to the MySQL Server”.

For more information about `mysqlshow`, see Section 4.5.6, “mysqlshow — Display Database, Table, and Column Information”.

2.3.7 Troubleshooting a Microsoft Windows MySQL Server Installation

When installing and running MySQL for the first time, you may encounter certain errors that prevent the MySQL server from starting. This section helps you diagnose and correct some of these errors.

Your first resource when troubleshooting server issues is the error log. The MySQL server uses the error log to record information relevant to the error that prevents the server from starting. The error log is located in the data directory specified in your `my.ini` file. The default data directory location is `C:\Program Files\MySQL\MySQL Server 5.1\data`, or `C:\ProgramData\Mysql` on Windows.
Troubleshooting a Microsoft Windows MySQL Server Installation

7 and Windows Server 2008. The C:\ProgramData directory is hidden by default. You need to change your folder options to see the directory and contents. For more information on the error log and understanding the content, see Section 5.4.2, “The Error Log”.

For information regarding possible errors, also consult the console messages displayed when the MySQL service is starting. Use the NET START MySQL command from the command line after installing mysqld as a service to see any error messages regarding the starting of the MySQL server as a service. See Section 2.3.6.7, “Starting MySQL Server as a Microsoft Windows Service”.

The following examples show other common error messages you might encounter when installing MySQL and starting the server for the first time:

- If the MySQL server cannot find the mysql privileges database or other critical files, it displays these messages:

  
  System error 1067 has occurred.
  Fatal error: Can't open and lock privilege tables:
  Table 'mysql.user' doesn't exist

  These messages often occur when the MySQL base or data directories are installed in different locations than the default locations (C:\Program Files\MySQL\MySQL Server 5.1 and C:\Program Files\MySQL\MySQL Server 5.1\data, respectively).

  This situation can occur when MySQL is upgraded and installed to a new location, but the configuration file is not updated to reflect the new location. In addition, old and new configuration files might conflict. Be sure to delete or rename any old configuration files when upgrading MySQL.

  If you have installed MySQL to a directory other than C:\Program Files\MySQL\MySQL Server 5.1, ensure that the MySQL server is aware of this through the use of a configuration (my.ini) file. Put the my.ini file in your Windows directory, typically C:\WINDOWS. To determine its exact location from the value of the WINDIR environment variable, issue the following command from the command prompt:

  C:\> echo %WINDIR%

  You can create or modify an option file with any text editor, such as Notepad. For example, if MySQL is installed in E:\mysql and the data directory is D:\MySQLdata, you can create the option file and set up a [mysqld] section to specify values for the basedir and datadir options:

  [mysqld]
  # set basedir to your installation path
  basedir=E:/mysql
  # set datadir to the location of your data directory
  datadir=D:/MySQLdata

  Microsoft Windows path names are specified in option files using (forward) slashes rather than backslashes. If you do use backslashes, double them:

  [mysqld]
  # set basedir to your installation path
  basedir=C:\\Program Files\\MySQL\\MySQL Server 5.1
  # set datadir to the location of your data directory
  datadir=D:\\MySQLdata

  The rules for use of backslash in option file values are given in Section 4.2.6, “Using Option Files”.

  If you change the datadir value in your MySQL configuration file, you must move the contents of the existing MySQL data directory before restarting the MySQL server.

  See Section 2.3.6.2, “Creating an Option File”.

  104
- If you reinstall or upgrade MySQL without first stopping and removing the existing MySQL service and install MySQL using the MySQL Config Wizard, you may see this error:

```
Error: Cannot create Windows service for MySql. Error: 0
```

This occurs when the Configuration Wizard tries to install the service and finds an existing service with the same name.

One solution to this problem is to choose a service name other than `mysql` when using the configuration wizard. This enables the new service to be installed correctly, but leaves the outdated service in place. Although this is harmless, it is best to remove old services that are no longer in use.

To permanently remove the old `mysql` service, execute the following command as a user with administrative privileges, on the command line:

```
C:\> sc delete mysql
[SC] DeleteService SUCCESS
```

If the `sc` utility is not available for your version of Windows, download the `delsrv` utility from [http://www.microsoft.com/windows2000/techinfo/reskit/tools/existing/delsrv-o.asp](http://www.microsoft.com/windows2000/techinfo/reskit/tools/existing/delsrv-o.asp) and use the `delsrv mysql` syntax.

### 2.3.8 Windows Postinstallation Procedures

GUI tools exist that perform most of the tasks described in this section, including:

- **MySQL Installer**: Used to install and upgrade MySQL products.
- **MySQL Workbench**: Manages the MySQL server and edits SQL queries.
- **MySQL Notifier**: Starts, stops, or restarts the MySQL server, and monitors its status.
- **MySQL for Excel**: Edits MySQL data with Microsoft Excel.

On Windows, you need not create the data directory and the grant tables. MySQL Windows distributions include the grant tables with a set of preinitialized accounts in the `mysql` database under the data directory.

Regarding passwords, if you installed MySQL using the Windows Installation Wizard, you may have already assigned passwords to the accounts. (See [Section 2.3.4.1, “Using the MySQL Installation Wizard for Microsoft Windows”](#).) Otherwise, use the password-assignment procedure given in [Section 2.12.4, “Securing the Initial MySQL Accounts”](#).

Before assigning passwords, you might want to try running some client programs to make sure that you can connect to the server and that it is operating properly. Make sure that the server is running (see [Section 2.3.6.4, “Starting MySQL Server on Microsoft Windows for the First Time”](#)). You can also set up a MySQL service that runs automatically when Windows starts (see [Section 2.3.6.7, “Starting MySQL Server as a Microsoft Windows Service”](#)).

These instructions assume that your current location is the MySQL installation directory and that it has a `bin` subdirectory containing the MySQL programs used here. If that is not true, adjust the command path names accordingly.

If you installed MySQL using the Windows installation Wizard (see [Section 2.3.4.1, “Using the MySQL Installation Wizard for Microsoft Windows”](#)), the default installation directory is `C:\Program Files\MySQL\MySQL Server 5.1`:

```
C:\> cd "C:\Program Files\MySQL\MySQL Server 5.1"
```

A common installation location for installation from a Zip package is `C:\mysql`:
Windows Postinstallation Procedures

C:\> cd C:\mysql

Alternatively, add the bin directory to your PATH environment variable setting. That enables your command interpreter to find MySQL programs properly, so that you can run a program by typing only its name, not its path name. See Section 2.3.6.6, “Customizing the PATH for MySQL Tools”.

With the server running, issue the following commands to verify that you can retrieve information from the server. The output should be similar to that shown here.

Use mysqlshow to see what databases exist:

C:\> bin\mysqlshow
+
+-------------------+
|     Databases     |
+-------------------+
| information_schema|
| mysql             |
| test              |
+-------------------+

The list of installed databases may vary, but will always include the minimum of mysql and information_schema.

The preceding command (and commands for other MySQL programs such as mysql) may not work if the correct MySQL account does not exist. For example, the program may fail with an error, or you may not be able to view all databases. If you installed using the MSI packages and used the MySQL Server Instance Config Wizard, then the root user will have been created automatically with the password you supplied. In this case, you should use the -u root and -p options. (You will also need to use the -u root and -p options if you have already secured the initial MySQL accounts.) With -p, you will be prompted for the root password. For example:

C:\> bin\mysqlshow -u root -p
Enter password: (enter root password here)
+
+-------------------+
|     Databases     |
+-------------------+
| information_schema|
| mysql             |
| test              |
+-------------------+

If you specify a database name, mysqlshow displays a list of the tables within the database:

C:\> bin\mysqlshow mysql
Database: mysql
+
+-------------------+
|     Tables        |
+-------------------+
| columns_priv      |
| db                |
| event             |
| func              |
| help_category     |
| help_keyword      |
| help_relation     |
| help_topic        |
| host              |
| ndb_binlog_index  |
| plugin            |
| proc              |
| procgs_priv       |
| servers           |
Use the `mysql` program to select information from a table in the `mysql` database:

```
C:\> bin\mysql -e "SELECT User, Host FROM mysql.user" mysql
```

<table>
<thead>
<tr>
<th>User</th>
<th>Host</th>
</tr>
</thead>
<tbody>
<tr>
<td>root</td>
<td>localhost</td>
</tr>
</tbody>
</table>

For more information about `mysql` and `mysqlshow`, see Section 4.5.1, “mysql — The MySQL Command-Line Tool”, and Section 4.5.6, “mysqlshow — Display Database, Table, and Column Information”.

If you are running a version of Windows that supports services, you can set up the MySQL server to run automatically when Windows starts. See Section 2.3.6.7, “Starting MySQL Server as a Microsoft Windows Service”.

### 2.3.9 Upgrading MySQL Server on Microsoft Windows

To upgrade MySQL on Windows, follow these steps:

1. Review Section 2.13.1, “Upgrading MySQL”, for additional information on upgrading MySQL that is not specific to Windows.

2. Always back up your current MySQL installation before performing an upgrade. See Section 7.2, “Database Backup Methods”.

4. Before upgrading MySQL, stop the server. If the server is installed as a service, stop the service with the following command from the command prompt:

   ```
   C:\> NET STOP MySQL
   ```

   If you are not running the MySQL server as a service, use `mysqladmin` to stop it. For example, before upgrading from MySQL 5.0 to 5.1, use `mysqladmin` from MySQL 5.0 as follows:

   ```
   C:\> "C:\Program Files\MySQL\MySQL Server 5.0\bin\mysqladmin" -u root shutdown
   ```

   **Note**

   If the MySQL root user account has a password, invoke `mysqladmin` with the `-p` option and enter the password when prompted.

5. Before upgrading to MySQL 5.1 from a version previous to 4.1.5, or from a version of MySQL installed from a Zip archive to a version of MySQL installed with the MySQL Installation Wizard, you must first manually remove the previous installation and MySQL service (if the server is installed as a service).

   To remove the MySQL service, use the following command:
6. When upgrading from MySQL 5.1.23 to MySQL 5.1.24, the change in the default location of the data directory from a directory within the MySQL installation to the AppData folder means that you must manually copy the data files from your old installation to the new location.

7. If you are using the MySQL Installation Wizard, start the wizard as described in Section 2.3.4.1, "Using the MySQL Installation Wizard for Microsoft Windows".

8. If you are upgrading MySQL from a Zip archive, extract the archive. You may either overwrite your existing MySQL installation (usually located at C:\mysql), or install it into a different directory, such as C:\mysql5. Overwriting the existing installation is recommended. However, for upgrades (as opposed to installing for the first time), you must remove the data directory from your existing MySQL installation to avoid replacing your current data files. To do so, follow these steps:
   a. Unzip the Zip archive in some location other than your current MySQL installation
   b. Remove the data directory
   c. Rezip the Zip archive
   d. Unzip the modified Zip archive on top of your existing installation

   Alternatively:
   a. Unzip the Zip archive in some location other than your current MySQL installation
   b. Remove the data directory
   c. Move the data directory from the current MySQL installation to the location of the just-removed data directory
   d. Remove the current MySQL installation
   e. Move the unzipped installation to the location of the just-removed installation

9. If you were running MySQL as a Windows service and you had to remove the service earlier in this procedure, reinstall the service. (See Section 2.3.6.7, “Starting MySQL Server as a Microsoft Windows Service”.)

10. Restart the server. For example, use NET START MySQL if you run MySQL as a service, or invoke mysqld directly otherwise.

11. As Administrator, run mysql_upgrade to check your tables, attempt to repair them if necessary, and update your grant tables if they have changed so that you can take advantage of any new capabilities. See Section 4.4.8, "mysql_upgrade — Check and Upgrade MySQL Tables".

12. If you encounter errors, see Section 2.3.7, “Troubleshooting a Microsoft Windows MySQL Server Installation”.

2.4 Installing MySQL on OS X

For a list of OS X versions that the MySQL server supports, see http://www.mysql.com/support/ supportedplatforms/database.html.

MySQL for OS X is available in a number of different forms:
• Native Package Installer format, which uses the native OS X installer (DMG) to walk you through the installation of MySQL. For more information, see Section 2.4.2, “Installing MySQL on OS X Using Native Packages”. You can use the package installer with OS X 10.6 and later, and the package is available for both 32-bit and 64-bit architectures. The user you use to perform the installation must have administrator privileges.

• Tar package format, which uses a file packaged using the Unix `tar` and `gzip` commands. To use this method, you will need to open a `Terminal` window. You do not need administrator privileges using this method, as you can install the MySQL server anywhere using this method. For more information on using this method, you can use the generic instructions for using a tarball, Section 2.2, “Installing MySQL on Unix/Linux Using Generic Binaries”. You can use the package installer with OS X 10.6 and later, and available for both 32-bit and 64-bit architectures.

In addition to the core installation, the Package Installer also includes Section 2.4.4, “Installing the MySQL Startup Item” and Section 2.4.5, “Installing and Using the MySQL Preference Pane”, both of which simplify the management of your installation.

• OS X server includes a version of MySQL as standard. If you want to use a more recent version than that supplied with the OS X server release, you can make use of the package or tar formats. For more information on using the MySQL bundled with OS X, see Section 2.4.6, “Using the Bundled MySQL on OS X Server”.

For additional information on using MySQL on OS X, see Section 2.4.1, “General Notes on Installing MySQL on OS X”.

2.4.1 General Notes on Installing MySQL on OS X

You should keep the following issues and notes in mind:

• OS X 10.4 deprecated startup items in favor of launchd daemons, and as of OS X 10.10 (Yosemite), startup items do not function. For these reasons, using launchd daemons is preferred over startup items.

• The default location for the MySQL Unix socket is different on OS X and OS X Server depending on the installation type you chose. The following table shows the default locations by installation type.

<table>
<thead>
<tr>
<th>Installation Type</th>
<th>Socket Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Package Installer from MySQL</td>
<td>/tmp/mysql.sock</td>
</tr>
<tr>
<td>Tarball from MySQL</td>
<td>/tmp/mysql.sock</td>
</tr>
<tr>
<td>MySQL Bundled with OS X Server</td>
<td>/var/mysql/mysql.sock</td>
</tr>
</tbody>
</table>

To prevent issues, you should either change the configuration of the socket used within your application (for example, changing `php.ini`), or you should configure the socket location using a MySQL configuration file and the `socket` option. For more information, see Section 5.1.3, “Server Command Options”.

• You may need (or want) to create a specific `mysql` user to own the MySQL directory and data. You can do this through the Directory Utility, and the `mysql` user should already exist. For use in single user mode, an entry for `_mysql` (note the underscore prefix) should already exist within the system `/etc/passwd` file.

• If you get an “insecure startup item disabled” error when MySQL launches, use the following procedure. Adjust the pathnames appropriately for your system.

1. Modify the `mysql.script` using this command (enter it on a single line):
2. Locate the option file that defines the `basedir` value and modify it to contain these lines:

```
basedir=/usr/local/mysql
datadir=/usr/local/mysql/data
```

In the `/Library/StartupItems/MySQLCOM/` directory, make the following group ID changes from `staff` to `wheel`:

```
shell> sudo chgrp wheel MySQLCOM StartupParameters.plist
```

3. Start the server from System Preferences or Terminal.app.

- Because the MySQL package installer installs the MySQL contents into a version and platform specific directory, you can use this to upgrade and migrate your database between versions. You will need to either copy the `data` directory from the old version to the new version, or alternatively specify an alternative `datadir` value to set location of the data directory.

- You might want to add aliases to your shell's resource file to make it easier to access commonly used programs such as `mysql` and `mysqladmin` from the command line. The syntax for `bash` is:

```
alias mysql=/usr/local/mysql/bin/mysql
alias mysqladmin=/usr/local/mysql/bin/mysqladmin
```

For `tcsh`, use:

```
alias mysql /usr/local/mysql/bin/mysql
alias mysqladmin /usr/local/mysql/bin/mysqladmin
```

Even better, add `/usr/local/mysql/bin` to your `PATH` environment variable. You can do this by modifying the appropriate startup file for your shell. For more information, see Section 4.2.1, “Invoking MySQL Programs”.

- After you have copied over the MySQL database files from the previous installation and have successfully started the new server, you should consider removing the old installation files to save disk space. Additionally, you should also remove older versions of the Package Receipt directories located in `/Library/Receipts/mysql-VERSION.pkg`.

### 2.4.2 Installing MySQL on OS X Using Native Packages

The package is located inside a disk image (`.dmg`) file that you first need to mount by double-clicking its icon in the Finder. It should then mount the image and display its contents.

**Note**

Before proceeding with the installation, be sure to stop all running MySQL server instances by using either the MySQL Manager Application (on OS X Server) or `mysqladmin shutdown` on the command line.

When installing from the package version, you should also install the MySQL Preference Pane, which will enable you to control the startup and execution of your MySQL server from System Preferences. For more information, see Section 2.4.5, “Installing and Using the MySQL Preference Pane”.

When installing using the package installer, the files are installed into a directory within `/usr/local` matching the name of the installation version and platform. For example, the installer file `mysql-5.1-osx10.6-x86_64.dmg` installs MySQL into `/usr/local/mysql-5.1-osx10.6-x86_64/`. The following table shows the layout of the installation directory.
Table 2.12 MySQL Installation Layout on OS X

<table>
<thead>
<tr>
<th>Directory</th>
<th>Contents of Directory</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin, scripts</td>
<td>mysql server, client and utility programs</td>
</tr>
<tr>
<td>data</td>
<td>Log files, databases</td>
</tr>
<tr>
<td>docs</td>
<td>Helper documents, like the Release Notes and build information</td>
</tr>
<tr>
<td>include</td>
<td>Include (header) files</td>
</tr>
<tr>
<td>lib</td>
<td>Libraries</td>
</tr>
<tr>
<td>man</td>
<td>Unix manual pages</td>
</tr>
<tr>
<td>mysql-test</td>
<td>MySQL test suite</td>
</tr>
<tr>
<td>share</td>
<td>Miscellaneous support files, including error messages, sample</td>
</tr>
<tr>
<td></td>
<td>configuration files, SQL for database installation</td>
</tr>
<tr>
<td>sql-bench</td>
<td>Benchmarks</td>
</tr>
<tr>
<td>support-files</td>
<td>Scripts and sample configuration files</td>
</tr>
<tr>
<td>/tmp/mysql.sock</td>
<td>Location of the MySQL Unix socket</td>
</tr>
</tbody>
</table>

During the package installer process, a symbolic link from /usr/local/mysql to the version/platform specific directory created during installation will be created automatically.

1. Download and open the MySQL package installer, which is provided on a disk image (.dmg) that includes the main MySQL installation package, the MySQLStartupItem.pkg installation package, and the MySQL.prefPane. Double-click the disk image to open it.

Figure 2.19 MySQL Package Installer: DMG Contents

2. Double-click the MySQL installer package. It will be named according to the version of MySQL you have downloaded. For example, if you have downloaded MySQL server 5.1.73, double-click mysql-5.1.73-osx-10.6-x86_64.pkg.

3. You will be presented with the opening installer dialog. Click Continue to begin installation.
4. A copy of the installation instructions and other important information relevant to this installation are displayed. Click **Continue**.

5. If you have downloaded the community version of MySQL, you will be shown a copy of the relevant GNU General Public License. Click **Continue**.

6. Select the drive you want to use to install the MySQL Startup Item. The drive must have a valid, bootable, OS X operating system installed. Click **Continue**.
7. You will be asked to confirm the details of the installation, including the space required for the installation. To change the drive on which the MySQL server is installed, click either Go Back or Change Install Location... To install the MySQL server, click Install.

8. Once the installation has been completed successfully, you will be shown an Install Succeeded message.

For convenience, you may also want to install the startup item and preference pane. See Section 2.4.4, “Installing the MySQL Startup Item”, and Section 2.4.5, “Installing and Using the MySQL Preference Pane”.

2.4.3 Installing a MySQL Launch Daemon

OS X uses launch daemons to automatically start, stop, and manage processes and applications such as MySQL. Using launch daemons is recommended over startup items on OS X.

Note

OS X 10.4 deprecated startup items in favor of launchd daemons, and as of OS X 10.10 (Yosemite), startup items do not function. For these reasons, using launchd daemons is preferred over startup items.

Here is an example launchd file that starts MySQL:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<plist version="1.0">
  <dict>
    <key>KeepAlive</key>
    <true/>
  </dict>
</plist>
```
Installing the MySQL Startup Item

Note
Some users report that adding a plist DOCTYPE declaration causes the launchd operation to fail, despite it passing the lint check. For this reason, we have removed it from the example above.

Adjust the ProgramArguments array according to your system, as for example your path to mysqld_safe might be different. After making the proper adjustments, do the following:

- Save the XML as a file named /Library/LaunchDaemons/com.mysql.mysql.plist
- Adjust the file permissions using the Apple recommended owner "root", owning group "wheel", and file permissions "644"

```
shell> sudo chown root:wheel /Library/LaunchDaemons/com.mysql.mysql.plist
shell> sudo chmod 644 /Library/LaunchDaemons/com.mysql.mysql.plist
```
- Enable this new MySQL service

```
shell> sudo launchctl load -w /Library/LaunchDaemons/com.mysql.mysql.plist
```

The MySQL daemon is now running, and automatically starts when your system is rebooted.

2.4.4 Installing the MySQL Startup Item

The MySQL Installation Package includes a startup item that can be used to automatically start and stop MySQL.

Important
Startup items are deprecated in favor of launchd daemons. For additional information, see Section 2.4.3, “Installing a MySQL Launch Daemon”.

To install the MySQL Startup Item:

1. Download and open the MySQL package installer, which is provided on a disk image (.dmg) that includes the main MySQL installation package, the MySQLStartupScriptItem.pkg installation package, and the MySQL.prefPane. Double-click the disk image to open it.
2. Double-click the *MySQLStartItem.pkg* file to start the installation process.

3. You will be presented with the **Install MySQL Startup Item** dialog.

   Click **Continue** to continue the installation process.
4. A copy of the installation instructions and other important information relevant to this installation are displayed. Click Continue.

5. Select the drive you want to use to install the MySQL Startup Item. The drive must have a valid, bootable, OS X operating system installed. Click Continue.

Figure 2.24 MySQL Startup Item Installer: Choose Your Hard drive

6. You will be asked to confirm the details of the installation. To change the drive on which the startup item is installed, click either Go Back or Change Install Location. To install the startup item, click Install.

7. Once the installation has been completed successfully, you will be shown an Install Succeeded message.
The Startup Item for MySQL is installed into /Library/StartupItems/MySQLCOM. The Startup Item installation adds a variable MYSQLCOM=-YES- to the system configuration file /etc/hostconfig. If you want to disable the automatic startup of MySQL, change this variable to MYSQLCOM=-NO-.

Note

Deselecting Automatically Start MySQL Server on Startup from the MySQL Preference Pane sets the MYSQLCOM variable to -NO-.

After the installation, you can start and stop the MySQL server from the MySQL Preference Pane (preferred), or by running the following commands in a terminal window. You must have administrator privileges to perform these tasks, and you may be prompted for your password.

If you have installed the Startup Item, use this command to start the server:

```
shell> sudo /Library/StartupItems/MySQLCOM/MySQLCOM start
```

If you have installed the Startup Item, use this command to stop the server:

```
shell> sudo /Library/StartupItems/MySQLCOM/MySQLCOM stop
```

### 2.4.5 Installing and Using the MySQL Preference Pane

The MySQL Package installer disk image also includes a custom MySQL Preference Pane that enables you to start, stop, and control automated startup during boot of your MySQL installation.

To install the MySQL Preference Pane:
1. Download and open the MySQL package installer package, which is provided on a disk image (.dmg) that includes the main MySQL installation package, the MySQLStartupItem.pkg installation package, and the MySQL.prefPane. Double-click the disk image to open it.

Figure 2.26 MySQL Package Installer: DMG Contents

2. Double-click the MySQL.prefPane. The MySQL System Preferences will open.

3. If this is the first time you have installed the preference pane, you will be asked to confirm installation and whether you want to install the preference pane for all users, or only the current user. To install the preference pane for all users you will need administrator privileges. If necessary, you will be prompted for the username and password for a user with administrator privileges.

4. If you already have the MySQL Preference Pane installed, you will be asked to confirm whether you want to overwrite the existing MySQL Preference Pane.

Note
The MySQL Preference Pane only starts and stops MySQL installation installed from the MySQL package installation that have been installed in the default location.

Once the MySQL Preference Pane has been installed, you can control your MySQL server instance using the preference pane. To use the preference pane, open the System Preferences... from the Apple menu. Select the MySQL preference pane by clicking the MySQL logo within the Other section of the preference panes list.
The MySQL Preference Pane shows the current status of the MySQL server, showing **stopped** (in red) if the server is not running and **running** (in green) if the server has already been started. The preference pane also shows the current setting for whether the MySQL server has been set to start automatically.

- **To start the MySQL server using the preference pane:**
  
  Click **Start MySQL Server**. You may be prompted for the username and password of a user with administrator privileges to start the MySQL server.

- **To stop the MySQL server using the preference pane:**
  
  Click **Stop MySQL Server**. You may be prompted for the username and password of a user with administrator privileges to stop the MySQL server.

- **To automatically start the MySQL server when the system boots:**
  
  Check the check box next to **Automatically Start MySQL Server on Startup**.

- **To disable automatic MySQL server startup when the system boots:**
  
  Uncheck the check box next to **Automatically Start MySQL Server on Startup**.
2.4.6 Using the Bundled MySQL on OS X Server

If you are running OS X Server, a version of MySQL should already be installed. The following table shows the versions of MySQL that ship with OS X Server versions.

Table 2.13 MySQL Versions Preinstalled with OS X Server

<table>
<thead>
<tr>
<th>OS X Server Version</th>
<th>MySQL Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.2-10.2.2</td>
<td>3.23.51</td>
</tr>
<tr>
<td>10.2.3-10.2.6</td>
<td>3.23.53</td>
</tr>
<tr>
<td>10.3</td>
<td>4.0.14</td>
</tr>
<tr>
<td>10.3.2</td>
<td>4.0.16</td>
</tr>
<tr>
<td>10.4.0</td>
<td>4.1.10a</td>
</tr>
<tr>
<td>10.5.0</td>
<td>5.0.45</td>
</tr>
<tr>
<td>10.6.0</td>
<td>5.0.82</td>
</tr>
</tbody>
</table>

The following table shows the installation layout of MySQL on OS X Server.

Table 2.14 MySQL Directory Layout for Preinstalled MySQL Installations on OS X Server

<table>
<thead>
<tr>
<th>Directory</th>
<th>Contents of Directory</th>
</tr>
</thead>
<tbody>
<tr>
<td>/usr/bin</td>
<td>Client programs</td>
</tr>
<tr>
<td>/var/mysql</td>
<td>Log files, databases</td>
</tr>
<tr>
<td>/usr/libexec</td>
<td>The <code>mysqld</code> server</td>
</tr>
<tr>
<td>/usr/share/man</td>
<td>Unix manual pages</td>
</tr>
<tr>
<td>/usr/share/mysql/mysql-test</td>
<td>MySQL test suite</td>
</tr>
<tr>
<td>/usr/share/mysql</td>
<td>Miscellaneous support files, including error messages, character set files, sample configuration files, SQL for database installation</td>
</tr>
<tr>
<td>/var/mysql/mysql.sock</td>
<td>Location of the MySQL Unix socket</td>
</tr>
</tbody>
</table>

Additional Resources

- For more information on managing the bundled MySQL instance in OS X Server 10.5, see Mac OS X Server: Web Technologies Administration For Version 10.5 Leopard.
- For more information on managing the bundled MySQL instance in OS X Server 10.6, see Mac OS X Server: Web Technologies Administration Version 10.6 Snow Leopard.
- The MySQL server bundled with OS X Server does not include the MySQL client libraries and header files required to access and use MySQL from a third-party driver, such as Perl DBI or PHP. For more information on obtaining and installing MySQL libraries, see OS X Server version 10.5: MySQL libraries available for download. Alternatively, you can ignore the bundled MySQL server and install MySQL from the package or tarball installation.

2.5 Installing MySQL on Linux

Linux supports a number of different solutions for installing MySQL. The recommended method is to use one of the distributions from Oracle. If you choose this method, there are several options available:

- Installing from a generic binary package in .tar.gz format. See Section 2.2, “Installing MySQL on Unix/Linux Using Generic Binaries” for more information.
- Extracting and compiling MySQL from a source distribution. For detailed instructions, see Section 2.11, “Installing MySQL from Source”.

You can close the System Preferences... window once you have completed your settings.
Installing MySQL on Linux Using RPM Packages

- Installing using a precompiled RPM package. For more information, see Section 2.5.1, “Installing MySQL on Linux Using RPM Packages”.

As an alternative, you can use the native package manager within your Linux distribution to automatically download and install MySQL for you. Native package installations can take care of the download and dependencies required to run MySQL, but the MySQL version will often be some versions behind the currently available release. You will also normally be unable to install development releases, as these are not usually made available in the native repository. For more information on using the native package installers, see Section 2.5.2, “Installing MySQL on Linux Using Native Package Managers”.

Note
For many Linux installations, you will want to set up MySQL to be started automatically when your machine starts. Many of the native package installations perform this operation for you, but for source, binary and RPM solutions you may need to set this up separately. The required script, `mysql.server`, can be found in the `support-files` directory under the MySQL installation directory or in a MySQL source tree. You can install it as `/etc/init.d/mysql` for automatic MySQL startup and shutdown. See Section 4.3.3, “mysql.server — MySQL Server Startup Script”.

2.5.1 Installing MySQL on Linux Using RPM Packages

The recommended way to install MySQL on RPM-based Linux distributions is by using the RPM packages. The RPMs that we provide to the community should work on all versions of Linux that support RPM packages and use glibc 2.3. To obtain RPM packages, see Section 2.1.2, “How to Get MySQL”.

For non-RPM Linux distributions, you can install MySQL using a `.tar.gz` package. See Section 2.2, “Installing MySQL on Unix/Linux Using Generic Binaries”.

Installations created from our Linux RPM distributions result in files under the system directories shown in the following table.

<table>
<thead>
<tr>
<th>Directory</th>
<th>Contents of Directory</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>/usr/bin</code></td>
<td>Client programs and scripts</td>
</tr>
<tr>
<td><code>/usr/sbin</code></td>
<td>The <code>mysqld</code> server</td>
</tr>
<tr>
<td><code>/var/lib/mysql</code></td>
<td>Log files, databases</td>
</tr>
<tr>
<td><code>/usr/share/info</code></td>
<td>MySQL manual in Info format</td>
</tr>
<tr>
<td><code>/usr/share/man</code></td>
<td>Unix manual pages</td>
</tr>
<tr>
<td><code>/usr/include/mysql</code></td>
<td>Include (header) files</td>

<tr>
<td><code>/usr/share/mysql</code></td>
<td>Miscellaneous support files, including error messages,</td>
</tr>
<tr>
<td></td>
<td>character set files, sample configuration files, SQL for</td>
</tr>
<tr>
<td></td>
<td>database installation</td>
</tr>
<tr>
<td><code>/usr/share/sql-bench</code></td>
<td>Benchmarks</td>
</tr>
</tbody>
</table>

Note
RPM distributions of MySQL are also provided by other vendors. Be aware that they may differ from those built by Oracle in features, capabilities, and conventions (including communication setup), and that the instructions in this manual do not necessarily apply to installing them. The vendor’s instructions
Installing MySQL on Linux Using RPM Packages

should be consulted instead. Because of these differences, RPM packages built by Oracle check whether such RPMs built by other vendors are installed. If so, the RPM does not install and produces a message explaining this.

Conflicts can arise when an RPM from another vendor is already installed, such as when a vendor's conventions about which files belong with the server and which belong with the client library differ from the breakdown used for Oracle packages. In such cases, attempts to install an Oracle RPM with `rpm -i` may result in messages that files in the RPM to be installed conflict with files from an installed package (denoted `mysql-libs` in the following paragraphs).

Each MySQL release provides a MySQL-shared-compat package that is meant to replace mysql-libs and provides a replacement-compatible client library for older MySQL series. MySQL-shared-compat is set up to make mysql-libs obsolete, but `rpm` explicitly refuses to replace obsoleted packages when invoked with `-i` (unlike `-U`), which is why installation with `rpm -i` produces a conflict.

MySQL-shared-compat can safely be installed alongside mysql-libs because libraries are installed to different locations. Therefore, it is possible to install MySQL-shared-compat first, then manually remove mysql-libs before continuing with the installation. After mysql-libs is removed, the dynamic linker stops looking for the client library in the location where mysql-libs puts it, and the library provided by the MySQL-shared-compat package takes over.

Another alternative is to install packages using `yum`. In a directory containing all RPM packages for a MySQL release, `yum install MySQL*rpm` installs them in the correct order and removes mysql-libs in one step without conflicts.

In most cases, you need install only the MySQL-server and MySQL-client packages to get a functional standard MySQL installation. The other packages are not required for a standard installation.

RPMs for MySQL Cluster. Beginning with MySQL 5.1.24, standard MySQL server RPMs built by MySQL no longer provide support for the NDBCLUSTER storage engine. MySQL Cluster users should check the MySQL Cluster Downloads page at [http://dev.mysql.com/downloads/cluster/](http://dev.mysql.com/downloads/cluster/) for RPMs that should work with most Linux distributions for both of these release series.

Important

When upgrading a MySQL Cluster RPM installation, you must upgrade all installed RPMs, including the Server and Client RPMs.

For more information about installing MySQL Cluster from RPMs, see Section 17.2.1.2, “Installing MySQL Cluster from RPM”.

For upgrades, if your installation was originally produced by installing multiple RPM packages, it is best to upgrade all the installed packages, not just some. For example, if you previously installed the server and client RPMs, do not upgrade just the server RPM.

The following list shows the available RPM packages. The names shown here use a suffix of `.glibc23.i386.rpm`, but particular packages can have different suffixes, described later.

- **MySQL-server-VERSION.glibc23.i386.rpm**
  The MySQL server. You need this unless you only want to connect to a MySQL server running on another machine.

- **MySQL-client-VERSION.glibc23.i386.rpm**
  The standard MySQL client programs. You probably always want to install this package.
Installing MySQL on Linux Using RPM Packages

- **MySQL-devel-VERSION.glibc23.i386.rpm**
  
  The libraries and include files needed to compile other MySQL clients, such as the Perl MySQL module. Install this RPM if you intend to compile C API applications.

- **MySQL-debuginfo-VERSION.glibc23.i386.rpm**
  
  Debugging information. It is specific to Red Hat Enterprise Linux. debuginfo RPMs are never needed to use MySQL software; this is true both for the server and for client programs. However, they contain additional information that might be needed by a debugger to analyze a crash.

- **MySQL-shared-VERSION.glibc23.i386.rpm**
  
  The shared libraries (libmysqlclient.so*) that certain languages and applications need to dynamically load and use MySQL. It contains single-threaded and thread-safe libraries. Install this RPM if you intend to compile or run C API applications that depend on the shared client library. If you install this package, do not install the MySQL-shared-compat package.

- **MySQL-shared-compat-VERSION.glibc23.i386.rpm**
  
  The shared libraries for older releases, up to the current release. It contains single-threaded and thread-safe libraries. Install this package instead of MySQL-shared if you have applications installed that are dynamically linked against older versions of MySQL but you want to upgrade to the current version without breaking the library dependencies.

- **MySQL-shared-compat-advanced-gpl-VERSION.glibc23.i386.rpm, MySQL-shared-compat-advanced-VERSION.glibc23.i386.rpm**
  
  These are like the MySQL-shared-compat package, but are for the “MySQL Enterprise Server – Advanced Edition” products. Install these packages rather than the normal MySQL-shared-compat package if you want to included shared client libraries for older MySQL versions.

- **MySQL-embedded-VERSION.glibc23.i386.rpm**
  
  The embedded MySQL server library.

- **MySQL-ndb-management-VERSION.glibc23.i386.rpm, MySQL-ndb-storage-VERSION.glibc23.i386.rpm, MySQL-ndb-tools-VERSION.glibc23.i386.rpm, MySQL-ndb-extra-VERSION.glibc23.i386.rpm**
  
  Packages that contain additional files for MySQL Cluster installations.

  **Note**
  
  The MySQL-ndb-tools RPM requires a working installation of perl. Prior to MySQL 5.1.18, the DBI and HTML::Template packages were also required. See Section 2.15, “Perl Installation Notes”, and Section 17.4.24, "ndb_size.pl — NDBCLUSTER Size Requirement Estimator", for more information.

- **MySQL-test-VERSION.glibc23.i386.rpm**
  
  The MySQL test suite.

- **MySQL-VERSION.src.rpm**
  
  The source code for all of the previous packages. It can also be used to rebuild the RPMs on other architectures (for example, SPARC).

In RPM package names, the suffix (following the VERSION value) has the following syntax:

```
.PLATFORM.CPU.rpm
```
The `PLATFORM` and `CPU` values indicate the type of system for which the package is built. `PLATFORM` indicates the platform and `CPU` indicates the processor type or family.

All packages are dynamically linked against `glibc` 2.3. The `PLATFORM` value indicates whether the package is platform independent or intended for a specific platform, as shown in the following table.

### Table 2.16 MySQL Linux RPM Package Platforms

<table>
<thead>
<tr>
<th>PLATFORM Value</th>
<th>Intended Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>glibc23</td>
<td>Platform independent, should run on any Linux distribution that supports glibc 2.3</td>
</tr>
<tr>
<td>rhel4, rhel5</td>
<td>Red Hat Enterprise Linux 4 or 5</td>
</tr>
<tr>
<td>sles10, sles11</td>
<td>SuSE Linux Enterprise Server 10 or 11</td>
</tr>
</tbody>
</table>

In MySQL 5.1, only `glibc23` packages are available currently.

The `CPU` value indicates the processor type or family for which the package is built, as shown in the following table.

### Table 2.17 MySQL Linux RPM Package CPU Identifiers

<table>
<thead>
<tr>
<th>CPU Value</th>
<th>Intended Processor Type or Family</th>
</tr>
</thead>
<tbody>
<tr>
<td>i386, i586, i686</td>
<td>Pentium processor or better, 32 bit</td>
</tr>
<tr>
<td>x86_64</td>
<td>64-bit x86 processor</td>
</tr>
<tr>
<td>ia64</td>
<td>Itanium (IA-64) processor</td>
</tr>
</tbody>
</table>

To see all files in an RPM package (for example, a `MySQL-server` RPM), run a command like this (modify the platform and CPU identifiers appropriately for your system):

```
shell> rpm -qpl MySQL-server-VERSION.glibc23.i386.rpm
```

To perform a standard minimal installation, install the server and client RPMs:

```
shell> rpm -i MySQL-server-VERSION.glibc23.i386.rpm
shell> rpm -i MySQL-client-VERSION.glibc23.i386.rpm
```

To install only the client programs, install just the client RPM:

```
shell> rpm -i MySQL-client-VERSION.glibc23.i386.rpm
```

RPM provides a feature to verify the integrity and authenticity of packages before installing them. To learn more about this feature, see Section 2.1.3, “Verifying Package Integrity Using MD5 Checksums or GnuPG”.

The server RPM places data under the `/var/lib/mysql` directory. The RPM also creates a login account for a user named `mysql` (if one does not exist) to use for running the MySQL server, and creates the appropriate entries in `/etc/init.d/` to start the server automatically at boot time. (This means that if you have performed a previous installation and have made changes to its startup script, you may want to make a copy of the script so that you can reinstall it after you install a newer RPM.) See Section 2.12.5, “Starting and Stopping MySQL Automatically”, for more information on how MySQL can be started automatically at system startup.

In MySQL 5.1.49 and later, during an upgrade installation using RPM packages, if the MySQL server is running when the upgrade occurs, the MySQL server is stopped, the upgrade occurs, and the MySQL server is restarted. If the MySQL server is not already running when the RPM upgrade occurs, the MySQL server is not started at the end of the installation.

If something goes wrong, you can find more information in the binary installation section. See Section 2.2, “Installing MySQL on Unix/Linux Using Generic Binaries”. 

---

124
Note

The accounts created in the MySQL grant tables for an RPM installation initially have no passwords. After starting the server, you should assign passwords to them using the instructions in Section 2.12, “Postinstallation Setup and Testing”.

An RPM installation creates a user named `mysql` and a group named `mysql` on the system using the `useradd`, `groupadd`, and `usermod` commands. Those commands require appropriate administrative privileges, which is required for locally managed users and groups (as listed in the `/etc/passwd` and `/etc/group` files) by the RPM installation process being run by `root`.

If you log in as the `mysql` user, you may find that MySQL displays “Invalid (old?) table or database name” errors that mention `.mysqlgui`, `.lost+found`, `.mysqlgui`, `.bash_history`, `.fonts.cache-1`, `.lesshst`, `.mysql_history`, `.profile`, `.viminfo`, and similar files created by MySQL or operating system utilities. You can safely ignore these error messages or remove the files or directories that cause them if you do not need them.

For nonlocal user management (LDAP, NIS, and so forth), the administrative tools may require additional authentication (such as a password), and will fail if the installing user does not provide this authentication. Even if they fail, the RPM installation will not abort but succeed, and this is intentional. If they failed, some of the intended transfer of ownership may be missing, and it is recommended that the system administrator then manually ensures some appropriate user and group exists and manually transfers ownership following the actions in the RPM spec file.

2.5.2 Installing MySQL on Linux Using Native Package Managers

Many Linux distributions include a version of the MySQL server, client tools, and development components into the standard package management system built into distributions such as Fedora, Debian, and Ubuntu. This section provides basic instructions for installing MySQL using these systems.

Important

Native package installations can take care of the download and dependencies required to run MySQL, but the MySQL version will often be some way behind the currently available release. You will also normally be unable to install development releases, as these are not usually made available in the native repository.

Distribution specific instructions are shown below:

• Red Hat Linux, Fedora, CentOS

For Red Hat and similar distributions, the MySQL distribution is divided into a number of separate packages, `mysql` for the client tools, `mysql-server` for the server and associated tools, and `mysql-libs` for the libraries. The libraries are required if you want to provide connectivity from different languages and environments such as Perl, Python and others.

To install, use the `yum` command to specify the packages that you want to install. For example:

```
root-shell> yum install mysql mysql-server mysql-libs
Loading plugins: presto, refresh-packagekit
Setting up Install Process
Resolving Dependencies
---> Running transaction check
---► Package mysql.x86_64 0:5.1.48-2.fc13 set to be updated

Transaction Summary

- **Total download size:** 10 M
- **Installed size:** 30 M
- **Is this ok [y/N]:** y

MySQL and the MySQL server should now be installed. A sample configuration file is installed into `/etc/my.cnf`. An init script, to start and stop the server, will have been installed into `/etc/init.d/mysqld`. To start the MySQL server use `service`:

```
root-shell> service mysqld start
```

To enable the server to be started and stopped automatically during boot, use `chkconfig`:

```
root-shell> chkconfig --levels 235 mysqld on
```

Which enables the MySQL server to be started (and stopped) automatically at the specified the run levels.

The database tables will have been automatically created for you, if they do not already exist. You should, however, run `mysql_secure_installation` to set the root passwords on your server.

- **Debian, Ubuntu, Kubuntu**
On Debian and related distributions, there are two packages, `mysql-client` and `mysql-server`, for the client and server components respectively. You should specify an explicit version, for example `mysql-client-5.1`, to ensure that you install the version of MySQL that you want.

To download and install, including any dependencies, use the `apt-get` command, specifying the packages that you want to install.

```
Note
Before installing, make sure that you update your `apt-get` index files to ensure you are downloading the latest available version.
```

A sample installation of the MySQL packages might look like this (some sections trimmed for clarity):

```
root-shell> apt-get install mysql-client-5.1 mysql-server-5.1
Reading package lists... Done
Building dependency tree
Reading state information... Done
The following packages were automatically installed and are no longer required:
  linux-headers-2.6.28-11 linux-headers-2.6.28-11-generic
Use 'apt-get autoremove' to remove them.
The following extra packages will be installed:
  bsd-mailx libdbd-mysql-perl libdbi-perl libhtml-template-perl
  libmysqlclient15off libmysqlclient16 libnet-daemon-perl libplrpc-perl mailx
  mysql-common postfix
Suggested packages:
  dbishell libipc-sharedcache-perl tinyca procmail postfix-mysql postfix-pgsql
  postfix-ldap postfix-pcre sasl2-bin resolvconf postfix-odbc
The following NEW packages will be installed
  bsd-mailx libdbd-mysql-perl libdbi-perl libhtml-template-perl
  libmysqlclient15off libmysqlclient16 libnet-daemon-perl libplrpc-perl mailx
  mysql-client-5.1 mysql-common mysql-server-5.1 postfix

Installing MySQL on Solaris and OpenSolaris

Note

The `apt-get` command will install a number of packages, including the MySQL server, in order to provide the typical tools and application environment. This can mean that you install a large number of packages in addition to the main MySQL package.

During installation, the initial database will be created, and you will be prompted for the MySQL root password (and confirmation). A configuration file will have been created in `/etc/mysql/my.cnf`. An init script will have been created in `/etc/init.d/mysql`.

The server will already be started. You can manually start and stop the server using:

```
root-shell> service mysql [start|stop]
```

The service will automatically be added to the 2, 3 and 4 run levels, with stop scripts in the single, shutdown and restart levels.

2.6 Installing MySQL on Solaris and OpenSolaris

MySQL on Solaris and OpenSolaris is available in a number of different formats.

- For information on installing using the native Solaris PKG format, see Section 2.6.1, “Installing MySQL on Solaris Using a Solaris PKG”.

- On OpenSolaris, the standard package repositories include MySQL packages specially built for OpenSolaris that include entries for the Service Management Framework (SMF) to enable control of the installation using the SMF administration commands. For more information, see Section 2.6.2, “Installing MySQL on OpenSolaris Using IPS”.

- To use a standard `tar` binary installation, use the notes provided in Section 2.2, “Installing MySQL on Unix/Linux Using Generic Binaries”. Check the notes and hints at the end of this section for Solaris specific notes that you may need before or after installation.

- For information on installing MySQL on Solaris or OpenSolaris using a source distribution, first check the Solaris advice, Section 2.11.8, “Notes on Installing MySQL on Solaris from Source”. For detailed instructions on installing from source, see Section 2.11, “Installing MySQL from Source”.

To obtain a binary MySQL distribution for Solaris in tarball or PKG format, [http://dev.mysql.com/downloads/mysql/5.1.html](http://dev.mysql.com/downloads/mysql/5.1.html).

Additional notes to be aware of when installing and using MySQL on Solaris:

- If you want to use MySQL with the `mysql` user and group, use the `groupadd` and `useradd` commands:

  ```
groupadd mysql
useradd -g mysql -s /bin/false mysql
```

- If you install MySQL using a binary tarball distribution on Solaris, you may run into trouble even before you get the MySQL distribution unpacked, as the Solaris `tar` cannot handle long file names. This means that you may see errors when you try to unpack MySQL.

  If this occurs, you must use GNU `tar (gtar)` to unpack the distribution. In Solaris 10 and OpenSolaris `gtar` is normally located in `/usr/sfw/bin/gtar`, but may not be included in the default path definition.

- When using Solaris 10 for x86_64, you should mount any file systems on which you intend to store InnoDB files with the `forcedirectio` option. (By default mounting is done without this option.)
Failing to do so will cause a significant drop in performance when using the InnoDB storage engine on this platform.

- If you would like MySQL to start automatically, you can copy `support-files/mysql.server` to `/etc/init.d` and create a symbolic link to it named `/etc/rc3.d/S99mysql.server`.

- If too many processes try to connect very rapidly to `mysqld`, you should see this error in the MySQL log:

```
Error in accept: Protocol error
```

You might try starting the server with the `--back_log=50` option as a workaround for this.

- To configure the generation of core files on Solaris you should use the `coreadm` command. Because of the security implications of generating a core on a `setuid()` application, by default, Solaris does not support core files on `setuid()` programs. However, you can modify this behavior using `coreadm`. If you enable `setuid()` core files for the current user, they will be generated using the mode 600 and owned by the superuser.

### 2.6.1 Installing MySQL on Solaris Using a Solaris PKG

You can install MySQL on Solaris and OpenSolaris using a binary package using the native Solaris PKG format instead of the binary tarball distribution.

To use this package, download the corresponding `mysql-VERSION-solaris10-PLATFORM.pkg.gz` file, then uncompress it. For example:

```
shell> gunzip mysql-5.1.73-solaris10-x86_64.pkg.gz
```

To install a new package, use `pkgadd` and follow the onscreen prompts. You must have root privileges to perform this operation:

```
shell> pkgadd -d mysql-5.1.73-solaris10-x86_64.pkg
```

The following packages are available:

| 1 | mysql | MySQL Community Server (GPL) (i86pc) 5.1.73 |

Select package(s) you wish to process (or 'all' to process all packages). (default: all) `[?,??,q]`

The PKG installer installs all of the files and tools needed, and then initializes your database if one does not exist. To complete the installation, you should set the root password for MySQL as provided in the instructions at the end of the installation. Alternatively, you can run the `mysql_secure_installation` script that comes with the installation.

By default, the PKG package installs MySQL under the root path `/opt/mysql`. You can change only the installation root path when using `pkgadd`, which can be used to install MySQL in a different Solaris zone. If you need to install in a specific directory, use a binary `tar` file distribution.

The `pkg` installer copies a suitable startup script for MySQL into `/etc/init.d/mysql`. To enable MySQL to start up and shut down automatically, you should create a link between this file and the init script directories. For example, to ensure safe startup and shutdown of MySQL you could use the following commands to add the right links:

```
shell> ln /etc/init.d/mysql /etc/rc3.d/S91mysql
shell> ln /etc/init.d/mysql /etc/rc0.d/K02mysql
```

To remove MySQL, the installed package name is `mysql`. You can use this in combination with the `pkgrm` command to remove the installation.
To upgrade when using the Solaris package file format, you must remove the existing installation before installing the updated package. Removal of the package does not delete the existing database information, only the server, binaries and support files. The typical upgrade sequence is therefore:

```shell
mysqladmin shutdown
pkgrm mysql
pkgadd -d mysql-5.1.73-solaris10-x86_64.pkg
mysqld_safe 
mysql_upgrade
```

You should check the notes in Section 2.13, “Upgrading or Downgrading MySQL” before performing any upgrade.

### 2.6.2 Installing MySQL on OpenSolaris Using IPS

OpenSolaris includes standard packages for MySQL in the core repository. The MySQL packages are based on a specific release of MySQL and updated periodically. For the latest release you must use either the native Solaris PKG, tar, or source installations. The native OpenSolaris packages include SMF files so that you can easily control your MySQL installation, including automatic startup and recovery, using the native service management tools.

To install MySQL on OpenSolaris, use the `pkg` command. You will need to be logged in as root, or use the `pfexec` tool, as shown in the example below:

```shell
pfexec pkg install SUNWmysql51
```

The package set installs three individual packages, `SUNWmysql51lib`, which contains the MySQL client libraries; `SUNWmysql51r` which contains the root components, including SMF and configuration files; and `SUNWmysql51u` which contains the scripts, binary tools and other files. You can install these packages individually if you only need the corresponding components.

The MySQL files are installed into `/usr/mysql` which symbolic links for the sub directories (`bin`, `lib`, etc.) to a version specific directory. For MySQL 5.1, the full installation is located in `/usr/mysql/5.1`. The default data directory is `/var/mysql/5.1/data`. The configuration file is installed in `/etc/mysql/5.1/my.cnf`. This layout permits multiple versions of MySQL to be installed, without overwriting the data and binaries from other versions.

Once installed, you must initialize the data directory (see Section 2.12.1, “Initializing the Data Directory”), and use the `mysql_secure_installation` to secure your installation.

### Using SMF to manage your MySQL installation

Once installed, you can start and stop your MySQL server using the installed SMF configuration. The service name is `mysql`, or if you have multiple versions installed, you should use the full version name, for example `mysql:version_51`. To start and enable MySQL to be started at boot time:

```shell
svcadm enable mysql
```

To disable MySQL from starting during boot time, and shut the MySQL server down if it is running, use:

```shell
svcadm disable mysql
```

To restart MySQL, for example after a configuration file changes, use the `restart` option:

```shell
svcadm restart mysql
```

You can also use SMF to configure the data directory and enable full 64-bit mode. For example, to set the data directory used by MySQL:

```shell
svccfg
svc: select mysql:version_51
svc:/application/database/mysql:version_51> setprop mysql/data=/data0/mysql
```
Installing MySQL on IBM AIX

By default, the 32-bit binaries are used. To enable the 64-bit server on 64-bit platforms, set the `enable_64bit` parameter. For example:

```
svc:/application/database/mysql:version_51> setprop mysql/enable_64bit=1
```

You need to refresh the SMF after settings these options:

```
shell> svcadm refresh mysql
```

### 2.7 Installing MySQL on IBM AIX

MySQL for IBM AIX is available in a number of different forms:

- Using a binary tarball distribution provided at http://dev.mysql.com/downloads/. Please read the general notes on AIX installation before continuing. For more information on binary installations, see Section 2.2, “Installing MySQL on Unix/Linux Using Generic Binaries”.
- Using a source tarball and compiling MySQL. Please read the general notes on AIX installation before continuing. You should also check the instructions on building on AIX from source. For general information on building from source, see Section 2.11, “Installing MySQL from Source”.

#### 2.7.1 General Notes on Installing MySQL on AIX

General notes on using MySQL on IBM AIX:

- If you have problems with threads on AIX 5.3, you should upgrade AIX 5.3 to technology level 7 (5300-07).

### 2.8 Installing MySQL on HP-UX

MySQL for HP-UX is available in a number of different forms:

- Using a DEPOT distribution provided at http://dev.mysql.com/downloads/. Please read the general notes on HP-UX installation before continuing. For more information on DEPOT installations, see Section 2.8.2, “Installing MySQL on HP-UX Using DEPOT Packages”.
- Using a binary tarball distribution provided at http://dev.mysql.com/downloads/. Please read the general notes on HP-UX installation before continuing. For more information on binary installations, see Section 2.2, “Installing MySQL on Unix/Linux Using Generic Binaries”.
- Using a source tarball and compiling MySQL. Please read the general notes on HP-UX installation before continuing. You should also check the instructions on building on HP-UX from source. For general information on building from source, see Section 2.11, “Installing MySQL from Source”.

#### 2.8.1 General Notes on Installing MySQL on HP-UX

Some additional notes on installing and using MySQL on HP-UX:

- If you install MySQL using a binary tarball distribution on HP-UX, you may run into trouble even before you get the MySQL distribution unpacked, as the HP-UX `tar` cannot handle long file names. This means that you may see errors when you try to unpack MySQL.
  
  If this occurs, you must use GNU `tar` (`gtar`) to unpack the distribution.

- Because of some critical bugs in the standard HP-UX libraries, you should install the following patches before trying to run MySQL on HP-UX 11.0:

  ```
  PHKL_22840 Streams cumulative
  PHNE_22397 ARPA cumulative
  ```

  This solves the problem of getting `EWOULDBLOCK` from `recv()` and `EBADF` from `accept()` in threaded applications.
2.8.2 Installing MySQL on HP-UX Using DEPOT Packages

The HP-UX DEPOT format packages can be installed using the `swinstall` command. You should install the `ncurses` and `zlib` libraries before installing the MySQL DEPOT package. You can use the free software `depothelper` tool to install these packages and any dependencies for you automatically.

To install using the MySQL DEPOT packages, follow this guide:

1. Download the MySQL DEPOT package from http://dev.mysql.com/downloads/. You must uncompress the package before installation:
   ```bash
   root-shell> gunzip mysql-5.1.48-hpux11.31-ia64-64bit.depot.gz
   ```

2. Install the DEPOT package using `swinstall`:
   ```bash
   root-shell> swinstall -s mysql-5.1.49-hpux11.31-ia64-64bit.depot
   ```
   MySQL will be installed into a directory matching the depot package name, within `/usr/local`. For convenience, you may want to create a symbolic link to the installed directory, for example:
   ```bash
   root-shell> ln -s mysql-5.1.49-hpux11.31-ia64-64bit mysql
   ```

3. Your package is now installed. You should complete the configuration of MySQL by creating a user and group:
   ```bash
   root-shell> /usr/sbin/groupadd mysql
   root-shell> /usr/sbin/useradd -g mysql -d /var/lib/mysql/ -s /bin/false mysql
   ```

4. Create the standard database using the new user/group you have created, and set the permissions:
   ```bash
   root-shell> cd /usr/local/
   root-shell> scripts/mysql_install_db --user=mysql
   root-shell> chown -R root .
   root-shell> chown -R mysql data
   ```

5. Finally, secure your new installation by setting the root passwords, and then start your MySQL server using the `mysql` user:
   ```bash
   root-shell> mysql_secure_installation
   root-shell> mysqld_safe --user=mysql &
   ```

2.9 Installing MySQL on FreeBSD

This section provides information about installing MySQL on variants of FreeBSD Unix.

You can install MySQL on FreeBSD by using the binary distribution provided by Oracle. For more information, see Section 2.2, “Installing MySQL on Unix/Linux Using Generic Binaries”.

The easiest (and preferred) way to install MySQL is to use the `mysql-server` and `mysql-client` ports available at http://www.freebsd.org/. Using these ports gives you the following benefits:

- A working MySQL with all optimizations enabled that are known to work on your version of FreeBSD.
- Automatic configuration and build.
- Startup scripts installed in `/usr/local/etc/rc.d`.
- The ability to use `pkg_info -L` to see which files are installed.
- The ability to use `pkg_delete` to remove MySQL if you no longer want it on your machine.
The MySQL build process requires GNU make (gmake) to work. If GNU make is not available, you must install it first before compiling MySQL.

To install using the ports system:

```
# cd /usr/ports/databases/mysql51-server
# make
... 
# cd /usr/ports/databases/mysql51-client
# make
...
```

The standard port installation places the server into /usr/local/libexec/mysqld, with the startup script for the MySQL server placed in /usr/local/etc/rc.d/mysql-server.

Some additional notes on the BSD implementation:

- To remove MySQL after installation using the ports system:

```
# cd /usr/ports/databases/mysql51-server
# make deinstall
...
# cd /usr/ports/databases/mysql51-client
# make deinstall
...
```

- If you get problems with the current date in MySQL, setting the TZ variable should help. See Section 2.14, “Environment Variables”.

## 2.10 Installing MySQL on i5/OS

The i5/OS POWER MySQL package was created in cooperation with IBM. MySQL works within the Portable Application Solution Environment (PASE) on the System i series of hardware and will also provide database services for the Zend Core for i5/OS.

MySQL for i5/OS is provided both as a tar file and as a save file (.savf) package that can be downloaded and installed directly without any additional installation steps required. To install MySQL using the tar file, see Section 2.2, “Installing MySQL on Unix/Linux Using Generic Binaries”.

MySQL is only supported on i5/OS V5R4 or later releases. The i5/OS PASE must be installed for MySQL to operate. You must be able to login as a user in *SECOFR class.

You should the installation notes and tips for i5/OS before starting installation. See i5/OS Installation Notes.

### Before Installation:

**Note**

The installation package will use an existing configuration if you have previously installed MySQL (which is identified by looking for the file /etc/my.cnf). The values for the data directory (DATADIR) and owner of the MySQL files (USRPRF) specified during the installation will be ignored, and the values determined from the /etc/my.cnf will be used instead.

If you want to change these parameters during a new install, you should temporarily rename /etc/my.cnf, install MySQL using the new parameters you want to use, and then merge your previous /etc/my.cnf configuration settings with the new /etc/my.cnf file that is created during installation.

- You must have a user profile with PASE with suitable privileges. The user should be within the *SECOFR class, such as the QSECOFR user ID. You can use the WRKUSRPRF command to check your user profile.
For network connections to MySQL, you must have TCP/IP enabled. You should also check the following:

- Ensure that a name has defined for the system. Run the Configure TCP/IP (CFGTCP) command and select option 12 (Change TCP/IP domain information) to display this setting. Make sure that a value is listed in the Host name field.
- Make sure that the system has a loopback entry which represents the localhost or 127.0.0.1.
- Ensure that the IP address of the IBM i machine is mapped correctly to the host name.

To install MySQL on i5/OS, follow these steps:

1. On the System i machine, create a save file that will be used to receive the downloaded installation save file. The file should be located within the General Purpose Library (QGPL):
   ```
   CRTSAVF FILE(QGPL/MYSQLINST) TESXT('MySQL Save file')
   ```

2. Download the MySQL installation save file in 32-bit (mysql-5.1.73-i5os-power-32bit.savf) or 64-bit (mysql-5.1.73-i5os-power-64bit.savf) from MySQL Downloads.

3. You need to FTP the downloaded .savf file directly into the QGPL/MYSQLINST file on the System i server. You can do this through FTP using the following steps after logging in to the System i machine:
   ```
   ftp> bin
   ftp> cd qgpl
   ftp> put mysql-5.1.73-i5os-power.savf mysqlinst
   ```

4. Log into the System i server using a user in the *SECOFR class, such as the QSECOFR user ID.

5. You need to restore the installation library stored in the .savf save file:
   ```
   RSTLIB MYSQLINST DEV(*SAVF) SAVF(QGPL/MYSQLINST) MBROPT(*ALL) ALWOBJDIF(*ALL)
   ```

   **Note**
   You can ignore the security changes-type message at the bottom of the installation panel.

6. Once you have finished restoring the MYSQLINST library, check that all the necessary objects for installation are on the system by using the Display Library (DSPLIB) command:
   ```
   DSPLIB LIB(MYSQLINST)
   ```

7. You need to execute the installation command, MYSQLINST/INSMYSQL. You can specify three parameter settings during installation:
   - `DIR('/QOpenSys/usr/local/mysql')` sets the installation location for the MySQL files. The directory will be created if it does not already exist.
   - `DATADIR('/QOpenSys/usr/local/mysql/data')` sets the location of the directory that will be used to store the database files and binary logs. The default setting is `/QOpenSys/usr/local/mysql/data`. Note that if the installer detects an existing installation (due to the existence of `/etc/my.cnf`), then the existing setting will be used instead of the default.
   - `USRPRF(MYSQL)` sets the user profile that will own the files that are installed. The profile will be created if it does not already exist.

   **Note**
   You should choose an appropriate user for using the MySQL server installation. The user will be used whenever you need to do any administration on the MySQL server.
Installing MySQL on i5/OS

Once you have set the appropriate parameters, you can begin the installation.

The installation copies all the necessary files into a directory matching the `DIR` configuration value; sets the ownership on those files, sets up the MySQL environment and creates the MySQL configuration file (in `/etc/my.cnf`) completing all the steps in a typical binary installation process automatically. If this is a new installation of MySQL, or if the installer detects that this is a new version (because the `/etc/my.cnf` file does not exist), then the initial core MySQL databases will also be created during installation.

Once the installation has been completed, you will get a notice advising you to set the password for the root user. For more information, Section 2.12, “Postinstallation Setup and Testing”.

8. Once the installation has completed, you can delete the installation file:

   `DLTLIB LIB(MYSQLINST)`

Upgrading an existing MySQL instance

You need to execute the upgrade command, `MYSQLINST/UPGMYSQL`.

**Note**

You cannot use `MYSQLINST/UPGMYSQL` to upgrade between release series of MySQL (for example from 5.0 to 5.1). For information and advice on migrating between release series you can use the advice provided in Section 2.13.1.1, “Changes Affecting Upgrades to 5.1”.

You must specify 6 parameters to perform an upgrade:

- `DIR('/QOpenSys/usr/local/')`: Sets the installation location for the MySQL files. The directory will be created if it does not already exist. This is the directory that the MySQL server will be installed into, inside a directory with a name matching the version and release. For example, if installing MySQL 5.1.73 with the `DIR` set to `/QOpenSys/usr/local/` would result in `/QOpenSys/usr/local/mysql-5.1.73-i5os-power64` and a symbolic link to this directory will be created in `/QOpenSys/usr/local/mysql`.

- `DATADIR('/QOpenSys/mysql/data')`: Sets the location of the directory that will be upgraded.

- `USRPRF('MYSQL')`: Sets the user profile that will own the files that are installed. The profile will be created if it does not already exist; if it is created as part of the upgrade process, it will be disabled initially. You may wish to enable this user profile so that it can be used to start the MySQL server later. It is best practice to use the one previously created during the first installation.

- `MYSQLUSR('root user')`: Any user account in the current MySQL server with `SUPER` privileges.

- `PASSWORD('root user password')`: The password for the above account. This is necessary as the upgrade starts the MySQL server to upgrade the tables and the password is need to be able to shutdown the MySQL server.

- `CURINST('path to previous install')`: The full path to the installation that is being upgraded. For example an installation in `/QOpenSys/usr/local/` will be `/QOpenSys/usr/local/mysql-5.1.73-i5os-power64`. Failure to specify this option may result in corruption of your existing data files.

For example:

```
MYSQLINST/UPGMYSQL DIR('/QOpenSys/usr/local/') DATADIR('/QOpenSys/mysql/data') USRPRF('MYSQL') MYSQLUSR('root') PASSWORD('root') CURINST('/QOpenSys/usr/local/mysql-5.1.73-i5os-power64')
```

You should receive a Program Message indicating `UPGRADE SUCCESSFUL!` upon completion or an error message if there is a problem. You can view the upgrade programs progression and the error in the text file `upgrade.log` in the installation directory.
To start MySQL:

1. Log into the System i server using the user profile create or specified during installation. By default, this is **MYSQL**.

   **Note**
   
   You should start `mysqld_safe` using a user that in the PASE environment has the id=0 (the equivalent of the standard Unix `root` user). If you do not use a user with this ID then the system will be unable to change the user when executing `mysqld` as set using the `--user` option. If this happens, `mysqld` may be unable to read the files located within the MySQL data directory and the execution will fail.

2. Enter the PASE environment using `call qp2term`.

3. Start the MySQL server by changing to the installation directory and running `mysqld_safe`, specifying the user name used to install the server. The installer conveniently installs a symbolic link to the installation directory (`mysql-5.0.42-i5os-power-32bit`) as `/opt/mysql/mysql`:

   ```
   > cd /opt/mysql/mysql
   > bin/mysqld_safe --user=mysql &
   ```

   You should see a message similar to the following:

   ```
   Starting mysqld daemon with databases »
   from /opt/mysql/mysql-enterprise-5.0.42-i5os-power-32bit/data
   ```

   If you are having problems starting MySQL server, see Section 2.12.2.1, "Troubleshooting Problems Starting the MySQL Server".

To stop MySQL:

1. Log into the System i server using the user profile create or specified during installation. By default, this is **MYSQL**.

2. Enter the PASE environment using `call qp2term`.

3. Stop the MySQL server by changing into the installation directory and running `mysqladmin`, specifying the user name used to install the server:

   ```
   > cd /opt/mysql/mysql
   > bin/mysqladmin -u root shutdown
   ```

   If the session that you started and stopped MySQL are the same, you may get the log output from `mysqld`:

   ```
   STOPPING server from pid file »
   /opt/mysql/mysql-enterprise-5.0.42-i5os-power-32bit/data/I5DBX.RCHLAND.IBM.COM.pid
   070718 10:34:20  mysqld ended
   ```

   If the sessions used to start and stop MySQL are different, you will not receive any confirmation of the shutdown.

**Notes and tips**

- A problem has been identified with the installation process on DBCS systems. If you are having problems installing MySQL on a DBCS system, you need to change your job's coded character set identifier (**CSSID**) to 37 (**EBCDIC**) before executing the install command, **INSMYSQL**. To do this, determine your existing **CSSID** (using **DSPJOB** and selecting option 2), execute **CHGJOB CSSID(37)**, run **INSMYSQL** to install MySQL and then execute **CHGJOB** again with your original **CSSID**.

- If you want to use the Perl scripts that are included with MySQL, you need to download the iSeries Tools for Developers (5799-PTL). See [http://www-03.ibm.com/servers/enable/site/porting/tools/](http://www-03.ibm.com/servers/enable/site/porting/tools/).
2.11 Installing MySQL from Source

Building MySQL from the source code enables you to customize build parameters, compiler optimizations, and installation location. For a list of systems on which MySQL is known to run, see http://www.mysql.com/support/supportedplatforms/database.html.

Before you proceed with an installation from source, check whether we produce a precompiled binary distribution for your platform and whether it works for you. We put a great deal of effort into ensuring that our binaries are built with the best possible options for optimal performance. Instructions for installing binary distributions are available in Section 2.2, “Installing MySQL on Unix/Linux Using Generic Binaries”.

To obtain a source distribution for MySQL, see Section 2.1.2, “How to Get MySQL”. MySQL source distributions are available as compressed tar files, Zip archives, or RPM packages. Distribution files have names of the form mysql-VERSION.tar.gz, mysql-VERSION.zip, or mysql-VERSION.rpm, where VERSION is a number like 5.1.73.

To perform a MySQL installation using the source code:

• To build MySQL from source on Unix-like systems, including Linux, commercial Unix, BSD, OS X and others using a .tar.gz or RPM-based source code distribution, see Section 2.11.2, “Installing MySQL Using a Standard Source Distribution”.

• To build MySQL from source on Windows (Windows XP or newer required), see Section 2.11.7, “Installing MySQL from Source on Windows”.

• For information on building from one of our development trees, see Section 2.11.3, “Installing MySQL Using a Development Source Tree”.

• For information on using the configure command to specify the source build parameters, including links to platform specific parameters that you might need, see Section 2.11.4, “MySQL Source-Configuration Options”.

To install MySQL from source, the following system requirements must be satisfied:

• GNU gunzip to uncompress the distribution and a reasonable tar to unpack it (if you use a .tar.gz distribution), or WinZip or another tool that can read .zip files (if you use a .zip distribution).

  GNU tar is known to work. The standard tar provided with some operating systems is not able to unpack the long file names in the MySQL distribution. You should download and install GNU tar, or if available, use a preinstalled version of GNU tar. Usually this is available as gnutar, gtar, or as tar within a GNU or Free Software directory, such as /usr/sfw/bin or /usr/local/bin. GNU tar is available from http://www.gnu.org/software/tar/.

• A working ANSI C++ compiler. GCC 3.4.6 or later, Sun Studio 10 or later, Visual Studio 2005 or later, and many current vendor-supplied compilers are known to work.

• A good make program. Although some platforms come with their own make implementations, it is highly recommended that you use GNU make 3.75 or newer. It may already be available on your system as gmake. GNU make is available from http://www.gnu.org/software/make/.

• libtool 1.5, available from http://www.gnu.org/software/libtool/. 1.5.24 or later is recommended.

  If you run into problems and need to file a bug report, please use the instructions in Section 1.7, “How to Report Bugs or Problems”.

2.11.1 MySQL Layout for Source Installation

By default, when you install MySQL after compiling it from a source distribution, the installation step installs files under /usr/local. Components are installed in the directories shown in the following
Installing MySQL Using a Standard Source Distribution

Table 2.18 MySQL Layout for Installation from Source

<table>
<thead>
<tr>
<th>Directory</th>

</tbody>
</table>

Within its installation directory, the layout of a source installation differs from that of a binary installation in the following ways:

- The mysqld server is installed in the libexec directory rather than in the bin directory.
- The data directory is var rather than data.
- mysql_install_db is installed in the bin directory rather than in the scripts directory.
- The header file and library directories are include/mysql and lib/mysql rather than include and lib.

2.11.2 Installing MySQL Using a Standard Source Distribution

To install MySQL from source, first configure, build, and install from a source package. Then follow the same postinstallation setup sequence as for a binary installation.

If you start from a source RPM, use the following command to make a binary RPM that you can install. If you do not have rpmbuild, use rpm instead.

```
shell> rpmbuild --rebuild --clean MySQL-VERSION.src.rpm
```

The result is one or more binary RPM packages that you install as indicated in Section 2.5.1, “Installing MySQL on Linux Using RPM Packages”.

The sequence for installation from a compressed tar file source distribution is similar to the process for installing from a generic binary distribution that is detailed in Section 2.2, “Installing MySQL on Unix/Linux Using Generic Binaries”. For a MySQL .tar.gz source distribution, the basic installation command sequence looks like this:

```
# Preconfiguration setup
shell> groupadd mysql
shell> useradd -g mysql -s /bin/false mysql
# Beginning of source-build specific instructions
shell> tar zxfv mysql-VERSION.tar.gz
shell> cd mysql-VERSION
shell> ./configure --prefix=/usr/local/mysql
shell> make
shell> make install
```
Installing MySQL Using a Standard Source Distribution

A more detailed version of the source-build specific instructions is shown following. Perform the following steps as the mysql user, except as noted.

Note

The procedure shown here does not set up any passwords for MySQL accounts. After following the procedure, proceed to Section 2.12, “Postinstallation Setup and Testing”, for postinstallation setup and testing.

1. Set up the mysql user and group that will be used to run and execute the MySQL server and own the database directory. For details, see Creating a mysql System User and Group, in Section 2.2, “Installing MySQL on Unix/Linux Using Generic Binaries”.

2. Pick the directory under which you want to unpack the distribution and change location into it.

3. Obtain a distribution file using the instructions in Section 2.1.2, “How to Get MySQL”.

4. Unpack the distribution into the current directory. tar can uncompress and unpack the distribution if it has z option support:

```shell
shell> tar zxfv /path/to/mysql-VERSION.tar.gz
```

This command creates a directory named mysql-VERSION.

If your tar does not have z option support, use gunzip to unpack the distribution and tar to unpack it:

```shell
shell> gunzip < /path/to/mysql-VERSION.tar.gz | tar xvf -
```

5. Change location into the top-level directory of the unpacked distribution:

```shell
shell> cd mysql-VERSION
```

6. Configure the source directory:

```shell
shell> ./configure --prefix=/usr/local/mysql
```

When you run configure, you might want to specify other options. For example, if you need to debug mysql or a MySQL client, run configure with the --with-debug option, and then recompile and link your clients with the new client library. See Section 22.4, “Debugging and Porting MySQL”.

Run ./configure --help for a list of options. Section 21.4.4, “MySQL Source-Configuration Options”, discusses some of the more useful options.

If configure fails and you are going to send mail to a MySQL mailing list to ask for assistance, please include any lines from config.log that you think can help solve the problem. Also include
the last couple of lines of output from configure. To file a bug report, please use the instructions in Section 1.7, “How to Report Bugs or Problems”.

7. Compile the source distribution:

```
shell> make
```

Use `gmake` instead on systems where you are using GNU `make` and it has been installed as `gmake`.

If the compile fails, see Section 2.11.5, “Dealing with Problems Compiling MySQL”, for help.

8. Install the distribution:

```
shell> make install
```

You might need to run this command as `root`.

The remainder of the installation process, including setting up the configuration file, creating the core databases, and starting the MySQL server, are identical to the remainder of the process as shown in Generic Binary Install.

After everything has been installed, test the distribution. To start the MySQL server, use the following command:

```
shell> /usr/local/mysql/bin/mysqld_safe --user=mysql &
```

If you run the command as `root`, you should use the `--user` option as shown. The option value is the name of the login account that you created in the first step to use for running the server. If you run the `mysqld_safe` command while logged in as that user, you can omit the `--user` option.

If the command fails immediately and prints `mysqld ended`, look for information in the error log (which by default is the `host_name.err` file in the data directory).

For more information about `mysqld_safe`, see Section 4.3.2, “mysqld_safe — MySQL Server Startup Script”.

To make it more convenient to invoke programs installed in `/usr/local/mysql/bin`, you can add that directory to your `PATH` environment variable setting. That enables you to run a program by typing only its name, not its entire path name. See Section 4.2.10, “Setting Environment Variables”.

---

Note

The accounts that are listed in the MySQL grant tables initially have no passwords. After starting the server, you should set up passwords for them using the instructions in Section 2.12, “Postinstallation Setup and Testing”.

2.11.3 Installing MySQL Using a Development Source Tree

This section discusses how to install MySQL from the latest development source code.

To obtain the source tree, you must have Bazaar installed. The Bazaar VCS Web site has instructions for downloading and installing Bazaar on different platforms. Bazaar is supported on any platform that supports Python, and is therefore compatible with any Linux, Unix, Windows, or OS X host.

MySQL development projects are hosted on Launchpad. MySQL projects, including MySQL Server, MySQL Workbench, and others are available from the Oracle/MySQL Engineering page. For the repositories related only to MySQL Server, see the MySQL Server page.

To build under Unix/Linux, you must have the following tools installed:
• A good make program. Although some platforms come with their own make implementations, it is highly recommended that you use GNU make 3.75 or newer. It may already be available on your system as gmake. GNU make is available from http://www.gnu.org/software/make/.

• autoconf 2.58 (or newer), available from http://www.gnu.org/software/autoconf/.

• libtool 1.5, available from http://www.gnu.org/software/libtool/. 1.5.24 or later is recommended.

• m4, available from http://www.gnu.org/software/m4/.

• bison 2.1 or newer, available from http://www.gnu.org/software/bison/. (Version 1 is no longer supported.) Use the latest version of bison where possible; if you experience problems, upgrade to a later version, rather than revert to an earlier one.

Once the necessary tools are installed, create a local branch of the MySQL development tree on your machine using this procedure:

1. To obtain a copy of the MySQL source code, you must create a new Bazaar branch. If you do not already have a Bazaar repository directory set up, you must initialize a new directory:

   ```
   shell> mkdir mysql-server
   shell> bzr init-repo --trees mysql-server
   ```

   This is a one-time operation.

2. Assuming that you have an initialized repository directory, you can branch from the public MySQL server repositories to create a local source tree. To create a branch of a specific version:

   ```
   shell> cd mysql-server
   shell> bzr branch lp:mysql-server/5.1 mysql-5.1
   ```

   This is a one-time operation per source tree. You can branch the source trees for several versions of MySQL under the mysql-server directory.

3. The initial download will take some time to complete, depending on the speed of your connection. Please be patient. Once you have downloaded the first tree, additional trees should take significantly less time to download.

4. When building from the Bazaar branch, you may want to create a copy of your active branch so that you can make configuration and other changes without affecting the original branch contents. You can achieve this by branching from the original branch:

   ```
   shell> bzr branch mysql-5.1 mysql-5.1-build
   ```

5. To obtain changes made after you have set up the branch initially, update it using the pull option periodically. Use this command in the top-level directory of the local copy:

   ```
   shell> bzr pull
   ```

   To examine the changeset comments for the tree, use the log option to bzr:

   ```
   shell> bzr log
   ```

   You can also browse changesets, comments, and source code online at the Launchpad MySQL Server page.
If you see diffs (changes) or code that you have a question about, do not hesitate to send email to the MySQL internals mailing list. See Section 1.6.1, “MySQL Mailing Lists”. If you think you have a better idea on how to do something, send an email message to the list with a patch.

After you have the local branch, you can build MySQL server from the source code. On Windows, the build process is different from Unix/Linux: see Section 2.11.7, “Installing MySQL from Source on Windows”.

On Unix/Linux, use the autoconf system to create the configure script so that you can configure the build environment before building. The following example shows the typical commands required to build MySQL from a source tree.

1. Change location to the top-level directory of the source tree; replace mysql-5.1 with the appropriate directory name.

shell> cd mysql-5.1

2. Prepare the source tree for configuration.

Prior to MySQL 5.1.12, you must separately configure the InnoDB storage engine. Run the following command from the main source directory:

shell> (cd storage/innobase; autoreconf --force --install)

You can omit the previous command for MySQL 5.1.12 and later, or if you do not require InnoDB support.

Prepare the remainder of the source tree:

shell> autoreconf --force --install

As an alternative to the preceding autoreconf command, you can use BUILD/autorun.sh, which acts as a shortcut for the following sequence of commands:

shell> aclocal; autoheader
shell> libtoolize --automake --force
shell> automake --force --add-missing; autoconf

If you get some strange errors during this stage, verify that you have the correct version of libtool installed.

3. Configure the source tree and compile MySQL:

shell> ./configure  # Add your favorite options here
shell> make

For a description of some configure options, see Section 2.11.4, “MySQL Source-Configuration Options”.

A collection of configuration scripts is located in the BUILD/ subdirectory. For example, you may find it more convenient to use the BUILD/compile-pentium-debug script than the preceding set of shell commands. To compile on a different architecture, modify the script by removing flags that are Pentium-specific, or use another script that may be more appropriate. These scripts are provided on an “as-is” basis. They are not supported and their contents may change from release to release.

4. When the build is done, run make install. Be careful with this on a production machine; the installation command may overwrite your live release installation. If you already have MySQL
installed and do not want to overwrite it, run `./configure` with values for the `--prefix`, `--with-tcp-port`, and `--with-unix-socket-path` options different from those used by your production server. For additional information about preventing multiple servers from interfering with each other, see Section 5.5, “Running Multiple MySQL Instances on One Machine”.

5. Play hard with your new installation. For example, try to make new features crash. Start by running `make test`. See Section 22.1.2, “The MySQL Test Suite”.

6. If you have gotten to the `make` stage, but the distribution does not compile, please enter the problem into our bugs database using the instructions given in Section 1.7, “How to Report Bugs or Problems”. If you have installed the latest versions of the required tools, and they crash trying to process our configuration files, please report that also. However, if you get a `command not found` error or a similar problem for required tools, do not report it. Instead, make sure that all the required tools are installed and that your `PATH` variable is set correctly so that your shell can find them.

### 2.11.4 MySQL Source-Configuration Options

The `configure` script provides a great deal of control over how you configure a MySQL source distribution. Typically, you do this using options on the `configure` command line. For a full list of options supported by `configure`, run this command:

```
shell> ./configure --help
```

You can also affect `configure` using certain environment variables. See Section 2.14, “Environment Variables”.

The following table shows the available `configure` options.

**Table 2.19 MySQL Source-Configuration Option Reference (configure)**

<table>
<thead>
<tr>
<th>Formats</th>
<th>Description</th>
<th>Default</th>
<th>Introduced</th>

If you are using a version of `gcc` recent enough to understand the `-fno-exceptions` option, it is very important that you use this option. Otherwise, you may compile a binary that crashes randomly. Also use `-felide-constructors` and `-fno-rtti` along with `-fno-exceptions`. When in doubt, do the following:

```
CFLAGS="-O3" CXX=gcc CXXFLAGS="-O3 -felide-constructors -fno-rtti" ./configure \
    --prefix=/usr/local/mysql --enable-assembler \
    --with-mysqld-ldflags=-all-static
```

On most systems, this gives you a fast and stable binary.

When compiling from source, you should also be aware of any platform specific considerations that may influence and impact the build process. Knowing and applying this information will help to ensure you get the best performance and most stable binary for your chosen platform. For more information, use the following sections:

- Section 2.11.9, “Notes on Installing MySQL on AIX from Source”
- Section 2.11.10, “Notes on Installing MySQL on HP-UX from Source”
- Section 2.11.8, “Notes on Installing MySQL on Solaris from Source”

Some of the `configure` options available are described here. For options that may be of use if you have difficulties building MySQL, see Section 2.11.5, “Dealing with Problems Compiling MySQL”.

Many options configure compile-time defaults that can be overridden at server startup. For example, the `--prefix`, `--with-tcp-port`, and `with-unix-socket-path` options that configure the default installation base directory location, TCP/IP port number, and Unix socket file can be changed at server startup with the `--basedir`, `--port`, and `--socket` options for `mysqld`.

- To compile just the MySQL client libraries and client programs and not the server, use the `--without-server` option:

```
shell> ./configure --without-server
```

If you have no C++ compiler, some client programs such as `mysql` cannot be compiled because they require C++. In this case, you can remove the code in `configure` that tests for the C++
compiler and then run `./configure` with the `--without-server` option. The compile step should still try to build all clients, but you can ignore any warnings about files such as `mysql.cc`. (If `make` stops, try `make -k` to tell it to continue with the rest of the build even if errors occur.)

- To build the embedded MySQL library (`libmysqld.a`), use the `--with-embedded-server` option.
- To place your log files and database directories elsewhere than under `/usr/local/var`, use a `configure` command something like one of these:

```shell
shell> ./configure --prefix=/usr/local/mysql
shell> ./configure --prefix=/usr/local/\ --localstatedir=/usr/local/mysql/data
```

The first command changes the installation prefix so that everything is installed under `/usr/local/mysql` rather than the default of `/usr/local`. The second command preserves the default installation prefix, but overrides the default location for database directories (normally `/usr/local/var`) and changes it to `/usr/local/mysql/data`.

You can also specify the installation directory and data directory locations at server startup time by using the `--basedir` and `--datadir` options. These can be given on the command line or in an MySQL option file, although it is more common to use an option file. See Section 4.2.6, “Using Option Files”.

- The `--with-tcp-port` option specifies the port number on which the server listens for TCP/IP connections. The default is port 3306. To listen on a different port, use a `configure` command like this:

```shell
shell> ./configure --with-tcp-port=3307
```

- On Unix, if you want the MySQL socket file location to be somewhere other than the default location (normally in the directory `/tmp` or `/var/run`), use a `configure` command like this:

```shell
shell> ./configure --with-unix-socket-path=/usr/local/mysql/tmp/mysql.sock
```

The socket file name must be an absolute path name. You can also change the location of `mysql.sock` at server startup by using a MySQL option file. See Section B.5.3.6, “How to Protect or Change the MySQL Unix Socket File”.

- To compile statically linked programs (for example, to make a binary distribution, to get better performance, or to work around problems with some Red Hat Linux distributions), run `configure` like this:

```shell
shell> ./configure --with-client-ldflags=-all-static \ --with-mysqld-ldflags=-all-static
```

- If you are using `gcc` and do not have `libg++` or `libstdc++` installed, you can tell `configure` to use `gcc` as your C++ compiler:

```shell
shell> CC=gcc CXX=gcc ./configure
```

When you use `gcc` as your C++ compiler, it does not attempt to link in `libg++` or `libstdc++`. This may be a good thing to do even if you have those libraries installed. Some versions of them have caused strange problems for MySQL users in the past.

In most cases, you can get a reasonably optimized MySQL binary by using the following options on the `configure` line:
MySQL Source-Configuration Options

--prefix=/usr/local/mysql --enable-assembler \ 
--with-mysqld-ldflags=all-static

The full configure line would, in other words, be something like the following for all recent gcc versions:

CFLAGS="-O3 -mpentiumpro" CXX=gcc CXXFLAGS="-O3 -mpentiumpro \ 
-felide-constructors -fno-exceptions -fno-rtti" ./configure \ 
--prefix=/usr/local/mysql --enable-assembler \ 
--with-mysqld-ldflags=all-static

The binaries we provide on the MySQL Web site at http://dev.mysql.com/downloads/ are all compiled with full optimization and should work well for most users. See Section 2.2, “Installing MySQL on Unix/Linux Using Generic Binaries”.

- If the build fails and produces errors about your compiler or linker not being able to create the shared library libmysqlclient.so.N (where N is a version number), you can work around this problem by giving the --disable-shared option to configure. In this case, configure does not build a shared libmysqlclient.so.N library.

- By default, MySQL uses the latin1 (cp1252 West European) character set. To change the default set, use the --with-charset option:

```
$ ./configure --with-charset=CHARSET
```

CHARSET may be one of binary, armscii8, ascii, big5, cp1250, cp1251, cp1256, cp1257, cp850, cp852, cp866, cp932, dec8, eucjpms, euckr, gb2312, gbk, geostd8, greek, hebrew, hp8, keybcs2, koi8r, koi8u, latin1, latin2, latin5, latin7, macce, macroman, sjis, swe7, tis620, ucs2, ujis, utf8. (Additional character sets might be available. Check the output from ./configure --help for the current list.)

The default collation may also be specified. MySQL uses the latin1_swedish_ci collation by default. To change this, use the --with-collation option:

```
$ ./configure --with-collation=COLLATION
```

To change both the character set and the collation, use both the --with-charset and --with-collation options. The collation must be a legal collation for the character set. (Use the SHOW COLLATION statement to determine which collations are available for each character set.)

With the configure option --with-extra-charsets=LIST, you can define which additional character sets should be compiled into the server. LIST is one of the following:

- A list of character set names separated by spaces
- complex to include all character sets that can’t be dynamically loaded
- all to include all character sets into the binaries

Clients that want to convert characters between the server and the client should use the SET NAMES statement. See Section 10.1.4, “Connection Character Sets and Collations”.

- To configure MySQL with debugging code, use the --with-debug option:

```
$ ./configure --with-debug
```

This causes a safe memory allocator to be included that can find some errors and that provides output about what is happening. See Section 22.4, “Debugging and Porting MySQL”.
As of MySQL 5.1.12, using `--with-debug` to configure MySQL with debugging support enables you to use the `--debug="d.parser_debug"` option when you start the server. This causes the Bison parser that is used to process SQL statements to dump a parser trace to the server’s standard error output. Typically, this output is written to the error log.

- To cause the Debug Sync facility to be compiled into the server, use the `--enable-debug-sync` option. This facility is used for testing and debugging. When compiled in, Debug Sync is disabled by default at runtime. To enable it, start `mysqld` with the `--debug-sync-timeout=N` option, where $N$ is a timeout value greater than 0. (The default value is 0, which disables Debug Sync.) $N$ becomes the default timeout for individual synchronization points.

Debug Sync is also compiled in if you configure with the `--with-debug` option (which implies `--enable-debug-sync`), unless you also use the `--disable-debug-sync` option.

For a description of the Debug Sync facility and how to use synchronization points, see MySQL Internals: Test Synchronization.

The `--enable-debug-sync` and `--disable-debug-sync` options were added in MySQL 5.1.41.

- If your client programs are using threads, you must compile a thread-safe version of the MySQL client library with the `--enable-thread-safe-client` configure option. This creates a `libmysqlclient_r` library with which you should link your threaded applications. See Section 21.8.4.2, “Writing C API Threaded Client Programs”.

- Some features require that the server be built with compression library support, such as the `COMPRESS()` and `UNCOMPRESS()` functions, and compression of the client/server protocol. The `--with-zlib-dir=no|bundled|DIR` option provides control over compression library support. The value `no` explicitly disables compression library support. `bundled` causes the `zlib` library bundled in the MySQL sources to be used. A `DIR` path name specifies the directory in which to find the compression library sources.

- It is possible to build MySQL with large table support using the `--with-big-tables` option.

This option causes the variables that store table row counts to be declared as `unsigned long long` rather than `unsigned long`. This enables tables to hold up to approximately $1.844E+19$ rows rather than $2^{32}$ (~4.295E+09) rows. Previously it was necessary to pass `-DBIG_TABLES` to the compiler manually in order to enable this feature.

- Run `configure` with the `--disable-grant-options` option to cause the `--bootstrap`, `--skip-grant-tables`, and `--init-file` options for `mysqld` to be disabled. For Windows, the `configure.js` script recognizes the `DISABLE_GRANT_OPTIONS` flag, which has the same effect. The capability is available as of MySQL 5.1.15.

This option allows MySQL Community Server features to be enabled. Additional options may be required for individual features, such as `--enable-profiling` to enable statement profiling. This option was added in MySQL 5.1.24. It is enabled by default as of MySQL 5.1.28; to disable it, use `--disable-community-features`.

- When given with `--enable-community-features`, the `--enable-profiling` option enables the statement profiling capability exposed by the `SHOW PROFILE` and `SHOW PROFILES` statements. (See Section 13.7.5.33, “SHOW PROFILES Syntax”.) This option was added in MySQL 5.1.24. It is enabled by default as of MySQL 5.1.28; to disable it, use `--disable-profiling`.

- See Section 2.1, “General Installation Guidance”, for options that pertain to particular operating systems.

- See Section 6.4.2, “Building MySQL with Support for Secure Connections”, for options that pertain to configuring MySQL to support secure (encrypted) connections.

- Several `configure` options apply to plugin selection and building:
Dealing with Problems Compiling MySQL

```bash
--with-plugins=PLUGIN[, PLUGIN]...
--with-plugins=GROUP
--with-plugin-PLUGIN
--without-plugin-PLUGIN
```

`PLUGIN` is an individual plugin name such as `csv` or `archive`.

As shorthand, `GROUP` is a configuration group name such as `none` (select no plugins) or `all` (select all plugins).

You can build a plugin as static (compiled into the server) or dynamic (built as a dynamic library that must be installed using the `INSTALL PLUGIN` statement or the `--plugin-load` option before it can be used). Some plugins might not support static or dynamic build.

`configure --help` shows the following information pertaining to plugins:

- The plugin-related options
- The names of all available plugins
- For each plugin, a description of its purpose, which build types it supports (static or dynamic), and which plugin groups it is a part of.

`--with-plugins` can take a list of one or more plugin names separated by commas, or a plugin group name. The named plugins are configured to be built as static plugins.

`--with-plugin-PLUGIN` configures the given plugin to be built as a static plugin.

`--without-plugin-PLUGIN` disables the given plugin from being built.

If a plugin is named both with a `--with` and `--without` option, the result is undefined.

For any plugin that is not explicitly selected or disabled, it is selected to be built dynamically if it supports dynamic build, and not built if it does not support dynamic build. (Thus, in the case that no plugin options are given, all plugins that support dynamic build are selected to be built as dynamic plugins. Plugins that do not support dynamic build are not built.)

### 2.11.5 Dealing with Problems Compiling MySQL

All MySQL programs compile cleanly for us with no warnings on Solaris or Linux using `gcc`. On other systems, warnings may occur due to differences in system include files. For other problems, check the following list.

The solution to many problems involves reconfiguring. If you do need to reconfigure, take note of the following:

- If `configure` is run after it has previously been run, it may use information that was gathered during its previous invocation. This information is stored in `config.cache`. When `configure` starts up, it looks for that file and reads its contents if it exists, on the assumption that the information is still correct. That assumption is invalid when you reconfigure.

- Each time you run `configure`, you must run `make` again to recompile. However, you may want to remove old object files from previous builds first because they were compiled using different configuration options.

To prevent old configuration information or object files from being used, run these commands before re-running `configure`:

```bash
shell> rm config.cache
```
Dealing with Problems Compiling MySQL

shell> make clean

Alternatively, you can run make distclean.

The following list describes some of the problems that have been found to occur most often when compiling MySQL:

• If you get errors such as the ones shown here when compiling sql_yacc.cc, you probably have run out of memory or swap space:

```
Internal compiler error: program cc1plus got fatal signal 11
Out of virtual memory
Virtual memory exhausted
```

The problem is that gcc requires a huge amount of memory to compile sql_yacc.cc with inline functions. Try running configure with the --with-low-memory option:

shell> ./configure --with-low-memory

This option causes -fno-inline to be added to the compile line if you are using gcc and -O0 if you are using something else. You should try the --with-low-memory option even if you have so much memory and swap space that you think you can't possibly have run out. This problem has been observed to occur even on systems with generous hardware configurations, and the --with-low-memory option usually fixes it.

• By default, configure picks c++ as the compiler name and GNU c++ links with -lg++. If you are using gcc, that behavior can cause problems during configuration such as this:

```
configure: error: installation or configuration problem:
C++ compiler cannot create executables.
```

You might also observe problems during compilation related to g++, libg++, or libstdc++.

One cause of these problems is that you may not have g++, or you may have g++ but not libg++, or libstdc++. Take a look at the config.log file. It should contain the exact reason why your C++ compiler did not work. To work around these problems, you can use gcc as your C++ compiler. Try setting the environment variable CXX to "gcc -O3". For example:

shell> CXX="gcc -O3" ./configure

This works because gcc compiles C++ source files as well as g++ does, but does not link in libg++ or libstdc++ by default.

Another way to fix these problems is to install g++, libg++, and libstdc++. However, do not use libg++ or libstdc++ with MySQL because this only increases the binary size of mysqld without providing any benefits. Some versions of these libraries have also caused strange problems for MySQL users in the past.

• To define flags to be used by your C or C++ compilers, specify them using the CFLAGS and CXXFLAGS environment variables. You can also specify the compiler names this way using CC and CXX. For example:

shell> CC=gcc
shell> CFLAGS=-O3
shell> CXX=gcc
shell> CXXFLAGS=-O3
shell> export CC CFLAGS CXX CXXFLAGS

To see what flags you might need to specify, invoke mysql_config with the --cflags option.
• If you get errors such as those shown here when compiling mysqlld, configure did not correctly detect the type of the last argument to accept(), getsockname(), or getpeername():

```
cxx: Error: mysqlld.cc, line 645: In this statement, the referenced type of the pointer value ''length'' is ''unsigned long'', which is not compatible with ''int''.
new_sock = accept(sock, (struct sockaddr *)&cAddr, &length);
```

To fix this, edit the config.h file (which is generated by configure). Look for these lines:

```
/* Define as the base type of the last arg to accept */
#define SOCKET_SIZE_TYPE XXX
```

Change XXX to size_t or int, depending on your operating system. (You must do this each time you run configure because configure regenerates config.h.)

• If your compile fails with errors such as any of the following, you must upgrade your version of make to GNU make:

```
make: Fatal error in reader: Makefile, line 18:
Badly formed macro assignment
```

Or:

```
make: file `Makefile' line 18: Must be a separator (:)
```

Or:

```
pthread.h: No such file or directory
```

Solaris and FreeBSD are known to have troublesome make programs.

GNU make 3.75 is known to work.

• The sql_yacc.cc file is generated from sql_yacc.yy. Normally, the build process does not need to create sql_yacc.cc because MySQL comes with a pregenerated copy. However, if you do need to re-create it, you might encounter this error:

```
"sql_yacc.yy", line xxx fatal: default action causes potential...
```

This is a sign that your version of yacc is deficient. You probably need to install bison (the GNU version of yacc) and use that instead.

Versions of bison older than 1.75 may report this error:

```
sql_yacc.yy:#####: fatal error: maximum table size (32767) exceeded
```

The maximum table size is not actually exceeded; the error is caused by bugs in older versions of bison.

• On Debian Linux 3.0, you need to install gawk instead of the default mawk.

• If you get a compilation error on Linux (for example, SuSE Linux 8.1 or Red Hat Linux 7.3) similar to the following one, you probably do not have g++ installed:

```
libmysql.c:1329: warning: passing arg 5 of 'gethostbyname_r' from incompatible pointer type
libmysql.c:1329: too few arguments to function 'gethostbyname_r'
```
By default, the `configure` script attempts to determine the correct number of arguments by using `g++` (the GNU C++ compiler). This test yields incorrect results if `g++` is not installed. There are two ways to work around this problem:

- Make sure that the GNU C++ `g++` is installed. On some Linux distributions, the required package is called `gpp`; on others, it is named `gcc-c++`.
- Use `gcc` as your C++ compiler by setting the `CXX` environment variable to `gcc`:

```
export CXX="gcc"
```

You must run `configure` again after making either of those changes.

For information about acquiring or updating tools, see the system requirements in Section 2.11, “Installing MySQL from Source”.

### 2.11.6 Compiling and Linking an Optimized mysqld Server

Most of the following tests were performed on Linux with the MySQL benchmarks, but they should give some indication for other operating systems and workloads.

You obtain the fastest executables when you link with `-static`.

By using better compiler and compilation options, you can obtain a 10% to 30% speed increase in applications. This is particularly important if you compile the MySQL server yourself.

When we tested both the Cygnus CodeFusion and Fujitsu compilers, neither was sufficiently bug-free to enable MySQL to be compiled with optimizations enabled.

The standard MySQL binary distributions are compiled with support for all character sets. When you compile MySQL yourself, include support only for the character sets that you are going to use. This is controlled by the `--with-charset` option to `configure`.

Here is a list of some measurements that we have made:

- If you link dynamically (without `-static`), the result is 13% slower on Linux. Note that you still can use a dynamically linked MySQL library for your client applications. It is the server that is most critical for performance.
- For a connection from a client to a server running on the same host, if you connect using TCP/IP rather than a Unix socket file, performance is 7.5% slower. (On Unix, if you connect to the host name `localhost`, MySQL uses a socket file by default.)
- For TCP/IP connections from a client to a server, connecting to a remote server on another host is 8% to 11% slower than connecting to a server on the same host, even for connections faster than 100Mb/s Ethernet.
- When running our benchmark tests using secure connections (all data encrypted with internal SSL support) performance was 55% slower than with unencrypted connections.
- On a Sun UltraSPARC-IIe, a server compiled with Forte 5.0 is 4% faster than one compiled with `gcc 3.2`.
- On a Sun UltraSPARC-IIe, a server compiled with Forte 5.0 is 4% faster in 32-bit mode than in 64-bit mode.
- Compiling on Linux-x86 using `gcc` without frame pointers (`-fomit-frame-pointer` or `--fomit-frame-pointer -ffixed-ebp`) makes `mysqld` 1% to 4% faster.
2.11.7 Installing MySQL from Source on Windows

These instructions describe how to build binaries from source for MySQL 5.1 on Windows. Instructions are provided for building binaries from a standard source distribution or from the Bazaar tree that contains the latest development source.

**Note**
The instructions here are strictly for users who want to test MySQL on Microsoft Windows from the latest source distribution or from the Bazaar tree. For production use, we do not advise using a MySQL server built by yourself from source. Normally, it is best to use precompiled binary distributions of MySQL that are built specifically for optimal performance on Windows by Oracle Corporation. Instructions for installing binary distributions are available in Section 2.3, “Installing MySQL on Microsoft Windows”.

To build MySQL on Windows from source, you must satisfy the following system, compiler, and resource requirements:

- Windows 2000, Windows XP, or newer version.
- Windows Vista is supported when using Visual Studio 2005 provided you have installed the following updates:
  - Update for Microsoft Visual Studio 2005 Professional Edition - ENU (KB932232)
- **CMake**, which can be downloaded from [http://www.cmake.org](http://www.cmake.org). After installing, modify your PATH environment variable to include the directory where `cmake` is located.
- If you are compiling from a Bazaar tree or making changes to the parser, you need **bison** for Windows, which can be downloaded from [http://gnuwin32.sourceforge.net/packages/bison.htm](http://gnuwin32.sourceforge.net/packages/bison.htm). Download the package labeled “Complete package, excluding sources”. After installing the package, modify your PATH environment variable to include the directory where `bison` is located.

**Note**
On Windows, the default location for bison is the `C:\Program Files \GnuWin32` directory. Some utilities, including `m4`, may fail to find `bison` because of the space in the directory name. You can resolve this by installing into a directory that does not contain a space; for example `C:\GnuWin32`.

- Cygwin might be necessary if you want to run the test script or package the compiled binaries and support files into a Zip archive. (Cygwin is needed only to test or package the distribution, not to build it.) Cygwin is available from [http://cygwin.com](http://cygwin.com).
- 3GB to 5GB of disk space.

You also need a MySQL source distribution for Windows, which can be obtained two ways:

- Obtain a source distribution packaged by Oracle Corporation. These are available from [http://dev.mysql.com/downloads/](http://dev.mysql.com/downloads/).
Installing MySQL from Source on Windows

- Package a source distribution yourself from the latest Bazaar developer source tree. For instructions on pulling the latest source files, see Section 2.11.3, “Installing MySQL Using a Development Source Tree”.

If you find something not working as expected, or you have suggestions about ways to improve the current build process on Windows, please send a message to the win32 mailing list. See Section 1.6.1, “MySQL Mailing Lists”.

Note
To compile from the source code on Windows you must use the standard source distribution (for example, mysql-5.1.73.zip or mysql-5.1.73.tar.gz). You build from the same distribution as used to build MySQL on Unix, Linux and other platforms. Do not use the Windows Source distributions as they do not contain the necessary configuration script and other files.

Follow this procedure to build MySQL:

1. If you are installing from a packaged source distribution, create a work directory (for example, C: \workdir), and unpack the source distribution there using WinZip or another Windows tool that can read .zip files. This directory is the work directory in the following instructions.

   Note
   Commands that are located in the win directory should be executed from the top-level source directory. Do not change location into the win directory, as the commands will not execute correctly.

2. Start a command shell. If you have not configured the PATH and other environment variables for all command shells, you may be able to start a command shell from the Start Menu within the Windows Visual Studio menu that contains the necessary environment changes.

3. Within the command shell, navigate to the work directory and run the following command:

   C:\workdir>win\configure.js options

   If you have associated the .js file extension with an application such as a text editor, then you may need to use the following command to force configure.js to be executed as a script:

   C:\workdir>cscript win\configure.js options

These options are available for configure.js:

- **WITH_INNODB_STORAGE_ENGINE**: Enable the InnoDB storage engine.
- **WITH_PARTITION_STORAGE_ENGINE**: Enable user-defined partitioning.
- **WITH_ARCHIVE_STORAGE_ENGINE**: Enable the ARCHIVE storage engine.
- **WITH_BLACKHOLE_STORAGE_ENGINE**: Enable the BLACKHOLE storage engine.
- **WITH EXAMPLE STORAGE ENGINE**: Enable the EXAMPLE storage engine.
- **WITH FEDERATED STORAGE ENGINE**: Enable the FEDERATED storage engine.
- **WITH NDBCLUSTER STORAGE ENGINE**: Enable the NDBCLUSTER storage engine in the MySQL server; cause binaries for the MySQL Cluster management and data node, management client, and other programs to be built.
This option is supported only in MySQL Cluster NDB 7.0 and later (NDBCLUSTER storage engine versions 6.4.0 and later) using the MySQL Cluster sources. It cannot be used to enable clustering support in other MySQL source trees or distributions.

- **MYSQL_SERVER_SUFFIX=suffix**: Server suffix, default none.
- **COMPILATION_COMMENT=comment**: Server comment, default "Source distribution".
- **MYSQL_TCP_PORT=port**: Server port, default 3306.
- **DISABLE_GRANT_OPTIONS**: Disables the --bootstrap, --skip-grant-tables, and --init-file options for mysqld. This option is available as of MySQL 5.1.15.

For example (type the command on one line):

```
C:\workdir>win\configure.js WITH_INNODB_STORAGE_ENGINE
WITH_PARTITION_STORAGE_ENGINE MYSQL_SERVER_SUFFIX=-pro
```

4. From the work directory, execute the `win\build-vs9.bat` (Windows Visual Studio 2008), `win\build-vs8.bat` (Windows Visual Studio 2005), or `win\build-vs71.bat` (Windows Visual Studio 2003) script, depending on the version of Visual Studio you have installed. The script invokes CMake, which generates the `mysql.sln` solution file.

You can also use the corresponding 64-bit file (for example `win\build-vs8_x64.bat` or `win\build-vs9_x64.bat`) to build the 64-bit version of MySQL. However, you cannot build the 64-bit version with Visual Studio Express Edition. You must use Visual Studio 2005 (8.0) or higher.

5. From the work directory, open the generated `mysql.sln` file with Visual Studio and select the proper configuration using the **Configuration** menu. The menu provides **Debug**, **Release**, **RelwithDebInfo**, **MinRelInfo** options. Then select **Solution > Build** to build the solution.

Remember the configuration that you use in this step. It is important later when you run the test script because that script needs to know which configuration you used.

6. Test the server. The server built using the preceding instructions expects that the MySQL base directory and data directory are `C:\mysql` and `C:\mysql\data` by default. If you want to test your server using the source tree root directory and its data directory as the base directory and data directory, you need to tell the server their path names. You can either do this on the command line with the **--basedir** and **--datadir** options, or by placing appropriate options in an option file. (See Section 4.2.6, "Using Option Files".) If you have an existing data directory elsewhere that you want to use, you can specify its path name instead.

When the server is running in standalone fashion or as a service based on your configuration, try to connect to it from the `mysql` interactive command-line utility.

You can also run the standard test script, `mysql-test-run.pl`. This script is written in Perl, so you'll need either Cygwin or ActiveState Perl to run it. You may also need to install the modules required by the script. To run the test script, change location into the `mysql-test` directory under the work directory, set the `MTR_VS_CONFIG` environment variable to the configuration you selected earlier (or use the **--vs-config** option), and invoke `mysql-test-run.pl`. For example (using Cygwin and the `bash` shell):

```
shell> cd mysql-test
shell> export MTR_VS_CONFIG=debug
shell> ./mysql-test-run.pl --force --timer
```

When you are satisfied that the programs you have built are working correctly, stop the server. Now you can install the distribution. One way to do this is to use the `make_win_bin_dist` script in the `scripts` directory of the MySQL source distribution (see Section 4.4.2, "make_win_bin_dist —
Installing MySQL from Source on Windows

Package MySQL Distribution as Zip Archive`). This is a shell script, so you must have Cygwin installed if you want to use it. It creates a Zip archive of the built executables and support files that you can unpack in the location at which you want to install MySQL.

It is also possible to install MySQL by copying directories and files directly:

1. Create the directories where you want to install MySQL. For example, to install into C:\mysql, use these commands:

```
C:\> mkdir C:\mysql
C:\> mkdir C:\mysql\bin
C:\> mkdir C:\mysql\data
C:\> mkdir C:\mysql\share
C:\> mkdir C:\mysql\scripts
```

If you want to compile other clients and link them to MySQL, you should also create several additional directories:

```
C:\> mkdir C:\mysql\include
C:\> mkdir C:\mysql\lib
C:\> mkdir C:\mysql\lib\debug
C:\> mkdir C:\mysql\lib\opt
```

If you want to benchmark MySQL, create this directory:

```
C:\> mkdir C:\mysql\sql-bench
```

Benchmarking requires Perl support for MySQL. See Section 2.15, “Perl Installation Notes”.

2. From the work directory, copy into the C:\mysql directory the following files and directories:

```
C:\\workdir> cd \workdir
C:\\workdir> mkdir C:\mysql
C:\\workdir> mkdir C:\mysql\bin
C:\\workdir> copy client\Release\*.exe C:\mysql\bin
C:\\workdir> copy sql\Release\mysqld.exe C:\mysql\bin\mysqld.exe
C:\\workdir> xcopy scripts\*.* C:\mysql\scripts /E
C:\\workdir> xcopy share\*.* C:\mysql\share /E
```

If you want to compile other clients and link them to MySQL, you should also copy several libraries and header files:

```
C:\\workdir> copy lib\Release\mysqlclient.lib C:\mysql\lib\debug
C:\\workdir> copy lib\Release\libmysql.* C:\mysql\lib\debug
C:\\workdir> copy lib\Release\zlib.* C:\mysql\lib\debug
C:\\workdir> copy lib\Release\mysqlclient.lib C:\mysql\lib\opt
C:\\workdir> copy lib\Release\libmysql.* C:\mysql\lib\opt
C:\\workdir> copy lib\Release\zlib.* C:\mysql\lib\opt
C:\\workdir> copy include\*.h C:\mysql\include
C:\\workdir> copy libmysql\libmysql.def C:\mysql\include
```

**Note**

If you have compiled a Debug solution, rather than a Release solution, install it by replacing `Release` with `Debug` in the source file names just shown.

If you want to benchmark MySQL, you should also do this:

```
C:\workdir> xcopy sql-bench\*.* C:\mysql\bench /E
```
Notes on Installing MySQL on Solaris from Source

After installation, set up and start the server in the same way as for binary Windows distributions. This includes creating the system tables by running `mysql_install_db`. For more information, see Section 2.3, “Installing MySQL on Microsoft Windows”.

2.11.8 Notes on Installing MySQL on Solaris from Source

When building MySQL on Solaris you can use either the Sun Studio or GNU cc compilers. For more information on specific notes and environments, use the following hints.

- When building you should ensure that your `PATH` variable includes the necessary tools, including `ar` for building libraries. Some tools are located in `/usr/ccs/bin`.

- When running `configure`, you should specify the C and C++ compiler explicitly to ensure that the right compiler combination is used:

  ```
  CC=gcc CXX=g++ ./configure
  ```

- If you have an UltraSPARC system, you can get 4% better performance by adding `-mcpu=v8 -Wa,-xarch=v8plusa` to the `CFLAGS` and `CXXFLAGS` environment variables.

- If you have Sun's Forte 5.00 (or newer) or Sun Studio compiler, you can run `configure` like this:

  ```
  CC=cc CFLAGS="-Xa -fast -native -xstrconst -mt" \n  CXX=CC CXXFLAGS="-noex -mt -xarch=v9" \n  ./configure --prefix=/usr/local/mysql --enable-assembler
  ```

- To create a 64-bit SPARC binary with Sun's Forte or Sun Studio compiler, use the following configuration options:

  ```
  CC=cc CFLAGS="-Xa -fast -native -xstrconst -mt -xarch=v9" \n  CXX=CC CXXFLAGS="-noex -mt -xarch=v9" ASFLAGS="-xarch=v9" \n  ./configure --prefix=/usr/local/mysql --enable-assembler
  ```

  To create a 64-bit Solaris binary using `gcc`, add `-m64` to `CFLAGS` and `CXXFLAGS` and remove `--enable-assembler` from the `configure` line.

  In the MySQL benchmarks, we obtained a 4% speed increase on UltraSPARC when using Forte 5.0 in 32-bit mode, as compared to using `gcc` 3.2 with the `-mcpu` flag.

  If you create a 64-bit `mysqld` binary, it is 4% slower than the 32-bit binary, but can handle more threads and memory.

  - If you get a problem with `fdatasync` or `sched_yield`, you can fix this by adding `LIBS=-lrd` to the `configure` line.

  - Solaris does not provide static versions of all system libraries (`libpthreads` and `libdl`), so you cannot compile MySQL with `--static`. If you try to do so, you get one of the following errors:

    ```
    ld: fatal: library -ldl: not found
    undefined reference to `dlopen'
    cannot find -lrd
    ```

  - If you link your own MySQL client programs, you may see the following error at runtime:

    ```
    ld.so.1: fatal: libmysqlclient.so.#: 
    open failed: No such file or directory
    ```

    To avoid this problem, use one of the following methods:

    - Use the `crle` tool to add the directory containing the `libmysqlclient` library file to the list of standard library directories. You need administrator privileges to do this. Make sure you update the
library information, rather than replace it with the new path. For example, the following command adds the directory to the list of standard directories searched for libraries.

    crle -u -l /usr/local/mysql/lib

For 64-bit libraries, add the `-64` option:

    crle -64 -u -l /usr/local/mysql/lib

- Link clients with the `-Wl,r/full/path/to/libmysqlclient.so` flag rather than with `-Lpath`.
- Copy `libmysqlclient.so` to `/usr/lib`.
- Add the path name of the directory where `libmysqlclient.so` is located to the `LD_RUN_PATH` environment variable before running your client.
- If you have problems with `configure` trying to link with `-lz` when you do not have `zlib` installed, you have two options:
  - If you want to be able to use the compressed communication protocol, obtain and install `zlib` from `ftp.gnu.org`.
  - To build without `zlib`, run `configure` with the `--with-named-z-libs=no` option when building MySQL.
- If you are using `gcc` and have problems with loading user-defined functions (UDFs) into MySQL, try adding `-lgcc` to the link line for the UDF.

### 2.11.9 Notes on Installing MySQL on AIX from Source

General notes on building MySQL from source on IBM AIX:

- Automatic `xlC` detection is missing from Autoconf, so a number of variables need to be set before running `configure`. The following example uses the IBM compiler:

```bash
export CC="xlc_r -ma -O3 -qstrict -qoptimize=3 -qmaxmem=8192 "
export CXX="xlc_r -ma -O3 -qstrict -qoptimize=3 -qmaxmem=8192"
export CFLAGS="-I /usr/local/include"
export LDFLAGS="-L /usr/local/lib"
export CPPFLAGS="-I/usr/local/include"
export CXXFLAGS="-I/usr/local/include"
./configure --prefix=/usr/local \
  --localstatedir=/var/mysql \
  --sysconfdir=/etc/mysql \
  --sbindir=/usr/local/bin \
  --libexecdir=/usr/local/lib \
  --enable-thread-safe-client \
  --enable-thread-safe-client \
  --enable-large-files
```

The preceding options are used to compile the MySQL distribution that can be found at [http://www-frec.bull.com/](http://www-frec.bull.com/).

- If you change the `-O3` to `-O2` in the preceding `configure` line, you must also remove the `-qstrict` option. This is a limitation in the IBM C compiler.

- If you compile MySQL with `gcc`, you must use the `--fno-exceptions` flag because the exception handling in `gcc` is not thread-safe. There are also some known problems with IBM’s assembler that may cause it to generate bad code when used with `gcc`. 

161
• If you have problems with signals (MySQL dies unexpectedly under high load), you may have found an OS bug with threads and signals. In this case, you can tell MySQL not to use signals by configuring as follows:

```
CFLAGS=-DDONT_USE_THR_ALARM CXX=gcc \
CXXFLAGS="-fiele-constructors -fno-exceptions -fno-rtti" \n-DDONT_USE_THR_ALARM" \n./configure --prefix=/usr/local/mysql --with-debug \n--with-low-memory
```

This does not affect the performance of MySQL, but has the side effect that you cannot kill clients that are “sleeping” on a connection with `mysqladmin kill` or `mysqladmin shutdown`. Instead, the client dies when it issues its next command.

• On some versions of AIX, linking with `libbind.a` makes `getservbyname()` dump core. This is an AIX bug and should be reported to IBM.

### 2.11.10 Notes on Installing MySQL on HP-UX from Source

General notes on compiling MySQL on HP-UX.

• If you are using HP-UX compiler, you can use the following command (which has been tested with `cc` B.11.11.04):

```
CC=cc CXX=aCC CFLAGS=-DD64 CXXFLAGS=-DD64 ./configure \n--with-extra-character-set=complex
```

You can ignore any errors of the following type:

```
aCC: warning 901: unknown option: `-3': use +help for online documentation
```

• If you get the following error from `configure`, verify that you do not have the path to the K&R compiler before the path to the HP-UX C and C++ compiler:

```
checking for cc option to accept ANSI C... no
```

• Another reason for compile failure is that you did not define the `-DD64` flags as just described.

### 2.12 Postinstallation Setup and Testing

This section discusses tasks that you should perform after installing MySQL:

• If necessary, initialize the data directory and create the MySQL grant tables. For some MySQL installation methods, data directory initialization may be done for you automatically:
  
  • Installation on Windows
  
  • Installation on Linux using a server RPM distribution.
  
  • Installation using the native packaging system on many platforms, including Debian Linux, Ubuntu Linux, Gentoo Linux, and others.
  
  • Installation on OS X using a DMG distribution.

  For other platforms and installation types, including installation from generic binary and source distributions, you must initialize the data directory yourself. For instructions, see Section 2.12.1, “Initializing the Data Directory”.

162
• For instructions, see Section 2.12.2, “Starting the Server”, and Section 2.12.3, “Testing the Server”.

• Assign passwords to any initial accounts in the grant tables, if that was not already done during data directory initialization. Passwords prevent unauthorized access to the MySQL server. You may also wish to restrict access to test databases. For instructions, see Section 2.12.4, “Securing the Initial MySQL Accounts”.

• Optionally, arrange for the server to start and stop automatically when your system starts and stops. For instructions, see Section 2.12.5, “Starting and Stopping MySQL Automatically”.

• Optionally, populate time zone tables to enable recognition of named time zones. For instructions, see Section 10.6, “MySQL Server Time Zone Support”.

When you are ready to create additional user accounts, you can find information on the MySQL access control system and account management in Section 6.2, “The MySQL Access Privilege System”, and Section 6.3, “MySQL User Account Management”.

2.12.1 Initializing the Data Directory

After installing MySQL, you must initialize the data directory, including the tables in the mysql system database. For some MySQL installation methods, data directory initialization may be done automatically, as described in Section 2.12, “Postinstallation Setup and Testing”. For other installation methods, including installation from generic binary and source distributions, you must initialize the data directory yourself.

This section describes how to initialize the data directory on Unix and Unix-like systems. (For Windows, see Section 2.3.8, “Windows Postinstallation Procedures”.) For some suggested commands that you can use to test whether the server is accessible and working properly, see Section 2.12.3, “Testing the Server”.

In the examples shown here, the server runs under the user ID of the mysql login account. This assumes that such an account exists. Either create the account if it does not exist, or substitute the name of a different existing login account that you plan to use for running the server. For information about creating the account, see Creating a mysql System User and Group, in Section 2.2, “Installing MySQL on Unix/Linux Using Generic Binaries”.

1. Change location into the top-level directory of your MySQL installation, represented here by BASEDIR:

```
shell> cd BASEDIR
```

BASEDIR is likely to be something like /usr/local/mysql or /usr/local. The following steps assume that you have changed location to this directory.

You will find several files and subdirectories in the BASEDIR directory. The most important for installation purposes are the bin and scripts subdirectories, which contain the server as well as client and utility programs.

For some distribution types, mysqld is installed in the libexec directory.

2. If necessary, ensure that the distribution contents are accessible to mysql. If you installed the distribution as mysql, no further action is required. If you installed the distribution as root, its contents will be owned by root. Change its ownership to mysql by executing the following commands as root in the installation directory. The first command changes the owner attribute of the files to the mysql user. The second changes the group attribute to the mysql group.

```
shell> chown -R mysql .
shell> chgrp -R mysql .
```

3. If necessary, initialize the data directory, including the mysql database containing the initial MySQL grant tables that determine how users are permitted to connect to the server.
Typically, data directory initialization need be done only the first time you install MySQL. If you are upgrading an existing installation, you should run `mysql_upgrade` instead (see Section 4.4.8, “mysql_upgrade — Check and Upgrade MySQL Tables”). However, the command that initializes the data directory does not overwrite any existing privilege tables, so it should be safe to run in any circumstances.

The exact location of `mysql_install_db` depends on the layout for your given installation. To initialize the grant tables, use one of the following commands, depending on whether `mysql_install_db` is located in the `bin` or `scripts` directory:

```
shell> scripts/mysql_install_db --user=mysql
shell> bin/mysql_install_db --user=mysql
```

It is important to make sure that the database directories and files are owned by the `mysql` login account so that the server has read and write access to them when you run it later. To ensure this if you run `mysql_install_db` as `root`, include the `--user` option as shown. Otherwise, you should execute the program while logged in as `mysql`, in which case you can omit the `--user` option from the command.

The `mysql_install_db` command creates the server’s data directory. Under the data directory, it creates directories for the `mysql` database that holds the grant tables and the `test` database that you can use to test MySQL. The program also creates privilege table entries for the initial account or accounts. `test_`. For a complete listing and description of the grant tables, see Section 6.2, “The MySQL Access Privilege System”.

It might be necessary to specify other options such as `--basedir` or `--datadir` if `mysql_install_db` does not identify the correct locations for the installation directory or data directory. For example:

```
shell> scripts/mysql_install_db --user=mysql \
      --basedir=/opt/mysql/mysql \
      --datadir=/opt/mysql/mysql/data
```

If you do not want to have the `test` database, you can remove it after starting the server, using the instructions in Section 2.12.4, “Securing the Initial MySQL Accounts”.

If you have trouble with `mysql_install_db` at this point, see Section 2.12.1.1, “Problems Running mysql_install_db”.

4. After initializing the data directory, you can establish the final installation ownership settings. To leave the installation owned by `mysql`, no action is required here. Otherwise, most of the MySQL installation can be owned by `root` if you like. The exception is that the data directory must be owned by `mysql`. To accomplish this, run the following commands as `root` in the installation directory. For some distribution types, the data directory might be named `var` rather than `data`; adjust the second command accordingly.

```
shell> chown -R root .
shell> chown -R mysql data
```

If the plugin directory (the directory named by the `plugin_dir` system variable) is writable by the server, it may be possible for a user to write executable code to a file in the directory using `SELECT ... INTO DUMPFILE`. This can be prevented by making the plugin directory read only to the server or by setting the `secure_file_priv` system variable at server startup to a directory where `SELECT` writes can be performed safely.

5. If you installed MySQL using a source distribution, you may want to optionally copy one of the provided configuration files from the `support-files` directory into your `/etc` directory. There are different sample configuration files for different use cases, server types, and CPU and RAM
configurations. To use one of these standard files, copy it to `/etc/my.cnf`, or `/etc/mysql/my.cnf` and edit and check the configuration before starting your MySQL server for the first time.

You can also create `my.cnf` yourself and place into it the options the server should use at startup. See Section 5.1.2, “Server Configuration Defaults”.

If you do not copy one of the standard configuration files or create your own, the MySQL server starts with its default settings.

6. If you want MySQL to start automatically when you boot your machine, see Section 2.12.5, “Starting and Stopping MySQL Automatically”.

Data directory initialization creates time zone tables in the `mysql` database but does not populate them. To do so, use the instructions in Section 10.6, “MySQL Server Time Zone Support”.

### 2.12.1.1 Problems Running mysql_install_db

The purpose of the `mysql_install_db` program is to initialize the data directory, including the tables in the `mysql` system database. It does not overwrite existing MySQL privilege tables, and it does not affect any other data.

To re-create your privilege tables, first stop the `mysqld` server if it is running. Then rename the `mysql` directory under the data directory to save it, and run `mysql_install_db`. Suppose that your current directory is the MySQL installation directory and that `mysql_install_db` is located in the `bin` directory and the data directory is named `data`. To rename the `mysql` database and re-run `mysql_install_db`, use these commands.

```
shell> mv data/mysql data/mysql.old
shell> scripts/mysql_install_db --user=mysql
```

When you run `mysql_install_db`, you might encounter the following problems:

- **mysql_install_db fails to install the grant tables**

  You may find that `mysql_install_db` fails to install the grant tables and terminates after displaying the following messages:

  ```
  Starting mysqld daemon with databases from XXXXXX
  mysqld ended
  ```

  In this case, you should examine the error log file very carefully. The log should be located in the directory `XXXXXX` named by the error message and should indicate why `mysqld` did not start. If you do not understand what happened, include the log when you post a bug report. See Section 1.7, “How to Report Bugs or Problems”.

- **There is a mysqld process running**

  This indicates that the server is running, in which case the grant tables have probably been created already. If so, there is no need to run `mysql_install_db` at all because it needs to be run only once, when you first install MySQL.

- **Installing a second mysqld server does not work when one server is running**

  This can happen when you have an existing MySQL installation, but want to put a new installation in a different location. For example, you might have a production installation, but you want to create a second installation for testing purposes. Generally the problem that occurs when you try to run a second server is that it tries to use a network interface that is in use by the first server. In this case, you should see one of the following error messages:

  ```
  Can't start server: Bind on TCP/IP port:
  Address already in use
  ```
Can't start server: Bind on unix socket...

For instructions on setting up multiple servers, see Section 5.5, “Running Multiple MySQL Instances on One Machine”.

- You do not have write access to the /tmp directory

If you do not have write access to create temporary files or a Unix socket file in the default location (the /tmp directory) or the TMPDIR environment variable, if it has been set, an error occurs when you run mysql_install_db or the mysqld server.

You can specify different locations for the temporary directory and Unix socket file by executing these commands prior to starting mysql_install_db or mysqld, where some_tmp_dir is the full path name to some directory for which you have write permission:

```shell
shell> TMPDIR=/some_tmp_dir/
shell> MYSQL_UNIX_PORT=/some_tmp_dir/mysql.sock
shell> export TMPDIR MYSQL_UNIX_PORT
```

Then you should be able to run mysql_install_db and start the server with these commands:

```shell
shell> scripts/mysql_install_db --user=mysql
shell> bin/mysqld_safe --user=mysql &
```

If mysql_install_db is located in the bin directory, modify the first command to bin/mysql_install_db.

See Section B.5.3.6, “How to Protect or Change the MySQL Unix Socket File”, and Section 2.14, “Environment Variables”.

There are some alternatives to running the mysql_install_db program provided in the MySQL distribution:

- If you want the initial privileges to be different from the standard defaults, use account-management statements such as CREATE USER, GRANT, and REVOKE to change the privileges after the grant tables have been set up. In other words, run mysql_install_db, and then use mysql -u root mysql to connect to the server as the MySQL root user so that you can issue the necessary statements. (See Section 13.7.1, “Account Management Statements”.)

To install MySQL on several machines with the same privileges, put the CREATE USER, GRANT, and REVOKE statements in a file and execute the file as a script using mysql after running mysql_install_db. For example:

```shell
shell> scripts/mysql_install_db --user=mysql
shell> bin/mysql -u root < your_script_file
```

This enables you to avoid issuing the statements manually on each machine.

- It is possible to re-create the grant tables completely after they have previously been created. You might want to do this if you are just learning how to use CREATE USER, GRANT, and REVOKE and have made so many modifications after running mysql_install_db that you want to wipe out the tables and start over.

To re-create the grant tables, stop the server if it is running and remove the mysql database directory. Then run mysql_install_db again.

### 2.12.2 Starting the Server

This section describes how start the server on Unix and Unix-like systems. (For Windows, see Section 2.3.6.4, “Starting MySQL Server on Microsoft Windows for the First Time”.) For some
suggested commands that you can use to test whether the server is accessible and working properly, see Section 2.12.3, “Testing the Server”.

Start the MySQL server like this:

```
shell> bin/mysqld_safe --user=mysql &
```

It is important that the MySQL server be run using an unprivileged (non-root) login account. To ensure this if you run `mysqld_safe` as `root`, include the `--user` option as shown. Otherwise, execute the program while logged in as `mysql`, in which case you can omit the `--user` option from the command.

For further instructions for running MySQL as an unprivileged user, see Section 6.1.5, “How to Run MySQL as a Normal User”.

If the command fails immediately and prints `mysqld ended`, look for information in the error log (which by default is the `host_name.err` file in the data directory).

If the server is unable to access the data directory it starts or read the grant tables in the `mysql` database, it writes a message to its error log. Such problems can occur if you neglected to create the grant tables by initializing the data directory before proceeding to this step, or if you ran the command that initializes the data directory without the `--user` option. Remove the data directory and run the command with the `--user` option.

If you have other problems starting the server, see Section 2.12.2.1, “Troubleshooting Problems Starting the MySQL Server”. For more information about `mysqld_safe`, see Section 4.3.2, “`mysqld_safe` — MySQL Server Startup Script”.

You can set up new accounts using the `bin/mysql_setpermission` script if you install the DBI and `DBD::mysql` Perl modules. See Section 4.6.14, “`mysql_setpermission` — Interactively Set Permissions in Grant Tables”. For Perl module installation instructions, see Section 2.15, “Perl Installation Notes”.

If you would like to use `mysqlaccess` and have the MySQL distribution in some nonstandard location, you must change the location where `mysqlaccess` expects to find the `mysql` client. Edit the `bin/mysqlaccess` script at approximately line 18. Search for a line that looks like this:

```
$MYSQL     = '/usr/local/bin/mysql';    # path to mysql executable
```

Change the path to reflect the location where `mysql` actually is stored on your system. If you do not do this, a Broken pipe error will occur when you run `mysqlaccess`.

### 2.12.2.1 Troubleshooting Problems Starting the MySQL Server

This section provides troubleshooting suggestions for problems starting the server. For additional suggestions for Windows systems, see Section 2.3.7, “Troubleshooting a Microsoft Windows MySQL Server Installation”.

If you have problems starting the server, here are some things to try:

- Check the error log to see why the server does not start.
- Specify any special options needed by the storage engines you are using.
- Make sure that the server knows where to find the data directory.
- Make sure that the server can access the data directory. The ownership and permissions of the data directory and its contents must be set such that the server can read and modify them.
- Verify that the network interfaces the server wants to use are available.

167
Some storage engines have options that control their behavior. You can create a `my.cnf` file and specify startup options for the engines that you plan to use. If you are going to use storage engines that support transactional tables (InnoDB, NDB), be sure that you have them configured the way you want before starting the server:

If you are using InnoDB tables, see Section 14.6.2, “InnoDB Configuration”.

If you are using MySQL Cluster, see Section 17.3, “Configuration of MySQL Cluster NDB 6.1-7.1”.

Storage engines will use default option values if you specify none, but it is recommended that you review the available options and specify explicit values for those for which the defaults are not appropriate for your installation.

When the `mysqld` server starts, it changes location to the data directory. This is where it expects to find databases and where it expects to write log files. The server also writes the pid (process ID) file in the data directory.

The data directory location is hardwired in when the server is compiled. This is where the server looks for the data directory by default. If the data directory is located somewhere else on your system, the server will not work properly. You can determine what the default path settings are by invoking `mysqld` with the --verbose and --help options.

If the default locations do not match the MySQL installation layout on your system, you can override them by specifying options to `mysqld` or `mysqld_safe` on the command line or in an option file.

To specify the location of the data directory explicitly, use the `--datadir` option. However, normally you can tell `mysqld` the location of the base directory under which MySQL is installed and it looks for the data directory there. You can do this with the `--basedir` option.

To check the effect of specifying path options, invoke `mysqld` with those options followed by the --verbose and --help options. For example, if you change location into the directory where `mysqld` is installed and then run the following command, it shows the effect of starting the server with a base directory of `/usr/local`:

```
shell> ./mysqld --basedir=/usr/local --verbose --help
```

You can specify other options such as `--datadir` as well, but `--verbose` and `--help` must be the last options.

Once you determine the path settings you want, start the server without --verbose and --help.

If `mysqld` is currently running, you can find out what path settings it is using by executing this command:

```
shell> mysqladmin variables
```

Or:

```
shell> mysqladmin -h host_name variables
```

`host_name` is the name of the MySQL server host.

If you get `Errcode 13` (which means `Permission denied`) when starting `mysqld`, this means that the privileges of the data directory or its contents do not permit server access. In this case, you change the permissions for the involved files and directories so that the server has the right to use them. You can also start the server as `root`, but this raises security issues and should be avoided.

Change location into the data directory and check the ownership of the data directory and its contents to make sure the server has access. For example, if the data directory is `/usr/local/mysql/var`, use this command:
Testing the Server

If the data directory or its files or subdirectories are not owned by the login account that you use for running the server, change their ownership to that account. If the account is named `mysql`, use these commands:

```
shell> ls -la /usr/local/mysql/var
shell> chown -R mysql /usr/local/mysql/var
shell> chgrp -R mysql /usr/local/mysql/var
```

Even with correct ownership, MySQL might fail to start up if there is other security software running on your system that manages application access to various parts of the file system. In this case, reconfigure that software to enable `mysqld` to access the directories it uses during normal operation.

If the server fails to start up correctly, check the error log. Log files are located in the data directory (typically `C:\Program Files\MySQL\MySQL Server 5.1\data` on Windows, `/usr/local/mysql/data` for a Unix/Linux binary distribution, and `/usr/local/var` for a Unix/Linux source distribution). Look in the data directory for files with names of the form `host_name.err` and `host_name.log`, where `host_name` is the name of your server host. Then examine the last few lines of these files. You can use `tail` to display them:

```
shell> tail host_name.err
shell> tail host_name.log
```

The error log should contain information that indicates why the server could not start.

If either of the following errors occur, it means that some other program (perhaps another `mysqld` server) is using the TCP/IP port or Unix socket file that `mysqld` is trying to use:

```
Can't start server: Bind on TCP/IP port: Address already in use
Can't start server: Bind on unix socket...
```

Use `ps` to determine whether you have another `mysqld` server running. If so, shut down the server before starting `mysqld` again. (If another server is running, and you really want to run multiple servers, you can find information about how to do so in Section 5.5, “Running Multiple MySQL Instances on One Machine”.)

If no other server is running, try to execute the command `telnet your_host_name tcp_ip_port_number`. (The default MySQL port number is 3306.) Then press Enter a couple of times. If you do not get an error message like `telnet: Unable to connect to remote host: Connection refused`, some other program is using the TCP/IP port that `mysqld` is trying to use. You will need to track down what program this is and disable it, or else tell `mysqld` to listen to a different port with the `--port` option. In this case, you will also need to specify the port number for client programs when connecting to the server using TCP/IP.

Another reason the port might be inaccessible is that you have a firewall running that blocks connections to it. If so, modify the firewall settings to permit access to the port.

If the server starts but you cannot connect to it, you should make sure that you have an entry in `/etc/hosts` that looks like this:

```
127.0.0.1 localhost
```

If you cannot get `mysql` to start, you can try to make a trace file to find the problem by using the `--debug` option. See Section 22.4.3, “The DBUG Package”.

### 2.12.3 Testing the Server

After the data directory is initialized and you have started the server, perform some simple tests to make sure that it works satisfactorily. This section assumes that your current location is the MySQL
Testing the Server

installation directory and that it has a `bin` subdirectory containing the MySQL programs used here. If that is not true, adjust the command path names accordingly.

Alternatively, add the `bin` directory to your `PATH` environment variable setting. That enables your shell (command interpreter) to find MySQL programs properly, so that you can run a program by typing only its name, not its path name. See Section 4.2.10, “Setting Environment Variables”.

Use `mysqladmin` to verify that the server is running. The following commands provide simple tests to check whether the server is up and responding to connections:

```
shell> bin/mysqladmin version
shell> bin/mysqladmin variables
```

If you cannot connect to the server, specify a `-u root` option to connect as `root`. If you have assigned a password for the `root` account already, you’ll also need to specify `-p` on the command line and enter the password when prompted. For example:

```
shell> bin/mysqladmin -u root -p version
Enter password: (enter root password here)
```

The output from `mysqladmin version` varies slightly depending on your platform and version of MySQL, but should be similar to that shown here:

```
shell> bin/mysqladmin version
mysqladmin Ver 14.12 Distrib 5.1.73, for pc-linux-gnu on i686
... Server version 5.1.73
Protocol version 10
Connection Localhost via UNIX socket
UNIX socket /var/lib/mysql/mysql.sock
Uptime: 14 days 5 hours 5 min 21 sec
Threads: 1 Questions: 366 Slow queries: 0
Opens: 0 Flush tables: 1 Open tables: 19
Queries per second avg: 0.000
```

To see what else you can do with `mysqladmin`, invoke it with the `--help` option.

Verify that you can shut down the server (include a `-p` option if the `root` account has a password already):

```
shell> bin/mysqladmin -u root shutdown
```

Verify that you can start the server again. Do this by using `mysqld_safe` or by invoking `mysqld` directly. For example:

```
shell> bin/mysqld_safe --user=mysql &
```

If `mysqld_safe` fails, see Section 2.12.2.1, “Troubleshooting Problems Starting the MySQL Server”.

Run some simple tests to verify that you can retrieve information from the server. The output should be similar to that shown here.

Use `mysqlshow` to see what databases exist:

```
shell> bin/mysqlshow
+-------------------+
| Databases         |
+-------------------+
```
The list of installed databases may vary, but will always include the minimum of `mysql` and `information_schema`.

If you specify a database name, `mysqlshow` displays a list of the tables within the database:

```
shell> bin/mysqlshow mysql
Database: mysql
<table>
<thead>
<tr>
<th>Tables</th>
</tr>
</thead>
<tbody>
<tr>
<td>columns_priv</td>
</tr>
<tr>
<td>db</td>
</tr>
<tr>
<td>event</td>
</tr>
<tr>
<td>func</td>
</tr>
<tr>
<td>help_category</td>
</tr>
<tr>
<td>help_keyword</td>
</tr>
<tr>
<td>help_relation</td>
</tr>
<tr>
<td>help_topic</td>
</tr>
<tr>
<td>host</td>
</tr>
<tr>
<td>ndb_binlog_index</td>
</tr>
<tr>
<td>plugin</td>
</tr>
<tr>
<td>proc</td>
</tr>
<tr>
<td>procs_priv</td>
</tr>
<tr>
<td>servers</td>
</tr>
<tr>
<td>tables_priv</td>
</tr>
<tr>
<td>time_zone</td>
</tr>
<tr>
<td>time_zone_leap_second</td>
</tr>
<tr>
<td>time_zone_name</td>
</tr>
<tr>
<td>time_zone_transition</td>
</tr>
<tr>
<td>time_zone_transition_type</td>
</tr>
<tr>
<td>user</td>
</tr>
</tbody>
</table>
```

Use the `mysql` program to select information from a table in the `mysql` database:

```
shell> bin/mysql -e "SELECT User, Host FROM mysql.user" mysql
<table>
<thead>
<tr>
<th>User</th>
<th>Host</th>
</tr>
</thead>
<tbody>
<tr>
<td>root</td>
<td>localhost</td>
</tr>
</tbody>
</table>
```

There is a benchmark suite in the `sql-bench` directory (under the MySQL installation directory) that you can use to compare how MySQL performs on different platforms. The benchmark suite is written in Perl. It requires the Perl DBI module that provides a database-independent interface to the various databases, and some other additional Perl modules:

```
DBI
DBD::mysql
Data::Dumper
Data::ShowTable
```

These modules can be obtained from CPAN (http://www.cpan.org/). See also Section 2.15.1, “Installing Perl on Unix”.

The `sql-bench/Results` directory contains the results from many runs against different databases and platforms. To run all tests, execute these commands:
Securing the Initial MySQL Accounts

If you do not have the sql-bench directory, you probably installed MySQL using RPM files other than the source RPM. (The source RPM includes the sql-bench benchmark directory.) In this case, you must first install the benchmark suite before you can use it. There are separate benchmark RPM files named mysql-bench-VERSION.i386.rpm that contain benchmark code and data.

If you have a source distribution, there are also tests in its tests subdirectory that you can run. For example, to run auto_increment.tst, execute this command from the top-level directory of your source distribution:

shell> mysql -vvf test < ./tests/auto_increment.tst

The expected result of the test can be found in the ./tests/auto_increment.res file.

At this point, your server is running and you can access it. To tighten security if you have not yet assigned passwords to the initial account or accounts, follow the instructions in Section 2.12.4, “Securing the Initial MySQL Accounts”.

For more information about mysql, mysqladmin, and mysqlshow, see Section 4.5.1, "mysql — The MySQL Command-Line Tool", Section 4.5.2, "mysqladmin — Client for Administering a MySQL Server", and Section 4.5.6, "mysqlshow — Display Database, Table, and Column Information".

2.12.4 Securing the Initial MySQL Accounts

The MySQL installation process involves initializing the data directory, including the mysql database containing the grant tables that define MySQL accounts. For details, see Section 2.12, “Postinstallation Setup and Testing”.

This section describes how to assign passwords to the initial accounts created during the MySQL installation procedure, if you have not already done so.

The mysql.user grant table defines the initial MySQL user accounts and their access privileges:

• Some accounts have the user name root. These are superuser accounts that have all privileges and can do anything. If these root accounts have empty passwords, anyone can connect to the MySQL server as root without a password and be granted all privileges.

• On Windows, root accounts are created that permit connections from the local host only. Connections can be made by specifying the host name localhost or the IP address 127.0.0.1. If the user selects the Enable root access from remote machines option during installation, the Windows installer creates another root account that permits connections from any host.

• On Unix, each root account permits connections from the local host. Connections can be made by specifying the host name localhost, the IP address 127.0.0.1, or the actual host name or IP address.

An attempt to connect to the host 127.0.0.1 normally resolves to the localhost account. However, this fails if the server is run with the --skip-name-resolve option, so the 127.0.0.1 account is useful in that case.

• If accounts for anonymous users were created, these have an empty user name. The anonymous accounts have no password, so anyone can use them to connect to the MySQL server.

• On Windows, there is one anonymous account that permits connections from the local host. Connections can be made by specifying a host name of localhost. The account has no global privileges. (Before MySQL 5.1.16, it has all global privileges, just like the root accounts.)
Securing the Initial MySQL Accounts

- On Unix, each anonymous account permits connections from the local host. Connections can be made by specifying a host name of `localhost` for one of the accounts, or the actual host name or IP address for the other.

To display which accounts exist in the `mysql.user` table and check whether their passwords are empty, use the following statement:

```
mysql> SELECT User, Host, Password FROM mysql.user;
```

<table>
<thead>
<tr>
<th>User</th>
<th>Host</th>
<th>Password</th>
</tr>
</thead>
<tbody>
<tr>
<td>root</td>
<td>localhost</td>
<td></td>
</tr>
<tr>
<td>root</td>
<td>myhost.example.com</td>
<td></td>
</tr>
<tr>
<td>root</td>
<td>127.0.0.1</td>
<td></td>
</tr>
<tr>
<td></td>
<td>localhost</td>
<td></td>
</tr>
<tr>
<td></td>
<td>myhost.example.com</td>
<td></td>
</tr>
</tbody>
</table>

This output indicates that there are several root and anonymous-user accounts, none of which have passwords. The output might differ on your system, but the presence of accounts with empty passwords means that your MySQL installation is unprotected until you do something about it:

- Assign a password to each MySQL root account that does not have one.

- To prevent clients from connecting as anonymous users without a password, either assign a password to each anonymous account or remove the accounts.

In addition, the `mysql.db` table contains rows that permit all accounts to access the `test` database and other databases with names that start with `test_`. This is true even for accounts that otherwise have no special privileges such as the default anonymous accounts. This is convenient for testing but inadvisable on production servers. Administrators who want database access restricted only to accounts that have permissions granted explicitly for that purpose should remove these `mysql.db` table rows.

The following instructions describe how to set up passwords for the initial MySQL accounts, first for the root accounts, then for the anonymous accounts. The instructions also cover how to remove anonymous accounts, should you prefer not to permit anonymous access at all, and describe how to remove permissive access to test databases. Replace `new_password` in the examples with the password that you want to use. Replace `host_name` with the name of the server host. You can determine this name from the output of the preceding `SELECT` statement. For the output shown, `host_name` is `myhost.example.com`.

```
mysql> SELECT User, Host, Password FROM mysql.user;
```

<table>
<thead>
<tr>
<th>User</th>
<th>Host</th>
<th>Password</th>
</tr>
</thead>
<tbody>
<tr>
<td>root</td>
<td>localhost</td>
<td></td>
</tr>
<tr>
<td>root</td>
<td>myhost.example.com</td>
<td></td>
</tr>
<tr>
<td>root</td>
<td>127.0.0.1</td>
<td></td>
</tr>
<tr>
<td></td>
<td>localhost</td>
<td></td>
</tr>
<tr>
<td></td>
<td>myhost.example.com</td>
<td></td>
</tr>
</tbody>
</table>

Note
For additional information about setting passwords, see Section 6.3.5, “Assigning Account Passwords”. If you forget your root password after setting it, see Section B.5.3.2, “How to Reset the Root Password”.

To set up additional accounts, see Section 6.3.2, “Adding User Accounts”.

You might want to defer setting the passwords until later, to avoid the need to specify them while you perform additional setup or testing. However, be sure to set them before using your installation for production purposes.

Note
On Windows, you can also perform the process described in this section using the Configuration Wizard (see Section 2.3.5.11, “MySQL Server Instance Config Wizard: The Security Options Dialog”). On all platforms, the MySQL distribution includes `mysql_secure_installation`, a command-line utility that automates much of the process of securing a MySQL installation.
Assigning root Account Passwords

A root account password can be set several ways. The following discussion demonstrates three methods:

- Use the `SET PASSWORD` statement
- Use the `UPDATE` statement
- Use the `mysqladmin` command-line client program

To assign passwords using `SET PASSWORD`, connect to the server as root and issue a `SET PASSWORD` statement for each root account listed in the `mysql.user` table.

For Windows, do this:
```
shell> mysql -u root
mysql>
SET PASSWORD FOR 'root'@'localhost' = PASSWORD('new_password');
mysql>
SET PASSWORD FOR 'root'@'127.0.0.1' = PASSWORD('new_password');
mysql>
SET PASSWORD FOR 'root'@'%' = PASSWORD('new_password');
```

The last statement is unnecessary if the `mysql.user` table has no root account with a host value of `%`.

For Unix, do this:
```
shell> mysql -u root
mysql>
SET PASSWORD FOR 'root'@'localhost' = PASSWORD('new_password');
mysql>
SET PASSWORD FOR 'root'@'127.0.0.1' = PASSWORD('new_password');
mysql>
SET PASSWORD FOR 'root'@'host_name' = PASSWORD('new_password');
```

You can also use a single statement that assigns a password to all root accounts by using `UPDATE` to modify the `mysql.user` table directly. This method works on any platform:
```
shell> mysql -u root
mysql>
UPDATE mysql.user SET Password = PASSWORD('new_password')
    -> WHERE User = 'root';
mysql>
FLUSH PRIVILEGES;
```

The `FLUSH` statement causes the server to reread the grant tables. Without it, the password change remains unnoticed by the server until you restart it.

To assign passwords to the root accounts using `mysqladmin`, execute the following commands:
```
shell> mysqladmin -u root password "new_password"
shell> mysqladmin -u root -h host_name password "new_password"
```

Those commands apply both to Windows and to Unix. The double quotation marks around the password are not always necessary, but you should use them if the password contains spaces or other characters that are special to your command interpreter.

The `mysqladmin` method of setting the root account passwords does not work for the 'root'@'127.0.0.1' account. Use the `SET PASSWORD` method shown earlier.

After the root passwords have been set, you must supply the appropriate password whenever you connect as root to the server. For example, to shut down the server with `mysqladmin`, use this command:
```
shell> mysqladmin -u root -p shutdown
Enter password: (enter root password here)
```
Securing the Initial MySQL Accounts

The `mysql` commands in the following instructions include a `-p` option based on the assumption that you have assigned the `root` account passwords using the preceding instructions and must specify that password when connecting to the server.

Assigning Anonymous Account Passwords

To assign passwords to the anonymous accounts, connect to the server as `root`, then use either `SET PASSWORD` or `UPDATE`.

To use `SET PASSWORD` on Windows, do this:

```
shell> mysql -u root -p
Enter password: (enter root password here)
mysql> SET PASSWORD FOR ''@'localhost' = PASSWORD('new_password');
```

To use `SET PASSWORD` on Unix, do this:

```
shell> mysql -u root -p
Enter password: (enter root password here)
mysql> SET PASSWORD FOR ''@'localhost' = PASSWORD('new_password');
```

To set the anonymous-user account passwords with a single `UPDATE` statement, do this (on any platform):

```
shell> mysql -u root -p
Enter password: (enter root password here)
mysql> UPDATE mysql.user SET Password = PASSWORD('new_password')
   -> WHERE User = '';
mysql> FLUSH PRIVILEGES;
```

The `FLUSH` statement causes the server to reread the grant tables. Without it, the password change remains unnoticed by the server until you restart it.

Removing Anonymous Accounts

If you prefer to remove any anonymous accounts rather than assigning them passwords, do so as follows on Windows:

```
shell> mysql -u root -p
Enter password: (enter root password here)
mysql> DROP USER ''@'localhost';
```

On Unix, remove the anonymous accounts like this:

```
shell> mysql -u root -p
Enter password: (enter root password here)
mysql> DROP USER ''@'localhost';
mysql> DROP USER ''@'host_name';
```

Securing Test Databases

By default, the `mysql.db` table contains rows that permit access by any user to the `test` database and other databases with names that start with `test_`. (These rows have an empty `User` column value, which for access-checking purposes matches any user name.) This means that such databases can be used even by accounts that otherwise possess no privileges. If you want to remove any-user access to test databases, do so as follows:

```
shell> mysql -u root -p
```
Enter password: (enter root password here)
mysql> DELETE FROM mysql.db WHERE Db LIKE 'test%';
mysql> FLUSH PRIVILEGES;

The **FLUSH** statement causes the server to reread the grant tables. Without it, the privilege change remains unnoticed by the server until you restart it.

With the preceding change, only users who have global database privileges or privileges granted explicitly for the **test** database can use it. However, if you prefer that the database not exist at all, drop it:

mysql> DROP DATABASE test;

### 2.12.5 Starting and Stopping MySQL Automatically

This section discusses methods for starting and stopping the MySQL server.

Generally, you start the **mysql** server in one of these ways:

- Invoke **mysqld** directly. This works on any platform.
- On Windows, you can set up a MySQL service that runs automatically when Windows starts. See Section 2.3.6.7, “Starting MySQL Server as a Microsoft Windows Service”.
- On Unix and Unix-like systems, you can invoke **mysqld_safe**, which tries to determine the proper options for **mysqld** and then runs it with those options. See Section 4.3.2, “**mysqld_safe** — MySQL Server Startup Script”.
- On systems that use System V-style run directories (that is, /etc/init.d and run-level specific directories), invoke **mysql.server**. This script is used primarily at system startup and shutdown. It usually is installed under the name **mysql**. The **mysql.server** script starts the server by invoking **mysqld_safe**. See Section 4.3.3, “**mysql.server** — MySQL Server Startup Script”.
- On OS X, install a launchd daemon to enable automatic MySQL startup at system startup. The daemon starts the server by invoking **mysqld_safe**. For details, see Section 2.4.3, “Installing a MySQL Launch Daemon”. A MySQL Preference Pane also provides control for starting and stopping MySQL through the System Preferences. See Section 2.4.5, “Installing and Using the MySQL Preference Pane”.
- On Solaris/OpenSolaris, use the service management framework (SMF) system to initiate and control MySQL startup. For more information, see Section 2.6.2, “Installing MySQL on OpenSolaris Using IPS”.

The **mysqld_safe** and **mysql.server** scripts, Solaris/OpenSolaris SMF, and the OS X Startup Item (or MySQL Preference Pane) can be used to start the server manually, or automatically at system startup time. **mysql.server** and the Startup Item also can be used to stop the server.

The following table shows which option groups the server and startup scripts read from option files.

<table>
<thead>
<tr>
<th>Table 2.20 MySQL Startup Scripts and Supported Server Option Groups</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Script</strong></td>
</tr>
<tr>
<td>-----------------------------</td>
</tr>
<tr>
<td>mysqld</td>
</tr>
<tr>
<td>mysqld_safe</td>
</tr>
<tr>
<td>mysql.server</td>
</tr>
</tbody>
</table>

**[mysqld-major_version]** means that groups with names like [mysqld-5.0] and [mysqld-5.1] are read by servers having versions 5.0.x, 5.1.x, and so forth. This feature can be used to specify options that can be read only by servers within a given release series.
For backward compatibility, `mysql.server` also reads the `[mysql_server]` group and `mysqld_safe` also reads the `[safe_mysqld]` group. However, you should update your option files to use the `[mysql.server]` and `[mysqld_safe]` groups instead.

For more information on MySQL configuration files and their structure and contents, see Section 4.2.6, “Using Option Files”.

### 2.13 Upgrading or Downgrading MySQL

This section describes the steps to upgrade or downgrade a MySQL installation.

Upgrading is a common procedure, as you pick up bug fixes within the same MySQL release series or significant features between major MySQL releases. You perform this procedure first on some test systems to make sure everything works smoothly, and then on the production systems.

Downgrading is less common. Typically, you undo an upgrade because of some compatibility or performance issue that occurs on a production system, and was not uncovered during initial upgrade verification on the test systems. As with the upgrade procedure, perform and verify the downgrade procedure on some test systems first, before using it on a production system.

#### 2.13.1 Upgrading MySQL

This section describes how to upgrade to a new MySQL version.

- **Supported Upgrade Methods**
- **Supported Upgrade Paths**
- **Before You Begin**
- **Performing an In-place Upgrade**
- **Performing a Logical Upgrade**
- **Upgrade Troubleshooting**

**Supported Upgrade Methods**

- **In-place Upgrade**: Involves shutting down the old MySQL version, replacing the old MySQL binaries or packages with the new ones, restarting MySQL on the existing data directory, and running `mysql_upgrade`.

- **Logical Upgrade**: Involves exporting existing data from the old MySQL version using `mysqldump`, installing the new MySQL version, loading the dump file into the new MySQL version, and running `mysql_upgrade`.

**Note**

MySQL recommends a `mysqldump` upgrade when upgrading from a previous release. For example, use this method when upgrading from 5.0 to 5.1.

For in-place and logical upgrade procedures, see **Performing an In-place Upgrade**, and **Performing a Logical Upgrade**.

If you run MySQL Server on Windows, see Section 2.3.9, “Upgrading MySQL Server on Microsoft Windows”.

**Supported Upgrade Paths**

Unless otherwise documented, the following upgrade paths are supported:
• Upgrading from a release series version to a newer release series version is supported. For example, upgrading from 5.1.71 to 5.1.72 is supported. Skipping release series versions is also supported. For example, upgrading from 5.1.70 to 5.1.72 is supported.

• Upgrading one release level is supported. For example, upgrading from 5.0 to 5.1 is supported. Upgrading to the latest release series version is recommended before upgrading to the next release level. For example, upgrade to the latest 5.0 release before upgrading to 5.1.

• Upgrading more than one release level is supported, but only if you upgrade one release level at a time. For example, if you currently are running MySQL 4.1 and wish to upgrade to a newer series, upgrade to MySQL 5.0 first before upgrading to MySQL 5.1, and so forth. For information on upgrading to MySQL 5.0 see the MySQL 5.0 Reference Manual.

• Direct upgrades that skip a release level (for example, upgrading directly from MySQL 4.1 to 5.1) are not recommended or supported.

The following conditions apply to all upgrade paths:

• Upgrades between General Availability (GA) status releases are supported.

• Upgrades between milestone releases (or from a milestone release to a GA release) are not supported.

• For upgrades between versions of a MySQL release series that has reached GA status, you can move the MySQL format files and data files between different versions on systems with the same architecture. This is not necessarily true for upgrades between milestone releases. Use of milestone releases is at your own risk.

**Before You Begin**

Before upgrading, review the following information and perform the recommended steps:

• Before upgrading, protect your data by creating a backup of your current databases and log files. The backup should include the mysql database, which contains the MySQL system tables. See Section 7.2, “Database Backup Methods”.

• Review the Release Notes which provide information about features that are new in the MySQL 5.1 or differ from those found in earlier MySQL releases. Some of these changes may result in incompatibilities.

• Review Section 2.13.1.1, “Changes Affecting Upgrades to 5.1”. This section describes changes that may require action before or after upgrading.

• Check Section 2.13.3, “Checking Whether Tables or Indexes Must Be Rebuilt”, to see whether changes to table formats or to character sets or collations were made between your current version of MySQL and the version to which you are upgrading. If such changes have resulted in an incompatibility between MySQL versions, you will need to upgrade the affected tables using the instructions in Section 2.13.4, “Rebuilding or Repairing Tables or Indexes”.

• If you use replication, see Section 16.4.3, “Upgrading a Replication Setup”, for information on upgrading your replication setup.

• If you use XA transactions with InnoDB, run XA_RECOVER before upgrading to check for uncommitted XA transactions. If results are returned, either commit or rollback the XA transactions by issuing an XA_COMMIT or XA_ROLLBACK statement.

• If your MySQL installation contains a large amount of data that might take a long time to convert after an in-place upgrade, you might find it useful to create a “dummy” database instance for assessing what conversions might be needed and the work involved to perform them. Make a copy of your MySQL instance that contains a full copy of the mysql database, plus all other databases without data. Run your upgrade procedure on this dummy instance to see what actions might be needed.
Upgrading MySQL

so that you can better evaluate the work involved when performing actual data conversion on your original database instance.

- Rebuilding and reinstalling the Perl DBD::mysql module whenever you install or upgrade to a new release of MySQL is recommended. The same applies to other MySQL interfaces as well, such as PHP mysql extensions and the Python MySQLdb module.

Performing an In-place Upgrade

This section describes how to perform an in-place upgrade. Review Before you Begin before proceeding.

**Note**

If you upgrade an installation originally produced by installing multiple RPM packages, upgrade all the packages, not just some. For example, if you previously installed the server and client RPMs, do not upgrade just the server RPM.

To perform an in-place upgrade:

1. Review the changes described in Section 2.13.1.1, “Changes Affecting Upgrades to 5.1” for steps to be performed before upgrading.

2. If you use InnoDB, configure MySQL to perform a slow shutdown by setting innodb_fast_shutdown to 0. For example:

   ```
   shell> bin/mysql -u root -p password --execute="set global innodb_fast_shutdown=0"
   ```

   With a slow shutdown, InnoDB performs a full purge and change buffer merge before shutting down, which ensures that data files are fully prepared in case of file format differences between releases.

3. Shut down the old MySQL server. For example:

   ```
   shell> bin/mysqladmin -u root -p password shutdown
   ```

4. Upgrade the MySQL binaries or packages in place (replace the old binaries with the new ones).

5. Start the MySQL 5.1 server, using the existing data directory. For example:

   ```
   shell> bin/mysqld_safe --user=mysql --datadir=/path/to/existing-datadir
   ```

6. Run mysql_upgrade. For example:

   ```
   shell> bin/mysql_upgrade -u root -p password
   ```

   mysql_upgrade examines all tables in all databases for incompatibilities with the current version of MySQL. mysql_upgrade also upgrades the system tables so that you can take advantage of new privileges or capabilities.

   **Note**

   mysql_upgrade does not upgrade the contents of the help tables. For upgrade instructions, see Section 5.1.9, “Server-Side Help”.

Performing a Logical Upgrade

This section describes how to perform a logical upgrade. Review Before you Begin before proceeding.

To perform a logical upgrade:
1. Review the changes described in Section 2.13.1.1, “Changes Affecting Upgrades to 5.1” for steps to be performed before upgrading.

2. Export your existing data from the previous MySQL version:

```shell
mysqldump --add-drop-table --routines --events
--all-databases --force > data-for-upgrade.sql
```

**Note**
Use the `--routines` and `--events` options with `mysqldump` (as shown above) if your databases include stored programs. The `--all-databases` option includes all databases in the dump, including the `mysql` database that holds the system tables.

3. Shut down the old MySQL server. For example:

```shell
bin/mysqladmin -u root -p password shutdown
```

4. Install MySQL 5.1. For installation instructions, see Chapter 2, Installing and Upgrading MySQL.

5. Initialize a new data directory:

```shell
scripts/mysql_install_db --user=mysql --datadir=/path/to/5.1-datadir
```

6. Start the MySQL 5.1 server, using the new data directory. For example:

```shell
bin/mysqld_safe --user=mysql --datadir=/path/to/5.1-datadir
```

7. Load the previously created dump file into the new MySQL server. For example:

```shell
bin/mysql -u root -p password --execute="source data-for-upgrade.sql" --force
```

8. Run `mysql_upgrade`. For example:

```shell
bin/mysql_upgrade -u root -p
```

`mysql_upgrade` examines all tables in all databases for incompatibilities with the current version of MySQL. `mysql_upgrade` also upgrades the system tables so that you can take advantage of new privileges or capabilities.

**Note**
`mysql_upgrade` does not upgrade the contents of the help tables. For upgrade instructions, see Section 5.1.9, “Server-Side Help”.

9. If you use InnoDB, configure MySQL to perform a slow shutdown by setting `innodb_fast_shutdown` to 0. For example:

```shell
bin/mysql -u root -p password --execute="set global innodb_fast_shutdown=0"
```

10. Shut down and restart the MySQL server to ensure a clean shutdown and startup. For example:

```shell
bin/mysqladmin -u root -p password shutdown

bin/mysqld_safe --user=mysql --datadir=/path/to/5.1-datadir
```

**Upgrade Troubleshooting**

- If problems occur, such as that the new `mysqld` server does not start or that you cannot connect without a password, verify that you do not have an old `my.cnf` file from your previous installation. You can check this with the `--print-defaults` option (for example, `mysqld --print-defaults`). If this command displays anything other than the program name, you have an active `my.cnf` file that affects server or client operation.
• If, after an upgrade, you experience problems with compiled client programs, such as Commands out of sync or unexpected core dumps, you probably have used old header or library files when compiling your programs. In this case, check the date for your mysql.h file and libmysqlclient.a library to verify that they are from the new MySQL distribution. If not, recompile your programs with the new headers and libraries. Recompilation might also be necessary for programs compiled against the shared client library if the library major version number has changed (for example from libmysqlclient.so.15 to libmysqlclient.so.16).

• If you have created a user-defined function (UDF) with a given name and upgrade MySQL to a version that implements a new built-in function with the same name, the UDF becomes inaccessible. To correct this, use DROP FUNCTION to drop the UDF, and then use CREATE FUNCTION to re-create the UDF with a different nonconflicting name. The same is true if the new version of MySQL implements a built-in function with the same name as an existing stored function. See Section 9.2.4, “Function Name Parsing and Resolution”, for the rules describing how the server interprets references to different kinds of functions.

2.13.1.1 Changes Affecting Upgrades to 5.1

Before upgrading to MySQL 5.1, review the changes described in this section to identify upgrade issues that apply to your current MySQL installation and applications.

Note

In addition to the changes outlined in this section, review the Release Notes and other important information outlined in Before You Begin.

Changes marked as either Known issue or Incompatible change are incompatibilities with earlier versions of MySQL, and may require your attention before you upgrade. Our aim is to avoid these changes, but occasionally they are necessary to correct problems that would be worse than an incompatibility between releases. If any upgrade issue applicable to your installation involves an incompatibility that requires special handling, follow the instructions given in the incompatibility description. Sometimes this involves dumping and reloading tables, or use of a statement such as CHECK TABLE or REPAIR TABLE.

For dump and reload instructions, see Section 2.13.4, “Rebuilding or Repairing Tables or Indexes”. Any procedure that involves REPAIR TABLE with the USE_FRM option must be done before upgrading. Use of this statement with a version of MySQL different from the one used to create the table (that is, using it after upgrading) may damage the table. See Section 13.7.2.6, “REPAIR TABLE Syntax”.

• Configuration Changes

• System Table Changes

• Server Changes

• SQL Changes

• C API Changes

Configuration Changes

• Before MySQL 5.1.11, to build MySQL from source with SSL support enabled, you would invoke configure with either the --with-openssl or --with-yassl option. In MySQL 5.1.11, those options both have been replaced by the --with-ssl option. By default, --with-ssl causes the bundled yaSSL library to be used. To select OpenSSL instead, give the option as --with-ssl=path, where path is the directory where the OpenSSL header files and libraries are located.

System Table Changes

• After upgrading a 5.0 installation to 5.0.10 or above, it is necessary to upgrade your grant tables using mysql_upgrade. Otherwise, creating stored procedures and functions might not work. Running mysql_upgrade is part of the the in-place and logical upgrade procedures.
Server Changes

• As of MySQL 5.1.9, the `mysqld-max` server is included in binary distributions. There is no separate MySQL-Max distribution. As of MySQL 5.1.12, there is no `mysqld-max` server at all in binary distributions. They contain a server that includes the features previously included in `mysqld-max`.

• **Known issue:** As of MySQL 5.1.70, for new installations, the `url` columns in the `mysql` database help tables are now created as type `TEXT` to accommodate longer URLs. For upgrades, `mysql_upgrade` does *not* update the columns. Modify them manually using these statements:

  ```sql
  ALTER TABLE mysql.help_category MODIFY url TEXT NOT NULL;
  ALTER TABLE mysql.help_topic MODIFY url TEXT NOT NULL;
  ```

• **Known issue:** `mysql_upgrade` attempts to upgrade tables that are incompatible with the current version of MySQL. (It invokes `mysqlcheck` to check tables and, if necessary, repair them.) However this can fail for storage engines that do not support `REPAIR TABLE`, such as `InnoDB`, and leave tables in a nonupgradable state.

  To work around this problem, use `ALTER TABLE tbl_name ENGINE=InnoDB` to perform a “null” alter operation that rebuilds the table.

• **Known issue:** After a binary upgrade to MySQL 5.1 from a MySQL 5.0 installation that contains `ARCHIVE` tables:

  • Before MySQL 5.1.42, accessing those tables will cause the server to crash, even if you have run `mysql_upgrade` or `CHECK TABLE ... FOR UPGRADE.`

  • As of MySQL 5.1.42, the server will not open 5.0 `ARCHIVE` tables at all.

  In either case, the solution is to use `mysqldump` to dump all 5.0 `ARCHIVE` tables before upgrading, and reload them into MySQL 5.1 after upgrading. This problem is fixed in MySQL 5.6.4: The server can open `ARCHIVE` tables created in MySQL 5.0. However, it remains the recommended upgrade procedure to dump 5.0 `ARCHIVE` tables before upgrading and reload them after upgrading.

• **Known issue:** The fix for Bug #23491 introduced a problem with `SHOW CREATE VIEW`, which is used by `mysqldump`. This causes an incompatibility when upgrading from versions affected by that bug fix (MySQL 5.0.40 through 5.0.43, MySQL 5.1.18 through 5.1.19): If you use `mysqldump` before upgrading from an affected version and reload the data after upgrading to a higher version, you must drop and recreate your views.

• **Known issue:** Dumps performed by using `mysqldump` to generate a dump file before the upgrade and reloading the file after upgrading are subject to the following problem:

  Before MySQL 5.0.40, `mysqldump` displays `SPATIAL` index definitions using prefix lengths for the indexed columns. These prefix lengths are accepted in MySQL 5.0, but not as of MySQL 5.1. If you use `mysqldump` from versions of MySQL older than 5.0.40, any table containing `SPATIAL` indexes will cause an error when the dump file is reloaded into MySQL 5.1 or higher.

  For example, a table definition might look like this when dumped in MySQL 5.0:

  ```sql
  CREATE TABLE `t` (  
  `g` geometry NOT NULL,  
  SPATIAL KEY `g` (`g`(32))  
  ) ENGINE=MyISAM DEFAULT CHARSET=latin1
  ```

  The `SPATIAL` index definition will not be accepted in MySQL 5.1. To work around this, edit the dump file to remove the prefix:

  ```sql
  CREATE TABLE `t` (  
  `g` geometry NOT NULL,  
  SPATIAL KEY `g` (`g`)  
  )
Dump files can be large, so it may be preferable to dump table definitions and data separately to make it easier to edit the definitions:

```
shell> mysqldump --no-data other_args > definitions.sql
shell> mysqldump --no-create-info other_args > data.sql
```

Then edit `definitions.sql` before reloading `definitions.sql` and `data.sql`, in that order.

If you upgrade to a version of MySQL 5.0 higher than 5.0.40 before upgrading to MySQL 5.1, this problem does not occur.

- **Known issue:** Before MySQL 5.1.30, the `CHECK TABLE ... FOR UPGRADE` statement did not check for incompatible collation changes made in MySQL 5.1.24. (This also affects `mysqlcheck` and `mysql_upgrade`, which cause that statement to be executed.)

Prior to the fix made in 5.1.30, a binary upgrade (performed without dumping tables with `mysqldump` before the upgrade and reloading the dump file after the upgrade) would corrupt tables. After the fix, `CHECK TABLE ... FOR UPGRADE` properly detects the problem and warns about tables that need repair.

However, the fix is not backward compatible and can result in a downgrading problem under these circumstances:

1. Perform a binary upgrade to a version of MySQL that includes the fix.
2. Run `CHECK TABLE ... FOR UPGRADE` (or `mysqlcheck` or `mysql_upgrade`) to upgrade tables.
3. Perform a binary downgrade to a version of MySQL that does not include the fix.

The solution is to dump tables with `mysqldump` before the downgrade and reload the dump file after the downgrade. Alternatively, drop and recreate affected indexes.

- **Known issue:** MySQL introduces encoding for table names that have non-ASCII characters (see Section 9.2.3, “Mapping of Identifiers to File Names”). After a binary upgrade from MySQL 5.0 to 5.1 or higher, the server recognizes names that have non-ASCII characters and adds a `#mysql50#` prefix to them.

As of MySQL 5.1.31, `mysql_upgrade` encodes these names by executing the following command:

```
mysqlcheck --all-databases --check-upgrade --fix-db-names --fix-table-names
```

Prior to MySQL 5.1.31, `mysql_upgrade` does not execute this command, so you should execute it manually if you have database or table names that contain nonalphanumeric characters.

Prior to MySQL 5.1.23, the `mysqlcheck` command does not perform the name encoding for views. To work around this problem, drop each affected view and recreate it.

`mysqlcheck` cannot fix names that contain literal instances of the @ character that is used for encoding special characters. If you have databases or tables that contain this character, use `mysqldump` to dump them before upgrading to MySQL 5.1, and then reload the dump file after upgrading.

- **Known issue:** When upgrading from MySQL 5.0 to versions of 5.1 prior to 5.1.23, running `mysqlcheck` (or `mysql_upgrade`, which runs `mysqlcheck`) to upgrade tables fails for names that must be written as quoted identifiers. To work around this problem, rename each affected table to a name that does not require quoting:
RENAME TABLE `table_a` TO table_a;
RENAME TABLE `table_b` TO table_b;

After renaming the tables, run the `mysql_upgrade` program. Then rename the tables back to their original names:

RENAME TABLE table_a TO `table_a`;
RENAME TABLE table_b TO `table_b`;

• **Known issue**: In connection with view creation, the server created `arc` directories inside database directories and maintained useless copies of `.frm` files there. Creation and renaming procedures of those copies as well as creation of `arc` directories has been discontinued in MySQL 5.1.29.

This change does cause a problem when downgrading to older server versions which manifests itself under these circumstances:

1. Create a view `v_orig` in MySQL 5.1.29 or higher.
2. Rename the view to `v_new` and then back to `v_orig`.
3. Downgrade to an older 5.1.x server and run `mysql_upgrade`.
4. Try to rename `v_orig` to `v_new` again. This operation fails.

As a workaround to avoid this problem, use either of these approaches:

• Dump your data using `mysqldump` before downgrading and reload the dump file after downgrading.

• Instead of renaming a view after the downgrade, drop it and recreate it.

• **Incompatible change**: Character set or collation changes may require table indexes to be rebuilt. In MySQL 5.1, these occurred in versions 5.1.21, 5.1.23, and 5.1.24. For details, see Section 2.13.3, “Checking Whether Tables or Indexes Must Be Rebuilt”.

• **Incompatible change**: Prior to MySQL 5.1.51, if you flushed the logs using `FLUSH LOGS` or `mysqladmin flush-logs` and `mysqld` was writing the error log to a file (for example, if it was started with the `--log-error` option), it renames the current log file with the suffix `-old`, then created a new empty log file. This had the problem that a second log-flushing operation thus caused the original error log file to be lost unless you saved it under a different name. For example, you could use the following commands to save the file:

```shell
shell> mysqladmin flush-logs
shell> mv host_name.err-old backup-directory
```

To avoid the preceding file-loss problem, no renaming occurs as of MySQL 5.1.51; the server merely closes and reopens the log file. To rename the file, you can do so manually before flushing. Then flushing the logs reopens a new file with the original file name. For example, you can rename the file and create a new one using the following commands:

```shell
shell> mv host_name.err host_name.err-old
shell> mysqladmin flush-logs
shell> mv host_name.err-old backup-directory
```

• **Incompatible change**: MySQL 5.1 implements support for a plugin API that enables the loading and unloading of components at runtime, without restarting the server. Section 22.2, “The MySQL Plugin API”. The plugin API requires the `mysql.plugin` table. After upgrading from an older version of MySQL, you should run the `mysql_upgrade` command to create this table. See Section 4.4.8, “mysql_upgrade — Check and Upgrade MySQL Tables”.

184
Plugins are installed in the directory named by the `plugin_dir` system variable. This variable also controls the location from which the server loads user-defined functions (UDFs), which is a change from earlier versions of MySQL. That is, all UDF library files now must be installed in the plugin directory. When upgrading from an older version of MySQL, you must migrate your UDF files to the plugin directory.

- **Incompatible change**: The `table_cache` system variable has been renamed to `table_open_cache`. Any scripts that refer to `table_cache` must be updated to use the new name.

- **Incompatible change**: In MySQL 5.1.36, options for loading plugins such as pluggable storage engines were changed from boolean to tristate format. The implementations overlap, but if you previously used options of the form `--plugin_name=0` or `--plugin_name=1`, you should instead use `--plugin_name=OFF` or `--plugin_name=ON`, respectively. For details, see Section 5.1.8.1, “Installing and Uninstalling Plugins”.

- **Incompatible change**: From MySQL 5.1.24 to 5.1.31, the `UPDATE` statement was changed such that assigning `NULL` to a `NOT NULL` column caused an error even when strict SQL mode was not enabled. The original behavior before MySQL 5.1.24 was that such assignments caused an error only in strict SQL mode, and otherwise set the column to the implicit default value for the column data type and generated a warning. (For information about implicit default values, see Section 11.6, “Data Type Default Values”.)

  The change caused compatibility problems for applications that relied on the original behavior. It also caused replication problems between servers that had the original behavior and those that did not, for applications that assigned `NULL` to `NOT NULL` columns in `UPDATE` statements without strict SQL mode enabled. The change was reverted in MySQL 5.1.32 so that `UPDATE` again had the original behavior. Problems can still occur if you replicate between servers that have the modified `UPDATE` behavior and those that do not.

- **Incompatible change**: As of MySQL 5.1.29, the default binary logging mode has been changed from `MIXED` to `STATEMENT` for compatibility with MySQL 5.0.

- **Incompatible change**: In MySQL 5.1.25, a change was made to the way that the server handles prepared statements. This affects prepared statements processed at the SQL level (using the `PREPARE` statement) and those processed using the binary client/server protocol (using the `mysql_stmt_prepare()` C API function).

  Previously, changes to metadata of tables or views referred to in a prepared statement could cause a server crash when the statement was next executed, or perhaps an error at execute time with a crash occurring later. For example, this could happen after dropping a table and recreating it with a different definition.

  Now metadata changes to tables or views referred to by prepared statements are detected and cause automatic repreparation of the statement when it is next executed. Metadata changes occur for DDL statements such as those that create, drop, alter, rename, or truncate tables, or that analyze, optimize, or repair tables. Repreparation also occurs after referenced tables or views are flushed from the table definition cache, either implicitly to make room for new entries in the cache, or explicitly due to `FLUSH TABLES`.

  Repreparation is automatic, but to the extent that it occurs, performance of prepared statements is diminished.

  Table content changes (for example, with `INSERT` or `UPDATE`) do not cause repreparation, nor do `SELECT` statements.

  An incompatibility with previous versions of MySQL is that a prepared statement may now return a different set of columns or different column types from one execution to the next. For example, if the
prepared statement is `SELECT * FROM t1`, altering `t1` to contain a different number of columns causes the next execution to return a number of columns different from the previous execution.

Older versions of the client library cannot handle this change in behavior. For applications that use prepared statements with the new server, an upgrade to the new client library is strongly recommended.

Along with this change to statement repreparation, the default value of the `table_definition_cache` system variable has been increased from 128 to 256. The purpose of this increase is to lessen the chance that prepared statements will need repreparation due to referred-to tables/views having been flushed from the cache to make room for new entries.

A new status variable, `Com_stmt_reprepare`, has been introduced to track the number of repreparations.

- **Incompatible change:** The `-`, `*`, and `/` operators and the functions `POW()` and `EXP()` could misbehave when used with floating-point numbers. Previously they might return `+INF`, `-INF`, or `NaN` in cases of numeric overflow (including that caused by division by zero) or when invalid arguments were used. As of MySQL 5.1.24, `NULL` is returned in all such cases.

- **Incompatible change:** As of MySQL 5.1.23, within a stored routine, it is no longer permissible to declare a cursor for a `SHOW` or `DESCRIBE` statement. This happened to work in some instances, but is no longer supported. In many cases, a workaround for this change is to use the cursor with a `SELECT` query to read from an `INFORMATION_SCHEMA` table that produces the same information as the `SHOW` statement.

- **Incompatible change:** `SHOW CREATE VIEW` displays view definitions using an `AS alias_name` clause for each column. If a column is created from an expression, the default alias is the expression text, which can be quite long. As of MySQL 5.1.23, aliases for column names in `CREATE VIEW` statements are checked against the maximum column length of 64 characters (not the maximum alias length of 256 characters). As a result, views created from the output of `SHOW CREATE VIEW` fail if any column alias exceeds 64 characters. This can cause problems for replication or loading dump files. For additional information and workarounds, see Section C.4, “Restrictions on Views”.

- **Incompatible change:** Several issues were identified for stored programs (stored procedures and functions, triggers, and events) and views containing non-ASCII symbols. These issues involved conversion errors due to incomplete character set information when translating these objects to and from stored format.

To address these problems, the representation for these objects was changed in MySQL 5.1.21. However, the fixes affect *all* stored programs and views. (For example, you will see warnings about “no creation context.”) To avoid warnings from the server about the use of old definitions from any release prior to 5.1.21, you should dump stored programs and views with `mysqldump` after upgrading to 5.1.21 or higher, and then reload them to recreate them with new definitions. Invoke `mysqldump` with a `--default-character-set` option that names the non-ASCII character set that was used for the definitions when the objects were originally created, and the `--routines`, `--events`, and `--triggers` options to dump stored program definitions.

Upgrading for triggers in particular must be handled carefully, for two reasons:

- The output from `mysqldump` does not contain a `DROP TRIGGER` statement preceding each `CREATE TRIGGER` statement, so reloading the dump file will fail to re-create the triggers unless you manually drop them after generating the dump file and before reloading it.

- If you are upgrading from a very old version of MySQL 5.0 (before 5.0.10), the trigger upgrade procedure is different because triggers for those versions were created using a different namespace (trigger names had to be unique per table, rather than per schema as is true now).

Assuming that you are upgrading from MySQL 5.0.10 to 5.1.20 to MySQL 5.1.21 or later, use the following procedure to upgrade your triggers:
Upgrading MySQL

- Use `mysqldump` to generate a dump file that contains the trigger definitions:

  ```
  mysqldump --triggers --no-create-db --no-data
  --no-create-info --all-databases > triggers.sql
  ```

  You might need to add options to specify connection parameters, such as `--user` or `--password`. Also, if you are updating from a version of MySQL 5.1 older than 5.1.21, you may need to include a `--default-character-set` option that specifies the non-ASCII character set that was used for the definitions when the triggers were originally created.

  Otherwise, invoke `mysqldump` with exactly the preceding options to avoid generating a dump file that will not have the intended effect when reloaded. For example, if you omit the `--no-create-db` option, your databases will be removed and recreated with no contents when you reload the dump file.

- Drop existing triggers. To see which triggers exist, use this statement:

  ```
  SELECT TRIGGER_SCHEMA, EVENT_OBJECT_TABLE, TRIGGER_NAME
  FROM INFORMATION_SCHEMA.TRIGGERS;
  ```

  To generate `DROP TRIGGERS` statements for the triggers, use this statement:

  ```
  SELECT CONCAT('DROP TRIGGER ', TRIGGER_SCHEMA, '.', TRIGGER_NAME, ' ;')
  INTO OUTFILE '/tmp/drop_triggers.sql';
  ```

  The statement uses `INTO OUTFILE`, so you must have the `FILE` privilege. The file will be created on the server host. Use a different file name if you like. To be 100% safe, inspect the trigger definitions in the `drop_triggers.sql` file, and perhaps make a backup of the file. Then execute the statements in the file:

  ```
  mysql --force < /tmp/drop_triggers.sql
  ```

- Recreate the triggers by reloading the dump file created earlier:

  ```
  mysql --force < triggers.sql
  ```

  For upgrades from a version of MySQL older than 5.0.10 to MySQL 5.1.21 or later, use the following procedure to upgrade your triggers:

  1. Upgrade to MySQL 5.1 to be able to access trigger information in the `INFORMATION_SCHEMA.TRIGGERS` table. (This should work even for pre-5.0.10 triggers.)

  2. Dump all trigger definitions using the following `SELECT` statement:

     ```
     SELECT CONCAT('CREATE TRIGGER ', t.TRIGGER_SCHEMA, '.', t.TRIGGER_NAME,
                   ' ', t.ACTION_TIMING, ' ', t.EVENT_MANIPULATION, ' ON ',
                   t.EVENT_OBJECT_SCHEMA, '.', t.EVENT_OBJECT_TABLE,
                   ' FOR EACH ROW ', t.ACTION_STATEMENT, ' ;')
     INTO OUTFILE '/tmp/triggers.sql'
     FROM INFORMATION_SCHEMA.TRIGGERS AS t;
     ```

     The statement uses `INTO OUTFILE`, so you must have the `FILE` privilege. The file will be created on the server host. Use a different file name if you like. To be 100% safe, inspect the trigger definitions in the `triggers.sql` file, and perhaps make a backup of the file.

  3. Stop the server and drop all triggers by removing all `.TRG` files in your database directories. Change location to your data directory and issue this command:
4. Start the server and re-create all triggers using the `triggers.sql` file:

```bash
shell> rm */*.TRG
mysql> delimiter //;
mysql> source /tmp/triggers.sql //
```

5. Use the `SHOW TRIGGERS` statement to check that all triggers were created successfully.

- **Incompatible change:** As of MySQL 5.1.20, `mysqld_safe` supports error logging to `syslog` on systems that support the `logger` command. The new `--syslog` and `--skip-syslog` options can be used instead of the `--log-error` option to control logging behavior, as described in Section 4.3.2, "`mysqld_safe` — MySQL Server Startup Script".

In 5.1.21 and up, the default is `--skip-syslog`, which is compatible with the default behavior of writing an error log file for releases prior to 5.1.20.

**In 5.1.20 only, the following conditions apply:**

1) The default is to use `syslog`, which is not compatible with releases prior to 5.1.20. 2) Logging to `syslog` may fail to operate correctly in some cases. For these reasons, avoid using MySQL 5.1.20.

- **Incompatible change:** As of MySQL 5.1.18, the plugin interface and its handling of system variables was changed. Command-line options such as `--skip-innodb` now cause an error if InnoDB is not built-in or plugin-loaded. You should use `--loose-skip-innodb` if you do not want any error even if InnoDB is not available. The `--loose` prefix modifier should be used for all command-line options where you are uncertain whether the plugin exists and when you want the operation to proceed even if the option is necessarily ignored due to the absence of the plugin. (For a description of how `--loose` works, see Section 4.2.4, "Using Options on the Command Line".)

- **Incompatible change:** As of MySQL 5.1.15, InnoDB rolls back only the last statement on a transaction timeout. A new option, `--innodb_rollback_on_timeout`, causes InnoDB to abort and roll back the entire transaction if a transaction timeout occurs (the same behavior as in MySQL 4.1).

- **Incompatible change:** As of MySQL 5.1.15, the following conditions apply to enabling the `read_only` system variable:

  - If you attempt to enable `read_only` while you have any explicit locks (acquired with `LOCK TABLES` or have a pending transaction, an error will occur.

  - If other clients hold explicit table locks or have pending transactions, the attempt to enable `read_only` blocks until the locks are released and the transactions end. While the attempt to enable `read_only` is pending, requests by other clients for table locks or to begin transactions also block until `read_only` has been set.

  - `read_only` can be enabled while you hold a global read lock (acquired with `FLUSH TABLES WITH READ LOCK`) because that does not involve table locks.

Previously, the attempt to enable `read_only` would return immediately even if explicit locks or transactions were pending, so some data changes could occur for statements executing in the server at the same time.

- **Incompatible change:** The number of function names affected by `IGNORE_SPACE` was reduced significantly in MySQL 5.1.13, from about 200 to about 30. (For details about `IGNORE_SPACE`, see Section 9.2.4, "Function Name Parsing and Resolution"). This change improves the consistency of parser operation. However, it also introduces the possibility of incompatibility for old SQL code that relies on the following conditions:

  - `IGNORE_SPACE` is disabled.
• The presence or absence of whitespace following a function name is used to distinguish between a built-in function and stored function that have the same name (for example, PI() versus PI()).

For functions that are no longer affected by IGNORE_SPACE as of MySQL 5.1.13, that strategy no longer works. Either of the following approaches can be used if you have code that is subject to the preceding incompatibility:

• If a stored function has a name that conflicts with a built-in function, refer to the stored function with a schema name qualifier, regardless of whether whitespace is present. For example, write schema_name.PI() or schema_name.PI().

• Alternatively, rename the stored function to use a nonconflicting name and change invocations of the function to use the new name.

**Incompatible change:** For utf8 columns, the full-text parser incorrectly considered several nonword punctuation and whitespace characters as word characters, causing some searches to return incorrect results. The fix involves a change to the full-text parser in MySQL 5.1.12, so as of 5.1.12, any tables that have FULLTEXT indexes on utf8 columns must be repaired with REPAIR TABLE:

```
REPAIR TABLE tbl_name QUICK;
```

**Incompatible change:** Storage engines can be pluggable at runtime, so the distinction between disabled and invalid storage engines no longer applies. As of MySQL 5.1.12, this affects the NO_ENGINE_SUBSTITUTION SQL mode, as described in Section 5.1.7, "Server SQL Modes".

**Incompatible change:** The structure of FULLTEXT indexes has been changed in MySQL 5.1.6. After upgrading to MySQL 5.1.6 or greater, any tables that have FULLTEXT indexes must be repaired with REPAIR TABLE:

```
REPAIR TABLE tbl_name QUICK;
```

**Incompatible change:** In MySQL 5.1.6, when log tables were implemented, the default log destination for the general query and slow query log was TABLE. As of MySQL 5.1.21, this default has been changed to FILE, which is compatible with MySQL 5.0, but incompatible with earlier releases of MySQL 5.1. If you are upgrading from MySQL 5.0 to 5.1.21 or higher, no logging option changes should be necessary. However, if you are upgrading from 5.1.6 through 5.1.20 to 5.1.21 or higher and were using TABLE logging, use the --log-output=TABLE option explicitly to preserve your server’s table-logging behavior.

**Incompatible change:** In very old versions of MySQL (prior to 4.1), the TIMESTAMP data type supported a display width, which was silently ignored beginning with MySQL 4.1. This is deprecated in MySQL 5.1, and removed altogether in MySQL 5.5. These changes in behavior can lead to two problem scenarios when trying to use TIMESTAMP(N) columns with a MySQL 5.5 or later server:

• When importing a dump file (for example, one created using mysqldump) created in a MySQL 5.0 or earlier server into a server from a newer release series, a CREATE TABLE or ALTER TABLE statement containing TIMESTAMP(N) causes the import to fail with a syntax error.

To fix this problem, edit the dump file in a text editor to replace any instances of TIMESTAMP(N) with TIMESTAMP prior to importing the file. Be sure to use a plain text editor for this, and not a word processor; otherwise, the result is almost certain to be unusable for importing into the MySQL server.

You should try to handle potential issues of these types proactively by updating with ALTER TABLE any TIMESTAMP(N) columns in your databases so that they use TIMESTAMP instead, before performing any upgrades.
• **Incompatible change**: For ENUM columns that had enumeration values containing commas, the commas were mapped to \texttt{0xff} internally. However, this rendered the commas indistinguishable from true \texttt{0xff} characters in the values. This no longer occurs. However, the fix requires that you dump and reload any tables that have ENUM columns containing true \texttt{0xff} in their values: Dump the tables using mysqldump with the current server before upgrading from a version of MySQL 5.1 older than 5.1.15 to version 5.1.15 or newer.

• As of MySQL 5.1.12, the \texttt{lc_time_names} system variable specifies the locale that controls the language used to display day and month names and abbreviations. This variable affects the output from the \texttt{DATE_FORMAT()}, \texttt{DAYNAME()} and \texttt{MONTHNAME()} functions. See Section 10.7, “MySQL Server Locale Support”.

• As of MySQL 5.1.9, mysqld_safe no longer implicitly invokes mysqld-max if it exists. Instead, it invokes mysqld unless a \texttt{--mysqld} or \texttt{--mysqld-version} option is given to specify another server explicitly. If you previously relied on the implicit invocation of mysqld-max, you should use an appropriate option now. As of MySQL 5.1.12, there is no longer any separate mysqld-max server, so no change should be necessary.

**SQL Changes**

• **Known issue**: Prior to MySQL 5.1.17, the parser accepted invalid code in SQL condition handlers, leading to server crashes or unexpected execution behavior in stored programs. Specifically, the parser permitted a condition handler to refer to labels for blocks that enclose the handler declaration. This was incorrect because block label scope does not include the code for handlers declared within the labeled block.

As of 5.1.17, the parser rejects this invalid construct, but if you perform a binary upgrade (without dumping and reloading your databases), existing handlers that contain the construct still are invalid and should be rewritten even if they appear to function as you expect.

To find affected handlers, use mysqldump to dump all stored procedures and functions, triggers, and events. Then attempt to reload them into an upgraded server. Handlers that contain illegal label references will be rejected.

For more information about condition handlers and writing them to avoid invalid jumps, see Section 13.6.7.2, “DECLARE ... HANDLER Syntax”.

• **Incompatible change**: The parser accepted statements that contained \texttt{/* ... */} that were not properly closed with \texttt{*/}, such as \texttt{SELECT 1 /* + 2}. As of MySQL 5.1.23, statements that contain unclosed \texttt{/*}-comments now are rejected with a syntax error.

This fix has the potential to cause incompatibilities. Because of Bug #26302, which caused the trailing \texttt{*/} to be truncated from comments in views, stored routines, triggers, and events, it is possible that objects of those types may have been stored with definitions that now will be rejected as syntactically invalid. Such objects should be dropped and re-created so that their definitions do not contain truncated comments.

• **Incompatible change**: Multiple-table \texttt{DELETE} statements containing ambiguous aliases could have unintended side effects such as deleting rows from the wrong table. Examples:

```sql
DELETE FROM t1 AS a2 USING t1 AS a1 INNER JOIN t2 AS a2;
DELETE t1 AS a2 FROM t1 AS a1 INNER JOIN t2 AS a2;
```

To avoid ambiguity, declaration of aliases other than in the \texttt{table_references} part of the statement should be avoided:

```sql
DELETE FROM t1 USING t1 AS a1 INNER JOIN t2 AS a2;
DELETE t1 FROM t1 AS a1 INNER JOIN t2 AS a2;
```
As of MySQL 5.1.23, alias declarations outside the `table_references` part of the statement are disallowed for the `USING` variant of multiple-table `DELETE` syntax. (In MySQL 5.5, alias declarations outside `table_references` are disallowed for all multiple-table `DELETE` statements.) Statements containing aliases that are no longer permitted must be rewritten.

- **Incompatible change**: As of MySQL 5.1.8, `TYPE = engine_name` is still accepted as a synonym for the `ENGINE = engine_name` table option but generates a warning. You should note that this option is not available in MySQL 5.1.7, and is removed altogether in MySQL 5.5 and produces a syntax error. `TYPE` has been deprecated since MySQL 4.0.

- **Incompatible change**: MySQL 5.1.6 introduces the `TRIGGER` privilege. Previously, the `SUPER` privilege was needed to create or drop triggers. Now those operations require the `TRIGGER` privilege. This is a security improvement because you no longer need to grant users the `SUPER` privilege to enable them to create triggers. However, the requirement that the account named in a trigger’s `DEFINER` clause must have the `SUPER` privilege has changed to a requirement for the `TRIGGER` privilege. When upgrading from a previous version of MySQL 5.0 or 5.1 to MySQL 5.1.6 or newer, be sure to update your grant tables by running `mysql_upgrade`. This will assign the `TRIGGER` privilege to all accounts that had the `SUPER` privilege. If you fail to update the grant tables, triggers may fail when activated. After updating the grant tables, you can revoke the `SUPER` privilege from those accounts that no longer otherwise require it.

- Some keywords may be reserved in MySQL 5.1 that were not reserved in MySQL 5.0. See Section 9.3, “Keywords and Reserved Words”.

- The `BACKUP TABLE`, and `RESTORE TABLE` statements are deprecated. `mysqldump` or `mysqlhotcopy` can be used as alternatives.

- The `LOAD DATA FROM MASTER` and `LOAD TABLE FROM MASTER` statements are deprecated. See Section 13.4.2.2, “LOAD DATA FROM MASTER Syntax”, for recommended alternatives.

- The `INSTALL PLUGIN` and `UNINSTALL PLUGIN` statements that are used for the plugin API are new. So is the `WITH PARSER` clause for `FULLTEXT` index creation that associates a parser plugin with a full-text index. Section 22.2, “The MySQL Plugin API”.

### SC API Changes

- **Incompatible change**: As of MySQL 5.1.7, the `mysql_stmt_attr_get()` C API function returns a boolean rather than an unsigned int for `STMT_ATTR_UPDATE_MAX_LENGTH`. (Bug #16144)

### 2.13.2 Downgrading MySQL

This section describes how to downgrade to an older MySQL version.

- **Supported Downgrade Methods**
- **Supported Downgrade Paths**
- **Before You Begin**
- **Performing an In-place Downgrade**
- **Performing a Logical Downgrade**
- **Downgrade Troubleshooting**

#### Supported Downgrade Methods

Supported downgrade methods include:
• **In-place Downgrade**: Involves shutting down the new MySQL version, replacing the new MySQL binaries or packages with the old ones, and restarting the old MySQL version on the new data files. In-place downgrades are supported for downgrades between GA versions within the same release series. For example, in-place downgrades are supported for downgrades from 5.1.73 to 5.1.72.

• **Logical Downgrade**: Involves using `mysqldump` to dump all tables from the new MySQL version, and then loading the dump file into the old MySQL version. Logical downgrades are supported for downgrades between GA versions within the same release series and for downgrades between release levels. For example, logical downgrades are supported for downgrades from 5.1.73 to 5.1.72 and for downgrades from 5.1 to 5.0.

**Supported Downgrade Paths**

Unless otherwise documented, the following downgrade paths are supported:

• Downgrading from a release series version to an older release series version is supported using all **downgrade methods**. For example, downgrading from 5.1.73 to 5.1.72 is supported. Skipping release series versions is also supported. For example, downgrading from 5.1.73 to 5.1.71 is supported.

• Downgrading one release level is supported using the **logical downgrade** method. For example, downgrading from 5.1 to 5.0 is supported.

• Downgrading more than one release level is supported using the **logical downgrade** method, but only if you downgrade one release level at a time. For example, you can downgrade from 5.1 to 5.0, and then to 4.1.

The following conditions apply to all downgrade paths:

• Downgrades between General Availability (GA) status releases are supported.

• Downgrades between milestone releases (or from a GA release to a milestone release) are not supported.

**Before You Begin**

Before downgrading, the following steps are recommended:

• Review the **Release Notes** for the MySQL version you are downgrading from to ensure that there are no features or fixes that you really need.

• Review Section 2.13.2.1, **“Changes Affecting Downgrades from MySQL 5.1”**. This section describes changes that may require action before or after downgrading.

**Note**

The downgrade procedures described in the following sections assume you are downgrading with data files created or modified by the newer MySQL version. However, if you did not modify your data after upgrading, downgrading using backups taken before upgrading to the new MySQL version is recommended. Many of the changes described in Section 2.13.2.1, **“Changes Affecting Downgrades from MySQL 5.1”** that require action before or after downgrading are not applicable when downgrading using backups taken before upgrading to the new MySQL version.

• Always back up your current databases and log files before downgrading. The backup should include the **mysql** database, which contains the MySQL system tables. See Section 7.2, **“Database Backup Methods”**.

• Use of new features, new configuration options, or new configuration option values that are not supported by a previous release may cause downgrade errors or failures. Before downgrading, it is recommended that you reverse changes resulting from the use of new features and remove configuration settings that are not supported by the release you are downgrading to.
Downgrading MySQL

- Check Section 2.13.3, “Checking Whether Tables or Indexes Must Be Rebuilt”, to see whether changes to table formats or to character sets or collations were made between your current version of MySQL and the version to which you are downgrading. If such changes have resulted in an incompatibility between MySQL versions, downgrade the affected tables using the instructions in Section 2.13.4, “Rebuilding or Repairing Tables or Indexes”.

- If you use XA transactions with InnoDB, run XA_RECOVER before downgrading to check for uncommitted XA transactions. If results are returned, either commit or rollback the XA transactions by issuing an XA_COMMIT or XA_ROLLBACK statement.

Performing an In-place Downgrade

In-place downgrades are supported for downgrades between GA status releases within the same release series. Review Before you Begin before proceeding.

To perform an in-place downgrade:

1. Review the changes described in Section 2.13.2.1, “Changes Affecting Downgrades from MySQL 5.1” for steps to be performed before downgrading.

2. If you use InnoDB, configure MySQL to perform a slow shutdown by setting innodb_fast_shutdown to 0. For example:

```shell
shell> bin/mysql -u root -p password --execute="set global innodb_fast_shutdown=0"
```

With a slow shutdown, InnoDB performs a full purge and change buffer merge before shutting down, which ensures that data files are fully prepared in case of file format differences between releases.

3. Shut down the newer MySQL server. For example:

```shell
shell> bin/mysqladmin -u root -p password shutdown
```

4. Downgrade the MySQL binaries or packages in-place by replacing the newer binaries or packages with the older ones.

5. Start the older (downgraded) MySQL server, using the existing data directory. For example:

```shell
shell> bin/mysqld_safe --user=mysql --datadir=/path/to/existing-datadir
```

6. Run mysql_upgrade. For example:

```shell
shell> bin/mysql_upgrade -u root -p password
```

Performing a Logical Downgrade

Logical downgrades are supported for downgrades between releases within the same release series and for downgrades to the previous release level. Only downgrades between General Availability (GA) status releases are supported. Review Before you Begin before proceeding.

To perform a logical downgrade:

1. Review the changes described in Section 2.13.2.1, “Changes Affecting Downgrades from MySQL 5.1” for steps to be performed before downgrading.

2. Dump all databases. For example:

```shell
shell> bin/mysqldump --add-drop-table --skip-events -u root -p password --all-databases --force > all_5_1_databases_dump.sql
```

3. Shut down the newer MySQL server. For example:

```shell
shell> bin/mysqladmin -u root -p password shutdown
```
4. Initialize an older MySQL instance, with a new data directory. For example:

```
shell> scripts/mysql_install_db --user=mysql
```

5. Start the older MySQL server, using the new data directory. For example:

```
shell> bin/mysql_safe --user=mysql --datadir=/path/to/new-datadir
```

6. Load the dump file into the older MySQL server. For example:

```
shell> bin/mysql -u root -p password
```

7. Run `mysql_upgrade`. For example:

```
shell> bin/mysql_upgrade -u root -p
```

8. If you use InnoDB, configure MySQL to perform a slow shutdown by setting `innodb_fast_shutdown` to 0. For example:

```
shell> bin/mysql -u root -p password --execute="set global innodb_fast_shutdown=0"
```

9. Shut down and restart the MySQL server to ensure a clean shutdown and startup. For example:

```
shell> bin/mysqladmin -u root -p password shutdown
shell> bin/mysql_safe --user=mysql --datadir=/path/to/new-datadir
```

**Downgrade Troubleshooting**

If you downgrade from one release series to another, there may be incompatibilities in table storage formats. In this case, use `mysqldump` to dump your tables before downgrading. After downgrading, reload the dump file using `mysql` or `mysqlimport` to re-create your tables. For examples, see Section 2.13.5, “Copying MySQL Databases to Another Machine”.

A typical symptom of a downward-incompatible table format change when you downgrade is that you cannot open tables. In that case, use the following procedure:

1. Stop the older MySQL server that you are downgrading to.
2. Restart the newer MySQL server you are downgrading from.
3. Dump any tables that were inaccessible to the older server by using `mysqldump` to create a dump file.
4. Stop the newer MySQL server and restart the older one.
5. Reload the dump file into the older server. Your tables should be accessible.

**2.13.2.1 Changes Affecting Downgrades from MySQL 5.1**

Before downgrading from MySQL 5.1, review the changes described in this section. Some changes may require action before or after downgrading.

- **Partitioning.** MySQL 5.0 does not support user-defined partitioning. If a table was created as a partitioned table in 5.1 (or if an table created in a previous version of MySQL was altered to include partitions after an upgrade to 5.1), the table is accessible after downgrade only if you do one of the following:

  - Export the table using `mysqldump` and then drop it in MySQL 5.1; import the table again following the downgrade to MySQL 5.0.
  - Prior to the downgrade, remove the table’s partitioning using `ALTER TABLE table_name REMOVE PARTITIONING`.  

Downgrading MySQL

• **Event Scheduler.** MySQL 5.0 does not support scheduled events. If your databases contain scheduled event definitions, you should prevent them from being dumped when you use `mysqldump` by using the `--skip-events` option. (See Section 4.5.4, “`mysqldump` — A Database Backup Program”.)

• **Stored routines.** MySQL 5.1.21 added a number of new columns to the `mysql.proc` table in which stored routine definitions are stored. If you are downgrading from MySQL 5.1.21 or later to MySQL 5.0, you cannot import the MySQL 5.1 routine definitions into MySQL 5.0.46 or earlier using the dump of `mysql.proc` created by `mysqldump` (such as when using the `--all-databases` option). Instead, you should run `mysqldump --routines` prior to performing the downgrade and run the stored routines DDL statements following the downgrade.

See Bug #11986, Bug #30029, and Bug #30660, for more information.

• **Triggers.** Trigger creation requires the `TRIGGER` privilege as of MySQL 5.1. In MySQL 5.0, there is no `TRIGGER` privilege and `SUPER` is required instead. If you downgrade from MySQL 5.1 to 5.0, you will need to give the `SUPER` privilege to those accounts that had the `TRIGGER` privilege in 5.1.

### 2.13.2.2 Downgrading from MySQL Enterprise Edition to MySQL Community Server

This section describes the steps required to downgrade from MySQL Enterprise Edition to MySQL Community Edition. This can be done at any time, and is required at the expiration of a MySQL Enterprise Edition subscription if you wish to continue using MySQL Server.

When you perform such a downgrade, all commercially licensed components of the MySQL Enterprise Edition subscription must be uninstalled. These components and related considerations are described in the rest of this section.

**Note**

The issues described in this section are in addition to any that may be encountered as a result of any upgrade or downgrade of the MySQL Server version (such as between MySQL 5.1 and 5.0). Information about upgrading and downgrading between MySQL release series can be found elsewhere in this chapter: see Section 2.13.1, “Upgrading MySQL”, and Section 2.13.2, “Downgrading MySQL”.

**MySQL Enterprise Database Server.** All commercial versions of MySQL Database Server must be uninstalled.

**Commercially licensed extensions.** All commercially licensed MySQL Enterprise Database Server extensions must be uninstalled, including the MySQL High Availability extension. Following uninstallation of this extension, automated failover is no longer available.

**MySQL Enterprise Backup.** MySQL Enterprise Backup must be uninstalled. Uninstalling this application has the effects listed here:

• Automated backup scripts no longer work.

• Existing backup images taken with MySQL Enterprise Backup can no longer be used for recovery.

• Third-party integration with multimedia systems such as NetBackup, Tivoli, and Oracle Secure Backup no longer works.

**MySQL Enterprise Monitor, MySQL Query Analyzer, agents.** MySQL Enterprise Monitor, MySQL Query Analyzer, and all server-side agents must be uninstalled. Uninstalling these applications and agents has the following effects:

• Automated SNMP and SMTP alerts no longer work.

• All historical MySQL, OS monitoring, query, and performance metrics as well as all trending data are lost.
2.13.3 Checking Whether Tables or Indexes Must Be Rebuilt

A binary upgrade or downgrade is one that installs one version of MySQL "in place" over an existing version, without dumping and reloading tables:

1. Stop the server for the existing version if it is running.
2. Install a different version of MySQL. This is an upgrade if the new version is higher than the original version, a downgrade if the version is lower.
3. Start the server for the new version.

In many cases, the tables from the previous version of MySQL can be used without problem by the new version. However, sometimes changes occur that require tables or table indexes to be rebuilt, as described in this section. If you have tables that are affected by any of the issues described here, rebuild the tables or indexes as necessary using the instructions given in Section 2.13.4, "Rebuilding or Repairing Tables or Indexes".

Table Incompatibilities

After a binary upgrade to MySQL 5.1 from a MySQL 5.0 installation that contains ARCHIVE tables:

- Before MySQL 5.1.42, accessing those tables will cause the server to crash, even if you have run mysql_upgrade or CHECK TABLE ... FOR UPGRADE.
- As of MySQL 5.1.42, the server will not open 5.0 ARCHIVE tables at all.

In either case, the solution is to use mysqldump to dump all 5.0 ARCHIVE tables before upgrading, and reload them into MySQL 5.1 after upgrading. This problem is fixed in MySQL 5.6.4: The server can open ARCHIVE tables created in MySQL 5.0. However, it remains the recommended upgrade procedure to dump 5.0 ARCHIVE tables before upgrading and reload them after upgrading.

Index Incompatibilities

If you perform a binary upgrade without dumping and reloading tables, you cannot upgrade directly from MySQL 4.1 to 5.1 or higher. This occurs due to an incompatible change in the MyISAM table index format in MySQL 5.0. Upgrade from MySQL 4.1 to 5.0 and repair all MyISAM tables. Then upgrade from MySQL 5.0 to 5.1 and check and repair your tables.

Modifications to the handling of character sets or collations might change the character sort order, which causes the ordering of entries in any index that uses an affected character set or collation to be incorrect. Such changes result in several possible problems:

- Comparison results that differ from previous results
- Inability to find some index values due to misordered index entries
- Misordered ORDER BY results
- Tables that CHECK TABLE reports as being in need of repair

The solution to these problems is to rebuild any indexes that use an affected character set or collation, either by dropping and re-creating the indexes, or by dumping and reloading the entire table. In some cases, it is possible to alter affected columns to use a different collation. For information about rebuilding indexes, see Section 2.13.4, “Rebuilding or Repairing Tables or Indexes”.

To check whether a table has indexes that must be rebuilt, consult the following list. It indicates which versions of MySQL introduced character set or collation changes that require indexes to be rebuilt. Each entry indicates the version in which the change occurred and the character sets or collations that the change affects. If the change is associated with a particular bug report, the bug number is given.
The list applies both for binary upgrades and downgrades. For example, Bug #27877 was fixed in MySQL 5.1.24, so it applies to upgrades from versions older than 5.1.24 to 5.1.24 or newer, and to downgrades from 5.1.24 or newer to versions older than 5.1.24.

In many cases, you can use `CHECK TABLE ... FOR UPGRADE` to identify tables for which index rebuilding is required. It will report this message:

```
Table upgrade required.  
Please do "REPAIR TABLE `tbl_name`" or dump/reload to fix it!
```

In these cases, you can also use `mysqlcheck --check-upgrade` or `mysql_upgrade`, which execute `CHECK TABLE`. However, the use of `CHECK TABLE` applies only after upgrades, not downgrades. Also, `CHECK TABLE` is not applicable to all storage engines. For details about which storage engines `CHECK TABLE` supports, see Section 13.7.2.3, "CHECK TABLE Syntax".

These changes cause index rebuilding to be necessary:

- **MySQL 5.1.24 (Bug #27877)**
  
  Affects indexes that use the `utf8_general_ci` or `ucs2_general_ci` collation for columns that contain 'ß' LATIN SMALL LETTER SHARP S (German). The bug fix corrected an error in the original collations but introduced an incompatibility such that 'ß' compares equal to characters with which it previously compared different.

  Affected tables can be detected by `CHECK TABLE ... FOR UPGRADE` as of MySQL 5.1.30 (see Bug #40053).

  A workaround for this issue is implemented as of MySQL 5.1.62, 5.5.21, and 5.6.5. The workaround involves altering affected columns to use the `utf8_general_mysql500_ci` and `ucs2_general_mysql500_ci` collations, which preserve the original pre-5.1.24 ordering of `utf8_general_ci` and `ucs2_general_ci`.

- **MySQL 5.0.48, 5.1.23 (Bug #27562)**
  
  Affects indexes that use the `ascii_general_ci` collation for columns that contain any of these characters: '\', GRAVE ACCENT, '[', LEFT SQUARE BRACKET, '\', REVERSE SOLIDUS, ']' RIGHT SQUARE BRACKET, '-' TILDE

  Affected tables can be detected by `CHECK TABLE ... FOR UPGRADE` as of MySQL 5.1.29 (see Bug #39585).

- **MySQL 5.0.48, 5.1.21 (Bug #29461)**
  
  Affects indexes for columns that use any of these character sets: `eucjpms, euc_kr, gb2312, latin7, macce, ujis`

  Affected tables can be detected by `CHECK TABLE ... FOR UPGRADE` as of MySQL 5.1.29 (see Bug #39585).

### 2.13.4 Rebuilding or Repairing Tables or Indexes

This section describes how to rebuild a table. This can be necessitated by changes to MySQL such as how data types are handled or changes to character set handling. For example, an error in a collation might have been corrected, necessitating a table rebuild to update the indexes for character columns that use the collation. (For examples, see Section 2.13.3, "Checking Whether Tables or Indexes Must Be Rebuilt".) It might also be that a table repair or upgrade should be done as indicated by a table check operation such as that performed by `CHECK TABLE`, `mysqlcheck`, or `mysql_upgrade`.

Methods for rebuilding a table include dumping and reloading it, or using `ALTER TABLE` or `REPAIR TABLE`. 
Rebuilding or Repairing Tables or Indexes

**Note**

If you are rebuilding tables because a different version of MySQL will not handle them after a binary (in-place) upgrade or downgrade, you must use the dump-and-reload method. Dump the tables before upgrading or downgrading using your original version of MySQL. Then reload the tables after upgrading or downgrading.

If you use the dump-and-reload method of rebuilding tables only for the purpose of rebuilding indexes, you can perform the dump either before or after upgrading or downgrading. Reloading still must be done afterward.

To rebuild a table by dumping and reloading it, use `mysqldump` to create a dump file and `mysql` to reload the file:

```
shell> mysqldump db_name t1 > dump.sql
shell> mysql db_name < dump.sql
```

To rebuild all the tables in a single database, specify the database name without any following table name:

```
shell> mysqldump db_name > dump.sql
shell> mysql db_name < dump.sql
```

To rebuild all tables in all databases, use the `--all-databases` option:

```
shell> mysqldump --all-databases > dump.sql
shell> mysql < dump.sql
```

To rebuild a table with `ALTER TABLE`, use a “null” alteration; that is, an `ALTER TABLE` statement that “changes” the table to use the storage engine that it already has. For example, if `t1` is a `MyISAM` table, use this statement:

```
mysql> ALTER TABLE t1 ENGINE = MyISAM;
```

If you are not sure which storage engine to specify in the `ALTER TABLE` statement, use `SHOW CREATE TABLE` to display the table definition.

If you must rebuild a table because a table checking operation indicates that the table is corrupt or needs an upgrade, you can use `REPAIR TABLE` if that statement supports the table's storage engine. For example, to repair a `MyISAM` table, use this statement:

```
mysql> REPAIR TABLE t1;
```

For storage engines such as `InnoDB` that `REPAIR TABLE` does not support, use `mysqldump` to create a dump file and `mysql` to reload the file, as described earlier.

For specifics about which storage engines `REPAIR TABLE` supports, see Section 13.7.2.6, “REPAIR TABLE Syntax”.

`mysqlcheck --repair` provides command-line access to the `REPAIR TABLE` statement. This can be a more convenient means of repairing tables because you can use the `--databases` or `--all-databases` option to repair all tables in specific databases or all databases, respectively:

```
shell> mysqlcheck --repair --databases db_name ...
shell> mysqlcheck --repair --all-databases
```

For incompatibilities introduced in MySQL 5.1.24 by the fix for Bug #27877 that corrected the `utf8_general_ci` and `ucs2_general_ci` collations, a workaround is implemented as of MySQL
5.1.62, 5.5.21, and 5.6.5. Upgrade to one of those versions, then convert each affected table using one of the following methods. In each case, the workaround altering affected columns to use the `utf8_general_mysql500_ci` and `ucs2_general_mysql500_ci` collations, which preserve the original pre-5.1.24 ordering of `utf8_general_ci` and `ucs2_general_ci`.

- To convert an affected table after a binary upgrade that leaves the table files in place, alter the table to use the new collation. Suppose that the table `t1` contains one or more problematic `utf8` columns. To convert the table at the table level, use a statement like this:

```sql
ALTER TABLE t1
    CONVERT TO CHARACTER SET utf8 COLLATE utf8_general_mysql500_ci;
```

To apply the change on a column-specific basis, use a statement like this (be sure to repeat the column definition as originally specified except for the `COLLATE` clause):

```sql
ALTER TABLE t1
    MODIFY c1 CHAR(N) CHARACTER SET utf8 COLLATE utf8_general_mysql500_ci;
```

- To upgrade the table using a dump and reload procedure, dump the table using `mysqldump`, modify the `CREATE TABLE` statement in the dump file to use the new collation, and reload the table.

After making the appropriate changes, `CHECK TABLE` should report no error.

### 2.13.5 Copying MySQL Databases to Another Machine

You can copy the `.frm`, `.MYI`, and `.MYD` files for MyISAM tables between different architectures that support the same floating-point format. (MySQL takes care of any byte-swapping issues.) See Section 14.5, “The MyISAM Storage Engine”.

In cases where you need to transfer databases between different architectures, you can use `mysqldump` to create a file containing SQL statements. You can then transfer the file to the other machine and feed it as input to the `mysql` client.

Use `mysqldump --help` to see what options are available.

The easiest (although not the fastest) way to move a database between two machines is to run the following commands on the machine on which the database is located:

```bash
shell> mysqladmin -h 'other_hostname' create db_name
shell> mysqldump db_name | mysql -h 'other_hostname' db_name
```

If you want to copy a database from a remote machine over a slow network, you can use these commands:

```bash
shell> mysqladmin create db_name
shell> mysqldump -h 'other_hostname' --compress db_name | mysql db_name
```

You can also store the dump in a file, transfer the file to the target machine, and then load the file into the database there. For example, you can dump a database to a compressed file on the source machine like this:

```bash
shell> mysqldump --quick db_name | gzip > db_name.gz
```

Transfer the file containing the database contents to the target machine and run these commands there:

```bash
shell> mysqladmin create db_name
shell> gunzip < db_name.gz | mysql db_name
```
You can also use `mysqldump` and `mysqlimport` to transfer the database. For large tables, this is much faster than simply using `mysqldump`. In the following commands, `DUMPDIR` represents the full path name of the directory you use to store the output from `mysqldump`.

First, create the directory for the output files and dump the database:

```
shell> mkdir DUMPDIR
shell> mysqldump --tab=DUMPDIR db_name
```

Then transfer the files in the `DUMPDIR` directory to some corresponding directory on the target machine and load the files into MySQL there:

```
shell> mysqladmin create db_name # create database
shell> cat DUMPDIR/*.sql | mysql db_name # create tables in database
shell> mysqlimport db_name DUMPDIR/*.txt   # load data into tables
```

Do not forget to copy the `mysql` database because that is where the grant tables are stored. You might have to run commands as the MySQL root user on the new machine until you have the `mysql` database in place.

**After you import the `mysql` database on the new machine, execute `mysqladmin flush-privileges` so that the server reloads the grant table information.**

### 2.14 Environment Variables

This section lists environment variables that are used directly or indirectly by MySQL. Most of these can also be found in other places in this manual.

Options on the command line take precedence over values specified in option files and environment variables, and values in option files take precedence over values in environment variables. In many cases, it is preferable to use an option file instead of environment variables to modify the behavior of MySQL. See Section 4.2.6, “Using Option Files”.

To set an environment variable within `sh`, `ksh`, `bash`, or `zsh` shells you can use the following commands:

```
shell> ENVVAR=value
shell> export ENVVAR
```

The `export` is required if you want other sub-commands to inherit that value during execution. On more recent shells you can combine the export and setting processes, like this:

```
shell> export set ENVVAR=value
```

For the `csh`, or `tcsh` shells, use the `setenv` command:

```
shell> setenv ENVVAR value
```

Within the Windows Command Prompt use the `set` command to specify the value of a variable:

```
shell> set ENVVAR=value
```

On Unix, Linux, OS X, and Windows, the `set` command without parameters will display the list of currently set variables.

**Table 2.21 MySQL Related Environment Variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CXX</td>
<td>The name of your C++ compiler (for running <code>configure</code>).</td>
</tr>
<tr>
<td>CC</td>
<td>The name of your C compiler (for running <code>configure</code>).</td>
</tr>
</tbody>
</table>
### Perl Installation Notes

</tr>
<tr>
<td>MYSQL_PS1</td>
<td>The command prompt to use in the <code>mysql</code> command-line client.</td>
</tr>
<tr>
<td>MYSQL_PWD</td>
<td>The default password when connecting to <code>mysqld</code>. Using this is insecure. See Section 6.1.2.1, “End-User Guidelines for Password Security”</td>
</tr>
<tr>
<td>MYSQL_TCP_PORT</td>
<td>The default TCP/IP port number.</td>
</tr>
<tr>
<td>MYSQL_UNIX_PORT</td>
<td>The default Unix socket file name; used for connections to <code>localhost</code>.</td>
</tr>
<tr>
<td>PATH</td>
<td>Used by the shell to find MySQL programs.</td>
</tr>
<tr>
<td>TMPDIR</td>
<td>The directory in which temporary files are created.</td>
</tr>
<tr>
<td>TZ</td>
<td>This should be set to your local time zone. See Section B.5.3.7, “Time Zone Problems”</td>
</tr>
<tr>
<td>UMASK</td>
<td>The user-file creation mode when creating files. See note following table.</td>
</tr>
<tr>
<td>UMASK_DIR</td>
<td>The user-directory creation mode when creating directories. See note following table.</td>
</tr>
<tr>
<td>USER</td>
<td>The default user name on Windows and NetWare when connecting to <code>mysqld</code>.</td>
</tr>
</tbody>
</table>

For information about the `mysql` history file, see Section 4.5.1.3, “mysql Logging”.

The default `UMASK` and `UMASK_DIR` values are 0660 and 0700, respectively. MySQL assumes that the value for `UMASK` or `UMASK_DIR` is in octal if it starts with a zero. For example, setting `UMASK=0600` is equivalent to `UMASK=384` because 0600 octal is 384 decimal.

The `UMASK` and `UMASK_DIR` variables, despite their names, are used as modes, not masks:

- If `UMASK` is set, `mysqld` uses `($UMASK | 0600)` as the mode for file creation, so that newly created files have a mode in the range from 0600 to 0666 (all values octal).
- If `UMASK_DIR` is set, `mysqld` uses `($UMASK_DIR | 0700)` as the base mode for directory creation, which then is AND-ed with `~(~$UMASK & 0666)`, so that newly created directories have a mode in the range from 0700 to 0777 (all values octal). The AND operation may remove read and write permissions from the directory mode, but not execute permissions.

### 2.15 Perl Installation Notes

The Perl DBI module provides a generic interface for database access. You can write a DBI script that works with many different database engines without change. To use DBI, you must install the DBI module, as well as a DataBase Driver (DBD) module for each type of database server you want to access. For MySQL, this driver is the `DBD::mysql` module.
Perl, and the DBD::MySQL module for DBI must be installed if you want to run the MySQL benchmark scripts; see Section 8.13.2, “The MySQL Benchmark Suite”. They are also required for the MySQL Cluster ndb_size.pl utility; see Section 17.4.24, “ndb_size.pl — NDBCLUSTER Size Requirement Estimator”.

Note
Perl support is not included with MySQL distributions. You can obtain the necessary modules from http://search.cpan.org for Unix, or by using the ActiveState ppm program on Windows. The following sections describe how to do this.

The DBI/DBD interface requires Perl 5.6.0, and 5.6.1 or later is preferred. DBI does not work if you have an older version of Perl. You should use DBD::mysql 4.009 or higher. Although earlier versions are available, they do not support the full functionality of MySQL 5.1.

## 2.15.1 Installing Perl on Unix

MySQL Perl support requires that you have installed MySQL client programming support (libraries and header files). Most installation methods install the necessary files. If you install MySQL from RPM files on Linux, be sure to install the developer RPM as well. The client programs are in the client RPM, but client programming support is in the developer RPM.

The files you need for Perl support can be obtained from the CPAN (Comprehensive Perl Archive Network) at http://search.cpan.org.

The easiest way to install Perl modules on Unix is to use the CPAN module. For example:

```
shell> perl -MCPAN -e shell
cpan> install DBI
cpan> install DBD::mysql
```

The DBD::mysql installation runs a number of tests. These tests attempt to connect to the local MySQL server using the default user name and password. (The default user name is your login name on Unix, and ODBC on Windows. The default password is “no password.”) If you cannot connect to the server with those values (for example, if your account has a password), the tests fail. You can use `force install DBD::mysql` to ignore the failed tests.

DBI requires the Data::Dumper module. It may be installed; if not, you should install it before installing DBI.

It is also possible to download the module distributions in the form of compressed tar archives and build the modules manually. For example, to unpack and build a DBI distribution, use a procedure such as this:

1. Unpack the distribution into the current directory:

```
shell> gunzip < DBI-VERSION.tar.gz | tar xvf -
```

This command creates a directory named `DBI-VERSION`.

2. Change location into the top-level directory of the unpacked distribution:

```
shell> cd DBI-VERSION
```

3. Build the distribution and compile everything:

```
shell> perl Makefile.PL
shell> make
```
Shell> make test
Shell> make install

The `make test` command is important because it verifies that the module is working. Note that when you run that command during the `DBD::mysql` installation to exercise the interface code, the MySQL server must be running or the test fails.

It is a good idea to rebuild and reinstall the `DBD::mysql` distribution whenever you install a new release of MySQL. This ensures that the latest versions of the MySQL client libraries are installed correctly.

If you do not have access rights to install Perl modules in the system directory or if you want to install local Perl modules, the following reference may be useful: [http://learn.perl.org/faq/perlfaq8.html#How-do-I-keep-my-own-module-library-directory-](http://learn.perl.org/faq/perlfaq8.html#How-do-I-keep-my-own-module-library-directory-)

### 2.15.2 Installing ActiveState Perl on Windows

On Windows, you should do the following to install the MySQL `DBD` module with ActiveState Perl:

1. Get ActiveState Perl from [http://www.activestate.com/Products/ActivePerl/](http://www.activestate.com/Products/ActivePerl/) and install it.
2. Open a console window.
3. If necessary, set the `HTTP_proxy` variable. For example, you might try a setting like this:

   ```
   C:\> set HTTP_proxy=my.proxy.com:3128
   ```

4. Start the PPM program:

   ```
   C:\> C:\perl\bin\ppm.pl
   ```

5. If you have not previously done so, install `DBI`:

   ```
   ppm> install DBI
   ```

6. If this succeeds, run the following command:

   ```
   ppm> install DBD-mysql
   ```

This procedure should work with ActiveState Perl 5.6 or newer.

If you cannot get the procedure to work, you should install the ODBC driver instead and connect to the MySQL server through ODBC:

```perl
use DBI;
$dbh= DBI->connect("DBI:ODBC:$dsn",$user,$password) ||
die "Got error $DBI::errstr when connecting to $dsn\n";
```

### 2.15.3 Problems Using the Perl DBI/DBD Interface

If Perl reports that it cannot find the `../mysql/mysql.so` module, the problem is probably that Perl cannot locate the `libmysqlclient.so` shared library. You should be able to fix this problem by one of the following methods:

- Copy `libmysqlclient.so` to the directory where your other shared libraries are located (probably `/usr/lib` or `/lib`).
- Modify the `-L` options used to compile `DBD::mysql` to reflect the actual location of `libmysqlclient.so`. 
Problems Using the Perl DBI/DBD Interface

- On Linux, you can add the path name of the directory where libmysqlclient.so is located to the /etc/ld.so.conf file.

- Add the path name of the directory where libmysqlclient.so is located to the LD_RUN_PATH environment variable. Some systems use LD_LIBRARY_PATH instead.

Note that you may also need to modify the -L options if there are other libraries that the linker fails to find. For example, if the linker cannot find libc because it is in /lib and the link command specifies -L/usr/lib, change the -L option to -L/lib or add -L/lib to the existing link command.

If you get the following errors from DBD::mysql, you are probably using gcc (or using an old binary compiled with gcc):

```perl
/usr/bin/perl: can't resolve symbol '__moddi3'
/usr/bin/perl: can't resolve symbol '__divdi3'
```

Add -L/usr/lib/gcc-lib/... -lgcc to the link command when the mysql.so library gets built (check the output from make for mysql.so when you compile the Perl client). The -L option should specify the path name of the directory where libgcc.a is located on your system.

Another cause of this problem may be that Perl and MySQL are not both compiled with gcc. In this case, you can solve the mismatch by compiling both with gcc.

You may see the following error from DBD::mysql when you run the tests:

```plaintext
t/00base............install_driver(mysql) failed:
```

This means that you need to include the -lz compression library on the link line. That can be done by changing the following line in the file lib/DBD/mysql/Install.pm:

```perl
$sysliblist .= " -lm";
```

Change that line to:

```perl
$sysliblist .= " -lm -lz";
```

After this, you must run make realclean and then proceed with the installation from the beginning.

This chapter provides a tutorial introduction to MySQL by showing how to use the mysql client program to create and use a simple database. mysql (sometimes referred to as the “terminal monitor” or just “monitor”) is an interactive program that enables you to connect to a MySQL server, run queries, and view the results. mysql may also be used in batch mode: you place your queries in a file beforehand, then tell mysql to execute the contents of the file. Both ways of using mysql are covered here.

To see a list of options provided by mysql, invoke it with the --help option:

```
shell> mysql --help
```

This chapter assumes that mysql is installed on your machine and that a MySQL server is available to which you can connect. If this is not true, contact your MySQL administrator. (If you are the administrator, you need to consult the relevant portions of this manual, such as Chapter 5, MySQL Server Administration.)

This chapter describes the entire process of setting up and using a database. If you are interested only in accessing an existing database, you may want to skip over the sections that describe how to create the database and the tables it contains.

Because this chapter is tutorial in nature, many details are necessarily omitted. Consult the relevant sections of the manual for more information on the topics covered here.

3.1 Connecting to and Disconnecting from the Server

To connect to the server, you will usually need to provide a MySQL user name when you invoke mysql and, most likely, a password. If the server runs on a machine other than the one where you log in, you will also need to specify a host name. Contact your administrator to find out what connection parameters you should use to connect (that is, what host, user name, and password to use). Once you know the proper parameters, you should be able to connect like this:
**3.2 Entering Queries**

Make sure that you are connected to the server, as discussed in the previous section. Doing so does not in itself select any database to work with, but that is okay. At this point, it is more important to find out a little about how to issue queries than to jump right in creating tables, loading data into them, and retrieving data from them. This section describes the basic principles of entering queries, using several queries you can try out to familiarize yourself with how `mysql` works.
Here is a simple query that asks the server to tell you its version number and the current date. Type it in as shown here following the `mysql>` prompt and press Enter:

```
mysql> SELECT VERSION(), CURRENT_DATE;
+-----------------+--------------+
| VERSION()       | CURRENT_DATE |
+-----------------+--------------+
| 5.1.2-alpha-log | 2005-10-11   |
+-----------------+--------------+
1 row in set (0.01 sec)
mysql>
```

This query illustrates several things about `mysql`:

- **A query normally consists of an SQL statement followed by a semicolon.** (There are some exceptions where a semicolon may be omitted. `QUIT`, mentioned earlier, is one of them. We'll get to others later.)

- **When you issue a query, `mysql` sends it to the server for execution and displays the results, then prints another `mysql>` prompt to indicate that it is ready for another query.**

- **`mysql` displays query output in tabular form (rows and columns).** The first row contains labels for the columns. The rows following are the query results. Normally, column labels are the names of the columns you fetch from database tables. If you're retrieving the value of an expression rather than a table column (as in the example just shown), `mysql` labels the column using the expression itself.

- **`mysql` shows how many rows were returned and how long the query took to execute,** which gives you a rough idea of server performance. These values are imprecise because they represent wall clock time (not CPU or machine time), and because they are affected by factors such as server load and network latency. (For brevity, the “rows in set” line is sometimes not shown in the remaining examples in this chapter.)

Keywords may be entered in any lettercase. The following queries are equivalent:

```
mysql> SELECT VERSION(), CURRENT_DATE;
mysql> select version(), current_date;
mysql> SeLeCt vErSiOn(), current_DATE;
```

Here is another query. It demonstrates that you can use `mysql` as a simple calculator:

```
mysql> SELECT SIN(PI()/4), (4+1)*5;
+------------------+---------+
| SIN(PI()/4)      | (4+1)*5 |
+------------------+---------+
| 0.70710678118655 |      25 |
+------------------+---------+
1 row in set (0.02 sec)
```

The queries shown thus far have been relatively short, single-line statements. You can even enter multiple statements on a single line. Just end each one with a semicolon:

```
mysql> SELECT VERSION(); SELECT NOW();
+-----------------+
| VERSION()       |
+-----------------+
| 5.1.2-alpha-log |
+-----------------+
1 row in set (0.00 sec)
+---------------------+
| NOW()               |
+---------------------+
| 2005-10-11 15:15:00 |
+---------------------+
```
A query need not be given all on a single line, so lengthy queries that require several lines are not a problem. `mysql` determines where your statement ends by looking for the terminating semicolon, not by looking for the end of the input line. (In other words, `mysql` accepts free-format input: it collects input lines but does not execute them until it sees the semicolon.)

Here is a simple multiple-line statement:

```
mysql> SELECT
    -> USER()
    -> ,
    -> CURRENT_DATE;
```

```
+---------------+--------------+
| USER()        | CURRENT_DATE |
+---------------+--------------+
| jon@localhost | 2005-10-11   |
+---------------+--------------+
```

In this example, notice how the prompt changes from `mysql>` to `->` after you enter the first line of a multiple-line query. This is how `mysql` indicates that it has not yet seen a complete statement and is waiting for the rest. The prompt is your friend, because it provides valuable feedback. If you use that feedback, you can always be aware of what `mysql` is waiting for.

If you decide you do not want to execute a query that you are in the process of entering, cancel it by typing `\c`:

```
mysql> SELECT
    -> USER()
    -> \c
mysql>
```

Here, too, notice the prompt. It switches back to `mysql>` after you type `\c`, providing feedback to indicate that `mysql` is ready for a new query.

The following table shows each of the prompts you may see and summarizes what they mean about the state that `mysql` is in.

<table>
<thead>
<tr>
<th>Prompt</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>mysql&gt;</code></td>
<td>Ready for new query</td>
</tr>
<tr>
<td><code>-&gt;</code></td>
<td>Waiting for next line of multiple-line query</td>
</tr>
<tr>
<td><code>'&gt;</code></td>
<td>Waiting for next line, waiting for completion of a string that began with a single quote (<code>&quot;'&quot;</code>)</td>
</tr>
<tr>
<td><code>&quot;&gt;</code></td>
<td>Waiting for next line, waiting for completion of a string that began with a double quote (<code>&quot;&quot;</code>)</td>
</tr>
<tr>
<td><code>&gt;'</code></td>
<td>Waiting for next line, waiting for completion of an identifier that began with a backtick (``&quot;`&quot;)</td>
</tr>
<tr>
<td><code>/*&gt;</code></td>
<td>Waiting for next line, waiting for completion of a comment that began with <code>/*</code></td>
</tr>
</tbody>
</table>

Multiple-line statements commonly occur by accident when you intend to issue a query on a single line, but forget the terminating semicolon. In this case, `mysql` waits for more input:

```
mysql> SELECT USER()
    ->
```

If this happens to you (you think you've entered a statement but the only response is a `->` prompt), most likely `mysql` is waiting for the semicolon. If you don't notice what the prompt is telling you, you might sit there for a while before realizing what you need to do. Enter a semicolon to complete the statement, and `mysql` executes it:

```
mysql> SELECT USER()
    -> ;
```
The '>' prompts occur during string collection (another way of saying that MySQL is waiting for completion of a string). In MySQL, you can write strings surrounded by either "" or "" characters (for example, 'hello' or 'goodbye'), and MySQL lets you enter strings that span multiple lines. When you see a '>' or "" prompt, it means that you have entered a line containing a string that begins with a "" or "" quote character, but have not yet entered the matching quote that terminates the string. This often indicates that you have inadvertently left out a quote character. For example:

```sql
mysql> SELECT * FROM my_table WHERE name = 'Smith AND age < 30;
>
```

If you enter this `SELECT` statement, then press `Enter` and wait for the result, nothing happens. Instead of wondering why this query takes so long, notice the clue provided by the '>' prompt. It tells you that MySQL expects to see the rest of an unterminated string. (Do you see the error in the statement? The string 'Smith is missing the second single quotation mark.)

At this point, what do you do? The simplest thing is to cancel the query. However, you cannot just type \c in this case, because MySQL interprets it as part of the string that it is collecting. Instead, enter the closing quote character (so MySQL knows you’ve finished the string), then type \c:

```sql
mysql> SELECT * FROM my_table WHERE name = 'Smith AND age < 30;
>
mysql> \c
```

The prompt changes back to `mysql>`, indicating that MySQL is ready for a new query.

The '>' prompt is similar to the '>' and "" prompts, but indicates that you have begun but not completed a backtick-quoted identifier.

It is important to know what the '>', "", and '>' prompts signify, because if you mistakenly enter an unterminated string, any further lines you type appear to be ignored by MySQL—including a line containing QUIT. This can be quite confusing, especially if you do not know that you need to supply the terminating quote before you can cancel the current query.

### 3.3 Creating and Using a Database

Once you know how to enter SQL statements, you are ready to access a database. Suppose that you have several pets in your home (your menagerie) and you would like to keep track of various types of information about them. You can do so by creating tables to hold your data and loading them with the desired information. Then you can answer different sorts of questions about your animals by retrieving data from the tables. This section shows you how to perform the following operations:

- Create a database
- Create a table
- Load data into the table
- Retrieve data from the table in various ways
- Use multiple tables

The menagerie database is simple (deliberately), but it is not difficult to think of real-world situations in which a similar type of database might be used. For example, a database like this could be used by a farmer to keep track of livestock, or by a veterinarian to keep track of patient records. A menagerie
distribution containing some of the queries and sample data used in the following sections can be obtained from the MySQL Web site. It is available in both compressed tar file and Zip formats at http://dev.mysql.com/doc/.

Use the SHOW statement to find out what databases currently exist on the server:

```
mysql> SHOW DATABASES;
+----------+
| Database |
+----------+
| mysql    |
| test     |
| tmp      |
+----------+
```

The mysql database describes user access privileges. The test database often is available as a workspace for users to try things out.

The list of databases displayed by the statement may be different on your machine; SHOW DATABASES does not show databases that you have no privileges for if you do not have the SHOW DATABASES privilege. See Section 13.7.5.15, “SHOW DATABASES Syntax”.

If the test database exists, try to access it:

```
mysql> USE test
Database changed
```

USE, like QUIT, does not require a semicolon. (You can terminate such statements with a semicolon if you like; it does no harm.) The USE statement is special in another way, too: it must be given on a single line.

You can use the test database (if you have access to it) for the examples that follow, but anything you create in that database can be removed by anyone else with access to it. For this reason, you should probably ask your MySQL administrator for permission to use a database of your own. Suppose that you want to call yours menagerie. The administrator needs to execute a statement like this:

```
mysql> GRANT ALL ON menagerie.* TO 'your_mysql_name'@'your_client_host';
```

where your_mysql_name is the MySQL user name assigned to you and your_client_host is the host from which you connect to the server.

### 3.3.1 Creating and Selecting a Database

If the administrator creates your database for you when setting up your permissions, you can begin using it. Otherwise, you need to create it yourself:

```
mysql> CREATE DATABASE menagerie;
```

Under Unix, database names are case sensitive (unlike SQL keywords), so you must always refer to your database as menagerie, not as Menagerie, MENAGERIE, or some other variant. This is also true for table names. (Under Windows, this restriction does not apply, although you must refer to databases and tables using the same lettercase throughout a given query. However, for a variety of reasons, the recommended best practice is always to use the same lettercase that was used when the database was created.)

**Note**

If you get an error such as ERROR 1044 (42000): Access denied for user 'micah'@'localhost' to database 'menagerie' when attempting to create a database, this means that your user account does not
Creating a Table

have the necessary privileges to do so. Discuss this with the administrator or see Section 6.2, “The MySQL Access Privilege System”.

Creating a database does not select it for use; you must do that explicitly. To make menagerie the current database, use this statement:

```sql
mysql> USE menagerie
Database changed
```

Your database needs to be created only once, but you must select it for use each time you begin a mysql session. You can do this by issuing a USE statement as shown in the example. Alternatively, you can select the database on the command line when you invoke mysql. Just specify its name after any connection parameters that you might need to provide. For example:

```sh
shell> mysql -h host -u user -p menagerie
Enter password: ********
```

Important

menagerie in the command just shown is not your password. If you want to supply your password on the command line after the -p option, you must do so with no intervening space (for example, as -pmypassword, not as -p mypassword). However, putting your password on the command line is not recommended, because doing so exposes it to snooping by other users logged in on your machine.

Note

You can see at any time which database is currently selected using SELECT DATABASE().

3.3.2 Creating a Table

Creating the database is the easy part, but at this point it is empty, as SHOW TABLES tells you:

```sql
mysql> SHOW TABLES;
Empty set (0.00 sec)
```

The harder part is deciding what the structure of your database should be: what tables you need and what columns should be in each of them.

You want a table that contains a record for each of your pets. This can be called the pet table, and it should contain, as a bare minimum, each animal’s name. Because the name by itself is not very interesting, the table should contain other information. For example, if more than one person in your family keeps pets, you might want to list each animal’s owner. You might also want to record some basic descriptive information such as species and sex.

How about age? That might be of interest, but it is not a good thing to store in a database. Age changes as time passes, which means you’d have to update your records often. Instead, it is better to store a fixed value such as date of birth. Then, whenever you need age, you can calculate it as the difference between the current date and the birth date. MySQL provides functions for doing date arithmetic, so this is not difficult. Storing birth date rather than age has other advantages, too:

- You can use the database for tasks such as generating reminders for upcoming pet birthdays. (If you think this type of query is somewhat silly, note that it is the same question you might ask in the context of a business database to identify clients to whom you need to send out birthday greetings in the current week or month, for that computer-assisted personal touch.)
- You can calculate age in relation to dates other than the current date. For example, if you store death date in the database, you can easily calculate how old a pet was when it died.
You can probably think of other types of information that would be useful in the pet table, but the ones identified so far are sufficient: name, owner, species, sex, birth, and death.

Use a `CREATE TABLE` statement to specify the layout of your table:

```sql
mysql> CREATE TABLE pet (name VARCHAR(20), owner VARCHAR(20),
                         -> species VARCHAR(20), sex CHAR(1), birth DATE, death DATE);
```

`VARCHAR` is a good choice for the `name`, `owner`, and `species` columns because the column values vary in length. The lengths in those column definitions need not all be the same, and need not be 20. You can normally pick any length from 1 to 65535, whatever seems most reasonable to you. If you make a poor choice and it turns out later that you need a longer field, MySQL provides an `ALTER TABLE` statement.

Several types of values can be chosen to represent sex in animal records, such as ‘m’ and ‘f’, or perhaps ‘male’ and ‘female’. It is simplest to use the single characters ‘m’ and ‘f’.

The use of the `DATE` data type for the `birth` and `death` columns is a fairly obvious choice.

Once you have created a table, `SHOW TABLES` should produce some output:

```sql
mysql> SHOW TABLES;
+---------------------+
| Tables in menagerie |
+---------------------+
| pet                 |
+---------------------+
```

To verify that your table was created the way you expected, use a `DESCRIBE` statement:

```sql
mysql> DESCRIBE pet;
+---------+-------------+------+-----+---------+-------+
| Field   | Type        | Null | Key | Default | Extra |
+---------+-------------+------+-----+---------+-------+
| name    | varchar(20) | YES  |     | NULL    |       |
| owner   | varchar(20) | YES  |     | NULL    |       |
| species | varchar(20) | YES  |     | NULL    |       |
| sex     | char(1)     | YES  |     | NULL    |       |
| birth   | date        | YES  |     | NULL    |       |
| death   | date        | YES  |     | NULL    |       |
+---------+-------------+------+-----+---------+-------+
```

You can use `DESCRIBE` any time, for example, if you forget the names of the columns in your table or what types they have.

For more information about MySQL data types, see Chapter 11, Data Types.

### 3.3.3 Loading Data into a Table

After creating your table, you need to populate it. The `LOAD DATA` and `INSERT` statements are useful for this.

Suppose that your pet records can be described as shown here. (Observe that MySQL expects dates in 'YYYY-MM-DD' format; this may be different from what you are used to.)

<table>
<thead>
<tr>
<th>name</th>
<th>owner</th>
<th>species</th>
<th>sex</th>
<th>birth</th>
<th>death</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fluffy</td>
<td>Harold</td>
<td>cat</td>
<td>f</td>
<td>1993-02-04</td>
<td></td>
</tr>
<tr>
<td>Claws</td>
<td>Gwen</td>
<td>cat</td>
<td>m</td>
<td>1994-03-17</td>
<td></td>
</tr>
<tr>
<td>Buffy</td>
<td>Harold</td>
<td>dog</td>
<td>f</td>
<td>1989-05-13</td>
<td></td>
</tr>
<tr>
<td>Fang</td>
<td>Benny</td>
<td>dog</td>
<td>m</td>
<td>1990-08-27</td>
<td></td>
</tr>
</tbody>
</table>
Retrieving Information from a Table

<table>
<thead>
<tr>
<th>name</th>
<th>owner</th>
<th>species</th>
<th>sex</th>
<th>birth</th>
<th>death</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bowser</td>
<td>Diane</td>
<td>dog</td>
<td>m</td>
<td>1979-08-31</td>
<td>1995-07-29</td>
</tr>
<tr>
<td>Chirpy</td>
<td>Gwen</td>
<td>bird</td>
<td>f</td>
<td>1998-09-11</td>
<td></td>
</tr>
<tr>
<td>Whistler</td>
<td>Gwen</td>
<td>bird</td>
<td></td>
<td>1997-12-09</td>
<td></td>
</tr>
<tr>
<td>Slim</td>
<td>Benny</td>
<td>snake</td>
<td>m</td>
<td>1996-04-29</td>
<td></td>
</tr>
</tbody>
</table>

Because you are beginning with an empty table, an easy way to populate it is to create a text file containing a row for each of your animals, then load the contents of the file into the table with a single statement.

You could create a text file `pet.txt` containing one record per line, with values separated by tabs, and given in the order in which the columns were listed in the `CREATE TABLE` statement. For missing values (such as unknown sexes or death dates for animals that are still living), you can use `NULL` values. To represent these in your text file, use `\N` (backslash, capital-N). For example, the record for Whistler the bird would look like this (where the whitespace between values is a single tab character):

```
Whistler        Gwen    bird    \N      1997-12-09      \N
```

To load the text file `pet.txt` into the `pet` table, use this statement:

```
mysql> LOAD DATA LOCAL INFILE '/path/pet.txt' INTO TABLE pet;
```

If you created the file on Windows with an editor that uses `\r\n` as a line terminator, you should use this statement instead:

```
mysql> LOAD DATA LOCAL INFILE '/path/pet.txt' INTO TABLE pet
       LINES TERMINATED BY '\r\n';
```

(On an Apple machine running OS X, you would likely want to use `LINES TERMINATED BY '\r'.`)

You can specify the column value separator and end of line marker explicitly in the `LOAD DATA` statement if you wish, but the defaults are tab and linefeed. These are sufficient for the statement to read the file `pet.txt` properly.

If the statement fails, it is likely that your MySQL installation does not have local file capability enabled by default. See Section 6.1.6, "Security Issues with LOAD DATA LOCAL", for information on how to change this.

When you want to add new records one at a time, the `INSERT` statement is useful. In its simplest form, you supply values for each column, in the order in which the columns were listed in the `CREATE TABLE` statement. Suppose that Diane gets a new hamster named "Puffball." You could add a new record using an `INSERT` statement like this:

```
mysql> INSERT INTO pet
       VALUES ('Puffball','Diane','hamster','f','1999-03-30',NULL);
```

String and date values are specified as quoted strings here. Also, with `INSERT`, you can insert `NULL` directly to represent a missing value. You do not use `\N` like you do with `LOAD DATA`.

From this example, you should be able to see that there would be a lot more typing involved to load your records initially using several `INSERT` statements rather than a single `LOAD DATA` statement.

### 3.3.4 Retrieving Information from a Table

The `SELECT` statement is used to pull information from a table. The general form of the statement is:

```
SELECT what_to_select
```
Retrieving Information from a Table

FROM `which_table`
WHERE `conditions_to_satisfy`;

`what_to_select` indicates what you want to see. This can be a list of columns, or `*` to indicate “all columns.” `which_table` indicates the table from which you want to retrieve data. The `WHERE` clause is optional. If it is present, `conditions_to_satisfy` specifies one or more conditions that rows must satisfy to qualify for retrieval.

3.3.4.1 Selecting All Data

The simplest form of `SELECT` retrieves everything from a table:

```sql
mysql> SELECT * FROM pet;
```

<table>
<thead>
<tr>
<th>name</th>
<th>owner</th>
<th>species</th>
<th>sex</th>
<th>birth</th>
<th>death</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fluffy</td>
<td>Harold</td>
<td>cat</td>
<td>f</td>
<td>1993-02-04</td>
<td>NULL</td>
</tr>
<tr>
<td>Claws</td>
<td>Gwen</td>
<td>cat</td>
<td>m</td>
<td>1994-03-17</td>
<td>NULL</td>
</tr>
<tr>
<td>Buffy</td>
<td>Harold</td>
<td>dog</td>
<td>f</td>
<td>1989-05-13</td>
<td>NULL</td>
</tr>
<tr>
<td>Fang</td>
<td>Benny</td>
<td>dog</td>
<td>m</td>
<td>1990-08-27</td>
<td>NULL</td>
</tr>
<tr>
<td>Bowser</td>
<td>Diane</td>
<td>dog</td>
<td>m</td>
<td>1979-08-31</td>
<td>1995-07-29</td>
</tr>
<tr>
<td>Chirpy</td>
<td>Gwen</td>
<td>bird</td>
<td>f</td>
<td>1998-09-11</td>
<td>NULL</td>
</tr>
<tr>
<td>Whistler</td>
<td>Gwen</td>
<td>bird</td>
<td>NULL</td>
<td>1997-12-09</td>
<td>NULL</td>
</tr>
<tr>
<td>Slim</td>
<td>Benny</td>
<td>snake</td>
<td>m</td>
<td>1996-04-29</td>
<td>NULL</td>
</tr>
<tr>
<td>Puffball</td>
<td>Diane</td>
<td>hamster</td>
<td>f</td>
<td>1999-03-30</td>
<td>NULL</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This form of `SELECT` is useful if you want to review your entire table, for example, after you’ve just loaded it with your initial data set. For example, you may happen to think that the birth date for Bowser doesn’t seem quite right. Consulting your original pedigree papers, you find that the correct birth year should be 1989, not 1979.

There are at least two ways to fix this:

• Edit the file `pet.txt` to correct the error, then empty the table and reload it using `DELETE` and `LOAD DATA`:

```sql
mysql> DELETE FROM pet;
mysql> LOAD DATA LOCAL INFILE '/path/pet.txt' INTO TABLE pet;
```

However, if you do this, you must also re-enter the record for Puffball.

• Fix only the erroneous record with an `UPDATE` statement:

```sql
mysql> UPDATE pet SET birth = '1989-08-31' WHERE name = 'Bowser';
```

The `UPDATE` changes only the record in question and does not require you to reload the table.

3.3.4.2 Selecting Particular Rows

As shown in the preceding section, it is easy to retrieve an entire table. Just omit the `WHERE` clause from the `SELECT` statement. But typically you don’t want to see the entire table, particularly when it becomes large. Instead, you’re usually more interested in answering a particular question, in which case you specify some constraints on the information you want. Let’s look at some selection queries in terms of questions about your pets that they answer.

You can select only particular rows from your table. For example, if you want to verify the change that you made to Bowser’s birth date, select Bowser’s record like this:

```sql
mysql> SELECT * FROM pet WHERE name = 'Bowser';
```

<table>
<thead>
<tr>
<th>name</th>
<th>owner</th>
<th>species</th>
<th>sex</th>
<th>birth</th>
<th>death</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The output confirms that the year is correctly recorded as 1989, not 1979.

String comparisons normally are case-insensitive, so you can specify the name as 'bowser', 'BOWSER', and so forth. The query result is the same.

You can specify conditions on any column, not just name. For example, if you want to know which animals were born during or after 1998, test the birth column:

```
mysql> SELECT * FROM pet WHERE birth >= '1998-1-1';
+----------+-------+---------+------+------------+-------+
<table>
<thead>
<tr>
<th>name</th>
<th>owner</th>
<th>species</th>
<th>sex</th>
<th>birth</th>
<th>death</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chirpy</td>
<td>Gwen</td>
<td>bird</td>
<td>f</td>
<td>1998-09-11</td>
<td>NULL</td>
</tr>
<tr>
<td>Puffball</td>
<td>Diane</td>
<td>hamster</td>
<td>f</td>
<td>1999-03-30</td>
<td>NULL</td>
</tr>
</tbody>
</table>
+----------+-------+---------+------+------------+-------+
```

You can combine conditions, for example, to locate female dogs:

```
mysql> SELECT * FROM pet WHERE species = 'dog' AND sex = 'f';
+-------+--------+---------+------+------------+-------+
<table>
<thead>
<tr>
<th>name</th>
<th>owner</th>
<th>species</th>
<th>sex</th>
<th>birth</th>
<th>death</th>
</tr>
</thead>
<tbody>
<tr>
<td>Buffy</td>
<td>Harold</td>
<td>dog</td>
<td>f</td>
<td>1989-05-13</td>
<td>NULL</td>
</tr>
</tbody>
</table>
+-------+--------+---------+------+------------+-------+
```

The preceding query uses the AND logical operator. There is also an OR operator:

```
mysql> SELECT * FROM pet WHERE species = 'snake' OR species = 'bird';
+----------+-------+---------+------+------------+-------+
<table>
<thead>
<tr>
<th>name</th>
<th>owner</th>
<th>species</th>
<th>sex</th>
<th>birth</th>
<th>death</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chirpy</td>
<td>Gwen</td>
<td>bird</td>
<td>f</td>
<td>1998-09-11</td>
<td>NULL</td>
</tr>
<tr>
<td>Whistler</td>
<td>Gwen</td>
<td>bird</td>
<td>NULL</td>
<td>1997-12-09</td>
<td>NULL</td>
</tr>
<tr>
<td>Slim</td>
<td>Benny</td>
<td>snake</td>
<td>m</td>
<td>1996-04-29</td>
<td>NULL</td>
</tr>
</tbody>
</table>
+----------+-------+---------+------+------------+-------+
```

AND and OR may be intermixed, although AND has higher precedence than OR. If you use both operators, it is a good idea to use parentheses to indicate explicitly how conditions should be grouped:

```
mysql> SELECT * FROM pet WHERE (species = 'cat' AND sex = 'm')
-> OR (species = 'dog' AND sex = 'f');
+----------+-------+---------+------+------------+-------+
<table>
<thead>
<tr>
<th>name</th>
<th>owner</th>
<th>species</th>
<th>sex</th>
<th>birth</th>
<th>death</th>
</tr>
</thead>
<tbody>
<tr>
<td>Claws</td>
<td>Gwen</td>
<td>cat</td>
<td>m</td>
<td>1994-03-17</td>
<td>NULL</td>
</tr>
<tr>
<td>Buffy</td>
<td>Harold</td>
<td>dog</td>
<td>f</td>
<td>1989-05-13</td>
<td>NULL</td>
</tr>
</tbody>
</table>
+----------+-------+---------+------+------------+-------+
```

### 3.3.4.3 Selecting Particular Columns

If you do not want to see entire rows from your table, just name the columns in which you are interested, separated by commas. For example, if you want to know when your animals were born, select the name and birth columns:

```
mysql> SELECT name, birth FROM pet;
+---------+----------+
<table>
<thead>
<tr>
<th>name</th>
<th>birth</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fluffy</td>
<td>1993-02-04</td>
</tr>
<tr>
<td>Claws</td>
<td>1994-03-17</td>
</tr>
</tbody>
</table>
+---------+----------+
```
Retrieving Information from a Table

| Buffy    | 1989-05-13 |
| Fang     | 1990-08-27 |
| Bowser   | 1989-08-31 |
| Chirpy   | 1998-09-11 |
| Whistler | 1997-12-09 |
| Slim     | 1996-04-29 |
| Puffball | 1999-03-30 |

To find out who owns pets, use this query:

```sql
mysql> SELECT owner FROM pet;
+--------+
| owner  |
+--------+
| Harold |
| Gwen   |
| Harold |
| Benny  |
| Diane  |
| Gwen   |
| Gwen   |
| Benny  |
| Diane  |
+--------+
```

Notice that the query simply retrieves the `owner` column from each record, and some of them appear more than once. To minimize the output, retrieve each unique output record just once by adding the keyword `DISTINCT`:

```sql
mysql> SELECT DISTINCT owner FROM pet;
+--------+
| owner  |
+--------+
| Benny  |
| Diane  |
| Gwen   |
| Harold |
+--------+
```

You can use a `WHERE` clause to combine row selection with column selection. For example, to get birth dates for dogs and cats only, use this query:

```sql
mysql> SELECT name, species, birth FROM pet
   -> WHERE species = 'dog' OR species = 'cat';
+--------+---------+------------+
| name   | species | birth      |
|--------+---------+------------+
| Fluffy | cat     | 1993-02-04 |
| Claws  | cat     | 1994-03-17 |
| Buffy  | dog     | 1989-05-13 |
| Fang   | dog     | 1990-08-27 |
| Bowser | dog     | 1989-08-31 |
+--------+---------+------------+
```

### 3.3.4.4 Sorting Rows

You may have noticed in the preceding examples that the result rows are displayed in no particular order. It is often easier to examine query output when the rows are sorted in some meaningful way. To sort a result, use an `ORDER BY` clause.

Here are animal birthdays, sorted by date:

```sql
mysql> SELECT name, birth FROM pet ORDER BY birth;
+--------+------------+
| name   | birth      |
+--------+------------+
| Fluffy | 1993-02-04 |
| Claws  | 1994-03-17 |
| Buffy  | 1989-05-13 |
| Fang   | 1990-08-27 |
| Bowser | 1989-08-31 |
+--------+------------+
```
On character type columns, sorting—like all other comparison operations—is normally performed in a case-insensitive fashion. This means that the order is undefined for columns that are identical except for their case. You can force a case-sensitive sort for a column by using `BINARY` like so:

```
ORDER BY BINARY col_name
```

The default sort order is ascending, with smallest values first. To sort in reverse (descending) order, add the `DESC` keyword to the name of the column you are sorting by:

```
mysql> SELECT name, birth FROM pet ORDER BY birth DESC;
```

You can sort on multiple columns, and you can sort different columns in different directions. For example, to sort by type of animal in ascending order, then by birth date within animal type in descending order (youngest animals first), use the following query:

```
mysql> SELECT name, species, birth FROM pet
    -> ORDER BY species, birth DESC;
```

The `DESC` keyword applies only to the column name immediately preceding it (birth); it does not affect the `species` column sort order.

### 3.3.4.5 Date Calculations

MySQL provides several functions that you can use to perform calculations on dates, for example, to calculate ages or extract parts of dates.

To determine how many years old each of your pets is, use the `TIMESTAMPDIFF()` function. Its arguments are the unit in which you want the result expressed, and the two date for which to take the
difference. The following query shows, for each pet, the birth date, the current date, and the age in years. An alias (age) is used to make the final output column label more meaningful.

```sql
mysql> SELECT name, birth, CURDATE(),
       -> TIMESTAMPDIFF(YEAR, birth, CURDATE()) AS age
       -> FROM pet;
```

```
+----------+------------+------------+------+
<table>
<thead>
<tr>
<th>name</th>
<th>birth</th>
<th>CURDATE()</th>
<th>age</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fluffy</td>
<td>1993-02-04</td>
<td>2003-08-19</td>
<td>10</td>
</tr>
<tr>
<td>Claws</td>
<td>1994-03-17</td>
<td>2003-08-19</td>
<td>9</td>
</tr>
<tr>
<td>Buffy</td>
<td>1989-05-13</td>
<td>2003-08-19</td>
<td>14</td>
</tr>
<tr>
<td>Fang</td>
<td>1990-08-27</td>
<td>2003-08-19</td>
<td>12</td>
</tr>
<tr>
<td>Bowser</td>
<td>1989-08-31</td>
<td>2003-08-19</td>
<td>13</td>
</tr>
<tr>
<td>Chirpy</td>
<td>1998-09-11</td>
<td>2003-08-19</td>
<td>4</td>
</tr>
<tr>
<td>Whistler</td>
<td>1997-12-09</td>
<td>2003-08-19</td>
<td>5</td>
</tr>
<tr>
<td>Slim</td>
<td>1996-04-29</td>
<td>2003-08-19</td>
<td>7</td>
</tr>
<tr>
<td>Puffball</td>
<td>1999-03-30</td>
<td>2003-08-19</td>
<td>4</td>
</tr>
</tbody>
</table>
+----------+------------+------------+------+
```

The query works, but the result could be scanned more easily if the rows were presented in some order. This can be done by adding an ORDER BY name clause to sort the output by name:

```sql
mysql> SELECT name, birth, CURDATE(),
       -> TIMESTAMPDIFF(YEAR, birth, CURDATE()) AS age
       -> FROM pet ORDER BY name;
```

```
+----------+------------+------------+------+
<table>
<thead>
<tr>
<th>name</th>
<th>birth</th>
<th>CURDATE()</th>
<th>age</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bowser</td>
<td>1989-08-31</td>
<td>2003-08-19</td>
<td>13</td>
</tr>
<tr>
<td>Buffy</td>
<td>1989-05-13</td>
<td>2003-08-19</td>
<td>14</td>
</tr>
<tr>
<td>Chirpy</td>
<td>1998-09-11</td>
<td>2003-08-19</td>
<td>4</td>
</tr>
<tr>
<td>Claws</td>
<td>1994-03-17</td>
<td>2003-08-19</td>
<td>9</td>
</tr>
<tr>
<td>Fang</td>
<td>1990-08-27</td>
<td>2003-08-19</td>
<td>12</td>
</tr>
<tr>
<td>Fluffy</td>
<td>1993-02-04</td>
<td>2003-08-19</td>
<td>10</td>
</tr>
<tr>
<td>Puffball</td>
<td>1999-03-30</td>
<td>2003-08-19</td>
<td>4</td>
</tr>
<tr>
<td>Slim</td>
<td>1996-04-29</td>
<td>2003-08-19</td>
<td>7</td>
</tr>
<tr>
<td>Whistler</td>
<td>1997-12-09</td>
<td>2003-08-19</td>
<td>5</td>
</tr>
</tbody>
</table>
+----------+------------+------------+------+
```

To sort the output by age rather than name, just use a different ORDER BY clause:

```sql
mysql> SELECT name, birth, CURDATE(),
       -> TIMESTAMPDIFF(YEAR, birth, CURDATE()) AS age
       -> FROM pet ORDER BY age;
```

```
+--------+------------+------------+------+
<table>
<thead>
<tr>
<th>name</th>
<th>birth</th>
<th>CURDATE()</th>
<th>age</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chirpy</td>
<td>1998-09-11</td>
<td>2003-08-19</td>
<td>4</td>
</tr>
<tr>
<td>Puffball</td>
<td>1999-03-30</td>
<td>2003-08-19</td>
<td>4</td>
</tr>
<tr>
<td>Whistler</td>
<td>1997-12-09</td>
<td>2003-08-19</td>
<td>5</td>
</tr>
<tr>
<td>Slim</td>
<td>1996-04-29</td>
<td>2003-08-19</td>
<td>7</td>
</tr>
<tr>
<td>Claws</td>
<td>1994-03-17</td>
<td>2003-08-19</td>
<td>9</td>
</tr>
<tr>
<td>Fluffy</td>
<td>1993-02-04</td>
<td>2003-08-19</td>
<td>10</td>
</tr>
<tr>
<td>Fang</td>
<td>1990-08-27</td>
<td>2003-08-19</td>
<td>12</td>
</tr>
<tr>
<td>Bowser</td>
<td>1989-08-31</td>
<td>2003-08-19</td>
<td>13</td>
</tr>
<tr>
<td>Buffy</td>
<td>1989-05-13</td>
<td>2003-08-19</td>
<td>14</td>
</tr>
</tbody>
</table>
+--------+------------+------------+------+
```

A similar query can be used to determine age at death for animals that have died. You determine which animals these are by checking whether the death value is NULL. Then, for those with non-NULL values, compute the difference between the death and birth values:

```sql
mysql> SELECT name, birth, death,
       -> TIMESTAMPDIFF(YEAR, birth, death) AS age
       -> FROM pet WHERE death IS NOT NULL ORDER BY age;
```

```
+--------+------------+------------+------+
<table>
<thead>
<tr>
<th>name</th>
<th>birth</th>
<th>death</th>
<th>age</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chirpy</td>
<td>1998-09-11</td>
<td>2003-08-19</td>
<td>4</td>
</tr>
<tr>
<td>Puffball</td>
<td>1999-03-30</td>
<td>2003-08-19</td>
<td>4</td>
</tr>
<tr>
<td>Whistler</td>
<td>1997-12-09</td>
<td>2003-08-19</td>
<td>5</td>
</tr>
<tr>
<td>Slim</td>
<td>1996-04-29</td>
<td>2003-08-19</td>
<td>7</td>
</tr>
<tr>
<td>Claws</td>
<td>1994-03-17</td>
<td>2003-08-19</td>
<td>9</td>
</tr>
<tr>
<td>Fluffy</td>
<td>1993-02-04</td>
<td>2003-08-19</td>
<td>10</td>
</tr>
<tr>
<td>Fang</td>
<td>1990-08-27</td>
<td>2003-08-19</td>
<td>12</td>
</tr>
<tr>
<td>Bowser</td>
<td>1989-08-31</td>
<td>2003-08-19</td>
<td>13</td>
</tr>
<tr>
<td>Buffy</td>
<td>1989-05-13</td>
<td>2003-08-19</td>
<td>14</td>
</tr>
</tbody>
</table>
+--------+------------+------------+------+
```
Retrieving Information from a Table

<table>
<thead>
<tr>
<th>name</th>
<th>birth</th>
<th>death</th>
<th>age</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bowser</td>
<td>1989-08-31</td>
<td>1995-07-29</td>
<td>5</td>
</tr>
</tbody>
</table>

The query uses `death IS NOT NULL` rather than `death <> NULL` because `NULL` is a special value that cannot be compared using the usual comparison operators. This is discussed later. See Section 3.3.4.6, “Working with NULL Values”.

What if you want to know which animals have birthdays next month? For this type of calculation, year and day are irrelevant; you simply want to extract the month part of the `birth` column. MySQL provides several functions for extracting parts of dates, such as `YEAR()`, `MONTH()`, and `DAYOFMONTH()` (`.MONTH()` is the appropriate function here. To see how it works, run a simple query that displays the value of both `birth` and `MONTH(birth)`:

```
SELECT name, birth, MONTH(birth) FROM pet;
```

<table>
<thead>
<tr>
<th>name</th>
<th>birth</th>
<th>MONTH(birth)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fluffy</td>
<td>1993-02-04</td>
<td>2</td>
</tr>
<tr>
<td>Claws</td>
<td>1994-03-17</td>
<td>3</td>
</tr>
<tr>
<td>Buffy</td>
<td>1989-05-13</td>
<td>5</td>
</tr>
<tr>
<td>Fang</td>
<td>1990-08-27</td>
<td>8</td>
</tr>
<tr>
<td>Bowser</td>
<td>1989-08-31</td>
<td>8</td>
</tr>
<tr>
<td>Chirpy</td>
<td>1998-09-11</td>
<td>9</td>
</tr>
<tr>
<td>Whistler</td>
<td>1997-12-09</td>
<td>12</td>
</tr>
<tr>
<td>Slim</td>
<td>1996-04-29</td>
<td>4</td>
</tr>
<tr>
<td>Puffball</td>
<td>1999-03-30</td>
<td>3</td>
</tr>
</tbody>
</table>

Finding animals with birthdays in the upcoming month is also simple. Suppose that the current month is April. Then the month value is 4 and you can look for animals born in May (month 5) like this:

```
SELECT name, birth FROM pet WHERE MONTH(birth) = 5;
```

<table>
<thead>
<tr>
<th>name</th>
<th>birth</th>
</tr>
</thead>
<tbody>
<tr>
<td>Buffy</td>
<td>1989-05-13</td>
</tr>
</tbody>
</table>

There is a small complication if the current month is December. You cannot merely add one to the month number (12) and look for animals born in month 13, because there is no such month. Instead, you look for animals born in January (month 1).

You can write the query so that it works no matter what the current month is, so that you do not have to use the number for a particular month. `DATE_ADD()` enables you to add a time interval to a given date. If you add a month to the value of `CURDATE()`, then extract the month part with `MONTH()`, the result produces the month in which to look for birthdays:

```
SELECT name, birth FROM pet
-> WHERE MONTH(birth) = MONTH(DATE_ADD(CURDATE(),INTERVAL 1 MONTH));
```

A different way to accomplish the same task is to add 1 to get the next month after the current one after using the modulo function (MOD) to wrap the month value to 0 if it is currently 12:

```
SELECT name, birth FROM pet
  -> WHERE MONTH(birth) = MOD(MONTH(CURDATE()), 12) + 1;
```

`MONTH()` returns a number between 1 and 12. And `MOD(something,12)` returns a number between 0 and 11. So the addition has to be after the `MOD()`, otherwise we would go from November (11) to January (1).

3.3.4.6 Working with NULL Values
The **NULL** value can be surprising until you get used to it. Conceptually, **NULL** means “a missing unknown value” and it is treated somewhat differently from other values.

To test for **NULL**, use the **IS NULL** and **IS NOT NULL** operators, as shown here:

```sql
mysql> SELECT 1 IS NULL, 1 IS NOT NULL;
+-----------+---------------+
| 1 IS NULL | 1 IS NOT NULL |
+-----------+---------------+
|         0 |             1 |
+-----------+---------------+
```

You cannot use arithmetic comparison operators such as `=`, `<`, or `<>` to test for **NULL**. To demonstrate this for yourself, try the following query:

```sql
mysql> SELECT 1 = NULL, 1 <> NULL, 1 < NULL, 1 > NULL;
+----------+-----------+----------+----------+
| 1 = NULL | 1 <> NULL | 1 < NULL | 1 > NULL |
+----------+-----------+----------+----------+
|     NULL |      NULL |     NULL |     NULL |
+----------+-----------+----------+----------+
```

Because the result of any arithmetic comparison with **NULL** is also **NULL**, you cannot obtain any meaningful results from such comparisons.

In MySQL, `0` or **NULL** means false and anything else means true. The default truth value from a boolean operation is **1**.

This special treatment of **NULL** is why, in the previous section, it was necessary to determine which animals are no longer alive using `death IS NOT NULL` instead of `death <> NULL`.

Two **NULL** values are regarded as equal in a **GROUP BY**.

When doing an **ORDER BY**,** NULL** values are presented first if you do **ORDER BY ... ASC** and last if you do **ORDER BY ... DESC**.

A common error when working with **NULL** is to assume that it is not possible to insert a zero or an empty string into a column defined as **NOT NULL**, but this is not the case. These are in fact values, whereas **NULL** means “not having a value.” You can test this easily enough by using **IS [NOT] NULL** as shown:

```sql
mysql> SELECT 0 IS NULL, 0 IS NOT NULL, '' IS NULL, '' IS NOT NULL;
+-----------+---------------+------------+----------------+
| 0 IS NULL | 0 IS NOT NULL | '' IS NULL | '' IS NOT NULL |
+-----------+---------------+------------+----------------+
|         0 |             1 |          0 |              1 |
+-----------+---------------+------------+----------------+
```

Thus it is entirely possible to insert a zero or empty string into a **NOT NULL** column, as these are in fact **NOT NULL**. See Section B.5.4.3, “Problems with NULL Values”.

### 3.3.4.7 Pattern Matching

MySQL provides standard SQL pattern matching as well as a form of pattern matching based on extended regular expressions similar to those used by Unix utilities such as `vi, grep, and sed`.

SQL pattern matching enables you to use “*” to match any single character and “%” to match an arbitrary number of characters (including zero characters). In MySQL, SQL patterns are case-insensitive by default. Some examples are shown here. You do not use `=` or `<>` when you use SQL patterns; use the **LIKE** or **NOT LIKE** comparison operators instead.

To find names beginning with "b":
Retrieving Information from a Table

mysql> SELECT * FROM pet WHERE name LIKE 'b\%';

<table>
<thead>
<tr>
<th>name</th>
<th>owner</th>
<th>species</th>
<th>sex</th>
<th>birth</th>
<th>death</th>
</tr>
</thead>
<tbody>
<tr>
<td>Buffy</td>
<td>Harold</td>
<td>dog</td>
<td>f</td>
<td>1989-05-13</td>
<td>NULL</td>
</tr>
<tr>
<td>Bowser</td>
<td>Diane</td>
<td>dog</td>
<td>m</td>
<td>1989-08-31</td>
<td>1995-07-29</td>
</tr>
</tbody>
</table>

To find names ending with “fy”:

mysql> SELECT * FROM pet WHERE name LIKE '%fy';

<table>
<thead>
<tr>
<th>name</th>
<th>owner</th>
<th>species</th>
<th>sex</th>
<th>birth</th>
<th>death</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fluffy</td>
<td>Harold</td>
<td>cat</td>
<td>f</td>
<td>1993-02-04</td>
<td>NULL</td>
</tr>
<tr>
<td>Buffy</td>
<td>Harold</td>
<td>dog</td>
<td>f</td>
<td>1989-05-13</td>
<td>NULL</td>
</tr>
</tbody>
</table>

To find names containing a “w”:

mysql> SELECT * FROM pet WHERE name LIKE '%w%';

<table>
<thead>
<tr>
<th>name</th>
<th>owner</th>
<th>species</th>
<th>sex</th>
<th>birth</th>
<th>death</th>
</tr>
</thead>
<tbody>
<tr>
<td>Claws</td>
<td>Gwen</td>
<td>cat</td>
<td>m</td>
<td>1994-03-17</td>
<td>NULL</td>
</tr>
<tr>
<td>Bowser</td>
<td>Diane</td>
<td>dog</td>
<td>m</td>
<td>1989-08-31</td>
<td>1995-07-29</td>
</tr>
<tr>
<td>Whistler</td>
<td>Gwen</td>
<td>bird</td>
<td>NULL</td>
<td>1997-12-09</td>
<td>NULL</td>
</tr>
</tbody>
</table>

To find names containing exactly five characters, use five instances of the “_” pattern character:

mysql> SELECT * FROM pet WHERE name LIKE '_____';

<table>
<thead>
<tr>
<th>name</th>
<th>owner</th>
<th>species</th>
<th>sex</th>
<th>birth</th>
<th>death</th>
</tr>
</thead>
<tbody>
<tr>
<td>Claws</td>
<td>Gwen</td>
<td>cat</td>
<td>m</td>
<td>1994-03-17</td>
<td>NULL</td>
</tr>
<tr>
<td>Buffy</td>
<td>Harold</td>
<td>dog</td>
<td>f</td>
<td>1989-05-13</td>
<td>NULL</td>
</tr>
</tbody>
</table>

The other type of pattern matching provided by MySQL uses extended regular expressions. When you test for a match for this type of pattern, use the REGEXP and NOT REGEXP operators (or RLIKE and NOT RLIKE, which are synonyms).

The following list describes some characteristics of extended regular expressions:

- “.” matches any single character.
- A character class “[abc]” matches any character within the brackets. For example, “[abc]” matches “a”, “b”, or “c”. To name a range of characters, use a dash. “[a-z]” matches any letter, whereas “[0-9]” matches any digit.
- “*” matches zero or more instances of the thing preceding it. For example, “x*” matches any number of “x” characters, “[0-9]” matches any number of digits, and “. *” matches any number of anything.
- A REGEXP pattern match succeeds if the pattern matches anywhere in the value being tested. (This differs from a LIKE pattern match, which succeeds only if the pattern matches the entire value.)
- To anchor a pattern so that it must match the beginning or end of the value being tested, use “^” at the beginning or “$” at the end of the pattern.

To demonstrate how extended regular expressions work, the LIKE queries shown previously are rewritten here to use REGEXP.

221
To find names beginning with "b", use "^b" to match the beginning of the name:

```sql
mysql> SELECT * FROM pet WHERE name REGEXP '^b';
+--------+--------+---------+------+------------+------------+
| name   | owner  | species | sex  | birth      | death      |
+--------+--------+---------+------+------------+------------+
| Buffy  | Harold | dog     | f    | 1989-05-13 | NULL       |
| Bowser | Diane  | dog     | m    | 1989-08-31 | 1995-07-29 |
+--------+--------+---------+------+------------+------------+
```

If you really want to force a REGEXP comparison to be case sensitive, use the BINARY keyword to make one of the strings a binary string. This query matches only lowercase "b" at the beginning of a name:

```sql
mysql> SELECT * FROM pet WHERE name REGEXP BINARY '^b';
```

To find names ending with "fy", use "$" to match the end of the name:

```sql
mysql> SELECT * FROM pet WHERE name REGEXP 'fy$';
+--------+--------+---------+------+------------+-------+
| name   | owner  | species | sex  | birth      | death |
+--------+--------+---------+------+------------+-------+
| Fluffy | Harold | cat     | f    | 1993-02-04 | NULL  |
| Buffy  | Harold | dog     | f    | 1989-05-13 | NULL  |
+--------+--------+---------+------+------------+-------+
```

To find names containing a "w", use this query:

```sql
mysql> SELECT * FROM pet WHERE name REGEXP 'w';
+----------+-------+---------+------+------------+------------+
| name     | owner | species | sex  | birth      | death      |
+----------+-------+---------+------+------------+------------+
| Claws    | Gwen  | cat     | m    | 1994-03-17 | NULL       |
| Bowser   | Diane | dog     | m    | 1989-08-31 | 1995-07-29 |
| Whistler | Gwen  | bird    | NULL | 1997-12-09 | NULL       |
+----------+-------+---------+------+------------+------------+
```

Because a regular expression pattern matches if it occurs anywhere in the value, it is not necessary in the previous query to put a wildcard on either side of the pattern to get it to match the entire value like it would be if you used an SQL pattern.

To find names containing exactly five characters, use "^" and "$" to match the beginning and end of the name, and five instances of "." in between:

```sql
mysql> SELECT * FROM pet WHERE name REGEXP '^.....$';
+-------+--------+---------+------+------------+------+
| name  | owner  | species | sex  | birth      | death|
+-------+--------+---------+------+------------+------+
| Claws | Gwen   | cat     | m    | 1994-03-17 | NULL |
| Buffy | Harold | dog     | f    | 1989-05-13 | NULL |
+-------+--------+---------+------+------------+------+
```

You could also write the previous query using the \{n\} ("repeat-n-times") operator:

```sql
mysql> SELECT * FROM pet WHERE name REGEXP '^.(5)$';
+-------+--------+---------+------+------------+------+
| name  | owner  | species | sex  | birth      | death|
+-------+--------+---------+------+------------+------+
| Claws | Gwen   | cat     | m    | 1994-03-17 | NULL |
| Buffy | Harold | dog     | f    | 1989-05-13 | NULL |
+-------+--------+---------+------+------------+------+
```

Section 12.5.2, “Regular Expressions”, provides more information about the syntax for regular expressions.
3.3.4.8 Counting Rows

Databases are often used to answer the question, “How often does a certain type of data occur in a table?” For example, you might want to know how many pets you have, or how many pets each owner has, or you might want to perform various kinds of census operations on your animals.

Counting the total number of animals you have is the same question as “How many rows are in the pet table?” because there is one record per pet. `COUNT(*)` counts the number of rows, so the query to count your animals looks like this:

```sql
mysql> SELECT COUNT(*) FROM pet;
+----------+
| COUNT(*) |
+----------+
|        9 |
+----------+
```

Earlier, you retrieved the names of the people who owned pets. You can use `COUNT()` if you want to find out how many pets each owner has:

```sql
mysql> SELECT owner, COUNT(*) FROM pet GROUP BY owner;
+--------+----------+
| owner  | COUNT(*) |
+--------+----------+
| Benny  |        2 |
| Diane  |        2 |
| Gwen   |        3 |
| Harold |        2 |
+--------+----------+
```

The preceding query uses `GROUP BY` to group all records for each `owner`. The use of `COUNT()` in conjunction with `GROUP BY` is useful for characterizing your data under various groupings. The following examples show different ways to perform animal census operations.

Number of animals per species:

```sql
mysql> SELECT species, COUNT(*) FROM pet GROUP BY species;
+---------+----------+
| species | COUNT(*) |
+---------+----------+
| bird    |        2 |
| cat     |        2 |
| dog     |        3 |
| hamster |        1 |
| snake   |        1 |
+---------+----------+
```

Number of animals per sex:

```sql
mysql> SELECT sex, COUNT(*) FROM pet GROUP BY sex;
+------+----------+
| sex  | COUNT(*) |
+------+----------+
| NULL |        1 |
| f    |        4 |
| m    |        4 |
+------+----------+
```

(In this output, `NULL` indicates that the sex is unknown.)

Number of animals per combination of species and sex:

```sql
mysql> SELECT species, sex, COUNT(*) FROM pet GROUP BY species, sex;
+---------+------+----------+
| species | sex  | COUNT(*) |
+---------+------+----------+
| bird    | NULL |        1 |
| cat     | NULL |        1 |
| dog     | NULL |        1 |
| hamster | NULL |        1 |
| snake   | NULL |        1 |
|         | f    |        4 |
|         | m    |        4 |
+---------+------+----------+
```
You need not retrieve an entire table when you use `COUNT()`. For example, the previous query, when performed just on dogs and cats, looks like this:

```sql
mysql> SELECT species, sex, COUNT(*) FROM pet
    -> WHERE species = 'dog' OR species = 'cat'
    -> GROUP BY species, sex;
+---------+------+----------+
<table>
<thead>
<tr>
<th>species</th>
<th>sex</th>
<th>COUNT(*)</th>
</tr>
</thead>
<tbody>
<tr>
<td>cat</td>
<td>f</td>
<td>1</td>
</tr>
<tr>
<td>cat</td>
<td>m</td>
<td>1</td>
</tr>
<tr>
<td>dog</td>
<td>f</td>
<td>1</td>
</tr>
<tr>
<td>dog</td>
<td>m</td>
<td>2</td>
</tr>
</tbody>
</table>
+---------+------+----------+
```

Or, if you wanted the number of animals per sex only for animals whose sex is known:

```sql
mysql> SELECT species, sex, COUNT(*) FROM pet
    -> WHERE sex IS NOT NULL
    -> GROUP BY species, sex;
+---------+------+----------+
<table>
<thead>
<tr>
<th>species</th>
<th>sex</th>
<th>COUNT(*)</th>
</tr>
</thead>
<tbody>
<tr>
<td>bird</td>
<td>f</td>
<td>1</td>
</tr>
<tr>
<td>cat</td>
<td>f</td>
<td>1</td>
</tr>
<tr>
<td>cat</td>
<td>m</td>
<td>1</td>
</tr>
<tr>
<td>dog</td>
<td>f</td>
<td>1</td>
</tr>
<tr>
<td>dog</td>
<td>m</td>
<td>2</td>
</tr>
<tr>
<td>hamster</td>
<td>f</td>
<td>1</td>
</tr>
<tr>
<td>snake</td>
<td>m</td>
<td>1</td>
</tr>
</tbody>
</table>
+---------+------+----------+
```

If you name columns to select in addition to the `COUNT()` value, a `GROUP BY` clause should be present that names those same columns. Otherwise, the following occurs:

- If the `ONLY_FULL_GROUP_BY` SQL mode is enabled, an error occurs:

```sql
mysql> SET sql_mode = 'ONLY_FULL_GROUP_BY';
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT owner, COUNT(*) FROM pet;
ERROR 1140 (42000): Mixing of GROUP columns (MIN(),MAX(),COUNT()...) with no GROUP BY clause is illegal if there is no GROUP BY clause
```

- If `ONLY_FULL_GROUP_BY` is not enabled, the query is processed by treating all rows as a single group, but the value selected for each named column is indeterminate. The server is free to select the value from any row:

```sql
mysql> SET sql_mode = '';
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT owner, COUNT(*) FROM pet;
+--------+----------+
| owner  | COUNT(*) |
+--------+----------+
```
Retrieving Information from a Table

| ---------------+-------+
| Harold         | 8     |
| ---------------+-------+

1 row in set (0.00 sec)

See also Section 12.17.3, “MySQL Handling of GROUP BY”.

3.3.4.9 Using More Than one Table

The pet table keeps track of which pets you have. If you want to record other information about them, such as events in their lives like visits to the vet or when litters are born, you need another table. What should this table look like? It needs to contain the following information:

- The pet name so that you know which animal each event pertains to.
- A date so that you know when the event occurred.
- A field to describe the event.
- An event type field, if you want to be able to categorize events.

Given these considerations, the CREATE TABLE statement for the event table might look like this:

```sql
mysql> CREATE TABLE event (name VARCHAR(20), date DATE, type VARCHAR(15), remark VARCHAR(255));
```

As with the pet table, it is easiest to load the initial records by creating a tab-delimited text file containing the following information.

<table>
<thead>
<tr>
<th>name</th>
<th>date</th>
<th>type</th>
<th>remark</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fluffy</td>
<td>1995-05-15</td>
<td>litter</td>
<td>4 kittens, 3 female, 1 male</td>
</tr>
<tr>
<td>Buffy</td>
<td>1993-06-23</td>
<td>litter</td>
<td>5 puppies, 2 female, 3 male</td>
</tr>
<tr>
<td>Buffy</td>
<td>1994-06-19</td>
<td>litter</td>
<td>3 puppies, 3 female</td>
</tr>
<tr>
<td>Chirpy</td>
<td>1999-03-21</td>
<td>vet</td>
<td>needed beak straightened</td>
</tr>
<tr>
<td>Slim</td>
<td>1997-08-03</td>
<td>vet</td>
<td>broken rib</td>
</tr>
<tr>
<td>Bowser</td>
<td>1991-10-12</td>
<td>kennel</td>
<td></td>
</tr>
<tr>
<td>Fang</td>
<td>1991-10-12</td>
<td>kennel</td>
<td></td>
</tr>
<tr>
<td>Fang</td>
<td>1998-08-28</td>
<td>birthday</td>
<td>Gave him a new chew toy</td>
</tr>
<tr>
<td>Claws</td>
<td>1998-03-17</td>
<td>birthday</td>
<td>Gave him a new flea collar</td>
</tr>
<tr>
<td>Whistler</td>
<td>1998-12-09</td>
<td>birthday</td>
<td>First birthday</td>
</tr>
</tbody>
</table>

Load the records like this:

```sql
mysql> LOAD DATA LOCAL INFILE 'event.txt' INTO TABLE event;
```

Based on what you have learned from the queries that you have run on the pet table, you should be able to perform retrievals on the records in the event table; the principles are the same. But when is the event table by itself insufficient to answer questions you might ask?

Suppose that you want to find out the ages at which each pet had its litters. We saw earlier how to calculate ages from two dates. The litter date of the mother is in the event table, but to calculate her age on that date you need her birth date, which is stored in the pet table. This means the query requires both tables:

```sql
mysql> SELECT pet.name, TIMESTAMPDIFF(YEAR,birth,date) AS age, remark
          FROM event INNER JOIN pet
          ON pet.name = event.name;
```
Getting Information About Databases and Tables

There are several things to note about this query:

- The `FROM` clause joins two tables because the query needs to pull information from both of them.

- When combining (joining) information from multiple tables, you need to specify how records in one table can be matched to records in the other. This is easy because they both have a `name` column. The query uses an `ON` clause to match up records in the two tables based on the `name` values.

- The query uses an `INNER JOIN` to combine the tables. An `INNER JOIN` permits rows from either table to appear in the result if and only if both tables meet the conditions specified in the `ON` clause. In this example, the `ON` clause specifies that the `name` column in the `pet` table must match the `name` column in the `event` table. If a name appears in one table but not the other, the row will not appear in the result because the condition in the `ON` clause fails.

- Because the `name` column occurs in both tables, you must be specific about which table you mean when referring to the column. This is done by prepending the table name to the column name.

You need not have two different tables to perform a join. Sometimes it is useful to join a table to itself, if you want to compare records in a table to other records in that same table. For example, to find breeding pairs among your pets, you can join the `pet` table with itself to produce candidate pairs of males and females of like species:

```
mysql> SELECT p1.name, p1.sex, p2.name, p2.sex, p1.species
    -> FROM pet AS p1 INNER JOIN pet AS p2
    -> ON p1.species = p2.species AND p1.sex = 'f' AND p2.sex = 'm';
```

```
+--------+------+--------+------+---------+
| name   | sex  | name   | sex  | species |
|--------+------+--------+------+---------|
| Fluffy | f    | Claws  | m    | cat     |
| Buffy  | f    | Fang   | m    | dog     |
| Buffy  | f    | Bowser | m    | dog     |
```

In this query, we specify aliases for the table name to refer to the columns and keep straight which instance of the table each column reference is associated with.

### 3.4 Getting Information About Databases and Tables

What if you forget the name of a database or table, or what the structure of a given table is (for example, what its columns are called)? MySQL addresses this problem through several statements that provide information about the databases and tables it supports.

You have previously seen `SHOW DATABASES`, which lists the databases managed by the server. To find out which database is currently selected, use the `DATABASE()` function:

```
mysql> SELECT DATABASE();
```

```
+------------+
| DATABASE()  |
| menagerie  |
```

If you have not yet selected any database, the result is `NULL`. 

226
To find out what tables the default database contains (for example, when you are not sure about the name of a table), use this statement:

```sql
mysql> SHOW TABLES;
+---------------------+
| Tables_in_menagerie |
| event               |
| pet                 |
+---------------------+
```

The name of the column in the output produced by this statement is always `Tables_in_db_name`, where `db_name` is the name of the database. See Section 13.7.5.39, “SHOW TABLES Syntax”, for more information.

If you want to find out about the structure of a table, the `DESCRIBE` statement is useful; it displays information about each of a table’s columns:

```sql
mysql> DESCRIBE pet;
```

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Null</th>
<th>Key</th>
<th>Default</th>
<th>Extra</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>varchar(20)</td>
<td>YES</td>
<td></td>
<td>NULL</td>
<td></td>
</tr>
<tr>
<td>owner</td>
<td>varchar(20)</td>
<td>YES</td>
<td></td>
<td>NULL</td>
<td></td>
</tr>
<tr>
<td>species</td>
<td>varchar(20)</td>
<td>YES</td>
<td></td>
<td>NULL</td>
<td></td>
</tr>
<tr>
<td>sex</td>
<td>char(1)</td>
<td>YES</td>
<td></td>
<td>NULL</td>
<td></td>
</tr>
<tr>
<td>birth</td>
<td>date</td>
<td>YES</td>
<td></td>
<td>NULL</td>
<td></td>
</tr>
<tr>
<td>death</td>
<td>date</td>
<td>YES</td>
<td></td>
<td>NULL</td>
<td></td>
</tr>
</tbody>
</table>

`Field` indicates the column name, `Type` is the data type for the column, `NULL` indicates whether the column can contain `NULL` values, `Key` indicates whether the column is indexed, and `Default` specifies the column’s default value. `Extra` displays special information about columns: If a column was created with the `AUTO_INCREMENT` option, the value will be `auto_increment` rather than empty.

`DESC` is a short form of `DESCRIBE`. See Section 13.8.1, “DESCRIBE Syntax”, for more information.

You can obtain the `CREATE TABLE` statement necessary to create an existing table using the `SHOW CREATE TABLE` statement. See Section 13.7.5.12, “SHOW CREATE TABLE Syntax”.

If you have indexes on a table, `SHOW INDEX FROM tbl_name` produces information about them. See Section 13.7.5.23, “SHOW INDEX Syntax”, for more about this statement.

### 3.5 Using mysql in Batch Mode

In the previous sections, you used `mysql` interactively to enter statements and view the results. You can also run `mysql` in batch mode. To do this, put the statements you want to run in a file, then tell `mysql` to read its input from the file:

```bash
shell> mysql < batch-file
```

If you are running `mysql` under Windows and have some special characters in the file that cause problems, you can do this:

```bash
C:\> mysql -e "source batch-file"
```

If you need to specify connection parameters on the command line, the command might look like this:

```bash
shell> mysql -h host -u user -p < batch-file
Enter password: ********
```
When you use `mysql` this way, you are creating a script file, then executing the script.

If you want the script to continue even if some of the statements in it produce errors, you should use the `--force` command-line option.

Why use a script? Here are a few reasons:

- If you run a query repeatedly (say, every day or every week), making it a script enables you to avoid retyping it each time you execute it.
- You can generate new queries from existing ones that are similar by copying and editing script files.
- Batch mode can also be useful while you're developing a query, particularly for multiple-line statements or multiple-statement sequences. If you make a mistake, you don't have to retype everything. Just edit your script to correct the error, then tell `mysql` to execute it again.
- If you have a query that produces a lot of output, you can run the output through a pager rather than watching it scroll off the top of your screen:

  ```shell
  mysql < batch-file | more
  ```

- You can catch the output in a file for further processing:

  ```shell
  mysql < batch-file > mysql.out
  ```

- You can distribute your script to other people so that they can also run the statements.

- Some situations do not allow for interactive use, for example, when you run a query from a `cron` job. In this case, you must use batch mode.

The default output format is different (more concise) when you run `mysql` in batch mode than when you use it interactively. For example, the output of `SELECT DISTINCT species FROM pet` looks like this when `mysql` is run interactively:

```
+---------+
| species |
+---------+
| bird    |
| cat     |
| dog     |
| hamster |
| snake   |
```

In batch mode, the output looks like this instead:

```
species
bird
cat
dog
hamster
snake
```

If you want to get the interactive output format in batch mode, use `mysql -t`. To echo to the output the statements that are executed, use `mysql -v`.

You can also use scripts from the `mysql` prompt by using the `source` command or `\. command`:

```
mysql> source filename;
mysql> \ filename
```

See Section 4.5.1.5, “Executing SQL Statements from a Text File”, for more information.
3.6 Examples of Common Queries

Here are examples of how to solve some common problems with MySQL.

Some of the examples use the table `shop` to hold the price of each article (item number) for certain traders (dealers). Supposing that each trader has a single fixed price per article, then `(article, dealer)` is a primary key for the records.

Start the command-line tool `mysql` and select a database:

```
shell> mysql your-database-name
```

(In most MySQL installations, you can use the database named `test`).

You can create and populate the example table with these statements:

```sql
CREATE TABLE shop (
  article INT(4) UNSIGNED ZEROFILL DEFAULT '0000' NOT NULL,
  dealer CHAR(20)                  DEFAULT ''     NOT NULL,
  price  DOUBLE(16,2)             DEFAULT '0.00' NOT NULL,
  PRIMARY KEY(article, dealer));
INSERT INTO shop VALUES
  (1,'A',3.45),(1,'B',3.99),(2,'A',10.99),(3,'B',1.45),
  (3,'C',1.69),(3,'D',1.25),(4,'D',19.95);
```

After issuing the statements, the table should have the following contents:

```
+---------+--------+-------+
| article | dealer | price |
+---------+--------+-------+
|    0001 | A      |  3.45 |
|    0001 | B      |  3.99 |
|    0002 | A      | 10.99 |
|    0003 | B      |  1.45 |
|    0003 | C      |  1.69 |
|    0003 | D      |  1.25 |
|    0004 | D      | 19.95 |
+---------+--------+-------+
```

### 3.6.1 The Maximum Value for a Column

“What is the highest item number?”

```sql
SELECT MAX(article) AS article FROM shop;
```

```
+--------+
| article |
+--------+
|       4 |
+--------+
```

### 3.6.2 The Row Holding the Maximum of a Certain Column

**Task:** Find the number, dealer, and price of the most expensive article.

This is easily done with a subquery:

```sql
SELECT article, dealer, price
FROM   shop
WHERE  price=(SELECT MAX(price) FROM shop);
```
### 3.6.3 Maximum of Column per Group

**Task:** Find the highest price per article.

```sql
SELECT article, MAX(price) AS price
FROM shop
GROUP BY article;
```

<table>
<thead>
<tr>
<th>article</th>
<th>price</th>
</tr>
</thead>
<tbody>
<tr>
<td>0001</td>
<td>3.99</td>
</tr>
<tr>
<td>0002</td>
<td>10.99</td>
</tr>
<tr>
<td>0003</td>
<td>1.69</td>
</tr>
<tr>
<td>0004</td>
<td>19.95</td>
</tr>
</tbody>
</table>

### 3.6.4 The Rows Holding the Group-wise Maximum of a Certain Column

**Task:** For each article, find the dealer or dealers with the most expensive price.

This problem can be solved with a subquery like this one:

```sql
SELECT article, dealer, price
FROM shop s1
WHERE price = (SELECT MAX(s2.price)
FROM shop s2
WHERE s1.article = s2.article);
```

<table>
<thead>
<tr>
<th>article</th>
<th>dealer</th>
<th>price</th>
</tr>
</thead>
<tbody>
<tr>
<td>0001</td>
<td>B</td>
<td>3.99</td>
</tr>
<tr>
<td>0002</td>
<td>A</td>
<td>10.99</td>
</tr>
<tr>
<td>0003</td>
<td>C</td>
<td>1.69</td>
</tr>
<tr>
<td>0004</td>
<td>D</td>
<td>19.95</td>
</tr>
</tbody>
</table>

The preceding example uses a correlated subquery, which can be inefficient (see Section 13.2.9.7, “Correlated Subqueries”). Other possibilities for solving the problem are to use an uncorrelated subquery in the `FROM` clause or a `LEFT JOIN`.

Other solutions are to use a `LEFT JOIN` or to sort all rows descending by price and get only the first row using the MySQL-specific `LIMIT` clause:

```sql
SELECT s1.article, s1.dealer, s1.price
FROM shop s1
LEFT JOIN shop s2 ON s1.price < s2.price
WHERE s2.article IS NULL;
```

```sql
SELECT article, dealer, price
FROM shop
ORDER BY price DESC
LIMIT 1;
```

**Note**

If there were several most expensive articles, each with a price of 19.95, the `LIMIT` solution would show only one of them.
Using User-Defined Variables

Uncorrelated subquery:

```sql
SELECT s1.article, dealer, s1.price
FROM shop s1
JOIN (
  SELECT article, MAX(price) AS price
  FROM shop
  GROUP BY article) AS s2
ON s1.article = s2.article AND s1.price = s2.price;
```

LEFT JOIN:

```sql
SELECT s1.article, s1.dealer, s1.price
FROM shop s1
LEFT JOIN shop s2 ON s1.article = s2.article AND s1.price < s2.price
WHERE s2.article IS NULL;
```

The LEFT JOIN works on the basis that when `s1.price` is at its maximum value, there is no `s2.price` with a greater value and the `s2` rows values will be NULL. See Section 13.2.8.2, “JOIN Syntax”.

### 3.6.5 Using User-Defined Variables

You can employ MySQL user variables to remember results without having to store them in temporary variables in the client. (See Section 9.4, “User-Defined Variables”.)

For example, to find the articles with the highest and lowest price you can do this:

```sql
mysql> SELECT @min_price:=MIN(price),@max_price:=MAX(price) FROM shop;
+---------+--------+-------+
| article | dealer | price |
+---------+--------+-------+
|    0003 | D      |  1.25 |
|    0004 | D      | 19.95 |
+---------+--------+-------+
```

Note

It is also possible to store the name of a database object such as a table or a column in a user variable and then to use this variable in an SQL statement; however, this requires the use of a prepared statement. See Section 13.5, “SQL Syntax for Prepared Statements”, for more information.

### 3.6.6 Using Foreign Keys

In MySQL, InnoDB tables support checking of foreign key constraints. See Section 14.6, “The InnoDB Storage Engine”, and Section 1.8.2.4, “Foreign Key Differences”.

A foreign key constraint is not required merely to join two tables. For storage engines other than InnoDB, it is possible when defining a column to use a REFERENCES `tbl_name`(`col_name`) clause, which has no actual effect, and serves only as a memo or comment to you that the column which you are currently defining is intended to refer to a column in another table. It is extremely important to realize when using this syntax that:

- MySQL does not perform any sort of CHECK to make sure that `col_name` actually exists in `tbl_name` (or even that `tbl_name` itself exists).
- MySQL does not perform any sort of action on `tbl_name` such as deleting rows in response to actions taken on rows in the table which you are defining; in other words, this syntax induces no ON DELETE or ON UPDATE behavior whatsoever. (Although you can write an ON DELETE or ON UPDATE clause as part of the REFERENCES clause, it is also ignored.)
• This syntax creates a column; it does not create any sort of index or key.

You can use a column so created as a join column, as shown here:

```sql
CREATE TABLE person (  
id SMALLINT UNSIGNED NOT NULL AUTO_INCREMENT,  
name CHAR(60) NOT NULL,  
PRIMARY KEY (id)  
);

CREATE TABLE shirt (  
id SMALLINT UNSIGNED NOT NULL AUTO_INCREMENT,  
style ENUM('t-shirt', 'polo', 'dress') NOT NULL,  
color ENUM('red', 'blue', 'orange', 'white', 'black') NOT NULL,  
owner SMALLINT UNSIGNED NOT NULL REFERENCES person(id),  
PRIMARY KEY (id)  
);

INSERT INTO person VALUES (NULL, 'Antonio Paz');
SELECT @last := LAST_INSERT_ID();
INSERT INTO shirt VALUES  
(NULL, 'polo', 'blue', @last),  
(NULL, 'dress', 'white', @last),  
(NULL, 't-shirt', 'blue', @last);

INSERT INTO person VALUES (NULL, 'Lilliana Angelovska');
SELECT @last := LAST_INSERT_ID();
INSERT INTO shirt VALUES  
(NULL, 'dress', 'orange', @last),  
(NULL, 'polo', 'red', @last),  
(NULL, 'dress', 'blue', @last),  
(NULL, 't-shirt', 'white', @last);

SELECT s.* FROM person p INNER JOIN shirt s  
ON s.owner = p.id  
WHERE p.name LIKE 'Lilliana%'  
AND s.color <> 'white';
```
When used in this fashion, the `REFERENCES` clause is not displayed in the output of `SHOW CREATE TABLE` or `DESCRIBE`:

```sql
SHOW CREATE TABLE shirt \G
*************************** 1. row ***************************
Table: shirt
Create Table: CREATE TABLE `shirt` (
  `id` smallint(5) unsigned NOT NULL auto_increment,
  `style` enum('t-shirt','polo','dress') NOT NULL,
  `color` enum('red','blue','orange','white','black') NOT NULL,
  `owner` smallint(5) unsigned NOT NULL,
) ENGINE=MyISAM DEFAULT CHARSET=latin1
```

The use of `REFERENCES` in this way as a comment or “reminder” in a column definition works with MyISAM tables.

### 3.6.7 Searching on Two Keys

An `OR` using a single key is well optimized, as is the handling of `AND`. The one tricky case is that of searching on two different keys combined with `OR`:

```sql
SELECT field1_index, field2_index FROM test_table WHERE field1_index = '1' OR field2_index = '1'
```

This case is optimized. See Section 8.2.1.4, “Index Merge Optimization”.

You can also solve the problem efficiently by using a `UNION` that combines the output of two separate `SELECT` statements. See Section 13.2.8.3, “UNION Syntax”.

Each `SELECT` searches only one key and can be optimized:

```sql
SELECT field1_index, field2_index FROM test_table WHERE field1_index = '1'
UNION
SELECT field1_index, field2_index FROM test_table WHERE field2_index = '1';
```

### 3.6.8 Calculating Visits Per Day

The following example shows how you can use the bit group functions to calculate the number of days per month a user has visited a Web page.

```sql
CREATE TABLE t1 (year YEAR, month INT(2) UNSIGNED ZEROFILL, day INT(2) UNSIGNED ZEROFILL);
INSERT INTO t1 VALUES(2000,1,1),(2000,1,20),(2000,1,30),(2000,2,2),
(2000,2,23),(2000,2,23);
```

The example table contains year-month-day values representing visits by users to the page. To determine how many different days in each month these visits occur, use this query:

```sql
SELECT year,month,BIT_COUNT(BIT_OR(1<<day)) AS days FROM t1
GROUP BY year,month;
```

Which returns:

```
<table>
<thead>
<tr>
<th>year</th>
<th>month</th>
<th>days</th>
</tr>
</thead>
<tbody>
<tr>
<td>2000</td>
<td>01</td>
<td>3</td>
</tr>
<tr>
<td>2000</td>
<td>02</td>
<td>2</td>
</tr>
</tbody>
</table>
```
The query calculates how many different days appear in the table for each year/month combination, with automatic removal of duplicate entries.

### 3.6.9 Using AUTO_INCREMENT

The **AUTO_INCREMENT** attribute can be used to generate a unique identity for new rows:

```
CREATE TABLE animals {
    id MEDIUMINT NOT NULL AUTO_INCREMENT,
    name CHAR(30) NOT NULL,
    PRIMARY KEY (id)
} ENGINE=INNODB;
```

```
INSERT INTO animals (name) VALUES
    ('dog'), ('cat'), ('penguin'),
    ('lax'), ('whale'), ('ostrich');
```

```
SELECT * FROM animals;
```

Which returns:

```
+----+---------+
| id | name    |
+----+---------+
|  1 | dog     |
|  2 | cat     |
|  3 | penguin |
|  4 | lax     |
|  5 | whale   |
|  6 | ostrich |
+----+---------+
```

No value was specified for the **AUTO_INCREMENT** column, so MySQL assigned sequence numbers automatically. You can also explicitly assign 0 to the column to generate sequence numbers. If the column is declared **NOT NULL**, it is also possible to assign **NULL** to the column to generate sequence numbers. When you insert any other value into an **AUTO_INCREMENT** column, the column is set to that value and the sequence is reset so that the next automatically generated value follows sequentially from the largest column value.

You can retrieve the most recent automatically generated **AUTO_INCREMENT** value with the **LAST_INSERT_ID()** SQL function or the **mysql_insert_id()** C API function. These functions are connection-specific, so their return values are not affected by another connection which is also performing inserts.

Use the smallest integer data type for the **AUTO_INCREMENT** column that is large enough to hold the maximum sequence value you will need. When the column reaches the upper limit of the data type, the next attempt to generate a sequence number fails. Use the **UNSIGNED** attribute if possible to allow a greater range. For example, if you use **TINYINT**, the maximum permissible sequence number is 127. For **TINYINT UNSIGNED**, the maximum is 255. See Section 11.2.1, “Integer Types (Exact Value) - INTEGER, INT, SMALLINT, TINYINT, MEDIUMINT, BIGINT” for the ranges of all the integer types.

**Note**

For a multiple-row insert, **LAST_INSERT_ID()** and **mysql_insert_id()** actually return the **AUTO_INCREMENT** key from the **first** of the inserted rows. This enables multiple-row inserts to be reproduced correctly on other servers in a replication setup.

To start with an **AUTO_INCREMENT** value other than 1, set that value with **CREATE TABLE** or **ALTER TABLE**, like this:

```
```
InnoDB Notes

For information about AUTO_INCREMENT usage specific to InnoDB, see Section 14.6.6.5, “AUTO_INCREMENT Handling in InnoDB”.

MyISAM Notes

- For MyISAM tables, you can specify AUTO_INCREMENT on a secondary column in a multiple-column index. In this case, the generated value for the AUTO_INCREMENT column is calculated as 
  \[ \text{MAX}(\text{auto_increment_column}) + 1 \text{ WHERE prefix=}\text{given-prefix} \]. This is useful when you want to put data into ordered groups.

```sql
CREATE TABLE animals (
  grp ENUM('fish','mammal','bird') NOT NULL,
  id MEDIUMINT NOT NULL AUTO_INCREMENT,
  name CHAR(30) NOT NULL,
  PRIMARY KEY (grp,id)
) ENGINE=MyISAM;

INSERT INTO animals (grp,name) VALUES
  ('mammal','dog'),('mammal','cat'),
  ('bird','penguin'),('fish','lax'),('mammal','whale'),
  ('bird','ostrich');

SELECT * FROM animals ORDER BY grp,id;
```

Which returns:

```
<table>
<thead>
<tr>
<th>grp</th>
<th>id</th>
<th>name</th>
</tr>
</thead>
<tbody>
<tr>
<td>fish</td>
<td>1</td>
<td>lax</td>
</tr>
<tr>
<td>mammal</td>
<td>1</td>
<td>dog</td>
</tr>
<tr>
<td>mammal</td>
<td>2</td>
<td>cat</td>
</tr>
<tr>
<td>mammal</td>
<td>3</td>
<td>whale</td>
</tr>
<tr>
<td>bird</td>
<td>1</td>
<td>penguin</td>
</tr>
<tr>
<td>bird</td>
<td>2</td>
<td>ostrich</td>
</tr>
</tbody>
</table>
```

In this case (when the AUTO_INCREMENT column is part of a multiple-column index), AUTO_INCREMENT values are reused if you delete the row with the biggest AUTO_INCREMENT value in any group. This happens even for MyISAM tables, for which AUTO_INCREMENT values normally are not reused.

- If the AUTO_INCREMENT column is part of multiple indexes, MySQL generates sequence values using the index that begins with the AUTO_INCREMENT column, if there is one. For example, if the animals table contained indexes PRIMARY KEY (grp, id) and INDEX (id), MySQL would ignore the PRIMARY KEY for generating sequence values. As a result, the table would contain a single sequence, not a sequence per grp value.

Further Reading

More information about AUTO_INCREMENT is available here:

- How to assign the AUTO_INCREMENT attribute to a column: Section 13.1.17, “CREATE TABLE Syntax”, and Section 13.1.7, “ALTER TABLE Syntax”.

- How AUTO_INCREMENT behaves depending on the NO_AUTO_VALUE_ON_ZERO SQL mode: Section 5.1.7, “Server SQL Modes”.

- How to use the LAST_INSERT_ID() function to find the row that contains the most recent AUTO_INCREMENT value: Section 12.14, “Information Functions”.
• Setting the AUTO_INCREMENT value to be used: Section 5.1.4, “Server System Variables”.

• Section 14.6.6.5, “AUTO_INCREMENT Handling in InnoDB”

• AUTO_INCREMENT and replication: Section 16.4.1.1, “Replication and AUTO_INCREMENT”.

• Server-system variables related to AUTO_INCREMENT (auto_increment_increment and auto_increment_offset) that can be used for replication: Section 5.1.4, “Server System Variables”.

3.7 Using MySQL with Apache

There are programs that let you authenticate your users from a MySQL database and also let you write your log files into a MySQL table.

You can change the Apache logging format to be easily readable by MySQL by putting the following into the Apache configuration file:

```
LogFormat \
    "\%h\",\%{Y%m%dH%M%S}t,\%>s,\%b\",\%{Content-Type}o", \n    \"\%U\",\%{Referer}i\",\%{User-Agent}i\"
```

To load a log file in that format into MySQL, you can use a statement something like this:

```
LOAD DATA INFILE '/local/access_log' INTO TABLE tbl_name
FIELDS TERMINATED BY ',' OPTIONALLY ENCLOSED BY '"' ESCAPED BY '\'"
```

The named table should be created to have columns that correspond to those that the LogFormat line writes to the log file.

Overview of MySQL Programs

4.7 MySQL Program Development Utilities

4.7.1 msql2mysql — Convert mSQL Programs for Use with MySQL

4.7.2 mysql_config — Display Options for Compiling Clients

4.7.3 my_print_defaults — Display Options from Option Files

4.7.4 resolve_stack_dump — Resolve Numeric Stack Trace Dump to Symbols

4.8 Miscellaneous Programs

4.8.1 perror — Explain Error Codes

4.8.2 replace — A String-Replacement Utility

4.8.3 resolveip — Resolve Host name to IP Address or Vice Versa

This chapter provides a brief overview of the MySQL command-line programs provided by Oracle Corporation. It also discusses the general syntax for specifying options when you run these programs. Most programs have options that are specific to their own operation, but the option syntax is similar for all of them. Finally, the chapter provides more detailed descriptions of individual programs, including which options they recognize.

4.1 Overview of MySQL Programs

There are many different programs in a MySQL installation. This section provides a brief overview of them. Later sections provide a more detailed description of each one, with the exception of MySQL Cluster programs. Each program’s description indicates its invocation syntax and the options that it supports. Chapter 17, MySQL Cluster NDB 6.1 - 7.1, describes programs specific to MySQL Cluster.

Most MySQL distributions include all of these programs, except for those programs that are platform-specific. (For example, the server startup scripts are not used on Windows.) The exception is that RPM distributions are more specialized. There is one RPM for the server, another for client programs, and so forth. If you appear to be missing one or more programs, see Chapter 2, Installing and Upgrading MySQL, for information on types of distributions and what they contain. It may be that you have a distribution that does not include all programs and you need to install an additional package.

Each MySQL program takes many different options. Most programs provide a --help option that you can use to get a description of the program's different options. For example, try mysql --help.

You can override default option values for MySQL programs by specifying options on the command line or in an option file. See Section 4.2, “Using MySQL Programs”, for general information on invoking programs and specifying program options.

The MySQL server, mysqld, is the main program that does most of the work in a MySQL installation. The server is accompanied by several related scripts that assist you in starting and stopping the server:

• mysqld

The SQL daemon (that is, the MySQL server). To use client programs, mysqld must be running, because clients gain access to databases by connecting to the server. See Section 4.3.1, “mysqld — The MySQL Server”.

• mysqld_safe

A server startup script. mysqld_safe attempts to start mysqld. See Section 4.3.2, “mysqld_safe — MySQL Server Startup Script”.

• mysql.server

A server startup script. This script is used on systems that use System V-style run directories containing scripts that start system services for particular run levels. It invokes mysqld_safe to start the MySQL server. See Section 4.3.3, “mysql.server — MySQL Server Startup Script”.

• mysqld_multi

A server startup script that can start or stop multiple servers installed on the system. See Section 4.3.4, “mysqld_multi — Manage Multiple MySQL Servers”. An alternative to
Overview of MySQL Programs

`mysqld_multi` is `mysqlmanager`, the MySQL Instance Manager. See Section 4.6.10, "mysqlmanager — The MySQL Instance Manager".

There are several programs that perform setup operations during MySQL installation or upgrading:

- `comp_err`
  This program is used during the MySQL build/installation process. It compiles error message files from the error source files. See Section 4.4.1, "`comp_err` — Compile MySQL Error Message File".

- `make_binary_distribution`
  This program makes a binary release of a compiled MySQL. This could be sent by FTP to `/pub/mysql/upload/` on `ftp.mysql.com` for the convenience of other MySQL users.

- `make_win_bin_dist`
  This program is used on Windows. It packages a MySQL distribution for installation after the source distribution has been built. See Section 4.4.2, "`make_win_bin_dist` — Package MySQL Distribution as Zip Archive".

- `mysql_fix_privilege_tables`
  This program is used after a MySQL upgrade operation. It updates the grant tables with any changes that have been made in newer versions of MySQL. See Section 4.4.4, "`mysql_fix_privilege_tables` — Upgrade MySQL System Tables".

  Note: As of MySQL 5.1.7, this program has been superseded by `mysql_upgrade` and should no longer be used.

- `mysql_install_db`
  This program initializes the MySQL data directory, creates the `mysql` database, and initializes its grant tables with default privileges. It is usually executed only once, when first installing MySQL on a system. See Section 4.4.5, "`mysql_install_db` — Initialize MySQL Data Directory", and Section 2.12, "Postinstallation Setup and Testing".

- `mysql_secure_installation`
  This program enables you to improve the security of your MySQL installation. See Section 4.4.6, "`mysql_secure_installation` — Improve MySQL Installation Security".

- `mysql_tzinfo_to_sql`
  This program loads the time zone tables in the `mysql` database using the contents of the host system `zoneinfo` database (the set of files describing time zones). See Section 4.4.7, "`mysql_tzinfo_to_sql` — Load the Time Zone Tables".

- `mysql_upgrade`
  This program is used after a MySQL upgrade operation. It checks tables for incompatibilities and repairs them if necessary, and updates the grant tables with any changes that have been made in newer versions of MySQL. See Section 4.4.8, "`mysql_upgrade` — Check and Upgrade MySQL Tables".

MySQL client programs:

- `mysql`
  The command-line tool for interactively entering SQL statements or executing them from a file in batch mode. See Section 4.5.1, "`mysql` — The MySQL Command-Line Tool".

- `mysqladmin`
Overview of MySQL Programs

A client that performs administrative operations, such as creating or dropping databases, reloading the grant tables, flushing tables to disk, and reopening log files. `mysqladmin` can also be used to retrieve version, process, and status information from the server. See Section 4.5.2, "mysqladmin — Client for Administering a MySQL Server".

- **mysqlcheck** 
  A table-maintenance client that checks, repairs, analyzes, and optimizes tables. See Section 4.5.3, "mysqlcheck — A Table Maintenance Program".

- **mysqldump** 
  A client that dumps a MySQL database into a file as SQL, text, or XML. See Section 4.5.4, "mysqldump — A Database Backup Program".

- **mysqlimport** 
  A client that imports text files into their respective tables using `LOAD DATA INFILE`. See Section 4.5.5, "mysqlimport — A Data Import Program".

- **mysqlshow** 
  A client that displays information about databases, tables, columns, and indexes. See Section 4.5.6, "mysqlshow — Display Database, Table, and Column Information".

- **mysqlslap** 
  A client that is designed to emulate client load for a MySQL server and report the timing of each stage. It works as if multiple clients are accessing the server. See Section 4.5.7, "mysqlslap — Load Emulation Client".

MySQL administrative and utility programs:

- **innochecksum** 
  An offline InnoDB offline file checksum utility. See Section 4.6.1, "innochecksum — Offline InnoDB File Checksum Utility".

- **myisam_ftdump** 
  A utility that displays information about full-text indexes in MyISAM tables. See Section 4.6.2, "myisam_ftdump — Display Full-Text Index information".

- **myisamchk** 
  A utility to describe, check, optimize, and repair MyISAM tables. See Section 4.6.3, "myisamchk — MyISAM Table-Maintenance Utility".

- **myisamlog** 
  A utility that processes the contents of a MyISAM log file. See Section 4.6.4, "myisamlog — Display MyISAM Log File Contents".

- **myisampack** 
  A utility that compresses MyISAM tables to produce smaller read-only tables. See Section 4.6.5, "myisampack — Generate Compressed, Read-Only MyISAM Tables".

- **mysqlaccess** 
  A script that checks the access privileges for a host name, user name, and database combination. See Section 4.6.6, "mysqlaccess — Client for Checking Access Privileges".
Overview of MySQL Programs

- **mysqlbinlog**
  A utility for reading statements from a binary log. The log of executed statements contained in the binary log files can be used to help recover from a crash. See Section 4.6.7, "mysqlbinlog — Utility for Processing Binary Log Files".

- **mysqldumpslow**
  A utility to read and summarize the contents of a slow query log. See Section 4.6.8, "mysqldumpslow — Summarize Slow Query Log Files".

- **mysqlhotcopy**
  A utility that quickly makes backups of MyISAM tables while the server is running. See Section 4.6.9, "mysqlhotcopy — A Database Backup Program".

- **mysqlmanager**
  The MySQL Instance Manager, a program for monitoring and managing MySQL servers. See Section 4.6.10, "mysqlmanager — The MySQL Instance Manager".

  **Important**
  MySQL Instance Manager has been deprecated and is removed in MySQL 5.5.

- **mysql_convert_table_format**
  A utility that converts tables in a database to use a given storage engine. See Section 4.6.11, "mysql_convert_table_format — Convert Tables to Use a Given Storage Engine".

- **mysql_find_rows**
  A utility that reads files containing SQL statements (such as update logs) and extracts statements that match a given regular expression. See Section 4.6.12, "mysql_find_rows — Extract SQL Statements from Files".

- **mysql_fix_extensions**
  A utility that converts the extensions for MyISAM table files to lowercase. This can be useful after transferring the files from a system with case-insensitive file names to a system with case-sensitive file names. See Section 4.6.13, "mysql_fix_extensions — Normalize Table File Name Extensions".

- **mysql_setpermission**
  A utility for interactively setting permissions in the MySQL grant tables. See Section 4.6.14, "mysql_setpermission — Interactively Set Permissions in Grant Tables".

- **mysql_waitpid**
  A utility that kills the process with a given process ID. See Section 4.6.15, "mysql_waitpid — Kill Process and Wait for Its Termination".

- **mysql_zap**
  A utility that kills processes that match a pattern. See Section 4.6.16, "mysql_zap — Kill Processes That Match a Pattern".

MySQL program-development utilities:
- **mysql2mysql**
Overview of MySQL Programs

A shell script that converts mSQL programs to MySQL. It doesn't handle every case, but it gives a good start when converting. See Section 4.7.1, "mSQL2mysql — Convert mSQL Programs for Use with MySQL".

• mysql_config

A shell script that produces the option values needed when compiling MySQL programs. See Section 4.7.2, "mysql_config — Display Options for Compiling Clients".

• my_print_defaults

A utility that shows which options are present in option groups of option files. See Section 4.7.3, "my_print_defaults — Display Options from Option Files".

• resolve_stack_dump

A utility program that resolves a numeric stack trace dump to symbols. See Section 4.7.4, "resolve_stack_dump — Resolve Numeric Stack Trace Dump to Symbols".

Miscellaneous utilities:

• perror

A utility that displays the meaning of system or MySQL error codes. See Section 4.8.1, "perror — Explain Error Codes".

• replace

A utility program that performs string replacement in the input text. See Section 4.8.2, "replace — A String-Replacement Utility".

• resolveip

A utility program that resolves a host name to an IP address or vice versa. See Section 4.8.3, "resolveip — Resolve Host name to IP Address or Vice Versa".

Oracle Corporation also provides the MySQL Workbench GUI tool, which is used to administer MySQL servers and databases, to create, execute, and evaluate queries, and to migrate schemas and data from other relational database management systems for use with MySQL. Additional GUI tools include MySQL Notifier and MySQL for Excel.

MySQL client programs that communicate with the server using the MySQL client/server library use the following environment variables.

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>MYSQL_UNIX_PORT</td>
<td>The default Unix socket file; used for connections to localhost</td>
</tr>
<tr>
<td>MYSQL_TCP_PORT</td>
<td>The default port number; used for TCP/IP connections</td>
</tr>
<tr>
<td>MYSQL_PWD</td>
<td>The default password</td>
</tr>
<tr>
<td>MYSQL_DEBUG</td>
<td>Debug trace options when debugging</td>
</tr>
<tr>
<td>TMPDIR</td>
<td>The directory where temporary tables and files are created</td>
</tr>
</tbody>
</table>

For a full list of environment variables used by MySQL programs, see Section 2.14, “Environment Variables”.

Use of MYSQL_PWD is insecure. See Section 6.1.2.1, “End-User Guidelines for Password Security".
4.2 Using MySQL Programs

4.2.1 Invoking MySQL Programs

To invoke a MySQL program from the command line (that is, from your shell or command prompt), enter the program name followed by any options or other arguments needed to instruct the program what you want it to do. The following commands show some sample program invocations. "shell>" represents the prompt for your command interpreter; it is not part of what you type. The particular prompt you see depends on your command interpreter. Typical prompts are $ for sh, ksh, or bash, % for csh or tcsh, and C:\> for the Windows command.com or cmd.exe command interpreters.

```
shell> mysql --user=root test
shell> mysqladmin extended-status variables
shell> mysqlshow --help
shell> mysqldump -u root personnel
```

Arguments that begin with a single or double dash ("--", "--") specify program options. Options typically indicate the type of connection a program should make to the server or affect its operational mode. Option syntax is described in Section 4.2.3, "Specifying Program Options".

Nonoption arguments (arguments with no leading dash) provide additional information to the program. For example, the mysql program interprets the first nonoption argument as a database name, so the command `mysql --user=root test` indicates that you want to use the test database.

Later sections that describe individual programs indicate which options a program supports and describe the meaning of any additional nonoption arguments.

Some options are common to a number of programs. The most frequently used of these are the `--host` (or `-h`), `--user` (or `-u`), and `--password` (or `-p`) options that specify connection parameters. They indicate the host where the MySQL server is running, and the user name and password of your MySQL account. All MySQL client programs understand these options; they enable you to specify which server to connect to and the account to use on that server. Other connection options are `--port` (or `-P`) to specify a TCP/IP port number and `--socket` (or `-S`) to specify a Unix socket file on Unix (or named pipe name on Windows). For more information on options that specify connection options, see Section 4.2.2, "Connecting to the MySQL Server".

You may find it necessary to invoke MySQL programs using the path name to the bin directory in which they are installed. This is likely to be the case if you get a "program not found" error whenever you attempt to run a MySQL program from any directory other than the bin directory. To make it more convenient to use MySQL, you can add the path name of the bin directory to your PATH environment variable setting. That enables you to run a program by typing only its name, not its entire path name. For example, if `mysql` is installed in /usr/local/mysql/bin, you can run the program by invoking it as `mysql`, and it is not necessary to invoke it as `/usr/local/mysql/bin/mysql`.

Consult the documentation for your command interpreter for instructions on setting your PATH variable. The syntax for setting environment variables is interpreter-specific. (Some information is given in Section 4.2.10, "Setting Environment Variables"). After modifying your PATH setting, open a new console window on Windows or log in again on Unix so that the setting goes into effect.

4.2.2 Connecting to the MySQL Server

This section describes how to establish a connection to the MySQL server. For additional information if you are unable to connect, see Section 6.2.7, "Troubleshooting Problems Connecting to MySQL".

For a client program to be able to connect to the MySQL server, it must use the proper connection parameters, such as the name of the host where the server is running and the user name and password of your MySQL account. Each connection parameter has a default value, but you can override them as necessary using program options specified either on the command line or in an option file.
The examples here use the `mysql` client program, but the principles apply to other clients such as `mysqldump`, `mysqladmin`, or `mysqlshow`.

This command invokes `mysql` without specifying any connection parameters explicitly:

```
shell> mysql
```

Because there are no parameter options, the default values apply:

- The default host name is `localhost`. On Unix, this has a special meaning, as described later.
- The default user name is `ODBC` on Windows or your Unix login name on Unix.
- No password is sent if neither `-p` nor `--password` is given.
- For `mysql`, the first nonoption argument is taken as the name of the default database. If there is no such option, `mysql` does not select a default database.

To specify the host name and user name explicitly, as well as a password, supply appropriate options on the command line:

```
shell> mysql --host=localhost --user=myname --password=mypass mydb
shell> mysql -h localhost -u myname -pmypass mydb
```

For password options, the password value is optional:

- If you use a `-p` or `--password` option and specify the password value, there must be no space between `-p` or `--password` and the password following it.
- If you use a `-p` or `--password` option but do not specify the password value, the client program prompts you to enter the password. The password is not displayed as you enter it. This is more secure than giving the password on the command line. Other users on your system may be able to see a password specified on the command line by executing a command such as `ps auxw`. See Section 6.1.2.1, “End-User Guidelines for Password Security”.

As just mentioned, including the password value on the command line can be a security risk. To avoid this problem, specify the `--password` or `-p` option without any following password value:

```
shell> mysql --host=localhost --user=myname --password mydb
shell> mysql -h localhost -u myname -p mydb
```

When the password option has no password value, the client program prints a prompt and waits for you to enter the password. (In these examples, `mydb` is not interpreted as a password because it is separated from the preceding password option by a space.)

On some systems, the library routine that MySQL uses to prompt for a password automatically limits the password to eight characters. That is a problem with the system library, not with MySQL. Internally, MySQL does not have any limit for the length of the password. To work around the problem, change your MySQL password to a value that is eight or fewer characters long, or put your password in an option file.

On Unix, MySQL programs treat the host name `localhost` specially, in a way that is likely different from what you expect compared to other network-based programs. For connections to `localhost`, MySQL programs attempt to connect to the local server by using a Unix socket file. This occurs even if a `--port` or `-P` option is given to specify a port number. To ensure that the client makes a TCP/IP connection to the local server, use `--host` or `-h` to specify a host name value of `127.0.0.1`, or the IP address or name of the local server. You can also specify the connection protocol explicitly, even for `localhost`, by using the `--protocol=TCP` option. For example:

```
shell> mysql --host=127.0.0.1
shell> mysql --protocol=TCP
```
The `--protocol` option enables you to establish a particular type of connection even when the other options would normally default to some other protocol.

On Windows, you can force a MySQL client to use a named-pipe connection by specifying the `--pipe` or `--protocol=PIPE` option, or by specifying . (period) as the host name. If named-pipe connections are not enabled, an error occurs. Use the `--socket` option to specify the name of the pipe if you do not want to use the default pipe name.

Connections to remote servers always use TCP/IP. This command connects to the server running on `remote.example.com` using the default port number (3306):

```shell
shell> mysql --host=remote.example.com
```

To specify a port number explicitly, use the `--port` or `-P` option:

```shell
shell> mysql --host=remote.example.com --port=13306
```

You can specify a port number for connections to a local server, too. However, as indicated previously, connections to `localhost` on Unix will use a socket file by default. You will need to force a TCP/IP connection as already described or any option that specifies a port number will be ignored.

For this command, the program uses a socket file on Unix and the `--port` option is ignored:

```shell
shell> mysql --port=13306 --host=localhost
```

To cause the port number to be used, invoke the program in either of these ways:

```shell
shell> mysql --port=13306 --host=127.0.0.1
shell> mysql --port=13306 --protocol=TCP
```

The following list summarizes the options that can be used to control how client programs connect to the server:

- `--host=host_name`, `-h host_name`
  The host where the server is running. The default value is `localhost`.

- `--password[=pass_val], -p[pass_val]`
  The password of the MySQL account. As described earlier, the password value is optional, but if given, there must be no space between `-p` or `--password=` and the password following it. The default is to send no password.

- `--pipe, -W`
  On Windows, connect to the server using a named pipe. The server must be started with the `--enable-named-pipe` option to enable named-pipe connections.

- `--port=port_num, -P port_num`
  The port number to use for the connection, for connections made using TCP/IP. The default port number is 3306.

- `--protocol={TCP|SOCKET|PIPE|MEMORY}`
  This option explicitly specifies a protocol to use for connecting to the server. It is useful when the other connection parameters normally would cause a protocol to be used other than the one you want. For example, connections on Unix to `localhost` are made using a Unix socket file by default:
Connecting to the MySQL Server

shell> mysql --host=localhost

To force a TCP/IP connection to be used instead, specify a `--protocol` option:

shell> mysql --host=localhost --protocol=TCP

The following table shows the permissible `--protocol` option values and indicates the platforms on which each value may be used. The values are not case sensitive.

<table>
<thead>
<tr>
<th><code>--protocol</code> Value</th>
<th>Connection Protocol</th>
<th>Permissible Operating Systems</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCP</td>
<td>TCP/IP connection to local or remote server</td>
<td>All</td>
</tr>
<tr>
<td>SOCKET</td>
<td>Unix socket file connection to local server</td>
<td>Unix only</td>
</tr>
<tr>
<td>PIPE</td>
<td>Named-pipe connection to local or remote server</td>
<td>Windows only</td>
</tr>
<tr>
<td>MEMORY</td>
<td>Shared-memory connection to local server</td>
<td>Windows only</td>
</tr>
</tbody>
</table>

• `--shared-memory-base-name=name`

On Windows, the shared-memory name to use, for connections made using shared memory to a local server. The default value is `MYSQL`. The shared-memory name is case sensitive.

The server must be started with the `--shared-memory` option to enable shared-memory connections.

• `--socket=file_name, -S file_name`

On Unix, the name of the Unix socket file to use, for connections made using a named pipe to a local server. The default Unix socket file name is `/tmp/mysql.sock`.

On Windows, the name of the named pipe to use, for connections to a local server. The default Windows pipe name is `MySQL`. The pipe name is not case sensitive.

The server must be started with the `--enable-named-pipe` option to enable named-pipe connections.

• `--ssl*`

Options that begin with `--ssl` are used for establishing a secure connection to the server using SSL, if the server is configured with SSL support. For details, see Section 6.4.5, “Command Options for Secure Connections”.

• `--user=user_name, -u user_name`

The user name of the MySQL account you want to use. The default user name is `ODBC` on Windows or your Unix login name on Unix.

It is possible to specify different default values to be used when you make a connection so that you need not enter them on the command line each time you invoke a client program. This can be done in a couple of ways:

• You can specify connection parameters in the `[client]` section of an option file. The relevant section of the file might look like this:

```
[client]
host=host_name
user=user_name
password=your_pass
```

Section 4.2.6, “Using Option Files”, discusses option files further.
You can specify some connection parameters using environment variables. The host can be specified for `mysql` using `MYSQL_HOST`. The MySQL user name can be specified using `USER` (this is for Windows and NetWare only). The password can be specified using `MYSQL_PWD`, although this is insecure; see Section 6.1.2.1, “End-User Guidelines for Password Security”. For a list of variables, see Section 2.14, “Environment Variables”.

### 4.2.3 Specifying Program Options

There are several ways to specify options for MySQL programs:

- List the options on the command line following the program name. This is common for options that apply to a specific invocation of the program.
- List the options in an option file that the program reads when it starts. This is common for options that you want the program to use each time it runs.
- List the options in environment variables (see Section 4.2.10, “Setting Environment Variables”). This method is useful for options that you want to apply each time the program runs. In practice, option files are used more commonly for this purpose, but Section 5.5.3, “Running Multiple MySQL Instances on Unix”, discusses one situation in which environment variables can be very helpful. It describes a handy technique that uses such variables to specify the TCP/IP port number and Unix socket file for the server and for client programs.

Options are processed in order, so if an option is specified multiple times, the last occurrence takes precedence. The following command causes `mysql` to connect to the server running on `localhost`:

```shell
grep mysql -h example.com -h localhost
```

If conflicting or related options are given, later options take precedence over earlier options. The following command runs `mysql` in “no column names” mode:

```shell
grep mysql --column-names --skip-column-names
```

MySQL programs determine which options are given first by examining environment variables, then by processing option files, and then by checking the command line. This means that environment variables have the lowest precedence and command-line options the highest.

You can take advantage of the way that MySQL programs process options by specifying default option values for a program in an option file. That enables you to avoid typing them each time you run the program while enabling you to override the defaults if necessary by using command-line options.

An option can be specified by writing it in full or as any unambiguous prefix. For example, the `--compress` option can be given to `mysqldump` as `--compr`, but not as `--comp` because the latter is ambiguous:

```shell
grep mysqldump --comp
```

mysqldump: ambiguous option '--comp' (compatible, compress)

Be aware that the use of option prefixes can cause problems in the event that new options are implemented for a program. A prefix that is unambiguous now might become ambiguous in the future.

### 4.2.4 Using Options on the Command Line

Program options specified on the command line follow these rules:

- Options are given after the command name.
- An option argument begins with one dash or two dashes, depending on whether it is a short form or long form of the option name. Many options have both short and long forms. For example, `--`
help are the short and long forms of the option that instructs a MySQL program to display its help message.

- Option names are case sensitive. -v and -V are both legal and have different meanings. (They are the corresponding short forms of the --verbose and --version options.)

- Some options take a value following the option name. For example, -h localhost or --host=localhost indicate the MySQL server host to a client program. The option value tells the program the name of the host where the MySQL server is running.

- For a long option that takes a value, separate the option name and the value by an "=" sign. For a short option that takes a value, the option value can immediately follow the option letter, or there can be a space between: -hlocalhost and -h localhost are equivalent. An exception to this rule is the option for specifying your MySQL password. This option can be given in long form as --password=pass_val or as --password. In the latter case (with no password value given), the program prompts you for the password. The password option also may be given in short form as -p pass_val or as -p. However, for the short form, if the password value is given, it must follow the option letter with no intervening space. The reason for this is that if a space follows the option letter, the program has no way to tell whether a following argument is supposed to be the password value or some other kind of argument. Consequently, the following two commands have two completely different meanings:

shell> mysql -ptest
shell> mysql -p test

The first command instructs mysql to use a password value of test, but specifies no default database. The second instructs mysql to prompt for the password value and to use test as the default database.

- Within option names, dash ("-") and underscore ("_") may be used interchangeably. For example, --skip-grant-tables and --skip_grant_tables are equivalent. (However, the leading dashes cannot be given as underscores.)

- For options that take a numeric value, the value can be given with a suffix of K, M, or G (either uppercase or lowercase) to indicate a multiplier of 1024, 1024^2 or 1024^3. For example, the following command tells mysqladmin to ping the server 1024 times, sleeping 10 seconds between each ping:

shell> mysqladmin --count=1K --sleep=10 ping

Option values that contain spaces must be quoted when given on the command line. For example, the --execute (or -e) option can be used with mysql to pass SQL statements to the server. When this option is used, mysql executes the statements in the option value and exits. The statements must be enclosed by quotation marks. For example, you can use the following command to obtain a list of user accounts:

shell> mysql -u root -p --execute="SELECT User, Host FROM mysql.user"
Enter password: ******

<table>
<thead>
<tr>
<th>User</th>
<th>Host</th>
</tr>
</thead>
<tbody>
<tr>
<td>root</td>
<td>gigan</td>
</tr>
<tr>
<td>jon</td>
<td>localhost</td>
</tr>
<tr>
<td>root</td>
<td>localhost</td>
</tr>
</tbody>
</table>

shell>

**Note**

The long form (--execute) is followed by an equals sign (=).
If you wish to use quoted values within a statement, you will either need to escape the inner quotation marks, or use a different type of quotation marks within the statement from those used to quote the statement itself. The capabilities of your command processor dictate your choices for whether you can use single or double quotation marks and the syntax for escaping quote characters. For example, if your command processor supports quoting with single or double quotation marks, you can use double quotation marks around the statement, and single quotation marks for any quoted values within the statement.

Multiple SQL statements may be passed in the option value on the command line, separated by semicolons:

```
shell> mysql -u root -p -e "SELECT VERSION();SELECT NOW()"
Enter password: ******
+------------------+
| VERSION()        |
| 5.1.74-debug-log |
+------------------+
| NOW()            |
| 2015-11-05 20:03:22 |
+------------------+
```

The `--execute` or `-e` option may also be used to pass commands in an analogous fashion to the `ndb_mgm` management client for MySQL Cluster. See Section 17.2.6, “Safe Shutdown and Restart of MySQL Cluster”, for an example.

### 4.2.5 Program Option Modifiers

Some options are "boolean" and control behavior that can be turned on or off. For example, the `mysql` client supports a `--column-names` option that determines whether or not to display a row of column names at the beginning of query results. By default, this option is enabled. However, you may want to disable it in some instances, such as when sending the output of `mysql` into another program that expects to see only data and not an initial header line.

To disable column names, you can specify the option using any of these forms:

```
--disable-column-names
--skip-column-names
--column-names=0
```

The `--disable` and `--skip` prefixes and the `=0` suffix all have the same effect: They turn the option off.

The "enabled" form of the option may be specified in any of these ways:

```
--column-names
--enable-column-names
--column-names=1
```

If an option is prefixed by `--loose`, a program does not exit with an error if it does not recognize the option, but instead issues only a warning:

```
shell> mysql --loose-no-such-option
mysql: WARNING: unknown option '--loose-no-such-option'
```

The `--loose` prefix can be useful when you run programs from multiple installations of MySQL on the same machine and list options in an option file. An option that may not be recognized by all versions of a program can be given using the `--loose` prefix (or `loose` in an option file). Versions of the program
that recognize the option process it normally, and versions that do not recognize it issue a warning and ignore it.

The `--maximum` prefix is available for `mysqld` only and permits a limit to be placed on how large client programs can set session system variables. To do this, use a `--maximum` prefix with the variable name. For example, `--maximum-max_heap_table_size=32M` prevents any client from making the heap table size limit larger than 32M.

The `--maximum` prefix is intended for use with system variables that have a session value. If applied to a system variable that has only a global value, an error occurs. For example, with `--maximum-query_cache_size=4M`, the server produces this error:

```plaintext
Maximum value of 'query_cache_size' cannot be set
```

### 4.2.6 Using Option Files

Most MySQL programs can read startup options from option files (sometimes called configuration files). Option files provide a convenient way to specify commonly used options so that they need not be entered on the command line each time you run a program. For the MySQL server, MySQL provides a number of preconfigured option files.

To determine whether a program reads option files, invoke it with the `--help` option. (For `mysqld`, use `--verbose` and `--help`.) If the program reads option files, the help message indicates which files it looks for and which option groups it recognizes.

---

**Note**

A MySQL program started with the `--no-defaults` option reads no option files.

Option files are plain text files, created using any text editor.

MySQL looks for option files in the order described in the following discussion and reads any that exist. If an option file you want to use does not exist, create it with a plain text editor.

---

**Note**

Option files used with MySQL Cluster programs are covered in Section 17.3, “Configuration of MySQL Cluster NDB 6.1-7.1”.

On Windows, MySQL programs read startup options from the files shown in the following table, in the specified order (top files are read first, files read later take precedence).

<table>
<thead>
<tr>
<th>File Name</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>%PROGRAMDATA %\MySQL\MySQL Server 5.1\my.ini, %PROGRAMDATA\MySQL \MySQL Server 5.1\my.cnf</td>
<td>Global options</td>
</tr>
<tr>
<td>%WINDIR%\my.ini, %WINDIR%\my.cnf</td>
<td>Global options</td>
</tr>
<tr>
<td>C:\my.ini,C:\my.cnf</td>
<td>Global options</td>
</tr>
<tr>
<td>BASEDIR\my.ini, BASEDIR\my.cnf</td>
<td>Global options</td>
</tr>
<tr>
<td>defaults-extra-file</td>
<td>The file specified with <code>--defaults-extra-file</code>, if any</td>
</tr>
</tbody>
</table>
In the preceding table, %PROGRAMDATA% represents the file system directory that contains application data for all users on the host. This path defaults to \C:\ProgramData on Microsoft Windows Vista and greater, and \C:\Documents and Settings\All Users\Application Data on older versions of Microsoft Windows.

%WINDIR% represents the location of your Windows directory. This is commonly \C:\WINDOWS. Use the following command to determine its exact location from the value of the WINDIR environment variable:

```
C:\> echo %WINDIR%
```

%APPDATA% represents the value of the Windows application data directory. Use the following command to determine its exact location from the value of the APPDATA environment variable:

```
C:\> echo %APPDATA%
```

BASEDIR represents the MySQL base installation directory. When MySQL 5.1 has been installed using the installation and configuration wizards, this is typically \C:\PROGRAMDIR\MySQL\MySQL 5.1 Server where PROGRAMDIR represents the programs directory (usually Program Files on English-language versions of Windows). See Section 2.3.5.1, “Starting the MySQL Server Instance Config Wizard”.

On Unix and Unix-like systems, MySQL programs read startup options from the files shown in the following table, in the specified order (top files are read first, files read later take precedence).

```
<table>
<thead>
<tr>
<th>File Name</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>/etc/my.cnf</td>
<td>Global options</td>
</tr>
<tr>
<td>/etc/mysql/my.cnf</td>
<td>Global options (as of MySQL 5.1.15)</td>
</tr>
<tr>
<td>SYSCONFDIR/my.cnf</td>
<td>Global options</td>
</tr>
<tr>
<td>$MYSQL_HOME/my.cnf</td>
<td>Server-specific options (server only)</td>
</tr>
<tr>
<td>defaults-extra-file</td>
<td>The file specified with --defaults-extra-file, if any</td>
</tr>
<tr>
<td>~/.my.cnf</td>
<td>User-specific options</td>
</tr>
</tbody>
</table>
```

In the preceding table, ~ represents the current user's home directory (the value of $HOME).

SYSCONFDIR represents the directory specified with the --sysconfdir option to configure when MySQL was built. By default, this is the etc directory located under the compiled-in installation directory. This location is used as of MySQL 5.1.10. (From 5.1.10 to 5.1.22, it was read last, after ~/.my.cnf.)

MYSQL_HOME is an environment variable containing the path to the directory in which the server-specific my.cnf file resides. If MYSQL_HOME is not set and you start the server using the mysqld_safe program, mysqld_safe attempts to set MYSQL_HOME as follows:

- Let BASEDIR and DATADIR represent the path names of the MySQL base directory and data directory, respectively.
- If there is a my.cnf file in DATADIR but not in BASEDIR, mysqld_safe sets MYSQL_HOME to DATADIR.
• Otherwise, if MYSQL_HOME is not set and there is no my.cnf file in DATADIR, mysqld_safe sets MYSQL_HOME to BASEDIR.

In MySQL 5.1, use of DATADIR as the location for my.cnf is deprecated.

Typically, DATADIR is /usr/local/mysql/data for a binary installation or /usr/local/var for a source installation. This is the data directory location built in when MySQL was compiled, not the location specified with the --datadir option when mysqld starts. Use of --datadir at runtime has no effect on where the server looks for option files that it reads before processing any options.

If multiple instances of a given option are found, the last instance takes precedence, with one exception: For mysqld, the first instance of the --user option is used as a security precaution, to prevent a user specified in an option file from being overridden on the command line.

The following description of option file syntax applies to files that you edit manually. This excludes .mylogin.cnf, which is created using mysql_config_editor and is encrypted.

Any long option that may be given on the command line when running a MySQL program can be given in an option file as well. To get the list of available options for a program, run it with the --help option. (For mysqld, use --verbose and --help.)

The syntax for specifying options in an option file is similar to command-line syntax (see Section 4.2.4, “Using Options on the Command Line”). However, in an option file, you omit the leading two dashes from the option name and you specify only one option per line. For example, --quick and -- host=localhost on the command line should be specified as quick and host=localhost on separate lines in an option file. To specify an option of the form --loose-opt_name in an option file, write it as loose-opt_name.

Empty lines in option files are ignored. Nonempty lines can take any of the following forms:

• #comment, ;comment
  Comment lines start with “#” or “;”. A “#” comment can start in the middle of a line as well.

• [group]
  group is the name of the program or group for which you want to set options. After a group line, any option-setting lines apply to the named group until the end of the option file or another group line is given. Option group names are not case sensitive.

• opt_name
  This is equivalent to --opt_name on the command line.

• opt_name=value
  This is equivalent to --opt_name=value on the command line. In an option file, you can have spaces around the “=” character, something that is not true on the command line. The value optionally can be enclosed within single quotation marks or double quotation marks, which is useful if the value contains a “#” comment character.

Leading and trailing spaces are automatically deleted from option names and values.

You can use the escape sequences “\b”, “\t”, “\n”, “\r”, “\", and “\s” in option values to represent the backspace, tab, newline, carriage return, backslash, and space characters. In option files, these escaping rules apply:

• A backslash followed by a valid escape sequence character is converted to the character represented by the sequence. For example, “\s” is converted to a space.

• A backslash not followed by a valid escape sequence character remains unchanged. For example, “\s” is retained as is.
The preceding rules mean that a literal backslash can be given as “\\”, or as “\” if it is not followed by a valid escape sequence character.

The rules for escape sequences in option files differ slightly from the rules for escape sequences in string literals in SQL statements. In the latter context, if “x” is not a valid escape sequence character, “\x” becomes “x” rather than “\x”. See Section 9.1.1, “String Literals”.

The escaping rules for option file values are especially pertinent for Windows path names, which use “\” as a path name separator. A separator in a Windows path name must be written as “\\” if it is followed by an escape sequence character. It can be written as “\” or “\” if it is not. Alternatively, “/” may be used in Windows path names and will be treated as “\”. Suppose that you want to specify a base directory of C:\Program Files\MySQL\MySQL Server 5.1 in an option file. This can be done several ways. Some examples:

```plaintext
basedir="C:\Program Files\MySQL\MySQL Server 5.1"
basedir="C:\\Program Files\\MySQL\\MySQL Server 5.1"
basedir=C:\Program\sFiles\MySQL\MySQL\sServer\s5.1
```

If an option group name is the same as a program name, options in the group apply specifically to that program. For example, the [mysql] and [mysqld] groups apply to the mysqld server and the mysql client program, respectively.

The [client] option group is read by all client programs (but not by mysqld). This enables you to specify options that apply to all clients. For example, [client] is the appropriate group to use to specify the password for connecting to the server. (But make sure that the option file is accessible only by yourself, so that other people cannot discover your password.) Be sure not to put an option in the [client] group unless it is recognized by all client programs that you use. Programs that do not understand the option quit after displaying an error message if you try to run them.

Here is a typical global option file:

```plaintext
[client]
port=3306
socket=/tmp/mysql.sock

[mysqld]
port=3306
socket=/tmp/mysql.sock
key_buffer_size=16M
max_allowed_packet=8M

[mysqldump]
quick
```

Here is a typical user option file:

```plaintext
[client]
# The following password will be sent to all standard MySQL clients
password="my password"

[mysqld]
no-auto-rehash
connect_timeout=2

[mysqlhotcopy]
interactive-timeout
```

To create option groups to be read only by mysqld servers from specific MySQL release series, use groups with names of [mysqld-5.0], [mysqld-5.1], and so forth. The following group indicates that the sql_mode setting should be used only by MySQL servers with 5.1.x version numbers:

```
```
It is possible to use `!include` directives in option files to include other option files and `!includedir` to search specific directories for option files. For example, to include the `/home/mydir/myopt.cnf` file, use the following directive:

```
!include /home/mydir/myopt.cnf
```

To search the `/home/mydir` directory and read option files found there, use this directive:

```
!includedir /home/mydir
```

MySQL makes no guarantee about the order in which option files in the directory will be read.

**Note**

Any files to be found and included using the `!includedir` directive on Unix operating systems must have file names ending in `.cnf`. On Windows, this directive checks for files with the `.ini` or `.cnf` extension.

Write the contents of an included option file like any other option file. That is, it should contain groups of options, each preceded by a `[[group]]` line that indicates the program to which the options apply.

While an included file is being processed, only those options in groups that the current program is looking for are used. Other groups are ignored. Suppose that a `my.cnf` file contains this line:

```
!include /home/mydir/myopt.cnf
```

And suppose that `/home/mydir/myopt.cnf` looks like this:

```
[mysqladmin]
force

[mysqld]
key_buffer_size=16M
```

If `my.cnf` is processed by `mysqld`, only the `[mysqld]` group in `/home/mydir/myopt.cnf` is used. If the file is processed by `mysqladmin`, only the `[mysqladmin]` group is used. If the file is processed by any other program, no options in `/home/mydir/myopt.cnf` are used.

The `!includedir` directive is processed similarly except that all option files in the named directory are read.

### 4.2.7 Command-Line Options that Affect Option-File Handling

Most MySQL programs that support option files handle the following options. Because these options affect option-file handling, they must be given on the command line and not in an option file. To work properly, each of these options must be given before other options, with these exceptions:

- `--print-defaults` may be used immediately after `--defaults-file` or `--defaults-extra-file`.

- On Windows, if the server is started with the `--defaults-file` and `--install` options, `--install` must be first. See Section 2.3.6.7, “Starting MySQL Server as a Microsoft Windows Service”.

When specifying file names, avoid the use of the “~” shell metacharacter because it might not be interpreted as you expect.
Using Options to Set Program Variables

- **--defaults-extra-file=file_name**

  Read this option file after the global option file but (on Unix) before the user option file. (For information about the order in which option files are used, see Section 4.2.6, “Using Option Files”.) If the file does not exist or is otherwise inaccessible, an error occurs. *file_name* is the full path name to the file.

- **--defaults-file=file_name**

  Use only the given option file. If the file does not exist or is otherwise inaccessible, an error occurs. *file_name* is the full path name to the file.

- **--defaults-group-suffix=str**

  Read not only the usual option groups, but also groups with the usual names and a suffix of *str*. For example, the *mysql* client normally reads the [client] and [mysql] groups. If the **--defaults-group-suffix=_other** option is given, *mysql* also reads the [client_other] and [mysql_other] groups.

- **--no-defaults**

  Do not read any option files. If program startup fails due to reading unknown options from an option file, **--no-defaults** can be used to prevent them from being read.

- **--print-defaults**

  Print the program name and all options that it gets from option files.

### 4.2.8 Using Options to Set Program Variables

Many MySQL programs have internal variables that can be set at runtime using the **SET** statement. See Section 13.7.4.1, “SET Syntax for Variable Assignment”, and Section 5.1.5, “Using System Variables”.

Most of these program variables also can be set at server startup by using the same syntax that applies to specifying program options. For example, *mysql* has a **max_allowed_packet** variable that controls the maximum size of its communication buffer. To set the **max_allowed_packet** variable for *mysql* to a value of 16MB, use either of the following commands:

```shell
shell> mysql --max_allowed_packet=16777216
shell> mysql --max_allowed_packet=16M
```

The first command specifies the value in bytes. The second specifies the value in megabytes. For variables that take a numeric value, the value can be given with a suffix of **K**, **M**, or **G** (either uppercase or lowercase) to indicate a multiplier of 1024, 1024², or 1024³. (For example, when used to set **max_allowed_packet**, the suffixes indicate units of kilobytes, megabytes, or gigabytes.)

In an option file, variable settings are given without the leading dashes:

```
[mysql]
max_allowed_packet=16777216
```

Or:

```
[mysql]
max_allowed_packet=16M
```

If you like, underscores in a variable name can be specified as dashes. The following option groups are equivalent. Both set the size of the server’s key buffer to 512MB:
A variable can be specified by writing it in full or as any unambiguous prefix. For example, the `max_allowed_packet` variable can be set for `mysql` as `--max-a`, but not as `--max` because the latter is ambiguous:

```
shell> mysql --max=1000000
mysql: ambiguous option '--max=1000000' (max_allowed_packet, max_join_size)
```

Be aware that the use of variable prefixes can cause problems in the event that new variables are implemented for a program. A prefix that is unambiguous now might become ambiguous in the future.

Suffixes for specifying a value multiplier can be used when setting a variable at server startup, but not to set the value with `SET` at runtime. On the other hand, with `SET`, you can assign a variable’s value using an expression, which is not true when you set a variable at server startup. For example, the first of the following lines is legal at server startup, but the second is not:

```
shell> mysql --max_allowed_packet=16M
shell> mysql --max_allowed_packet=16*1024*1024
```

Conversely, the second of the following lines is legal at runtime, but the first is not:

```
mysql> SET GLOBAL max_allowed_packet=16M;
mysql> SET GLOBAL max_allowed_packet=16*1024*1024;
```

**Note**

Before MySQL 4.0.2, the only syntax for setting program variables was `--set-variable=option=value` (or `set-variable=option=value` in option files). Underscores cannot be given as dashes, and the variable name must be specified in full. This syntax still is recognized, but is deprecated and is removed in MySQL 5.5.

### 4.2.9 Option Defaults, Options Expecting Values, and the = Sign

By convention, long forms of options that assign a value are written with an equals (=) sign, like this:

```
shell> mysql --host=tonfisk --user=jon
```

For options that require a value (that is, not having a default value), the equal sign is not required, and so the following is also valid:

```
shell> mysql --host tonfisk --user jon
```

In both cases, the `mysql` client attempts to connect to a MySQL server running on the host named “tonfisk” using an account with the user name “jon”.

Due to this behavior, problems can occasionally arise when no value is provided for an option that expects one. Consider the following example, where a user connects to a MySQL server running on host `tonfisk` as user `jon`:

```
shell> mysql --host 85.224.35.45 --user jon
```
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 3
Server version: 5.1.73 Source distribution
Type 'help;' or '\h' for help. Type '\c' to clear the buffer.

mysql> SELECT CURRENT_USER();
+----------------+
| CURRENT_USER() |
+----------------+
| jon@%          |
+----------------+
1 row in set (0.00 sec)

Omitting the required value for one of these option yields an error, such as the one shown here:

shell> mysql --host 85.224.35.45 --user
mysql: option '--user' requires an argument

In this case, mysql was unable to find a value following the --user option because nothing came after it on the command line. However, if you omit the value for an option that is not the last option to be used, you obtain a different error that you may not be expecting:

shell> mysql --host --user jon
ERROR 2005 (HY000): Unknown MySQL server host '--user' (1)

Because mysql assumes that any string following --host on the command line is a host name, --host --user is interpreted as --host=--user, and the client attempts to connect to a MySQL server running on a host named "--user".

Options having default values always require an equal sign when assigning a value; failing to do so causes an error. For example, the MySQL server --log-error option has the default value host_name.err, where host_name is the name of the host on which MySQL is running. Assume that you are running MySQL on a computer whose host name is "tonfisk", and consider the following invocation of mysqld_safe:

shell> mysqld_safe &
[1] 11699
shell> 080112 12:53:40 mysqld_safe Logging to '/usr/local/mysql/var/tonfisk.err'.
080112 12:53:40 mysqld_safe Starting mysqld daemon with databases from /usr/local/mysql/var
shell>

After shutting down the server, restart it as follows:

shell> mysqld_safe --log-error &
[1] 11699
shell> 080112 12:53:40 mysqld_safe Logging to '/usr/local/mysql/var/tonfisk.err'.
080112 12:53:40 mysqld_safe Starting mysqld daemon with databases from /usr/local/mysql/var
shell>

The result is the same, since --log-error is not followed by anything else on the command line, and it supplies its own default value. (The & character tells the operating system to run MySQL in the background; it is ignored by MySQL itself.) Now suppose that you wish to log errors to a file named my-errors.err. You might try starting the server with --log-error my-errors, but this does not have the intended effect, as shown here:

shell> mysqld_safe --log-error my-errors &
[1] 31357
shell> 080111 22:53:31 mysqld_safe Logging to '/usr/local/mysql/var/tonfisk.err'.
080111 22:53:32 mysqld_safe Starting mysqld daemon with databases from /usr/local/mysql/var
080111 22:53:34 mysqld_safe mysqld from pid file /usr/local/mysql/var/tonfisk.pid ended
Option Defaults, Options Expecting Values, and the = Sign

The server attempted to start using /usr/local/mysql/var/tonfisk.err as the error log, but then shut down. Examining the last few lines of this file shows the reason:

```
shell> tail /usr/local/mysql/var/tonfisk.err
080111 22:53:32 InnoDB: Started; log sequence number 0 46409
/usr/local/mysql/libexec/mysqld: Too many arguments (first extra is 'my-errors').
Use --verbose --help to get a list of available options
080111 22:53:32 InnoDB: Starting shutdown...
080111 22:53:34 InnoDB: Shutdown completed; log sequence number 0 46409
080111 22:53:34 mysqld_safe mysqld from pid file /usr/local/mysql/var/tonfisk.pid ended
```

Because the `--log-error` option supplies a default value, you must use an equal sign to assign a different value to it, as shown here:

```
shell> mysqld_safe --log-error=my-errors &
[1] 31437
shell> 080111 22:54:15 mysqld_safe Logging to '/usr/local/mysql/var/my-errors.err'.
080111 22:54:15 mysqld_safe Starting mysqld daemon with databases from /usr/local/mysql/var
shell>
```

Now the server has been started successfully, and is logging errors to the file /usr/local/mysql/var/my-errors.err.

Similar issues can arise when specifying option values in option files. For example, consider a `my.cnf` file that contains the following:

```
[mysql]
host
user
```

When the `mysql` client reads this file, these entries are parsed as `--host --user` or `--host=--user`, with the result shown here:

```
shell> mysql
ERROR 2005 (HY000): Unknown MySQL server host '--user' (1)
```

However, in option files, an equal sign is not assumed. Suppose the `my.cnf` file is as shown here:

```
[mysql]
user jon
```

Trying to start `mysql` in this case causes a different error:

```
shell> mysql
mysql: unknown option '--user jon'
```

A similar error would occur if you were to write `host tonfisk` in the option file rather than `host=tonfisk`. Instead, you must use the equals sign:

```
[mysql]
host=tonfisk
```
user=jon

Now the login attempt succeeds:

```
shell> mysql
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 5
Server version: 5.1.73 Source distribution
Type 'help;' or '
' for help. Type '\c' to clear the buffer.

mysql> SELECT USER();
+---------------+
| USER()        |
| jon@localhost |
+---------------+
1 row in set (0.00 sec)
```

This is not the same behavior as with the command line, where the equal sign is not required:

```
shell> mysql --user jon --host tonfisk
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 6
Server version: 5.1.73 Source distribution
Type 'help;' or '
' for help. Type '\c' to clear the buffer.

mysql> SELECT USER();
+---------------+
| USER()        |
| jon@tonfisk   |
+---------------+
1 row in set (0.00 sec)
```

### 4.2.10 Setting Environment Variables

Environment variables can be set at the command prompt to affect the current invocation of your command processor, or set permanently to affect future invocations. To set a variable permanently, you can set it in a startup file or by using the interface provided by your system for this purpose. Consult the documentation for your command interpreter for specific details. Section 2.14, “Environment Variables”, lists all environment variables that affect MySQL program operation.

To specify a value for an environment variable, use the syntax appropriate for your command processor. For example, on Windows or NetWare, you can set the `USER` variable to specify your MySQL account name. To do so, use this syntax:

```
SET USER=your_name
```

The syntax on Unix depends on your shell. Suppose that you want to specify the TCP/IP port number using the `MYSQL_TCP_PORT` variable. Typical syntax (such as for `sh`, `ksh`, `bash`, `zsh`, and so on) is as follows:

```
MYSQL_TCP_PORT=3306
export MYSQL_TCP_PORT
```

The first command sets the variable, and the `export` command exports the variable to the shell environment so that its value becomes accessible to MySQL and other processes.

For `csh` and `tcsh`, use `setenv` to make the shell variable available to the environment:
setenv MYSQL_TCP_PORT 3306

The commands to set environment variables can be executed at your command prompt to take effect immediately, but the settings persist only until you log out. To have the settings take effect each time you log in, use the interface provided by your system or place the appropriate command or commands in a startup file that your command interpreter reads each time it starts.

On Windows, you can set environment variables using the System Control Panel (under Advanced).

On Unix, typical shell startup files are .bashrc or .bash_profile for bash, or .tcshrc for tcsh.

Suppose that your MySQL programs are installed in /usr/local/mysql/bin and that you want to make it easy to invoke these programs. To do this, set the value of the PATH environment variable to include that directory. For example, if your shell is bash, add the following line to your .bashrc file:

```
PATH=${PATH}:/usr/local/mysql/bin
```

bash uses different startup files for login and nonlogin shells, so you might want to add the setting to .bashrc for login shells and to .bash_profile for nonlogin shells to make sure that PATH is set regardless.

If your shell is tcsh, add the following line to your .tcshrc file:

```
setenv PATH ${PATH}:/usr/local/mysql/bin
```

If the appropriate startup file does not exist in your home directory, create it with a text editor.

After modifying your PATH setting, open a new console window on Windows or log in again on Unix so that the setting goes into effect.

### 4.3 MySQL Server and Server-Startup Programs

This section describes mysqld, the MySQL server, and several programs that are used to start the server.

#### 4.3.1 mysqld — The MySQL Server

mysqld, also known as MySQL Server, is the main program that does most of the work in a MySQL installation. MySQL Server manages access to the MySQL data directory that contains databases and tables. The data directory is also the default location for other information such as log files and status files.

When MySQL server starts, it listens for network connections from client programs and manages access to databases on behalf of those clients.

The mysqld program has many options that can be specified at startup. For a complete list of options, run this command:

```
shell> mysqld --verbose --help
```

MySQL Server also has a set of system variables that affect its operation as it runs. System variables can be set at server startup, and many of them can be changed at runtime to effect dynamic server reconfiguration. MySQL Server also has a set of status variables that provide information about its operation. You can monitor these status variables to access runtime performance characteristics.

For a full description of MySQL Server command options, system variables, and status variables, see Section 5.1, “The MySQL Server”. For information about installing MySQL and setting up the initial configuration, see Chapter 2, Installing and Upgrading MySQL.
mysqld_safe is the recommended way to start a mysqld server on Unix and NetWare. mysqld_safe adds some safety features such as restarting the server when an error occurs and logging runtime information to an error log file. Descriptions of error logging and NetWare-specific behaviors are given later in this section.

Note
In MySQL 5.1.20 (only), the default error logging behavior with mysqld_safe is to write errors to syslog on systems that support the logger program. This differs from the default behavior of writing an error log file for other versions.

In 5.1.20, logging to syslog may fail to operate correctly in some cases; if so, use --skip-syslog to use the default log file or --log-error=file_name to specify a log file name explicitly.

mysqld_safe tries to start an executable named mysqld. To override the default behavior and specify explicitly the name of the server you want to run, specify a --mysqld or --mysqld-version option to mysqld_safe. You can also use --ledir to indicate the directory where mysqld_safe should look for the server.

Many of the options to mysqld_safe are the same as the options to mysqld. See Section 5.1.3, "Server Command Options".

Options unknown to mysqld_safe are passed to mysqld if they are specified on the command line, but ignored if they are specified in the [mysqld_safe] group of an option file. See Section 4.2.6, "Using Option Files".

mysqld_safe reads all options from the [mysqld], [server], and [mysqld_safe] sections in option files. For example, if you specify a [mysqld] section like this, mysqld_safe will find and use the --log-error option:

```
[mysqld]
log-error=error.log
```

For backward compatibility, mysqld_safe also reads [safe_mysqld] sections, but to be current you should rename such sections to [mysqld_safe].

mysqld_safe supports the options in the following list. It also reads option files and supports the options for processing them described at Section 4.2.7, "Command-Line Options that Affect Option-File Handling".

### Table 4.3 mysqld_safe Options

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
<th>Introduced</th>
</tr>
</thead>
<tbody>
<tr>
<td>--autoclose</td>
<td>On NetWare, mysqld_safe provides a screen presence</td>
<td></td>
</tr>
<tr>
<td>--basedir</td>
<td>Path to MySQL installation directory</td>
<td></td>
</tr>
<tr>
<td>--core-file-size</td>
<td>Size of core file that mysqld should be able to create</td>
<td></td>
</tr>
<tr>
<td>--datadir</td>
<td>Path to data directory</td>
<td></td>
</tr>
<tr>
<td>--defaults-extra-file</td>
<td>Read named option file in addition to usual option files</td>
<td></td>
</tr>
<tr>
<td>--defaults-file</td>
<td>Read only named option file</td>
<td></td>
</tr>
<tr>
<td>--help</td>
<td>Display help message and exit</td>
<td></td>
</tr>
<tr>
<td>--ledir</td>
<td>Path to directory where server is located</td>
<td></td>
</tr>
<tr>
<td>--log-error</td>
<td>Write error log to named file</td>
<td></td>
</tr>
</tbody>
</table>
### mysqld_safe — MySQL Server Startup Script

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
<th>Introduced</th>
</tr>
</thead>
<tbody>
<tr>
<td>--mysqld</td>
<td>Name of server program to start (in ledir directory)</td>
<td></td>
</tr>
<tr>
<td>--mysqld-version</td>
<td>Suffix for server program name</td>
<td></td>
</tr>
<tr>
<td>--nice</td>
<td>Use nice program to set server scheduling priority</td>
<td></td>
</tr>
<tr>
<td>--no-defaults</td>
<td>Read no option files</td>
<td></td>
</tr>
<tr>
<td>--open-files-limit</td>
<td>Number of files that mysqld should be able to open</td>
<td></td>
</tr>
<tr>
<td>--pid-file</td>
<td>Path name of process ID file</td>

<tr>
<td>--skip-kill-mysqld</td>
<td>Do not try to kill stray mysqld processes</td>
<td></td>
</tr>
<tr>
<td>--skip-syslog</td>
<td>Do not write error messages to syslog; use error log file</td>
<td>5.1.20</td>
</tr>
<tr>
<td>--socket</td>
<td>Socket file on which to listen for Unix socket connections</td>
<td></td>
</tr>
<tr>
<td>--syslog</td>
<td>Write error messages to syslog</td>
<td>5.1.20</td>
</tr>
<tr>
<td>--syslog-tag</td>
<td>Tag suffix for messages written to syslog</td>
<td>5.1.21</td>
</tr>
<tr>
<td>--timezone</td>
<td>Set TZ time zone environment variable to named value</td>
<td></td>
</tr>
<tr>
<td>--user</td>
<td>Run mysqld as user having name user_name or numeric user ID user_id</td>
<td></td>
</tr>
<tr>
<td>--help</td>
<td>Display a help message and exit.</td>
<td></td>
</tr>
<tr>
<td>--autoclose</td>
<td>(NetWare only) On NetWare, mysqld_safe provides a screen presence. When you unload (shut down) the mysqld_safe NLM, the screen does not by default go away. Instead, it prompts for user input: &quot;&lt;NLM has terminated; Press any key to close the screen&gt;&quot; If you want NetWare to close the screen automatically instead, use the --autoclose option to mysqld_safe.</td>
<td></td>
</tr>
</tbody>
</table>

- **--basedir=dir_name**

  The path to the MySQL installation directory.

- **--core-file-size=size**

  The size of the core file that mysqld should be able to create. The option value is passed to ulimit -c.

- **--datadir=dir_name**

  The path to the data directory.

- **--defaults-extra-file=file_name**

  The name of an option file to be read in addition to the usual option files. This must be the first option on the command line if it is used. If the file does not exist or is otherwise inaccessible, the server will exit with an error.

- **--defaults-file=file_name**

  The name of an option file to be read instead of the usual option files. This must be the first option on the command line if it is used.
• **--ledir=dir_name**

If `mysqld_safe` cannot find the server, use this option to indicate the path name to the directory where the server is located.

• **--log-error=file_name**

Write the error log to the given file. See Section 5.4.2, “The Error Log”.

• **--mysqld=prog_name**

The name of the server program (in the `ledir` directory) that you want to start. This option is needed if you use the MySQL binary distribution but have the data directory outside of the binary distribution. If `mysqld_safe` cannot find the server, use the `--ledir` option to indicate the path name to the directory where the server is located.

• **--mysqld-version=suffix**

This option is similar to the `--mysqld` option, but you specify only the suffix for the server program name. The base name is assumed to be `mysqld`. For example, if you use `--mysqld-version=debug,mysqld_safe` starts the `mysqld-debug` program in the `ledir` directory. If the argument to `--mysqld-version` is empty, `mysqld_safe` uses `mysqld` in the `ledir` directory.

• **--nice=priority**

Use the `nice` program to set the server's scheduling priority to the given value.

• **--no-defaults**

Do not read any option files. This must be the first option on the command line if it is used.

• **--open-files-limit=count**

The number of files that `mysqld` should be able to open. The option value is passed to `ulimit -n`.

  Note

You must start `mysqld_safe` as `root` for this to function properly.

• **--pid-file=file_name**

The path name of the process ID file.

• **--port=port_num**

The port number that the server should use when listening for TCP/IP connections. The port number must be 1024 or higher unless the server is started by the `root` system user.

• **--skip-kill-mysqld**

Do not try to kill stray `mysqld` processes at startup. This option works only on Linux.

• **--socket=path**

The Unix socket file that the server should use when listening for local connections.

• **--syslog,** **--skip-syslog**

`--syslog` causes error messages to be sent to `syslog` on systems that support the `logger` program. `--skip-syslog` suppresses the use of `syslog`; messages are written to an error log file. These options were added in MySQL 5.1.20.

When `syslog` is used, the `daemon.err` `syslog` facility/severity is used for all log messages.
• **--syslog-tag=tag**

   For logging to syslog, messages from **mysqld_safe** and **mysqld** are written with identifiers of **mysqld_safe** and **mysqld**, respectively. To specify a suffix for the identifiers, use **--syslog-tag=tag**, which modifies the identifiers to be **mysqld_safe-tag** and **mysqld-tag**. This option was added in MySQL 5.1.21.

• **--timezone=timezone**

   Set the TZ time zone environment variable to the given option value. Consult your operating system documentation for legal time zone specification formats.

• **--user={user_name|user_id}**

   Run the **mysqld** server as the user having the name **user_name** or the numeric user ID **user_id**. (“User” in this context refers to a system login account, not a MySQL user listed in the grant tables.)

   If you execute **mysqld_safe** with the **--defaults-file** or **--defaults-extra-file** option to name an option file, the option must be the first one given on the command line or the option file will not be used. For example, this command will not use the named option file:

   ```sql
   mysql> mysqld_safe --port=port_num --defaults-file=file_name
   ```

   Instead, use the following command:

   ```sql
   mysql> mysqld_safe --defaults-file=file_name --port=port_num
   ```

The **mysqld_safe** script is written so that it normally can start a server that was installed from either a source or a binary distribution of MySQL, even though these types of distributions typically install the server in slightly different locations. (See Section 2.1.4, “Installation Layouts”.) **mysqld_safe** expects one of the following conditions to be true:

• The server and databases can be found relative to the working directory (the directory from which **mysqld_safe** is invoked). For binary distributions, **mysqld_safe** looks under its working directory for **bin** and **data** directories. For source distributions, it looks for **libexec** and **var** directories. This condition should be met if you execute **mysqld_safe** from your MySQL installation directory (for example, `/usr/local/mysql` for a binary distribution).

• If the server and databases cannot be found relative to the working directory, **mysqld_safe** attempts to locate them by absolute path names. Typical locations are `/usr/local/libexec` and `/usr/local/var`. The actual locations are determined from the values configured into the distribution at the time it was built. They should be correct if MySQL is installed in the location specified at configuration time.

Because **mysqld_safe** tries to find the server and databases relative to its own working directory, you can install a binary distribution of MySQL anywhere, as long as you run **mysqld_safe** from the MySQL installation directory:

```sh
getty> cd mysql_installation_directory
shell> bin/mysqld_safe &
```}

If **mysqld_safe** fails, even when invoked from the MySQL installation directory, specify the **--ledir** and **--datadir** options to indicate the directories in which the server and databases are located on your system.

When you use **mysqld_safe** to start **mysqld**, **mysqld_safe** arranges for error (and notice) messages from itself and from **mysqld** to go to the same destination.

As of MySQL 5.1.20, there are several **mysqld_safe** options for controlling the destination of these messages:
mysql.server — MySQL Server Startup Script

• **--log-error=file_name**: Write error messages to the named error file.

• **--syslog**: Write error messages to syslog on systems that support the logger program.

• **--skip-syslog**: Do not write error messages to syslog. Messages are written to the default error log file (host_name.err in the data directory), or to a named file if the **--log-error** option is given.

If none of these options is given, the default is **--skip-syslog**.

**Note**

In MySQL 5.1.20 only, the default is **--syslog**. This differs from logging behavior for other versions of MySQL, for which the default is to write messages to the default error log file.

If **--log-error** and **--syslog** are both given, a warning is issued and **--log-error** takes precedence.

When mysqld_safe writes a message, notices go to the logging destination (syslog or the error log file) and stdout. Errors go to the logging destination and stderr.

Before MySQL 5.1.20, error logging is controlled only with the **--log-error** option. If it is given, messages go to the named error file. Otherwise, messages go to the default error file.

Normally, you should not edit the mysqld_safe script. Instead, configure mysqld_safe by using command-line options or options in the [mysqld_safe] section of a my.cnf option file. In rare cases, it might be necessary to edit mysqld_safe to get it to start the server properly. However, if you do this, your modified version of mysqld_safe might be overwritten if you upgrade MySQL in the future, so you should make a copy of your edited version that you can reinstall.

On NetWare, mysqld_safe is a NetWare Loadable Module (NLM) that is ported from the original Unix shell script. It starts the server as follows:

1. Runs a number of system and option checks.
2. Runs a check on MyISAM tables.
3. Provides a screen presence for the MySQL server.
4. Starts mysqld, monitors it, and restarts it if it terminates in error.
5. Sends error messages from mysqld to the host_name.err file in the data directory.
6. Sends mysqld_safe screen output to the host_name.safe file in the data directory.

**4.3.3 mysql.server — MySQL Server Startup Script**

MySQL distributions on Unix include a script named mysql.server, which starts the server using mysqld_safe. It can be used on systems such as Linux and Solaris that use System V-style run directories to start and stop system services. It is also used by the OS X Startup Item for MySQL.

To start or stop the server manually using the mysql.server script, invoke it with start or stop arguments:

```
shell> mysql.server start
shell> mysql.server stop
```

Before mysql.server starts the server, it changes location to the MySQL installation directory, and then invokes mysqld_safe. To run the server as some specific user, add an appropriate user option
mysql.server — MySQL Server Startup Script

to the [mysqld] group of the /etc/my.cnf option file, as shown later in this section. (It is possible that you must edit mysql.server if you’ve installed a binary distribution of MySQL in a nonstandard location. Modify it to change location into the proper directory before it runs mysqld_safe. If you do this, your modified version of mysql.server may be overwritten if you upgrade MySQL in the future, so you should make a copy of your edited version that you can reinstall.)

mysql.server stop stops the server by sending a signal to it. You can also stop the server manually by executing mysqladmin shutdown.

To start and stop MySQL automatically on your server, you must add start and stop commands to the appropriate places in your /etc/rc* files.

If you use the Linux server RPM package (MySQL-server-VERSION.rpm), or a native Linux package installation, the mysql.server script may be installed in the /etc/init.d directory with the name mysql. See Section 2.5.1, “Installing MySQL on Linux Using RPM Packages”, for more information on the Linux RPM packages.

Some vendors provide RPM packages that install a startup script under a different name such as mysqld.

If you install MySQL from a source distribution or using a binary distribution format that does not install mysql.server automatically, you can install it manually. The script can be found in the support-files directory under the MySQL installation directory or in a MySQL source tree. Copy it to the /etc/init.d directory with the name mysql, and then make it executable:

```
shell> cp mysql.server /etc/init.d/mysql
shell> chmod +x /etc/init.d/mysql
```

Note

Older Red Hat systems use the /etc/rc.d/init.d directory rather than /etc/init.d. Adjust the preceding commands accordingly. Alternatively, first create /etc/init.d as a symbolic link that points to /etc/rc.d/init.d:

```
shell> cd /etc
shell> ln -s rc.d/init.d .
```

After installing the script, the commands needed to activate it to run at system startup depend on your operating system. On Linux, you can use chkconfig:

```
shell> chkconfig --add mysql
```

On some Linux systems, the following command also seems to be necessary to fully enable the mysql script:

```
shell> chkconfig --level 345 mysql on
```

On FreeBSD, startup scripts generally should go in /usr/local/etc/rc.d/. The rc(8) manual page states that scripts in this directory are executed only if their base name matches the *.sh shell file name pattern. Any other files or directories present within the directory are silently ignored. In other words, on FreeBSD, you should install the mysql.server script as /usr/local/etc/rc.d/mysql.server.sh to enable automatic startup.

As an alternative to the preceding setup, some operating systems also use /etc/rc.local or /etc/init.d/boot.local to start additional services on startup. To start up MySQL using this method, append a command like the one following to the appropriate startup file:
The `mysql.server` script supports the following options. If specified, they must be placed in an option file, not on the command line. `mysql.server` supports only `start` and `stop` as command-line arguments.

### Table 4.4 `mysql.server` Options

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
<th>Introduced</th>
</tr>
</thead>
<tbody>
<tr>
<td>--basedir=dir_name</td>
<td>Path to MySQL installation directory</td>
<td></td>
</tr>
<tr>
<td>--datadir=dir_name</td>
<td>Path to MySQL data directory</td>
<td></td>
</tr>
<tr>
<td>--pid-file=file_name</td>
<td>File in which server should write its process ID</td>
<td></td>
</tr>
<tr>
<td>--service-startup-timeout=seconds</td>
<td>How long to wait for server startup</td>
<td>5.1.17</td>
</tr>
<tr>
<td>--use-manager</td>
<td>Use Instance Manager to start server</td>
<td></td>
</tr>
<tr>
<td>--use-mysqld_safe</td>
<td>Use mysqld_safe to start server</td>
<td></td>
</tr>
<tr>
<td>--user</td>
<td>Run server using this login user name</td>
<td></td>
</tr>
</tbody>
</table>

- **--basedir=dir_name**

  The path to the MySQL installation directory.

- **--datadir=dir_name**

  The path to the MySQL data directory.

- **--pid-file=file_name**

  The path name of the file in which the server should write its process ID.

- **--service-startup-timeout=seconds**

  How long in seconds to wait for confirmation of server startup. If the server does not start within this time, `mysql.server` exits with an error. The default value is 900. A value of 0 means not to wait at all for startup. Negative values mean to wait forever (no timeout). This option was added in MySQL 5.1.17. Before that, a value of 900 is always used.

- **--use-mysqld_safe**

  Use `mysqld_safe` to start the server. This is the default.

- **--use-manager**
Use Instance Manager to start the server.

- `--user=user_name`

The login user name to use for running `mysqld`.

### 4.3.4 `mysqld_multi` — Manage Multiple MySQL Servers

`mysqld_multi` is designed to manage several `mysqld` processes that listen for connections on different Unix socket files and TCP/IP ports. It can start or stop servers, or report their current status. The MySQL Instance Manager is an alternative means of managing multiple servers (see Section 4.6.10, “mysqlmanager — The MySQL Instance Manager”).

`mysqld_multi` searches for groups named `[mysqldN]` in `my.cnf` (or in the file named by the `--config-file` option). $N$ can be any positive integer. This number is referred to in the following discussion as the option group number, or `GNR`. Group numbers distinguish option groups from one another and are used as arguments to `mysqld_multi` to specify which servers you want to start, stop, or obtain a status report for. Options listed in these groups are the same that you would use in the `[mysqld]` group used for starting `mysqld`. (See, for example, Section 2.12.5, “Starting and Stopping MySQL Automatically”.) However, when using multiple servers, it is necessary that each one use its own value for options such as the Unix socket file and TCP/IP port number. For more information on which options must be unique per server in a multiple-server environment, see Section 5.5, “Running Multiple MySQL Instances on One Machine”.

To invoke `mysqld_multi`, use the following syntax:

```
shell> mysqld_multi [options] {start|stop|report} [GNR[,GNR] ...]
```

`start`, `stop`, and `report` indicate which operation to perform. You can perform the designated operation for a single server or multiple servers, depending on the `GNR` list that follows the option name. If there is no list, `mysqld_multi` performs the operation for all servers in the option file.

Each `GNR` value represents an option group number or range of group numbers. The value should be the number at the end of the group name in the option file. For example, the `GNR` for a group named `[mysqld17]` is 17. To specify a range of numbers, separate the first and last numbers by a dash. The `GNR` value 10-13 represents groups `[mysqld10]` through `[mysqld13]`. Multiple groups or group ranges can be specified on the command line, separated by commas. There must be no whitespace characters (spaces or tabs) in the `GNR` list; anything after a whitespace character is ignored.

This command starts a single server using option group `[mysqld17]`:

```
shell> mysqld_multi start 17
```

This command stops several servers, using option groups `[mysqld8]` and `[mysqld10]` through `[mysqld13]`:

```
shell> mysqld_multi stop 8,10-13
```

For an example of how you might set up an option file, use this command:

```
shell> mysqld_multi --example
```

As of MySQL 5.1.18, `mysqld_multi` searches for option files as follows:

- With `--no-defaults`, no option files are read.
- With `--defaults-file=file_name`, only the named file is read.
mysqld_multi — Manage Multiple MySQL Servers

- Otherwise, option files in the standard list of locations are read, including any file named by the `--defaults-extra-file=file_name` option, if one is given. (If the option is given multiple times, the last value is used.)

Before MySQL 5.1.18, the preceding options are not recognized. Files in the standard locations are read, and any file named by the `--config-file=file_name` option, if one is given. A file named by `--config-file` is read only for [mysqld] option groups, not the [mysqld_multi] group.

Option files read are searched for [mysqld_multi] and [mysqld] option groups. The [mysqld_multi] group can be used for options to mysqld_multi itself. [mysqld] groups can be used for options passed to specific mysqld instances.

As of MySQL 5.1.35, the [mysqld] or [mysqld_safe] groups can be used for common options read by all instances of mysqld or mysqld_safe. You can specify a `--defaults-file=file_name` option to use a different configuration file for that instance, in which case the [mysqld] or [mysqld_safe] groups from that file will be used for that instance. Before MySQL 5.1.35, some versions of mysqld_multi pass the `--no-defaults` options to instances, so these techniques are inapplicable.

mysqld_multi supports the following options.

- `--help`
  Display a help message and exit.

- `--config-file=file_name`
  As of MySQL 5.1.18, this option is deprecated. If given, it is treated the same way as `--defaults-extra-file`, described earlier. `--config-file` is removed in MySQL 5.5.

Before MySQL 5.1.18, this option specifies the name of an extra option file. It affects where mysqld_multi looks for [mysqld] option groups. Without this option, all options are read from the usual my.cnf file. The option does not affect where mysqld_multi reads its own options, which are always taken from the [mysqld_multi] group in the usual my.cnf file.

- `--example`
  Display a sample option file.

- `--log=file_name`
  Specify the name of the log file. If the file exists, log output is appended to it.

- `--mysqldadmin=prog_name`
  The mysqladmin binary to be used to stop servers.

- `--mysqld=prog_name`
  The mysqld binary to be used. Note that you can specify mysqld_safe as the value for this option also. If you use mysqld_safe to start the server, you can include the mysqld or ledir options in the corresponding [mysqld] option group. These options indicate the name of the server that mysqld_safe should start and the path name of the directory where the server is located. (See the descriptions for these options in Section 4.3.2, "mysqld_safe — MySQL Server Startup Script".) Example:

```
[mysqld38]
mysqld = mysqld-debug
ledir  = /opt/local/mysql/libexec
```

- `--no-log`
Print log information to stdout rather than to the log file. By default, output goes to the log file.

- **--password=password**
  The password of the MySQL account to use when invoking mysqladmin. Note that the password value is not optional for this option, unlike for other MySQL programs.

- **--silent**
  Silent mode; disable warnings.

- **--tcp-ip**
  Connect to each MySQL server through the TCP/IP port instead of the Unix socket file. (If a socket file is missing, the server might still be running, but accessible only through the TCP/IP port.) By default, connections are made using the Unix socket file. This option affects stop and report operations.

- **--user=user_name**
  The user name of the MySQL account to use when invoking mysqladmin.

- **--verbose**
  Be more verbose.

- **--version**
  Display version information and exit.

Some notes about mysqld_multi:

- **Most important**: Before using mysqld_multi be sure that you understand the meanings of the options that are passed to the mysqld servers and why you would want to have separate mysqld processes. Beware of the dangers of using multiple mysqld servers with the same data directory. Use separate data directories, unless you know what you are doing. Starting multiple servers with the same data directory does not give you extra performance in a threaded system. See Section 5.5, “Running Multiple MySQL Instances on One Machine”.

- **Important**
  Make sure that the data directory for each server is fully accessible to the Unix account that the specific mysqld process is started as. Do not use the Unix root account for this, unless you know what you are doing. See Section 6.1.5, “How to Run MySQL as a Normal User”.

- Make sure that the MySQL account used for stopping the mysqld servers (with the mysqladmin program) has the same user name and password for each server. Also, make sure that the account has the SHUTDOWN privilege. If the servers that you want to manage have different user names or passwords for the administrative accounts, you might want to create an account on each server that has the same user name and password. For example, you might set up a common multi_admin account by executing the following commands for each server:

  ```
  shell> mysql -u root -S /tmp/mysql.sock -p
  Enter password:
  mysql> CREATE USER 'multi_admin'@'localhost' IDENTIFIED BY 'multipass';
  mysql> GRANT SHUTDOWN ON *.* TO 'multi_admin'@'localhost';
  ```

  See Section 6.2, “The MySQL Access Privilege System”. You have to do this for each mysqld server. Change the connection parameters appropriately when connecting to each one. Note that the host name part of the account name must permit you to connect as multi_admin from the host where you want to run mysqld_multi.
The Unix socket file and the TCP/IP port number must be different for every mysqld. (Alternatively, if the host has multiple network addresses, you can use --bind-address to cause different servers to listen to different interfaces.)

The --pid-file option is very important if you are using mysqld_safe to start mysqld (for example, --mysqld=mysqld_safe) Every mysqld should have its own process ID file. The advantage of using mysqld_safe instead of mysqld is that mysqld_safe monitors its mysqld process and restarts it if the process terminates due to a signal sent using kill -9 or for other reasons, such as a segmentation fault. Please note that the mysqld_safe script might require that you start it from a certain place. This means that you might have to change location to a certain directory before running mysqld_multi. If you have problems starting, please see the mysqld_safe script. Check especially the lines:

```plaintext
MY_PWD=`pwd`
# Check if we are starting this relative (for the binary release)
if test -d $MY_PWD/data/mysql -a \
  -f ./share/mysql/english/errmsg.sys -a \
  -x ./bin/mysqld
```

The test performed by these lines should be successful, or you might encounter problems. See Section 4.3.2, "mysqld_safe — MySQL Server Startup Script".

You might want to use the --user option for mysqld, but to do this you need to run the mysqld_multi script as the Unix superuser (root). Having the option in the option file doesn't matter; you just get a warning if you are not the superuser and the mysqld processes are started under your own Unix account.

The following example shows how you might set up an option file for use with mysqld_multi. The order in which the mysqld programs are started or stopped depends on the order in which they appear in the option file. Group numbers need not form an unbroken sequence. The first and fifth [mysqldN] groups were intentionally omitted from the example to illustrate that you can have “gaps” in the option file. This gives you more flexibility.

```plaintext
# This is an example of a my.cnf file for mysqld_multi.
# Usually this file is located in home dir ~/.my.cnf or /etc/my.cnf

[mysqld_multi]
mysqld = /usr/local/mysql/bin/mysqld_safe
mysqladmin = /usr/local/mysql/bin/mysqladmin
user = multi_admin
password = my_password

[mysqld2]
socket = /tmp/mysql.sock2
port = 3307
pid-file = /usr/local/mysql/data2/hostname.pid2
datadir = /usr/local/mysql/data2
language = /usr/local/mysql/share/mysql/english
user = unix_user1

[mysqld3]
mysqld = /path/to/mysqld_safe
ledir = /path/to/mysqld-binary/
mysqladmin = /path/to/mysqladmin
socket = /tmp/mysql.sock3
port = 3308
pid-file = /usr/local/mysql/data3/hostname.pid3
datadir = /usr/local/mysql/data3
language = /usr/local/mysql/share/mysql/swedish
user = unix_user2

[mysqld4]
socket = /tmp/mysql.sock4
```
MySQL Installation-Related Programs

4.4 MySQL Installation-Related Programs

The programs in this section are used when installing or upgrading MySQL.

4.4.1 comp_err — Compile MySQL Error Message File

comp_err creates the errmsg.sys file that is used by mysqld to determine the error messages to display for different error codes. comp_err normally is run automatically when MySQL is built. It compiles the errmsg.sys file from the text file located at sql/share/errmsg.txt in MySQL source distributions.

comp_err also generates mysqld_error.h, mysqld_ername.h, and sql_state.h header files.

For more information about how error messages are defined, see the MySQL Internals Manual.

Invoke comp_err like this:

```
shell> comp_err [options]
```

comp_err supports the following options.

- **--help, -?**
  Display a help message and exit.

- **--charset=dir_name, -C dir_name**
  The character set directory. The default is ../sql/share/charsets.

- **--debug=debug_options, -# debug_options**
  Write a debugging log. A typical debug_options string is d:t:O, file_name. The default is d:t:O, /tmp/comp_err.trace.

- **--debug-info, -T**
  Print some debugging information when the program exits.

- **--header_file=file_name, -H file_name**
  The name of the error header file. The default is mysqld_error.h.

- **--in_file=file_name, -F file_name**
  The name of the input file. The default is ../sql/share/errmsg.txt.

- **--name_file=file_name, -N file_name**
The name of the error name file. The default is `mysqld_ename.h`.

- `--out_dir=dir_name, -D dir_name`

  The name of the output base directory. The default is `../sql/share/`.

- `--out_file=file_name, -O file_name`

  The name of the output file. The default is `errmsg.sys`.

- `--statefile=file_name, -S file_name`

  The name for the SQLSTATE header file. The default is `sql_state.h`.

- `--version, -V`

  Display version information and exit.

---

### 4.4.2 make_win_bin_dist — Package MySQL Distribution as Zip Archive

This script is used on Windows after building a MySQL distribution from source to create executable programs. It packages the binaries and support files into a Zip archive that can be unpacked at the location where you want to install MySQL.

`make_win_bin_dist` is a shell script, so you must have Cygwin installed to use it.

This program's use is subject to change. Currently, you invoke it as follows from the root directory of your source distribution:

```
shell> make_win_bin_dist [options] package_basename [copy_def ...]
```

The `package_basename` argument provides the base name for the resulting Zip archive. This name will be the name of the directory that results from unpacking the archive.

Because you might want to include files of directories from other builds, you can instruct this script to copy them in for you, using `copy_def` arguments, which have the form `relative_dest_name=source_name`.

Example:

```
bin/mysqld-max.exe=../my-max-build/sql/release/mysqld.exe
```

If you specify a directory, the entire directory will be copied.

`make_win_bin_dist` supports the following options.

- `--debug`

  Pack the debug binaries and produce an error if they were not built.

- `--embedded`

  Pack the embedded server and produce an error if it was not built. The default is to pack it if it was built.

- `--exe-suffix=suffix`

  Add a suffix to the base name of the `mysql` binary. For example, a suffix of `-abc` produces a binary named `mysqld-abc.exe`.

- `--no-debug`
Do not pack the debug binaries even if they were built.

- `--no-embedded`

Do not pack the embedded server even if it was built.

- `--only-debug`

Use this option when the target for this build was **Debug**, and you just want to replace the normal binaries with debug versions (that is, do not use separate **debug** directories).

### 4.4.3 mysqlbug — Generate Bug Report

This program enables you to generate a bug report and send it to Oracle Corporation. It is a shell script and runs on Unix.

The normal way to report bugs is to visit [http://bugs.mysql.com/](http://bugs.mysql.com/), which is the address for our bugs database. This database is public and can be browsed and searched by anyone. If you log in to the system, you can enter new reports. If you have no Web access, you can generate a bug report by using the `mysqlbug` script.

`mysqlbug` helps you generate a report by determining much of the following information automatically, but if something important is missing, please include it with your message. `mysqlbug` can be found in the `scripts` directory (source distribution) and in the `bin` directory under your MySQL installation directory (binary distribution).

Invoke `mysqlbug` without arguments:

```
shell> mysqlbug
```

The script will place you in an editor with a copy of the report to be sent. Edit the lines near the beginning that indicate the nature of the problem. Then write the file to save your changes, quit the editor, and `mysqlbug` will send the report by email.

### 4.4.4 mysql_fix_privilege_tables — Upgrade MySQL System Tables

**Note**

In MySQL 5.1.7, `mysql_fix_privilege_tables` was superseded by `mysql_upgrade`, which should be used instead. See Section 4.4.8, "mysql_upgrade — Check and Upgrade MySQL Tables".

Some releases of MySQL introduce changes to the structure of the system tables in the `mysql` database to add new privileges or support new features. When you update to a new version of MySQL, update your system tables as well to make sure that their structure is up to date. Otherwise, there might be capabilities that you cannot take advantage of.

`mysql_fix_privilege_tables` is an older script that previously was used to upgrade the system tables in the `mysql` database after a MySQL upgrade.

Before running `mysql_fix_privilege_tables`, make a backup of your `mysql` database.

On Unix or Unix-like systems, update the system tables by running the `mysql_fix_privilege_tables` script:

```
shell> mysql_fix_privilege_tables
```

You must run this script while the server is running. It attempts to connect to the server running on the local host as **root**. If your **root** account requires a password, indicate the password on the command line like this:
The *mysql_fix_privilege_tables* script performs any actions necessary to convert your system tables to the current format. You might see some Duplicate column name warnings as it runs; you can ignore them.

After running the script, stop the server and restart it so that any changes made to the system tables take effect.

On Windows systems, MySQL distributions include a *mysql_fix_privilege_tables.sql* SQL script that you can run using the *mysql* client. For example, if your MySQL installation is located at `C:\Program Files\MySQL\MySQL Server 5.1`, the commands look like this:

```
C:\> cd "C:\Program Files\MySQL\MySQL Server 5.1"
C:\> bin\mysql -u root -p mysql
mysql> SOURCE share/mysql_fix_privilege_tables.sql
```

**Note**

Prior to version 5.1.17, the *mysql_fix_privilege_tables.sql* script is found in the `scripts` directory.

The *mysql* command will prompt you for the root password; enter it when prompted.

If your installation is located in some other directory, adjust the path names appropriately.

As with the Unix procedure, you might see some Duplicate column name warnings as *mysql* processes the statements in the *mysql_fix_privilege_tables.sql* script; you can ignore them.

After running the script, stop the server and restart it.

### 4.4.5 *mysql_install_db* — Initialize MySQL Data Directory

*mysql_install_db* initializes the MySQL data directory and creates the system tables that it contains, if they do not exist. *mysql_install_db* is a shell script and is available only on Unix platforms.

To invoke *mysql_install_db*, use the following syntax:

```
shell> mysql_install_db [options]
```

Because the MySQL server, *mysqld*, must access the data directory when it runs later, you should either run *mysql_install_db* from the same system account that will be used for running *mysqld*, or run it as root and specify the --user option to indicate the user name that *mysqld* will run as. It might be necessary to specify other options such as --basedir or --datadir if *mysql_install_db* does not use the correct locations for the installation directory or data directory. For example:

```
shell> bin/mysql_install_db --user=mysql \
   --basedir=/opt/mysql/mysql \
   --datadir=/opt/mysql/mysql/data
```

*mysql_install_db* needs to invoke *mysqld* with the --bootstrap and --skip-grant-tables options. If MySQL was configured with the --disable-grant-options option, --bootstrap and --skip-grant-tables will be disabled (see Section 2.11.4, "MySQL Source-Configuration Options"). To handle this, set the MYSQLD_BOOTSTRAP environment variable to the full path name of a server that has all options enabled. *mysql_install_db* will use that server.
mysql_install_db — Initialize MySQL Data Directory

Note

If you have set a custom `TMPDIR` environment variable when performing the installation, and the specified directory is not accessible, `mysql_install_db` may fail. If so, unset `TMPDIR` or set `TMPDIR` to point to the system temporary directory (usually `/tmp`).

`mysql_install_db` supports the following options, which can be specified on the command line or in the `[mysql_install_db]` group of an option file. (Options that are common to `mysqld` can also be specified in the `[mysqld]` group.) Other options are passed to `mysqld`. For information about option files used by MySQL programs, see Section 4.2.6, “Using Option Files”. `mysql_install_db` also supports the options for processing option files described at Section 4.2.7, “Command-Line Options that Affect Option-File Handling”.

• **--help**
  
  Display a help message and exit.

• **--basedir=dir_name**
  
  The path to the MySQL installation directory.

• **--builddir=dir_name**
  
  For use with `--srcdir` and out-of-source builds. Set this to the location of the directory where the built files reside.

• **--cross-bootstrap**
  
  For internal use. This option is used for building system tables on one host intended for another.

• **--datadir=dir_name**
  
  The path to the MySQL data directory.

• **--defaults-extra-file=file_name**
  
  Read this option file after the global option file but (on Unix) before the user option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is interpreted relative to the current directory if given as a relative path name rather than a full path name.

• **--defaults-file=file_name**
  
  Use only the given option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is interpreted relative to the current directory if given as a relative path name rather than a full path name.

• **--force**
  
  Cause `mysql_install_db` to run even if DNS does not work. Grant table entries normally created using host names will use IP addresses instead.

• **--ldata=dir_name**
  
  A synonym for `--datadir`.

• **--no-defaults**
  
  Do not read any option files. If program startup fails due to reading unknown options from an option file, `--no-defaults` can be used to prevent them from being read.

• **--rpm**
For internal use. This option is used during the MySQL installation process for install operations performed using RPM packages.

• **--skip-name-resolve**

Use IP addresses rather than host names when creating grant table entries. This option can be useful if your DNS does not work.

• **--srcdir=dir_name**

For internal use. This option specifies the directory under which `mysql_install_db` looks for support files such as the error message file and the file for populating the help tables. This option was added in MySQL 5.1.14.

• **--user=user_name**

The system (login) user name to use for running `mysqld`. Files and directories created by `mysqld` will be owned by this user. You must be the system root user to use this option. By default, `mysqld` runs using your current login name and files and directories that it creates will be owned by you.

• **--verbose**

Verbose mode. Print more information about what the program does.

• **--windows**

For internal use. This option is used for creating Windows distributions.

**4.4.6 mysql_secure_installation — Improve MySQL Installation Security**

This program enables you to improve the security of your MySQL installation in the following ways:

• You can set a password for root accounts.

• You can remove root accounts that are accessible from outside the local host.

• You can remove anonymous-user accounts.

• You can remove the test database (which by default can be accessed by all users, even anonymous users), and privileges that permit anyone to access databases with names that start with test_.

`mysql_secure_installation` helps you implement security recommendations similar to those described at Section 2.12.4, “Securing the Initial MySQL Accounts”.

Invoke `mysql_secure_installation` without arguments:

```
shell> mysql_secure_installation
```

When executed, the script prompts you to determine which actions to perform.

**4.4.7 mysql_tzinfo_to_sql — Load the Time Zone Tables**

The `mysql_tzinfo_to_sql` program loads the time zone tables in the `mysql` database. It is used on systems that have a zoneinfo database (the set of files describing time zones). Examples of such systems are Linux, FreeBSD, Solaris, and OS X. One likely location for these files is the `/usr/share/zoneinfo` directory (`/usr/share/lib/zoneinfo` on Solaris). If your system does not have a zoneinfo database, you can use the downloadable package described in Section 10.6, “MySQL Server Time Zone Support”.
mysql_tzinfo_to_sql can be invoked several ways:

shell> mysql_tzinfo_to_sql tz_dir
shell> mysql_tzinfo_to_sql tz_file tz_name
shell> mysql_tzinfo_to_sql --leap tz_file

For the first invocation syntax, pass the zoneinfo directory path name to mysql_tzinfo_to_sql and send the output into the mysql program. For example:

shell> mysql_tzinfo_to_sql /usr/share/zoneinfo | mysql -u root mysql

mysql_tzinfo_to_sql reads your system's time zone files and generates SQL statements from them. mysql processes those statements to load the time zone tables.

The second syntax causes mysql_tzinfo_to_sql to load a single time zone file tz_file that corresponds to a time zone name tz_name:

shell> mysql_tzinfo_to_sql tz_file tz_name | mysql -u root mysql

If your time zone needs to account for leap seconds, invoke mysql_tzinfo_to_sql using the third syntax, which initializes the leap second information. tz_file is the name of your time zone file:

shell> mysql_tzinfo_to_sql --leap tz_file | mysql -u root mysql

After running mysql_tzinfo_to_sql, it is best to restart the server so that it does not continue to use any previously cached time zone data.

4.4.8 mysql_upgrade — Check and Upgrade MySQL Tables

mysql_upgrade examines all tables in all databases for incompatibilities with the current version of MySQL Server. mysql_upgrade also upgrades the system tables so that you can take advantage of new privileges or capabilities that might have been added.

If mysql_upgrade finds that a table has a possible incompatibility, it performs a table check and, if problems are found, attempts a table repair. If the table cannot be repaired, see Section 2.13.4, “Rebuilding or Repairing Tables or Indexes” for manual table repair strategies.

You should execute mysql_upgrade each time you upgrade MySQL. It supersedes the older mysql_fix_privilege_tables script, which should no longer be used.

If you install MySQL from RPM packages on Linux, you must install the server and client RPMs. mysql_upgrade is included in the server RPM but requires the client RPM because the latter includes mysqlcheck. (See Section 2.5.1, “Installing MySQL on Linux Using RPM Packages”.)

Note

On Windows Server 2008, Vista, and newer, you must run mysql_upgrade with administrator privileges. You can do this by running a Command Prompt as Administrator and running the command. Failure to do so may result in the upgrade failing to execute correctly.

Caution

You should always back up your current MySQL installation before performing an upgrade. See Section 7.2, “Database Backup Methods”.

Some upgrade incompatibilities may require special handling before you upgrade your MySQL installation and run mysql_upgrade. See Section 2.13.1, “Upgrading MySQL”, for instructions on determining whether any such incompatibilities apply to your installation and how to handle them.
To use `mysql_upgrade`, make sure that the server is running. Then invoke it like this:

```
shell> mysql_upgrade [options]
```

After running `mysql_upgrade`, stop the server and restart it so that any changes made to the system tables take effect.

If you have multiple MySQL server instances running, invoke `mysql_upgrade` with connection parameters appropriate for connecting to the desired server. For example, with servers running on the local host on parts 3306 through 3308, upgrade each of them by connecting to the appropriate port:

```
shell> mysql_upgrade --protocol=tcp -P 3306 [other_options]
shell> mysql_upgrade --protocol=tcp -P 3307 [other_options]
shell> mysql_upgrade --protocol=tcp -P 3308 [other_options]
```

For local host connections on Unix, the `--protocol=tcp` option forces a connection using TCP/IP rather than the Unix socket file.

`mysql_upgrade` executes the following commands to check and repair tables and to upgrade the system tables:

```
mysqlcheck --no-defaults --all-databases --fix-db-names --fix-table-names
mysqlcheck --no-defaults --check-upgrade --all-databases --auto-repair
mysql < fix_priv_tables
```

Notes about the preceding commands:

- `mysql_upgrade` also adds `--write-binlog` or `--skip-write-binlog` to the `mysqlcheck` commands, depending on whether the `--write-binlog` option was specified on the `mysql_upgrade` command.

- Because `mysql_upgrade` invokes `mysqlcheck` with the `--all-databases` option, it processes all tables in all databases, which might take a long time to complete. Each table is locked and therefore unavailable to other sessions while it is being processed. Check and repair operations can be time-consuming, particularly for large tables.

- For details about what checks the `--check-upgrade` option entails, see the description of the `FOR UPGRADE` option of the `CHECK TABLE` statement (see Section 13.7.2.3, “CHECK TABLE Syntax”).

- `fix_priv_tables` represents a script generated internally by `mysql_upgrade` that contains SQL statements to upgrade the tables in the `mysql` database.

- Prior to MySQL 5.1.31, `mysql_upgrade` does not run the second `mysqlcheck` command, which is necessary to re-encode database or table names that contain nonalphanumeric characters. (They still appear after the upgrade with the `#mysql50#` prefix described in Section 9.2.3, “Mapping of Identifiers to File Names”.) If you have such database or table names, execute the second `mysqlcheck` command manually after executing `mysql_upgrade`.

All checked and repaired tables are marked with the current MySQL version number. This ensures that next time you run `mysql_upgrade` with the same version of the server, it can tell whether there is any need to check or repair the table again.

`mysql_upgrade` also saves the MySQL version number in a file named `mysql_upgrade_info` in the data directory. This is used to quickly check whether all tables have been checked for this release so that table-checking can be skipped. To ignore this file and perform the check regardless, use the `--force` option.

In MySQL 5.1.7, `mysql_upgrade` was added as a shell script and worked only for Unix systems. As of MySQL 5.1.10, `mysql_upgrade` is an executable binary and is available on all systems.
mysql_upgrade does not upgrade the contents of the help tables. For upgrade instructions, see Section 5.1.9, “Server-Side Help”.

mysql_upgrade supports the following options, which can be specified on the command line or in the [mysql_upgrade] and [client] groups of an option file. Unrecognized options are passed to mysqlcheck. For information about option files, see Section 4.2.6, “Using Option Files”.

- **--help**
  Display a short help message and exit.

- **--basedir=dir_name**
  The path to the MySQL installation directory. This option is accepted for backward compatibility but ignored.

- **--character-sets-dir=dir_name**
  The directory where character sets are installed. See Section 10.5, “Character Set Configuration”. This option was added in MySQL 5.1.13.

- **--compress**
  Compress all information sent between the client and the server if both support compression. This option was added in MySQL 5.1.13.

- **--datadir=dir_name**
  The path to the data directory. This option is accepted for backward compatibility but ignored.

- **--debug[=debug_options],-# [debug_options]**
  Write a debugging log. A typical debug_options string is d:t:o, file_name. The default is d:t:o,/tmp/mysql_upgrade.trace.

- **--debug-check**
  Print some debugging information when the program exits. This option was added in MySQL 5.1.21.

- **--debug-info,-T**
  Print some debugging information when the program exits.

- **--default-character-set=charset_name**
  Use charset_name as the default character set. See Section 10.5, “Character Set Configuration”. This option was added in MySQL 5.1.13.

- **--defaults-extra-file=file_name**
  Read this option file after the global option file but (on Unix) before the user option file. If the file does not exist or is otherwise inaccessible, an error occurs. file_name is the full path name to the file.

- **--defaults-file=file_name**
  Use only the given option file. If the file does not exist or is otherwise inaccessible, an error occurs. file_name is the full path name to the file.

- **--defaults-group-suffix=str**
  Read not only the usual option groups, but also groups with the usual names and a suffix of str. For example, mysql_upgrade normally reads the [client] and [mysql_upgrade] groups. If the --defaults-group-suffix=other option is given, mysql_upgrade also reads the [client_other] and [mysql_upgrade_other] groups.
mysql_upgrade — Check and Upgrade MySQL Tables

- **--force**
  Ignore the `mysql_upgrade_info` file and force execution even if `mysql_upgrade` has already been executed for the current version of MySQL.

- **--host=host_name, -h host_name**
  Connect to the MySQL server on the given host. This option was added in MySQL 5.1.13.

- **--no-defaults**
  Do not read any option files. If program startup fails due to reading unknown options from an option file, **--no-defaults** can be used to prevent them from being read.

- **--password[=password], -p[password]**
  The password to use when connecting to the server. If you use the short option form (**-p**), you cannot have a space between the option and the password. If you omit the `password` value following the **--password** or **-p** option on the command line, `mysql_upgrade` prompts for one.

  Specifying a password on the command line should be considered insecure. See Section 6.1.2.1, “End-User Guidelines for Password Security”. You can use an option file to avoid giving the password on the command line.

- **--pipe, -W**
  On Windows, connect to the server using a named pipe. This option applies only if the server supports named-pipe connections. This option was added in MySQL 5.1.13.

- **--port=port_num, -P port_num**
  The TCP/IP port number to use for the connection.

- **--print-defaults**
  Print the program name and all options that it gets from option files.

- **--protocol={TCP|SOCKET|PIPE|MEMORY}**
  The connection protocol to use for connecting to the server. It is useful when the other connection parameters normally would cause a protocol to be used other than the one you want. For details on the permissible values, see Section 4.2.2, “Connecting to the MySQL Server”.

- **--shared-memory-base-name=name**
  On Windows, the shared-memory name to use, for connections made using shared memory to a local server. The default value is `MYSQL`. The shared-memory name is case sensitive.

  The server must be started with the **--shared-memory** option to enable shared-memory connections. This option was added in MySQL 5.1.13.

- **--socket=path, -S path**
  For connections to `localhost`, the Unix socket file to use, or, on Windows, the name of the named pipe to use.

- **--ssl**
  Options that begin with **--ssl** specify whether to connect to the server using SSL and indicate where to find SSL keys and certificates. See Section 6.4.5, “Command Options for Secure Connections”. These options were added in MySQL 5.1.13.

- **--tmpdir=dir_name, -t dir_name**
The path name of the directory to use for creating temporary files. This option was added in MySQL 5.1.25.

- `--user=user_name, -u user_name`

  The MySQL user name to use when connecting to the server. The default user name is `root`.

- `--verbose`

  Verbose mode. Print more information about what the program does.

- `--write-binlog`

  Cause binary logging to be enabled while `mysql_upgrade` runs. This is the default behavior; to disable binary logging during the upgrade, use the inverse of this option (that is, start the program with `--skip-write-binlog`).

  This option was introduced in MySQL 5.1.40.

4.5 MySQL Client Programs

This section describes client programs that connect to the MySQL server.

4.5.1 `mysql` — The MySQL Command-Line Tool

`mysql` is a simple SQL shell with input line editing capabilities. It supports interactive and noninteractive use. When used interactively, query results are presented in an ASCII-table format. When used noninteractively (for example, as a filter), the result is presented in tab-separated format. The output format can be changed using command options.

If you have problems due to insufficient memory for large result sets, use the `--quick` option. This forces `mysql` to retrieve results from the server a row at a time rather than retrieving the entire result set and buffering it in memory before displaying it. This is done by returning the result set using the `mysql_use_result()` C API function in the client/server library rather than `mysql_store_result()`.

Using `mysql` is very easy. Invoke it from the prompt of your command interpreter as follows:

```bash
shell> mysql db_name
```

Or:

```bash
shell> mysql --user=user_name --password=your_password db_name
```

Then type an SQL statement, end it with `;`, `\g`, or `\G` and press Enter.

As of MySQL 5.1.10, typing `Control+C` causes `mysql` to attempt to kill the current statement. If this cannot be done, or `Control+C` is typed again before the statement is killed, `mysql` exits. Previously, `Control+C` caused `mysql` to exit in all cases.

You can execute SQL statements in a script file (batch file) like this:

```bash
shell> mysql db_name < script.sql > output.tab
```

On Unix, the `mysql` client logs statements executed interactively to a history file. See Section 4.5.1.3, "mysql Logging".

4.5.1.1 `mysql` Options
`mysql` supports the following options, which can be specified on the command line or in the `[mysql]` and `[client]` groups of an option file. For information about option files used by MySQL programs, see Section 4.2.6, “Using Option Files”.

### Table 4.5 `mysql` Options

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
<th>Introduced</th>
</tr>
</thead>
<tbody>
<tr>
<td>--auto-rehash</td>
<td>Enable automatic rehashing</td>
<td></td>
</tr>
<tr>
<td>--batch</td>
<td>Do not use history file</td>
<td></td>
</tr>
<tr>
<td>--bind-address</td>
<td>Use specified network interface to connect to MySQL Server</td>
<td>5.1.22-ndb-6.3.4</td>
</tr>
<tr>
<td>--character-sets-dir</td>
<td>Directory where character sets are installed</td>
<td></td>
</tr>
<tr>
<td>--column-names</td>
<td>Write column names in results</td>
<td></td>
</tr>
<tr>
<td>--column-type-info</td>
<td>Display result set metadata</td>
<td></td>
</tr>
<tr>
<td>--comments</td>
<td>Whether to retain or strip comments in statements sent to the server</td>
<td>5.1.23</td>
</tr>
<tr>
<td>--compress</td>
<td>Compress all information sent between client and server</td>
<td></td>
</tr>
<tr>
<td>--connect_timeout</td>
<td>Number of seconds before connection timeout</td>
<td></td>
</tr>
<tr>
<td>--database</td>
<td>The database to use</td>
<td></td>
</tr>
<tr>
<td>--debug</td>
<td>Write debugging log; supported only if MySQL was built with debugging support</td>
<td></td>
</tr>
<tr>
<td>--debug-check</td>
<td>Print debugging information when program exits</td>
<td>5.1.21</td>
</tr>
<tr>
<td>--debug-info</td>
<td>Print debugging information, memory, and CPU statistics when program exits</td>
<td></td>
</tr>
<tr>
<td>--default-character-set</td>
<td>Specify default character set</td>
<td></td>
</tr>
<tr>
<td>--defaults-extra-file</td>
<td>Read named option file in addition to usual option files</td>
<td></td>
</tr>
<tr>
<td>--defaults-file</td>
<td>Read only named option file</td>
<td></td>
</tr>
<tr>
<td>--defaults-group-suffix</td>
<td>Option group suffix value</td>
<td></td>
</tr>
<tr>
<td>--delimiter</td>
<td>Set the statement delimiter</td>
<td></td>
</tr>
<tr>
<td>--execute</td>
<td>Execute the statement and quit</td>
<td></td>
</tr>
<tr>
<td>--force</td>
<td>Continue even if an SQL error occurs</td>
<td></td>
</tr>
<tr>
<td>--help</td>
<td>Display help message and exit</td>
<td></td>
</tr>
<tr>
<td>--host</td>
<td>Connect to MySQL server on given host</td>
<td></td>
</tr>
<tr>
<td>--html</td>
<td>Produce HTML output</td>
<td></td>
</tr>
<tr>
<td>--ignore-spaces</td>
<td>Ignore spaces after function names</td>
<td></td>
</tr>
<tr>
<td>--line-numbers</td>
<td>Write line numbers for errors</td>
<td></td>
</tr>
<tr>
<td>--local-infile</td>
<td>Enable or disable for LOCAL capability for LOAD DATA INFILE</td>
<td></td>
</tr>
<tr>
<td>--max_allowed_packet</td>
<td>Maximum packet length to send to or receive from server</td>
<td></td>
</tr>
<tr>
<td>--max_join_size</td>
<td>The automatic limit for rows in a join when using --safe-updates</td>
<td></td>
</tr>
<tr>
<td>--named-commands</td>

<td>--xml</td>
<td>Produce XML output</td>
<td></td>
</tr>
</tbody>
</table>

- **--help, -?**
  Display a help message and exit.

- **--auto-rehash**
  Enable automatic rehashing. This option is on by default, which enables database, table, and column name completion. Use `--disable-auto-rehash` to disable rehashing. That causes `mysql` to start faster, but you must issue the `rehash` command or its `#` shortcut if you want to use name completion.

  To complete a name, enter the first part and press Tab. If the name is unambiguous, `mysql` completes it. Otherwise, you can press Tab again to see the possible names that begin with what you have typed so far. Completion does not occur if there is no default database.

  **Note**
  This feature requires a MySQL client that is compiled with the `readline` library. Typically, the `readline` library is not available on Windows.

- **--batch, -B**
  Print results using tab as the column separator, with each row on a new line. With this option, `mysql` does not use the history file.

  Batch mode results in nontabular output format and escaping of special characters. Escaping may be disabled by using raw mode; see the description for the `--raw` option.

- **--bind-address=ip_address**
  On a computer having multiple network interfaces, use this option to select which interface to use for connecting to the MySQL server.

  This option is supported only in the version of the `mysql` client that is supplied with MySQL Cluster, beginning with MySQL Cluster NDB 6.3.4. It is not available in standard MySQL 5.1 releases.

- **--character-sets-dir=dir_name**
  The directory where character sets are installed. See Section 10.5, “Character Set Configuration”.

- **--column-names**
  Write column names in results.

- **--column-type-info**
Display result set metadata. This option was added in MySQL 5.1.14. (Before that, use \(--debug-info\).)

\- `--comments, -c`

Whether to preserve comments in statements sent to the server. The default is `--skip-comments` (discard comments), enable with `--comments` (preserve comments). This option was added in MySQL 5.1.23.

\- `--compress, -C`

Compress all information sent between the client and the server if both support compression.

\- `--database=db_name, -D db_name`

The database to use. This is useful primarily in an option file.

\- `--debug [=debug_options], -# [debug_options]`

Write a debugging log. A typical `debug_options` string is `d:t:o, file_name`. The default is `d:t:o,/tmp/mysql.trace`.

This option is available only if MySQL was built using `--with-debug`. MySQL release binaries are not built using this option.

\- `--debug-check`

Print some debugging information when the program exits. This option was added in MySQL 5.1.21.

\- `--debug-info, -T`

Before MySQL 5.1.14, this option prints debugging information and memory and CPU usage statistics when the program exits, and also causes display of result set metadata during execution. As of MySQL 5.1.14, use `--column-type-info` to display result set metadata.

\- `--default-character-set=charset_name`

Use `charset_name` as the default character set for the client and connection.

A common issue that can occur when the operating system uses `utf8` or another multibyte character set is that output from the `mysql` client is formatted incorrectly, due to the fact that the MySQL client uses the `latin1` character set by default. You can usually fix such issues by using this option to force the client to use the system character set instead.

See Section 10.5, “Character Set Configuration”, for more information.

\- `--defaults-extra-file=file_name`

Read this option file after the global option file but (on Unix) before the user option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is the full path name to the file.

\- `--defaults-file=file_name`

Use only the given option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is the full path name to the file.

\- `--defaults-group-suffix=str`

Read not only the usual option groups, but also groups with the usual names and a suffix of `str`. For example, `mysql` normally reads the [client] and [mysql] groups. If the `--defaults-group-suffix=_other` option is given, `mysql` also reads the [client_other] and [mysql_other] groups.
• **--delimiter=**str

Set the statement delimiter. The default is the semicolon character (";").

• **--disable-named-commands**

Disable named commands. Use the \* form only, or use named commands only at the beginning of a line ending with a semicolon (";"). mysql starts with this option enabled by default. However, even with this option, long-format commands still work from the first line. See Section 4.5.1.2, “mysql Commands”.

• **--execute=**statement, -e statement

Execute the statement and quit. The default output format is like that produced with **--batch**. See Section 4.2.4, “Using Options on the Command Line”, for some examples. With this option, mysql does not use the history file.

• **--force,-f**

Continue even if an SQL error occurs.

• **--host=host_name,-h host_name**

Connect to the MySQL server on the given host.

• **--html,-H**

Produce HTML output.

• **--ignore-spaces,-i**

Ignore spaces after function names. The effect of this is described in the discussion for the IGNORE_SPACE SQL mode (see Section 5.1.7, “Server SQL Modes”).

• **--line-numbers**

Write line numbers for errors. Disable this with **--skip-line-numbers**.

• **--local-infile={[0|1]}**

Enable or disable LOCAL capability for LOAD DATA INFILE. With no value, the option enables LOCAL. The option may be given as **--local-infile=0** or **--local-infile=1** to explicitly disable or enable LOCAL. Enabling LOCAL has no effect if the server does not also support it.

• **--named-commands,-G**

Enable named mysql commands. Long-format commands are permitted, not just short-format commands. For example, quit and \q both are recognized. Use **--skip-named-commands** to disable named commands. See Section 4.5.1.2, “mysql Commands”.

• **--no-auto-rehash,-A**

This has the same effect as **--skip-auto-rehash**. See the description for **--auto-rehash**.

• **--no-beep,-b**

Do not beep when errors occur.

• **--no-defaults**

Do not read any option files. If program startup fails due to reading unknown options from an option file, **--no-defaults** can be used to prevent them from being read.

• **--no-named-commands,-g**
Deprecated, use `--disable-named-commands` instead. `--no-named-commands` is removed in MySQL 5.5.

- `--no-pager`

Deprecated form of `--skip-pager`. See the `--pager` option. `--no-pager` is removed in MySQL 5.5.

- `--no-tee`

Deprecated form of `--skip-tee`. See the `--tee` option. `--no-tee` is removed in MySQL 5.5.

- `--one-database, -o`

Ignore statements except those that occur while the default database is the one named on the command line. This option is rudimentary and should be used with care. Statement filtering is based only on `USE` statements.

Initially, `mysql` executes statements in the input because specifying a database `db_name` on the command line is equivalent to inserting `USE db_name` at the beginning of the input. Then, for each `USE` statement encountered, `mysql` accepts or rejects following statements depending on whether the database named is the one on the command line. The content of the statements is immaterial.

Suppose that `mysql` is invoked to process this set of statements:

```
DELETE FROM db2.t2;
USE db2;
DROP TABLE db1.t1;
USE db1;
INSERT INTO t1 {i} VALUES(i);
CREATE TABLE db2.t1 {j INT};
```

If the command line is `mysql --force --one-database db1`, `mysql` handles the input as follows:

- The `DELETE` statement is executed because the default database is `db1`, even though the statement names a table in a different database.

- The `DROP TABLE` and `CREATE TABLE` statements are not executed because the default database is not `db1`, even though the statements name a table in `db1`.

- The `INSERT` and `CREATE TABLE` statements are executed because the default database is `db1`, even though the `CREATE TABLE` statement names a table in a different database.

- `--pager [=command]`

Use the given command for paging query output. If the command is omitted, the default pager is the value of your `PAGER` environment variable. Valid pagers are `less`, `more`, `cat [> filename]`, and so forth. This option works only on Unix and only in interactive mode. To disable paging, use `--skip-pager`. Section 4.5.1.2, “mysql Commands”, discusses output paging further.

- `--password [=password], -p [password]`

The password to use when connecting to the server. If you use the short option form (`-p`), you cannot have a space between the option and the password. If you omit the `password` value following the `--password` or `-p` option on the command line, `mysql` prompts for one.

Specifying a password on the command line should be considered insecure. See Section 6.1.2.1, “End-User Guidelines for Password Security”. You can use an option file to avoid giving the password on the command line.
- `--pipe, -W`
  On Windows, connect to the server using a named pipe. This option applies only if the server supports named-pipe connections.

- `--port=port_num, -P port_num`
  The TCP/IP port number to use for the connection.

- `--print-defaults`
  Print the program name and all options that it gets from option files.

- `--prompt=format_str`
  Set the prompt to the specified format. The default is `mysql>`. The special sequences that the prompt can contain are described in Section 4.5.1.2, “mysql Commands”.

- `--protocol={TCP|SOCKET|PIPE|MEMORY}`
  The connection protocol to use for connecting to the server. It is useful when the other connection parameters normally would cause a protocol to be used other than the one you want. For details on the permissible values, see Section 4.2.2, “Connecting to the MySQL Server”.

- `--quick, -q`
  Do not cache each query result, print each row as it is received. This may slow down the server if the output is suspended. With this option, `mysql` does not use the history file.

- `--raw, -r`
  For tabular output, the “boxing” around columns enables one column value to be distinguished from another. For nontabular output (such as is produced in batch mode or when the `--batch` or `--silent` option is given), special characters are escaped in the output so they can be identified easily. Newline, tab, NUL, and backslash are written as `\n`, `\t`, `\0`, and `\`. The `--raw` option disables this character escaping.

  The following example demonstrates tabular versus nontabular output and the use of raw mode to disable escaping:

  ```
  mysql> SELECT CHAR(92);
  +----------+
  | CHAR(92) |
  +----------+
  mysql> SELECT CHAR(92);
  | \        |
  +----------+
  `
  mysql -s
  mysql> SELECT CHAR(92);
  CHAR(92)
  \ \
  mysql -s -r
  mysql> SELECT CHAR(92);
  CHAR(92)
  \\
  ```

- `--reconnect`
  If the connection to the server is lost, automatically try to reconnect. A single reconnect attempt is made each time the connection is lost. To suppress reconnection behavior, use `--skip-reconnect`.

- `--safe-updates, --i-am-a-dummy, -U`
Permit only those `UPDATE` and `DELETE` statements that specify which rows to modify by using key values. If you have set this option in an option file, you can override it by using `--safe-updates` on the command line. See Section 4.5.1.6, “mysql Tips”, for more information about this option.

- `--secure-auth`
  Do not send passwords to the server in old (pre-4.1) format. This prevents connections except for servers that use the newer password format.

- `--shared-memory-base-name=name`
  On Windows, the shared-memory name to use, for connections made using shared memory to a local server. The default value is MySQL. The shared-memory name is case sensitive.
  The server must be started with the `--shared-memory` option to enable shared-memory connections.

- `--show-warnings`
  Cause warnings to be shown after each statement if there are any. This option applies to interactive and batch mode.

- `--sigint-ignore`
  Ignore SIGINT signals (typically the result of typing Control+C).

- `--silent, -s`
  Silent mode. Produce less output. This option can be given multiple times to produce less and less output.
  This option results in nontabular output format and escaping of special characters. Escaping may be disabled by using raw mode; see the description for the `--raw` option.

- `--skip-column-names, -N`
  Do not write column names in results.

- `--skip-line-numbers, -L`
  Do not write line numbers for errors. Useful when you want to compare result files that include error messages.

- `--socket=path, -S path`
  For connections to localhost, the Unix socket file to use, or, on Windows, the name of the named pipe to use.

- `--ssl*`
  Options that begin with `--ssl` specify whether to connect to the server using SSL and indicate where to find SSL keys and certificates. See Section 6.4.5, “Command Options for Secure Connections”.

- `--table, -t`
  Display output in table format. This is the default for interactive use, but can be used to produce table output in batch mode.

- `--tee=file_name`
  Append a copy of output to the given file. This option works only in interactive mode. Section 4.5.1.2, “mysql Commands”, discusses tee files further.
--unbuffered, -n
Flush the buffer after each query.

--user=user_name, -u user_name
The MySQL user name to use when connecting to the server.

--verbose, -v
Verbose mode. Produce more output about what the program does. This option can be given multiple times to produce more and more output. (For example, -v -v -v produces table output format even in batch mode.)

--version, -V
Display version information and exit.

--vertical, -E
Print query output rows vertically (one line per column value). Without this option, you can specify vertical output for individual statements by terminating them with \G.

--wait, -w
If the connection cannot be established, wait and retry instead of aborting.

--xml, -X
Produce XML output.

Note:
Prior to MySQL 5.1.12, there was no differentiation in the output when using this option between columns containing the NULL value and columns containing the string literal 'NULL'; both were represented as

```xml
<field name="column_name">NULL</field>
```

Beginning with MySQL 5.1.12, the output when --xml is used with mysql matches that of mysqldump --xml. See Section 4.5.4, "mysqldump — A Database Backup Program" for details.

Beginning with MySQL 5.1.18, the XML output also uses an XML namespace, as shown here:

```xml
shell> mysql --xml -uroot -e "SHOW VARIABLES LIKE 'version%'"
<?xml version="1.0"?>
<resultset statement="SHOW VARIABLES LIKE 'version%'" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <row>
    <field name="Variable_name">version</field>
    <field name="Value">5.0.40-debug</field>
  </row>
  <row>
    <field name="Variable_name">version_comment</field>
    <field name="Value">Source distribution</field>
  </row>
  <row>
    <field name="Variable_name">version_compile_machine</field>
    <field name="Value">i686</field>
  </row>
  <row>
    <field name="Variable_name">version_compile_os</field>
    <field name="Value">Linux</field>
  </row>
</resultset>
```
You can also set the following variables by using `--var_name=value`. The `--set-variable` format is deprecated and is removed in MySQL 5.5.

- **connect_timeout**
  
  The number of seconds before connection timeout. (Default value is 0.)

- **max_allowed_packet**
  
  The maximum size of the buffer for client/server communication. The default is 16MB, the maximum is 1GB.

- **max_join_size**
  
  The automatic limit for rows in a join when using `--safe-updates`. (Default value is 1,000,000.)

- **net_buffer_length**
  
  The buffer size for TCP/IP and socket communication. (Default value is 16KB.)

- **select_limit**
  
  The automatic limit for `SELECT` statements when using `--safe-updates`. (Default value is 1,000.)

### 4.5.1.2 mysql Commands

mysql sends each SQL statement that you issue to the server to be executed. There is also a set of commands that mysql itself interprets. For a list of these commands, type `help` or `\h` at the mysql> prompt:

```
mysql> help

List of all MySQL commands:
Note that all text commands must be first on line and end with ';'
?
  (?)
  Synonym for `help'.
clear
  (c)
  Clear command.
connect
  (r)
  Reconnect to the server. Optional arguments are db and host.
delimiter
  (d)
  Set statement delimiter.
edit
  (e)
  Edit command with $EDITOR.
ego
  (G)
  Send command to mysql server, display result vertically.
extit
  (q)
  Exit mysql. Same as quit.
go
  (g)
  Send command to mysql server.
help
  (h)
  Display this help.
nopager
  (n)
  Disable pager, print to stdout.
notee
  (t)
  Don't write into outfile.
pager
  (P)
  Set PAGER [to_pager]. Print the query results via PAGER.
print
  (p)
  Print current command.
prompt
  (R)
  Change your mysql prompt.
quit
  (q)
  Quit mysql.
rehash
  (#)
  Rebuild completion hash.
source
  (.)
  Execute an SQL script file. Takes a file name as an argument.
status
  (s)
  Get status information from the server.
system
  (!)
  Execute a system shell command.
tee
  (T)
  Set outfile [to_outfile]. Append everything into given outfile.
use
  (u)
  Use another database. Takes database name as argument.
charset
  (O)
  Switch to another charset. Might be needed for processing
binlog with multi-byte charsets.
warnings
  (W)
  Show warnings after every statement.
nowarning
  (w)
  Don't show warnings after every statement.
```

For server side help, type 'help contents'
Each command has both a long and short form. The long form is not case sensitive; the short form is. The long form can be followed by an optional semicolon terminator, but the short form should not.

The use of short-form commands within multiple-line /* ... */ comments is not supported.

- **help [arg], \h [arg], \? [arg], ? [arg]**
  Display a help message listing the available `mysql` commands.

  If you provide an argument to the `help` command, `mysql` uses it as a search string to access server-side help from the contents of the MySQL Reference Manual. For more information, see Section 4.5.1.4, "mysql Server-Side Help".

- **charset charset_name, \C charset_name**
  Change the default character set and issue a `SET NAMES` statement. This enables the character set to remain synchronized on the client and server if `mysql` is run with auto-reconnect enabled (which is not recommended), because the specified character set is used for reconnects. This command was added in MySQL 5.1.7.

- **clear, \c**
  Clear the current input. Use this if you change your mind about executing the statement that you are entering.

- **connect [db_name host_name], \r [db_name host_name]**
  Reconnect to the server. The optional database name and host name arguments may be given to specify the default database or the host where the server is running. If omitted, the current values are used.

- **delimiter str, \d str**
  Change the string that `mysql` interprets as the separator between SQL statements. The default is the semicolon character (";").

  The delimiter string can be specified as an unquoted or quoted argument on the `delimiter` command line. Quoting can be done with either single quote ("'"), double quote (""), or backtick (``) characters. To include a quote within a quoted string, either quote the string with a different quote character or escape the quote with a backslash ("\") character. Backslash should be avoided outside of quoted strings because it is the escape character for MySQL. For an unquoted argument, the delimiter is read up to the first space or end of line. For a quoted argument, the delimiter is read up to the matching quote on the line.

  `mysql` interprets instances of the delimiter string as a statement delimiter anywhere it occurs, except within quoted strings. Be careful about defining a delimiter that might occur within other words. For example, if you define the delimiter as `x`, you will be unable to use the word `INDEX` in statements. `mysql` interprets this as `INDE` followed by the delimiter `x`.

  When the delimiter recognized by `mysql` is set to something other than the default of ";", instances of that character are sent to the server without interpretation. However, the server itself still interprets ";" as a statement delimiter and processes statements accordingly. This behavior on the server side comes into play for multiple-statement execution (see Section 21.8.16, "C API Support for Multiple Statement Execution"), and for parsing the body of stored procedures and functions, triggers, and events (see Section 19.1, "Defining Stored Programs").

- **edit, \e**
  Edit the current input statement. `mysql` checks the values of the `EDITOR` and `VISUAL` environment variables to determine which editor to use. The default editor is `vi` if neither variable is set.

  The `edit` command works only in Unix.
• **ego, \G**
  Send the current statement to the server to be executed and display the result using vertical format.

• **exit, \q**
  Exit *mysql*.

• **go, \g**
  Send the current statement to the server to be executed.

• **nopager, \n**
  Disable output paging. See the description for *pager*.
  The *nopager* command works only in Unix.

• **notee, \t**
  Disable output copying to the tee file. See the description for *tee*.

• **nowarning, \w**
  Disable display of warnings after each statement.

• **pager [command], \P [command]**
  Enable output paging. By using the --pager option when you invoke *mysql*, it is possible to browse or search query results in interactive mode with Unix programs such as *less, more*, or any other similar program. If you specify no value for the option, *mysql* checks the value of the PAGER environment variable and sets the pager to that. Pager functionality works only in interactive mode.

  Output paging can be enabled interactively with the *pager* command and disabled with *nopager*. The command takes an optional argument; if given, the paging program is set to that. With no argument, the pager is set to the pager that was set on the command line, or *stdout* if no pager was specified.

  Output paging works only in Unix because it uses the `popen()` function, which does not exist on Windows. For Windows, the *tee* option can be used instead to save query output, although it is not as convenient as *pager* for browsing output in some situations.

• **print, \p**
  Print the current input statement without executing it.

• **prompt [str], \R [str]**
  Reconfigure the *mysql* prompt to the given string. The special character sequences that can be used in the prompt are described later in this section.

  If you specify the *prompt* command with no argument, *mysql* resets the prompt to the default of *mysql>.*

• **quit, \q**
  Exit *mysql*.

• **rehash, \#**
  Rebuild the completion hash that enables database, table, and column name completion while you are entering statements. (See the description for the --auto-rehash option.)

• **source file_name, \. file_name**
Read the named file and executes the statements contained therein. On Windows, you can specify path name separators as / or \\.

- **status, \s**

  Provide status information about the connection and the server you are using. If you are running in --safe-updates mode, status also prints the values for the mysql variables that affect your queries.

- **system command, \! command**

  Execute the given command using your default command interpreter.

  The system command works only in Unix.

- **tee [file_name], \T [file_name]**

  By using the --tee option when you invoke mysql, you can log statements and their output. All the data displayed on the screen is appended into a given file. This can be very useful for debugging purposes also. mysql flushes results to the file after each statement, just before it prints its next prompt. Tee functionality works only in interactive mode.

  You can enable this feature interactively with the tee command. Without a parameter, the previous file is used. The tee file can be disabled with the notee command. Executing tee again re-enables logging.

- **use db_name, \u db_name**

  Use db_name as the default database.

- **warnings, \W**

  Enable display of warnings after each statement (if there are any).

Here are a few tips about the pager command:

- You can use it to write to a file and the results go only to the file:

  ```
  mysql> pager cat > /tmp/log.txt
  ```

  You can also pass any options for the program that you want to use as your pager:

  ```
  mysql> pager less -n -i -S
  ```

  In the preceding example, note the -S option. You may find it very useful for browsing wide query results. Sometimes a very wide result set is difficult to read on the screen. The -S option to less can make the result set much more readable because you can scroll it horizontally using the left-arrow and right-arrow keys. You can also use -S interactively within less to switch the horizontal-browse mode on and off. For more information, read the less manual page:

  ```
  shell> man less
  ```

- The -F and -X options may be used with less to cause it to exit if output fits on one screen, which is convenient when no scrolling is necessary:

  ```
  mysql> pager less -n -i -S -F -X
  ```

- You can specify very complex pager commands for handling query output:
In this example, the command would send query results to two files in two different directories on two different file systems mounted on /dr1 and /dr2, yet still display the results onscreen using less.

You can also combine the tee and pager functions. Have a tee file enabled and pager set to less, and you are able to browse the results using the less program and still have everything appended into a file the same time. The difference between the Unix tee used with the pager command and the mysql built-in tee command is that the built-in tee works even if you do not have the Unix tee available. The built-in tee also logs everything that is printed on the screen, whereas the Unix tee used with pager does not log quite that much. Additionally, tee file logging can be turned on and off interactively from within mysql. This is useful when you want to log some queries to a file, but not others.

The prompt command reconfigures the default mysql> prompt. The string for defining the prompt can contain the following special sequences.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\c</td>
<td>A counter that increments for each statement you issue</td>
</tr>
<tr>
<td>\D</td>
<td>The full current date</td>
</tr>
<tr>
<td>\d</td>
<td>The default database</td>
</tr>
<tr>
<td>\h</td>
<td>The server host</td>
</tr>
<tr>
<td>\l</td>
<td>The current delimiter (new in 5.1.12)</td>
</tr>
<tr>
<td>\m</td>
<td>Minutes of the current time</td>
</tr>
<tr>
<td>\n</td>
<td>A newline character</td>
</tr>
<tr>
<td>\O</td>
<td>The current month in three-letter format (Jan, Feb, …)</td>
</tr>
<tr>
<td>\o</td>
<td>The current month in numeric format</td>
</tr>
<tr>
<td>\P</td>
<td>am/pm</td>
</tr>
<tr>
<td>\p</td>
<td>The current TCP/IP port or socket file</td>
</tr>
<tr>
<td>\R</td>
<td>The current time, in 24-hour military time (0–23)</td>
</tr>
<tr>
<td>\r</td>
<td>The current time, standard 12-hour time (1–12)</td>
</tr>
<tr>
<td>\S</td>
<td>Semicolon</td>
</tr>
<tr>
<td>\s</td>
<td>Seconds of the current time</td>
</tr>
<tr>
<td>\t</td>
<td>A tab character</td>
</tr>
<tr>
<td>\U</td>
<td>Your full user_name@host_name account name</td>
</tr>
<tr>
<td>\u</td>
<td>Your user name</td>
</tr>
<tr>
<td>\v</td>
<td>The server version</td>
</tr>
<tr>
<td>\w</td>
<td>The current day of the week in three-letter format (Mon, Tue, …)</td>
</tr>
<tr>
<td>\Y</td>
<td>The current year, four digits</td>
</tr>
<tr>
<td>\y</td>
<td>The current year, two digits</td>
</tr>
<tr>
<td>_</td>
<td>A space</td>
</tr>
<tr>
<td>\</td>
<td>A space (a space follows the backslash)</td>
</tr>
<tr>
<td>'</td>
<td>Single quote</td>
</tr>
<tr>
<td>&quot;</td>
<td>Double quote</td>
</tr>
<tr>
<td>\ \</td>
<td>A literal “\” backslash character</td>
</tr>
<tr>
<td>\x</td>
<td>x, for any “x” not listed above</td>
</tr>
</tbody>
</table>

You can set the prompt in several ways:
• **Use an environment variable.** You can set the `MYSQL_PS1` environment variable to a prompt string. For example:

```
shell> export MYSQL_PS1="(\u@\h) [\d]> "
```

• **Use a command-line option.** You can set the `--prompt` option on the command line to `mysql`. For example:

```
shell> mysql --prompt="(\u@\h) [\d]> "
(user@host) [database]>
```

• **Use an option file.** You can set the `prompt` option in the `[mysql]` group of any MySQL option file, such as `/etc/my.cnf` or the `.my.cnf` file in your home directory. For example:

```
[mysql]
prompt=\r:\m:\s>
```

In this example, note that the backslashes are doubled. If you set the prompt using the `prompt` option in an option file, it is advisable to double the backslashes when using the special prompt options. There is some overlap in the set of permissible prompt options and the set of special escape sequences that are recognized in option files. (The rules for escape sequences in option files are listed in Section 4.2.6, “Using Option Files”.) The overlap may cause you problems if you use single backslashes. For example, `\s` is interpreted as a space rather than as the current seconds value. The following example shows how to define a prompt within an option file to include the current time in `HH:MM:SS>` format:

```
[mysql]
prompt="\r:\m:\s>
```

• **Set the prompt interactively.** You can change your prompt interactively by using the `prompt` (or `\R`) command. For example:

```
mysql> prompt (\u@\h) [\d]> _
PROMPT set to ' (\u@\h) [\d]> _'
(user@host) [database]>
(user@host) [database]>
```

### 4.5.1.3 mysql Logging

On Unix, the `mysql` client logs statements executed interactively to a history file. By default, this file is named `~/.mysql_history` in your home directory. To specify a different file, set the value of the `MYSQL_HISTFILE` environment variable.

#### How Logging Occurs

Statement logging occurs as follows:

- Statements are logged only when executed interactively. Statements are noninteractive, for example, when read from a file or a pipe. It is also possible to suppress statement logging by using the `--batch` or `--execute` option.

- `mysql` logs each nonempty statement line individually.

- If a statement spans multiple lines (not including the terminating delimiter), `mysql` concatenates the lines to form the complete statement, maps newlines to spaces, and logs the result, plus a delimiter.

Consequently, an input statement that spans multiple lines can be logged twice. Consider this input:
In this case, *mysql* logs the “SELECT”, “Today is”, “,”, “CURDATE()”, and “;” lines as it reads them. It also logs the complete statement, after mapping `SELECT
'Today is'
,
CURDATE()
;
SELECT 'Today is'
,
CURDATE();` to `SELECT 'Today is'
,
CURDATE();`, plus a delimiter. Thus, these lines appear in logged output:

```sql
SELECT 'Today is'
,
CURDATE();
```

### Controlling the History File

The `.mysql_history` file should be protected with a restrictive access mode because sensitive information might be written to it, such as the text of SQL statements that contain passwords. See Section 6.1.2.1, “End-User Guidelines for Password Security”.

If you do not want to maintain a history file, first remove `.mysql_history` if it exists. Then use either of the following techniques to prevent it from being created again:

- Set the `MYSQL_HISTFILE` environment variable to `/dev/null`. To cause this setting to take effect each time you log in, put it in one of your shell’s startup files.
- Create `.mysql_history` as a symbolic link to `/dev/null`; this need be done only once:

  ```bash
  shell> ln -s /dev/null $HOME/.mysql_history
  ```

### 4.5.1.4 mysql Server-Side Help

If you provide an argument to the `help` command, *mysql* uses it as a search string to access server-side help from the contents of the MySQL Reference Manual. The proper operation of this command requires that the help tables in the *mysql* database be initialized with help topic information (see Section 5.1.9, “Server-Side Help”).

If there is no match for the search string, the search fails:

```sql
mysql> help me
Nothing found
Please try to run 'help contents' for a list of all accessible topics
```

Use `help contents` to see a list of the help categories:

```sql
mysql> help contents
You asked for help about help category: "Contents"
For more information, type 'help <item> ', where <item> is one of the following categories:
  Account Management
  Administration
  Data Definition
  Data Manipulation
  Data Types
  Functions
  Functions and Modifiers for Use with GROUP BY
  Geographic Features
```
If the search string matches multiple items, `mysql` shows a list of matching topics:

```
mysql> help logs
Many help items for your request exist.
To make a more specific request, please type 'help <item>',
where <item> is one of the following topics:
  SHOW
  SHOW BINARY LOGS
  SHOW ENGINE
  SHOW LOGS
```

Use a topic as the search string to see the help entry for that topic:

```
mysql> help show binary logs
Name: 'SHOW BINARY LOGS'
Description:
Syntax:
SHOW BINARY LOGS
SHOW MASTER LOGS
Lists the binary log files on the server. This statement is used as part of the procedure described in [purge-binary-logs], that shows how to determine which logs can be purged.
```

The search string can contain the wildcard characters "%" and "_". These have the same meaning as for pattern-matching operations performed with the `LIKE` operator. For example, `HELP rep%` returns a list of topics that begin with `rep`:

```
mysql> HELP rep%
Many help items for your request exist.
To make a more specific request, please type 'help <item>',
where <item> is one of the following topics:
  REPAIR TABLE
  REPEAT FUNCTION
  REPEAT LOOP
  REPLACE
  REPLACE FUNCTION
```

### 4.5.1.5 Executing SQL Statements from a Text File

The `mysql` client typically is used interactively, like this:

```
shell> mysql db_name
```

However, it is also possible to put your SQL statements in a file and then tell `mysql` to read its input from that file. To do so, create a text file `text_file` that contains the statements you wish to execute. Then invoke `mysql` as shown here:
shell> mysql db_name < text_file

If you place a `USE db_name` statement as the first statement in the file, it is unnecessary to specify the
database name on the command line:

shell> mysql < text_file

If you are already running `mysql`, you can execute an SQL script file using the `source` command or
`. command:

mysql> source file_name
mysql> . file_name

Sometimes you may want your script to display progress information to the user. For this you can insert
statements like this:

`SELECT '<info_to_display>' AS ' ';`

The statement shown outputs `<info_to_display>`.

You can also invoke `mysql` with the `--verbose` option, which causes each statement to be displayed
before the result that it produces.

As of MySQL 5.1.23, `mysql` ignores Unicode byte order mark (BOM) characters at the beginning of
input files. Previously, it read them and sent them to the server, resulting in a syntax error. Presence
of a BOM does not cause `mysql` to change its default character set. To do that, invoke `mysql` with an
option such as `--default-character-set=utf8`.

For more information about batch mode, see Section 3.5, “Using mysql in Batch Mode”.

4.5.1.6 mysql Tips

This section describes some techniques that can help you use `mysql` more effectively.

Input-Line Editing

`mysql` supports input-line editing, which enables you to modify the current input line in place or recall
previous input lines. For example, the `left-arrow` and `right-arrow` keys move horizontally within the
current input line, and the `up-arrow` and `down-arrow` keys move up and down through the set of
previously entered lines. `Backspace` deletes the character before the cursor and typing new characters
ersets them at the cursor position. To enter the line, press `Enter`.

On Windows, the editing key sequences are the same as supported for command editing in console
windows. On Unix, the key sequences depend on the input library used to build `mysql` (for example,
the `libedit` or `readline` library).

Documentation for the `libedit` and `readline` libraries is available online. To change the set of key
sequences permitted by a given input library, define key bindings in the library startup file. This is a file
in your home directory: `.editrc` for `libedit` and `.inputrc` for `readline`.

For example, in `libedit`, `Control+W` deletes everything before the current cursor position and
`Control+U` deletes the entire line. In `readline`, `Control+W` deletes the word before the cursor and
`Control+U` deletes everything before the current cursor position. If `mysql` was built using `libedit`, a
user who prefers the `readline` behavior for these two keys can put the following lines in the `.editrc`
file (creating the file if necessary):

```
binder "W" ed-delete-prev-word
binder "U" vi-kill-line-prev
```

To see the current set of key bindings, temporarily put a line that says only `bind` at the end of
`editrc.mysql` will show the bindings when it starts.
Displaying Query Results Vertically

Some query results are much more readable when displayed vertically, instead of in the usual horizontal table format. Queries can be displayed vertically by terminating the query with \G instead of a semicolon. For example, longer text values that include newlines often are much easier to read with vertical output:

```
mysql> SELECT * FROM mails WHERE LENGTH(txt) < 300 LIMIT 300,1\G
*************************** 1. row ***************************
msg_nro: 3068
date: 2000-03-01 23:29:50
time_zone: +0200
mail_from: Monty
reply: monty@no.spam.com
subj: UTF-8
txt: >>>>> "Thimble Smith" <tim@no.spam.com>
Thimble> Hi.  I think this is a good idea.  Is anyone familiar
Thimble> with UTF-8 or Unicode? Otherwise, I'll put this on my
Thimble> TODO list and see what happens.
Yes, please do that.
Regards,
Monty
    file: inbox-jani-1
    hash: 190402944
1 row in set (0.09 sec)
```

Using the --safe-updates Option

For beginners, a useful startup option is --safe-updates (or --i-am-a-dummy, which has the same effect). It is helpful for cases when you might have issued a DELETE FROM tbl_name statement but forgotten the WHERE clause. Normally, such a statement deletes all rows from the table. With --safe-updates, you can delete rows only by specifying the key values that identify them. This helps prevent accidents.

When you use the --safe-updates option, mysql issues the following statement when it connects to the MySQL server:

```
SET sql_safe_updates=1, sql_select_limit=1000, sql_max_join_size=1000000;
```

See Section 5.1.4, “Server System Variables”.

The SET statement has the following effects:

- You are not permitted to execute an UPDATE or DELETE statement unless you specify a key constraint in the WHERE clause or provide a LIMIT clause (or both). For example:

  ```
  UPDATE tbl_name SET not_key_column=val WHERE key_column=val;
  UPDATE tbl_name SET not_key_column=val LIMIT 1;
  ```

- The server limits all large SELECT results to 1,000 rows unless the statement includes a LIMIT clause.

- The server aborts multiple-table SELECT statements that probably need to examine more than 1,000,000 row combinations.

To specify limits different from 1,000 and 1,000,000, you can override the defaults by using the --select_limit and --max_join_size options:
Disabling mysql Auto-Reconnect

If the mysql client loses its connection to the server while sending a statement, it immediately and automatically tries to reconnect once to the server and send the statement again. However, even if mysql succeeds in reconnecting, your first connection has ended and all your previous session objects and settings are lost: temporary tables, the autocommit mode, and user-defined and session variables. Also, any current transaction rolls back. This behavior may be dangerous for you, as in the following example where the server was shut down and restarted between the first and second statements without you knowing it:

```sql
mysql> SET @a=1;
Query OK, 0 rows affected (0.05 sec)

mysql> INSERT INTO t VALUES(@a);
ERROR 2006: MySQL server has gone away
No connection. Trying to reconnect...
Connection id: 1
Current database: test
Query OK, 1 row affected (1.30 sec)

mysql> SELECT * FROM t;
+------+
| a    |
| NULL |
+------+
1 row in set (0.05 sec)
```

The @a user variable has been lost with the connection, and after the reconnection it is undefined. If it is important to have mysql terminate with an error if the connection has been lost, you can start the mysql client with the `--skip-reconnect` option.

For more information about auto-reconnect and its effect on state information when a reconnection occurs, see Section 21.8.15, “Controlling Automatic Reconnection Behavior”.

4.5.2 mysqladmin — Client for Administering a MySQL Server

mysqladmin is a client for performing administrative operations. You can use it to check the server's configuration and current status, to create and drop databases, and more.

Invoke mysqladmin like this:

```
shell> mysqladmin [options] command [command-arg] [command [command-arg]] ...
```

mysqladmin supports the following commands. Some of the commands take an argument following the command name.

- **create db_name**
  Create a new database named `db_name`.

- **debug**
  Tell the server to write debug information to the error log. Format and content of this information is subject to change.

  Beginning with MySQL 5.1.12, this includes information about the Event Scheduler. See Section 19.4.5, “Event Scheduler Status”.

- **drop db_name**
Delete the database named `db_name` and all its tables.

- **extended-status**
  Display the server status variables and their values.

- **flush-hosts**
  Flush all information in the host cache.

- **flush-logs**
  Flush all logs.

- **flush-privileges**
  Reload the grant tables (same as `reload`).

- **flush-status**
  Clear status variables.

- **flush-tables**
  Flush all tables.

- **flush-threads**
  Flush the thread cache.

- **kill id,id,...**
  Kill server threads. If multiple thread ID values are given, there must be no spaces in the list.

- **old-password new_password**
  This is like the `password` command but stores the password using the old (pre-4.1) password-hashing format. (See Section 6.1.2.4, “Password Hashing in MySQL”.

- **password new_password**
  Set a new password. This changes the password to `new_password` for the account that you use with `mysqladmin` for connecting to the server. Thus, the next time you invoke `mysqladmin` (or any other client program) using the same account, you will need to specify the new password.

  If the `new_password` value contains spaces or other characters that are special to your command interpreter, you need to enclose it within quotation marks. On Windows, be sure to use double quotation marks rather than single quotation marks; single quotation marks are not stripped from the password, but rather are interpreted as part of the password. For example:

  ```shell>
  mysqladmin password "my new password"
  ```

**Caution**

Do not use this command used if the server was started with the `--skip-grant-tables` option. No password change will be applied. This is true even if you precede the `password` command with `flush-privileges` on the same command line to re-enable the grant tables because the flush operation occurs after you connect. However, you can use `mysqladmin flush-privileges` to re-enable the grant table and then use a separate `mysqladmin password` command to change the password.
• ping
Check whether the server is available. The return status from mysqladmin is 0 if the server is running, 1 if it is not. This is 0 even in case of an error such as Access denied, because this means that the server is running but refused the connection, which is different from the server not running.

• processlist
Show a list of active server threads. This is like the output of the SHOW PROCESSLIST statement. If the --verbose option is given, the output is like that of SHOW FULL PROCESSLIST. (See Section 13.7.5.31, “SHOW PROCESSLIST Syntax”.)

• reload
Reload the grant tables.

• refresh
Flush all tables and close and open log files.

• shutdown
Stop the server.

• start-slave
Start replication on a slave server.

• status
Display a short server status message.

• stop-slave
Stop replication on a slave server.

• variables
Display the server system variables and their values.

• version
Display version information from the server.

All commands can be shortened to any unique prefix. For example:

```
shell> mysqladmin proc stat
+----+-------+-----------+----+---------+------+-------+------------------+
| Id | User  | Host      | db | Command | Time | State | Info             |
+----+-------+-----------+----+---------+------+-------+------------------+
| 51 | monty | localhost |    | Query   | 0    |       | show processlist |
+----+-------+-----------+----+---------+------+-------+------------------+
Uptime: 1473624  Threads: 1  Questions: 39487
Slow queries: 0  Opens: 541  Flush tables: 1
Open tables: 19  Queries per second avg: 0.0268
```

The mysqladmin status command result displays the following values:

• Uptime
  The number of seconds the MySQL server has been running.

• Threads
The number of active threads (clients).

- **Questions**
  
The number of questions (queries) from clients since the server was started.

- **Slow queries**
  
The number of queries that have taken more than *long_query_time* seconds. See Section 5.4.5, “The Slow Query Log”.

- **Opens**
  
The number of tables the server has opened.

- **Flush tables**
  
The number of `flush-*`, `refresh`, and `reload` commands the server has executed.

- **Open tables**
  
The number of tables that currently are open.

- **Memory in use**
  
The amount of memory allocated directly by `mysqld`. This value is displayed only when MySQL has been compiled with `--with-debug=full`.

- **Maximum memory used**
  
The maximum amount of memory allocated directly by `mysqld`. This value is displayed only when MySQL has been compiled with `--with-debug=full`.

If you execute `mysqladmin shutdown` when connecting to a local server using a Unix socket file, `mysqladmin` waits until the server's process ID file has been removed, to ensure that the server has stopped properly.

`mysqladmin` supports the following options, which can be specified on the command line or in the `[mysqladmin]` and `[client]` groups of an option file. For information about option files used by MySQL programs, see Section 4.2.6, “Using Option Files”.

**Table 4.6 mysqladmin Options**

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
<th>Introduced</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--bind-address</code></td>
<td>Use specified network interface to connect to MySQL Server</td>
<td>5.1.22-ndb-6.3.4</td>
</tr>
<tr>
<td><code>--compress</code></td>
<td>Compress all information sent between client and server</td>
<td></td>
</tr>
<tr>
<td><code>--connect_timeout</code></td>
<td>Number of seconds before connection timeout</td>
<td></td>
</tr>
<tr>
<td><code>--count</code></td>
<td>Number of iterations to make for repeated command execution</td>
<td></td>
</tr>
<tr>
<td><code>--debug</code></td>
<td>Write debugging log</td>
<td></td>
</tr>
<tr>
<td><code>--debug-check</code></td>
<td>Print debugging information when program exits</td>
<td>5.1.21</td>
</tr>
<tr>
<td><code>--debug-info</code></td>
<td>Print debugging information, memory, and CPU statistics when program exits</td>
<td>5.1.14</td>
</tr>

<tr>
<td>--vertical</td>
<td>Print query output rows vertically (one line per column value)</td>
<td></td>
</tr>
<tr>
<td>--wait</td>
<td>If the connection cannot be established, wait and retry instead of aborting</td>
<td></td>
</tr>
</tbody>
</table>

- **--help, --?**

Display a help message and exit.

- **--bind-address=ip_address**

On a computer having multiple network interfaces, use this option to select which interface to use for connecting to the MySQL server.
This option is supported only in the version of `mysqladmin` that is supplied with MySQL Cluster, beginning with MySQL Cluster NDB 6.3.4. It is not available in standard MySQL 5.1 releases.

- `--character-sets-dir=dir_name`
  The directory where character sets are installed. See Section 10.5, “Character Set Configuration”.

- `--compress`, `-C`
  Compress all information sent between the client and the server if both support compression.

- `--count=N`, `-c N`
  The number of iterations to make for repeated command execution if the `--sleep` option is given.

- `--debug[=debug_options],-# [debug_options]`
  Write a debugging log. A typical `debug_options` string is `d:t:o, file_name`. The default is `d:t:o,/tmp/mysqladmin.trace`.

- `--debug-check`
  Print some debugging information when the program exits. This option was added in MySQL 5.1.21.

- `--debug-info`
  Print debugging information and memory and CPU usage statistics when the program exits. This option was added in MySQL 5.1.14.

- `--default-character-set=charset_name`
  Use `charset_name` as the default character set. See Section 10.5, “Character Set Configuration”.

- `--defaults-extra-file=file_name`
  Read this option file after the global option file but (on Unix) before the user option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is the full path name to the file.

- `--defaults-file=file_name`
  Use only the given option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is the full path name to the file.

- `--defaults-group-suffix=str`
  Read not only the usual option groups, but also groups with the usual names and a suffix of `str`. For example, `mysqladmin` normally reads the `[client]` and `[mysqladmin]` groups. If the `--defaults-group-suffix=_other` option is given, `mysqladmin` also reads the `[client_other]` and `[mysqladmin_other]` groups.

- `--force`, `-f`
  Do not ask for confirmation for the `drop db_name` command. With multiple commands, continue even if an error occurs.

- `--host=host_name`, `-h host_name`
  Connect to the MySQL server on the given host.

- `--no-beep`, `-b`
  Suppress the warning beep that is emitted by default for errors such as a failure to connect to the server. This option was added in MySQL 5.1.17.
• **--no-defaults**

Do not read any option files. If program startup fails due to reading unknown options from an option file, **--no-defaults** can be used to prevent them from being read.

• **--password[=password], -p[password]**

The password to use when connecting to the server. If you use the short option form (\(-p\)), you *cannot* have a space between the option and the password. If you omit the *password* value following the **--password** or -p option on the command line, *mysqladmin* prompts for one.

Specifying a password on the command line should be considered insecure. See Section 6.1.2.1, “End-User Guidelines for Password Security”. You can use an option file to avoid giving the password on the command line.

• **--pipe, -W**

On Windows, connect to the server using a named pipe. This option applies only if the server supports named-pipe connections.

• **--port=port_num, -P port_num**

The TCP/IP port number to use for the connection.

• **--print-defaults**

Print the program name and all options that it gets from option files.

• **--protocol={TCP|SOCKET|PIPE|MEMORY}**

The connection protocol to use for connecting to the server. It is useful when the other connection parameters normally would cause a protocol to be used other than the one you want. For details on the permissible values, see Section 4.2.2, “Connecting to the MySQL Server”.

• **--relative, -r**

Show the difference between the current and previous values when used with the **--sleep** option. This option works only with the **extended-status** command.

• **--shared-memory-base-name=name**

On Windows, the shared-memory name to use, for connections made using shared memory to a local server. The default value is **MYSQL**. The shared-memory name is case sensitive.

The server must be started with the **--shared-memory** option to enable shared-memory connections.

• **--silent, -s**

Exit silently if a connection to the server cannot be established.

• **--sleep=delay, -i delay**

Execute commands repeatedly, sleeping for *delay* seconds in between. The **--count** option determines the number of iterations. If **--count** is not given, *mysqladmin* executes commands indefinitely until interrupted.

• **--socket=path, -S path**

For connections to **localhost**, the Unix socket file to use, or, on Windows, the name of the named pipe to use.

• **--ssl***
Options that begin with `--ssl` specify whether to connect to the server using SSL and indicate where to find SSL keys and certificates. See Section 6.4.5, “Command Options for Secure Connections”.

- `--user=user_name, -u user_name`
  The MySQL user name to use when connecting to the server.

- `--verbose, -v`
  Verbose mode. Print more information about what the program does.

- `--version, -V`
  Display version information and exit.

- `--vertical, -E`
  Print output vertically. This is similar to `--relative`, but prints output vertically.

- `--wait[=count], -w[count]`
  If the connection cannot be established, wait and retry instead of aborting. If a `count` value is given, it indicates the number of times to retry. The default is one time.

You can also set the following variables by using `--var_name=value` The `--set-variable` format is deprecated and is removed in MySQL 5.5.

- `connect_timeout`
  The maximum number of seconds before connection timeout. The default value is 43200 (12 hours).

- `shutdown_timeout`
  The maximum number of seconds to wait for server shutdown. The default value is 3600 (1 hour).

### 4.5.3 `mysqlcheck` — A Table Maintenance Program

The `mysqlcheck` client performs table maintenance: It checks, repairs, optimizes, or analyzes tables.

Each table is locked and therefore unavailable to other sessions while it is being processed, although for check operations, the table is locked with a `READ` lock only (see Section 13.3.5, “LOCK TABLES and UNLOCK TABLES Syntax”, for more information about `READ` and `WRITE` locks). Table maintenance operations can be time-consuming, particularly for large tables. If you use the `--databases` or `--all-databases` option to process all tables in one or more databases, an invocation of `mysqlcheck` might take a long time. (This is also true for `mysql_upgrade` because that program invokes `mysqlcheck` to check all tables and repair them if necessary.)

`mysqlcheck` is similar in function to `myisamchk`, but works differently. The main operational difference is that `mysqlcheck` must be used when the `mysqld` server is running, whereas `myisamchk` should be used when it is not. The benefit of using `mysqlcheck` is that you do not have to stop the server to perform table maintenance.

`mysqlcheck` uses the SQL statements `CHECK TABLE, REPAIR TABLE, ANALYZE TABLE, and OPTIMIZE TABLE` in a convenient way for the user. It determines which statements to use for the operation you want to perform, and then sends the statements to the server to be executed. For details about which storage engines each statement works with, see the descriptions for those statements in Section 13.7.2, “Table Maintenance Statements”.

The MyISAM storage engine supports all four maintenance operations, so `mysqlcheck` can be used to perform any of them on MyISAM tables. Other storage engines do not necessarily support all
operations. In such cases, an error message is displayed. For example, if test.t is a MEMORY table, an attempt to check it produces this result:

```plaintext
shell> mysqlcheck test t
failed: The storage engine for the table doesn't support check
```

If `mysqlcheck` is unable to repair a table, see Section 2.13.4, “Rebuilding or Repairing Tables or Indexes” for manual table repair strategies. This will be the case, for example, for InnoDB tables, which can be checked with `CHECK TABLE`, but not repaired with `REPAIR TABLE`.

The use of `mysqlcheck` with partitioned tables is not supported before MySQL 5.1.27.

Caution

It is best to make a backup of a table before performing a table repair operation; under some circumstances the operation might cause data loss. Possible causes include but are not limited to file system errors.

There are three general ways to invoke `mysqlcheck`:

```plaintext
shell> mysqlcheck [options] db_name [tbl_name ...]
shell> mysqlcheck [options] --databases db_name ...
shell> mysqlcheck [options] --all-databases
```

If you do not name any tables following `db_name` or if you use the `--databases` or `--all-databases` option, entire databases are checked.

`mysqlcheck` has a special feature compared to other client programs. The default behavior of checking tables (`--check`) can be changed by renaming the binary. If you want to have a tool that repairs tables by default, you should just make a copy of `mysqlcheck` named `mysqlrepair`, or make a symbolic link to `mysqlcheck` named `mysqlrepair`. If you invoke `mysqlrepair`, it repairs tables.

The names shown in the following table can be used to change `mysqlcheck` default behavior.

<table>
<thead>
<tr>
<th>Command</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>mysqlrepair</code></td>
<td>The default option is <code>--repair</code></td>
</tr>
<tr>
<td><code>mysqlanalyze</code></td>
<td>The default option is <code>--analyze</code></td>
</tr>
<tr>
<td><code>mysqloptimize</code></td>
<td>The default option is <code>--optimize</code></td>
</tr>
</tbody>
</table>

`mysqlcheck` supports the following options, which can be specified on the command line or in the `[mysqlcheck]` and `[client]` groups of an option file. For information about option files used by MySQL programs, see Section 4.2.6, “Using Option Files”.

### Table 4.7 `mysqlcheck` Options

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
<th>Introduced</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--all-databases</code></td>
<td>Check all tables in all databases</td>
<td></td>
</tr>
<tr>
<td><code>--all-in-1</code></td>
<td>Execute a single statement for each database that names all the tables from that database</td>
<td></td>
</tr>
<tr>
<td><code>--analyze</code></td>
<td>Analyze the tables</td>
<td></td>
</tr>
<tr>
<td><code>--auto-repair</code></td>
<td>If a checked table is corrupted, automatically fix it</td>
<td></td>
</tr>
<tr>
<td><code>--bind-address</code></td>
<td>Use specified network interface to connect to MySQL Server</td>
<td>5.1.22-ndb-6.3.4</td>
</tr>
<tr>
<td><code>--character-sets-dir</code></td>
<td>Directory where character sets are installed</td>
<td></td>
</tr>
<tr>
<td><code>--check</code></td>
<td>Check the tables for errors</td>
<td></td>
</tr>
<tr>
<td><code>--check-only-changed</code></td>
<td>Check only tables that have changed since the last check</td>
<td></td>
</tr>
<tr>
<td>Format</td>
<td>Description</td>
<td>Introduced</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>--check-upgrade</td>
<td>Invoke CHECK TABLE with the FOR UPGRADE option</td>
<td>5.1.7</td>
</tr>
<tr>
<td>--compress</td>
<td>Compress all information sent between client and server</td>
<td></td>
</tr>
<tr>
<td>--databases</td>
<td>Interpret all arguments as database names</td>
<td></td>
</tr>
<tr>
<td>--debug</td>
<td>Write debugging log</td>
<td></td>
</tr>
<tr>
<td>--debug-check</td>
<td>Print debugging information when program exits</td>
<td>5.1.21</td>
</tr>
<tr>
<td>--debug-info</td>
<td>Print debugging information, memory, and CPU statistics when program exits</td>
<td>5.1.14</td>
</tr>
<tr>
<td>--default-character-set</td>
<td>Specify default character set</td>
<td></td>
</tr>
<tr>
<td>--defaults-extra-file</td>
<td>Read named option file in addition to usual option files</td>
<td></td>
</tr>
<tr>
<td>--defaults-file</td>
<td>Read only named option file</td>
<td></td>
</tr>
<tr>
<td>--defaults-group-suffix</td>
<td>Option group suffix value</td>
<td></td>
</tr>
<tr>
<td>--extended</td>
<td>Check and repair tables</td>
<td></td>
</tr>
<tr>
<td>--fast</td>
<td>Check only tables that have not been closed properly</td>
<td></td>
</tr>
<tr>
<td>--fix-db-names</td>
<td>Convert database names to 5.1 format</td>
<td>5.1.7</td>
</tr>
<tr>
<td>--fix-table-names</td>
<td>Convert table names to 5.1 format</td>
<td>5.1.7</td>
</tr>
<tr>
<td>--force</td>
<td>Continue even if an SQL error occurs</td>
<td></td>
</tr>
<tr>
<td>--help</td>
<td>Display help message and exit</td>
<td></td>
</tr>
<tr>
<td>--host</td>
<td>Connect to MySQL server on given host</td>
<td></td>
</tr>
<tr>
<td>--medium-check</td>
<td>Do a check that is faster than an --extended operation</td>
<td></td>
</tr>
<tr>
<td>--no-defaults</td>
<td>Read no option files</td>
<td></td>
</tr>
<tr>
<td>--optimize</td>
<td>Optimize the tables</td>
<td></td>
</tr>
<tr>
<td>--password</td>
<td>Password to use when connecting to server</td>
<td></td>
</tr>
<tr>
<td>--pipe</td>
<td>On Windows, connect to server using named pipe</td>
<td></td>
</tr>
<tr>
<td>--port</td>
<td>TCP/IP port number to use for connection</td>
<td></td>
</tr>
<tr>
<td>--print-defaults</td>
<td>Print default options</td>
<td></td>
</tr>
<tr>
<td>--protocol</td>
<td>Connection protocol to use</td>
<td></td>
</tr>
<tr>
<td>--quick</td>
<td>The fastest method of checking</td>
<td></td>
</tr>
<tr>
<td>--repair</td>
<td>Perform a repair that can fix almost anything except unique keys that are not unique</td>
<td></td>
</tr>
<tr>
<td>--shared-memory-base-name</td>
<td>The name of shared memory to use for shared-memory connections</td>
<td></td>
</tr>
<tr>
<td>--silent</td>
<td>Silent mode</td>
<td></td>
</tr>
<tr>
<td>--socket</td>
<td>For connections to localhost, the Unix socket file to use</td>
<td></td>
</tr>
<tr>
<td>--ssl</td>
<td>Enable secure connection</td>
<td></td>
</tr>
<tr>
<td>--ssl-ca</td>
<td>Path of file that contains list of trusted SSL CAs</td>
<td></td>
</tr>
<tr>
<td>--ssl-capath</td>
<td>Path of directory that contains trusted SSL CA certificates in PEM format</td>
<td></td>
</tr>
<tr>
<td>--ssl-cert</td>
<td>Path of file that contains X509 certificate in PEM format</td>
<td></td>
</tr>
<tr>
<td>--ssl-cipher</td>
<td>List of permitted ciphers to use for connection encryption</td>
<td></td>
</tr>
<tr>
<td>--ssl-key</td>
<td>Path of file that contains X509 key in PEM format</td>
<td></td>
</tr>
<tr>
<td>--ssl-verify-server-cert</td>
<td>Verify server certificate Common Name value against host name used when connecting to server</td>
<td>5.1.11</td>
</tr>
<tr>
<td>Format</td>
<td>Description</td>
<td>Introduced</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------</td>
</tr>
<tr>
<td>--tables</td>
<td>Overrides the --databases or -B option</td>
<td></td>
</tr>
<tr>
<td>--use-frm</td>
<td>For repair operations on MyISAM tables</td>
<td></td>
</tr>
<tr>
<td>--user</td>
<td>MySQL user name to use when connecting to server</td>
<td></td>
</tr>
<tr>
<td>--verbose</td>
<td>Verbose mode</td>
<td></td>
</tr>
<tr>
<td>--version</td>
<td>Display version information and exit</td>
<td></td>
</tr>
<tr>
<td>--write-binlog</td>
<td>Log ANALYZE, OPTIMIZE, REPAIR statements to binary log. --skip-write-binlog adds NO_WRITE_TO_BINLOG to these statements.</td>
<td>5.1.18</td>
</tr>
</tbody>
</table>

- **--help, -?**
  Display a help message and exit.

- **--all-databases, -A**
  Check all tables in all databases. This is the same as using the --databases option and naming all the databases on the command line.

- **--all-in-1, -l**
  Instead of issuing a statement for each table, execute a single statement for each database that names all the tables from that database to be processed.

- **--analyze, -a**
  Analyze the tables.

- **--auto-repair**
  If a checked table is corrupted, automatically fix it. Any necessary repairs are done after all tables have been checked.

- **--bind-address=ip_address**
  On a computer having multiple network interfaces, use this option to select which interface to use for connecting to the MySQL server.

  This option is supported only in the version of mysqlcheck that is supplied with MySQL Cluster, beginning with MySQL Cluster NDB 6.3.4. It is not available in standard MySQL 5.1 releases.

- **--character-sets-dir=dir_name**
  The directory where character sets are installed. See Section 10.5, “Character Set Configuration”.

- **--check, -c**
  Check the tables for errors. This is the default operation.

- **--check-only-changed, -C**
  Check only tables that have changed since the last check or that have not been closed properly.

- **--check-upgrade, -g**
  Invoke CHECK TABLE with the FOR UPGRADE option to check tables for incompatibilities with the current version of the server. This option automatically enables the --fix-db-names and --fix-table-names options. --check-upgrade was added in MySQL 5.1.7.

- **--compress**
Compress all information sent between the client and the server if both support compression.

- **--databases,** `-B`

Process all tables in the named databases. Normally, mysqlcheck treats the first name argument on the command line as a database name and any following names as table names. With this option, it treats all name arguments as database names.

- **--debug[=debug_options],`-# [debug_options]`**

Write a debugging log. A typical `debug_options` string is `d:t:o, file_name`. The default is `d:t:o`.

- **--debug-check**

Print some debugging information when the program exits. This option was added in MySQL 5.1.21.

- **--debug-info**

Print debugging information and memory and CPU usage statistics when the program exits. This option was added in MySQL 5.1.14.

- **--default-character-set=charset_name**

Use `charset_name` as the default character set. See Section 10.5, “Character Set Configuration”.

- **--defaults-extra-file=file_name**

Read this option file after the global option file but (on Unix) before the user option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is the full path name to the file.

- **--defaults-file=file_name**

Use only the given option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is the full path name to the file.

- **--defaults-group-suffix=str**

Read not only the usual option groups, but also groups with the usual names and a suffix of `str`. For example, mysqlcheck normally reads the `[client]` and `[mysqlcheck]` groups. If the `--defaults-group-suffix=_other` option is given, mysqlcheck also reads the `[client_other]` and `[mysqlcheck_other]` groups.

- **--extended,** `-e`

If you are using this option to check tables, it ensures that they are 100% consistent but takes a long time.

If you are using this option to repair tables, it runs an extended repair that may not only take a long time to execute, but may produce a lot of garbage rows also!

- **--fast,** `-F`

Check only tables that have not been closed properly.

- **--fix-db-names**

Convert database names to 5.1 format. Only database names that contain special characters are affected. This option was added in MySQL 5.1.7.

- **--fix-table-names**
Convert table names to 5.1 format. Only table names that contain special characters are affected. This option was added in MySQL 5.1.7. As of MySQL 5.1.23, this option also applies to views.

- **--force, -f**
  Continue even if an SQL error occurs.

- **--host=host_name, -h host_name**
  Connect to the MySQL server on the given host.

- **--medium-check, -m**
  Do a check that is faster than an **--extended** operation. This finds only 99.99% of all errors, which should be good enough in most cases.

- **--no-defaults**
  Do not read any option files. If program startup fails due to reading unknown options from an option file, **--no-defaults** can be used to prevent them from being read.

- **--optimize, -o**
  Optimize the tables.

- **--password[=password], -p[password]**
  The password to use when connecting to the server. If you use the short option form (-p), you cannot have a space between the option and the password. If you omit the password value following the **--password** or -p option on the command line, mysqlcheck prompts for one.

  Specifying a password on the command line should be considered insecure. See Section 6.1.2.1, “End-User Guidelines for Password Security”. You can use an option file to avoid giving the password on the command line.

- **--pipe, -W**
  On Windows, connect to the server using a named pipe. This option applies only if the server supports named-pipe connections.

- **--port=port_num, -P port_num**
  The TCP/IP port number to use for the connection.

- **--print-defaults**
  Print the program name and all options that it gets from option files.

- **--protocol={TCP|SOCKET|PIPE|MEMORY}**
  The connection protocol to use for connecting to the server. It is useful when the other connection parameters normally would cause a protocol to be used other than the one you want. For details on the permissible values, see Section 4.2.2, “Connecting to the MySQL Server”.

- **--quick, -q**
  If you are using this option to check tables, it prevents the check from scanning the rows to check for incorrect links. This is the fastest check method.

  If you are using this option to repair tables, it tries to repair only the index tree. This is the fastest repair method.

- **--repair, -r**
Perform a repair that can fix almost anything except unique keys that are not unique.

- `--shared-memory-base-name=name`

On Windows, the shared-memory name to use, for connections made using shared memory to a local server. The default value is `MYSQL`. The shared-memory name is case sensitive.

The server must be started with the `--shared-memory` option to enable shared-memory connections.

- `--silent, -s`

Silent mode. Print only error messages.

- `--socket=path, -S path`

For connections to `localhost`, the Unix socket file to use, or, on Windows, the name of the named pipe to use.

- `--ssl*`

Options that begin with `--ssl` specify whether to connect to the server using SSL and indicate where to find SSL keys and certificates. See Section 6.4.5, “Command Options for Secure Connections”.

- `--tables`

Override the `--databases` or `-B` option. All name arguments following the option are regarded as table names.

- `--use frm`

For repair operations on `MyISAM` tables, get the table structure from the `.frm` file so that the table can be repaired even if the `.MYI` header is corrupted.

- `--user=user_name, -u user_name`

The MySQL user name to use when connecting to the server.

- `--verbose, -v`

Verbose mode. Print information about the various stages of program operation.

- `--version, -V`

Display version information and exit.

- `--write-binlog`

This option is enabled by default, so that `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE` statements generated by `mysqlcheck` are written to the binary log. Use `--skip-write-binlog` to cause `NO_WRITE_TO_BINLOG` to be added to the statements so that they are not logged. Use the `--skip-write-binlog` when these statements should not be sent to replication slaves or run when using the binary logs for recovery from backup. This option was added in MySQL 5.1.18.

4.5.4 `mysqldump — A Database Backup Program`

- Invocation Syntax
- Option Syntax - Alphabetical Summary

The `mysqldump` client is a backup program originally written by Igor Romanenko. It can be used to dump a database or a collection of databases for backup or transfer to another SQL server (not
necessarily a MySQL server). The dump typically contains SQL statements to create the table, populate it, or both. However, mysqldump can also be used to generate files in CSV, other delimited text, or XML format.

mysqldump requires at least the SELECT privilege for dumped tables, SHOW VIEW for dumped views, TRIGGER for dumped triggers, and LOCK TABLES if the --single-transaction option is not used. Certain options might require other privileges as noted in the option descriptions.

To reload a dump file, you must have the privileges required to execute the statements that it contains, such as the appropriate CREATE privileges for objects created by those statements.

mysqldump output can include ALTER DATABASE statements that change the database collation. These may be used when dumping stored programs to preserve their character encodings. To reload a dump file containing such statements, the ALTER privilege for the affected database is required.

If you are performing a backup on the server and your tables all are MyISAM tables, you can also use mysqlhotcopy for this purpose.

Invocation Syntax

There are in general three ways to use mysqldump—in order to dump a set of one or more tables, a set of one or more complete databases, or an entire MySQL server—as shown here:

shell> mysqldump [options] db_name [tbl_name ...]
shell> mysqldump [options] --databases db_name ...
shell> mysqldump [options] --all-databases

To dump entire databases, do not name any tables following db_name, or use the --databases or --all-databases option.

mysqldump does not dump the INFORMATION_SCHEMA database by default. As of MySQL 5.1.38, mysqldump dumps INFORMATION_SCHEMA if you name it explicitly on the command line, although you must also use the --skip-lock-tables option. Before 5.1.38, mysqldump silently ignores INFORMATION_SCHEMA even if you name it explicitly on the command line.

Before MySQL 5.1.64, mysqldump does not dump the general_log or slow_query_log tables for dumps of the mysql database. As of 5.1.64, the dump includes statements to recreate those tables so that they are not missing after reloading the dump file. Log table contents are not dumped.

In MySQL Cluster NDB 7.1.7 and later, the ndbinfo information database is ignored and not dumped by mysqldump.

To see a list of the options your version of mysqldump supports, execute mysqldump --help.

Some mysqldump options are shorthand for groups of other options:

• Use of --opt is the same as specifying --add-drop-table, --add-locks, --create-options, --disable-keys, --extended-insert, --lock-tables, --quick, and --set-charset. All of the options that --opt stands for also are on by default because --opt is on by default.

• Use of --compact is the same as specifying --skip-add-drop-table, --skip-add-locks, --skip-comments, --skip-disable-keys, and --skip-set-charset options.

To reverse the effect of a group option, uses its --skip-xxx form ( --skip-opt or --skip-compact). It is also possible to select only part of the effect of a group option by following it with options that enable or disable specific features. Here are some examples:

• To select the effect of --opt except for some features, use the --skip option for each feature. To disable extended inserts and memory buffering, use --opt --skip-extended-insert --skip-quick. (Actually, --skip-extended-insert --skip-quick is sufficient because --opt is on by default.)
To reverse `--opt` for all features except index disabling and table locking, use `--skip-opt --disable-keys --lock-tables`.

When you selectively enable or disable the effect of a group option, order is important because options are processed first to last. For example, `--disable-keys --lock-tables --skip-opt` would not have the intended effect; it is the same as `--skip-opt` by itself.

`mysqldump` can retrieve and dump table contents row by row, or it can retrieve the entire content from a table and buffer it in memory before dumping it. Buffering in memory can be a problem if you are dumping large tables. To dump tables row by row, use the `--quick` option (or `--opt`, which enables `--quick`). The `--opt` option (and hence `--quick`) is enabled by default, so to enable memory buffering, use `--skip-quick`.

If you are using a recent version of `mysqldump` to generate a dump to be reloaded into a very old MySQL server, you should not use the `--opt` or `--extended-insert` option. Use `--skip-opt` instead.

**Note**

`mysqldump` from MySQL 5.1.21 cannot be used to create dumps from MySQL server 5.1.20 and older. This issue is fixed in MySQL 5.1.22. (Bug #30123)

### Option Syntax - Alphabetical Summary

`mysqldump` supports the following options, which can be specified on the command line or in the `[mysqldump]` and `[client]` groups of an option file. For information about option files used by MySQL programs, see Section 4.2.6, “Using Option Files”.

#### Table 4.8 mysqldump Options

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
<th>Introduced</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--add-drop-database</code></td>
<td>Add DROP DATABASE statement before each CREATE DATABASE statement</td>
<td></td>
</tr>
<tr>
<td><code>--add-drop-table</code></td>
<td>Add DROP TABLE statement before each CREATE TABLE statement</td>
<td></td>
</tr>
<tr>
<td><code>--add-drop-trigger</code></td>
<td>Add DROP TRIGGER statement before each CREATE TRIGGER statement</td>
<td>5.1.47-ndb-7.1.8</td>
</tr>
<tr>
<td><code>--add-locks</code></td>
<td>Surround each table dump with LOCK TABLES and UNLOCK TABLES statements</td>
<td></td>
</tr>
<tr>
<td><code>--all-databases</code></td>
<td>Dump all tables in all databases</td>
<td></td>
</tr>
<tr>
<td><code>--all-tablespaces</code></td>
<td>Adds to a table dump all SQL statements needed to create any tablespaces used by an NDB Cluster table</td>
<td>5.1.6</td>
</tr>
<tr>
<td><code>--allow-keywords</code></td>
<td>Allow creation of column names that are keywords</td>
<td></td>
</tr>
<tr>
<td><code>--bind-address</code></td>
<td>Use specified network interface to connect to MySQL Server</td>
<td>5.1.22-ndb-6.3.4</td>
</tr>
<tr>
<td><code>--character-sets-dir</code></td>
<td>Directory where character sets are installed</td>
<td></td>
</tr>
<tr>
<td><code>--comments</code></td>
<td>Add comments to dump file</td>
<td></td>
</tr>
<tr>
<td><code>--compact</code></td>
<td>Produce more compact output</td>
<td></td>
</tr>
<tr>
<td><code>--compatible</code></td>

<td></td>
</tr>
</tbody>
</table>

- **--help, -?**

Display a help message and exit.

- **--add-drop-database**

Write a `DROP DATABASE` statement before each `CREATE DATABASE` statement. This option is typically used in conjunction with the `--all-databases` or `--databases` option because no `CREATE DATABASE` statements are written unless one of those options is specified.

- **--add-drop-table**

Write a `DROP TABLE` statement before each `CREATE TABLE` statement.

- **--add-drop-trigger**

Write a `DROP TRIGGER` statement before each `CREATE TRIGGER` statement.
mysqldump — A Database Backup Program

**Note**
This option is supported only by `mysqldump` as supplied with MySQL Cluster NDB 6.3.38, MySQL Cluster NDB 7.0.19, MySQL Cluster NDB 7.1.8, and later MySQL Cluster releases. It is not available when using MySQL 5.1.

- **--add-locks**
  Surround each table dump with `LOCK TABLES` and `UNLOCK TABLES` statements. This results in faster inserts when the dump file is reloaded. See Section 8.2.2.1, “Speed of INSERT Statements”.

- **--all-databases, -A**
  Dump all tables in all databases. This is the same as using the `--databases` option and naming all the databases on the command line.

- **--all-tablespaces, -Y**
  Adds to a table dump all SQL statements needed to create any tablespaces used by an `NDBCLUSTER` table. This information is not otherwise included in the output from `mysqldump`. This option is currently relevant only to MySQL Cluster tables.
  
  This option was added in MySQL 5.1.6.

- **--allow-keywords**
  Permit creation of column names that are keywords. This works by prefixing each column name with the table name.

- **--bind-address=ip_address**
  On a computer having multiple network interfaces, use this option to select which interface to use for connecting to the MySQL server.
  
  This option is supported only in the version of `mysqldump` that is supplied with MySQL Cluster, beginning with MySQL Cluster NDB 6.3.4. It is not available in standard MySQL 5.1 releases.

- **--character-sets-dir=dir_name**
  The directory where character sets are installed. See Section 10.5, “Character Set Configuration”.

- **--comments, -i**
  Write additional information in the dump file such as program version, server version, and host. This option is enabled by default. To suppress this additional information, use `--skip-comments`.

- **--compact**
  Produce more compact output. This option enables the `--skip-add-drop-table, --skip-add-locks, --skip-comments, --skip-disable-keys, and --skip-set-charset` options.
  
  **Note**
  Prior to MySQL 5.1.21, this option did not create valid SQL if the database dump contained views. The recreation of views requires the creation and removal of temporary tables and this option suppressed the removal of those temporary tables. As a workaround, use `--compact` with the `--add-drop-table` option and then manually adjust the dump file.

- **--compatible=name**
Produce output that is more compatible with other database systems or with older MySQL servers. The value of `name` can be `ansi`, `mysql323`, `mysql40`, `postgresql`, `oracle`, `mssql`, `db2`, `maxdb`, `no_key_options`, `no_table_options`, or `no_field_options`. To use several values, separate them by commas. These values have the same meaning as the corresponding options for setting the server SQL mode. See Section 5.1.7, “Server SQL Modes”.

This option does not guarantee compatibility with other servers. It only enables those SQL mode values that are currently available for making dump output more compatible. For example, `--compatible=oracle` does not map data types to Oracle types or use Oracle comment syntax.

This option requires a server version of 4.1.0 or higher. With older servers, it does nothing.

- `--complete-insert`, `-c`
  
  Use complete INSERT statements that include column names.

- `--compress`, `-C`
  
  Compress all information sent between the client and the server if both support compression.

- `--create-options`
  
  Include all MySQL-specific table options in the CREATE TABLE statements.

- `--databases`, `-B`
  
  Dump several databases. Normally, mysqldump treats the first name argument on the command line as a database name and following names as table names. With this option, it treats all name arguments as database names. CREATE DATABASE and USE statements are included in the output before each new database.

- `--debug[=debug_options], -# [debug_options]`
  
  Write a debugging log. A typical `debug_options` string is `d:t:o`, `file_name`. The default value is `d:t:o`, `/tmp/mysqldump.trace`.

- `--debug-check`
  
  Print some debugging information when the program exits. This option was added in MySQL 5.1.21.

- `--debug-info`
  
  Print debugging information and memory and CPU usage statistics when the program exits. This option was added in MySQL 5.1.14.

- `--default-character-set=charset_name`
  
  Use `charset_name` as the default character set. See Section 10.5, “Character Set Configuration”. If no character set is specified, mysqldump uses `utf8`.

  Prior to MySQL 5.1.38, this option has no effect for output data files produced by using the `--tab` option. See the description for that option.

- `--defaults-extra-file=file_name`
  
  Read this option file after the global option file but (on Unix) before the user option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is the full path name to the file.

- `--defaults-file=file_name`
  
  Use only the given option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is the full path name to the file.
- **--defaults-group-suffix=** *str*

  Read not only the usual option groups, but also groups with the usual names and a suffix of *str*. For example, `mysqldump` normally reads the [client] and [mysqldump] groups. If the **--defaults-group-suffix=** *other* option is given, `mysqldump` also reads the [client_other] and [mysqldump_other] groups.

- **--delayed-insert**

  Write INSERT DELAYED statements rather than INSERT statements.

- **--delete-master-logs**

  On a master replication server, delete the binary logs by sending a PURGE BINARY LOGS statement to the server after performing the dump operation. This option automatically enables **--master-data**.

- **--disable-keys, -K**

  For each table, surround the INSERT statements with `/*!40000 ALTER TABLE tbl_name DISABLE KEYS */;` and `/*!40000 ALTER TABLE tbl_name ENABLE KEYS */;` statements. This makes loading the dump file faster because the indexes are created after all rows are inserted. This option is effective only for nonunique indexes of MyISAM tables. It has no effect for other tables.

- **--dump-date**

  If the **--comments** option is given, `mysqldump` produces a comment at the end of the dump of the following form:

  ```
  -- Dump completed on DATE
  ```

  However, the date causes dump files taken at different times to appear to be different, even if the data are otherwise identical. **--dump-date** and **--skip-dump-date** control whether the date is added to the comment. The default is **--dump-date** (include the date in the comment). **--skip-dump-date** suppresses date printing. This option was added in MySQL 5.1.23.

- **--events, -E**

  Include Event Scheduler events for the dumped databases in the output. This option requires the EVENT privileges for those databases. This option was added in MySQL 5.1.8.

- **--extended-insert, -e**

  Write INSERT statements using multiple-row syntax that includes several VALUES lists. This results in a smaller dump file and speeds up inserts when the file is reloaded.

- **--fields-terminated-by=..., --fields-enclosed-by=..., --fields-optionally-enclosed-by=..., --fields-escaped-by=...**

  These options are used with the **--tab** option and have the same meaning as the corresponding FIELDS clauses for LOAD DATA INFILE. See Section 13.2.6, “LOAD DATA INFILE Syntax”.

- **--first-slave**

  Deprecated. Use **--lock-all-tables** instead. **--first-slave** is removed in MySQL 5.5.

- **--flush-logs, -F**

  Flush the MySQL server log files before starting the dump. This option requires the RELOAD privilege. If you use this option in combination with the **--all-databases** option, the logs are flushed for each database dumped. The exception is when using **--lock-all-tables** or **--master-data**: In this case, the logs are flushed only once, corresponding to the moment that all
tables are locked. If you want your dump and the log flush to happen at exactly the same moment, you should use `--flush-logs` together with either `--lock-all-tables` or `--master-data`.

- `--flush-privileges`

Add a `FLUSH PRIVILEGES` statement to the dump output after dumping the `mysql` database. This option should be used any time the dump contains the `mysql` database and any other database that depends on the data in the `mysql` database for proper restoration. This option was added in MySQL 5.1.12.

- `--force, -f`

Continue even if an SQL error occurs during a table dump.

One use for this option is to cause `mysqldump` to continue executing even when it encounters a view that has become invalid because the definition refers to a table that has been dropped. Without `--force`, `mysqldump` exits with an error message. With `--force`, `mysqldump` prints the error message, but it also writes an SQL comment containing the view definition to the dump output and continues executing.

- `--host=host_name, -h host_name`

Dump data from the MySQL server on the given host. The default host is `localhost`.

- `--hex-blob`

Dump binary columns using hexadecimal notation (for example, 'abc' becomes `0x616263`). The affected data types are `BINARY`, `VARBINARY`, the `BLOB` types, and `BIT`.

- `--ignore-table=db_name.tbl_name`

Do not dump the given table, which must be specified using both the database and table names. To ignore multiple tables, use this option multiple times. This option also can be used to ignore views.

- `--insert-ignore`

Write `INSERT IGNORE` statements rather than `INSERT` statements.

- `--lines-terminated-by=...`

This option is used with the `--tab` option and has the same meaning as the corresponding `LINES` clause for `LOAD DATA INFILE`. See Section 13.2.6, “LOAD DATA INFILE Syntax”.

- `--lock-all-tables, -x`

Lock all tables across all databases. This is achieved by acquiring a global read lock for the duration of the whole dump. This option automatically turns off `--single-transaction` and `--lock-tables`.

- `--lock-tables, -l`

For each dumped database, lock all tables to be dumped before dumping them. The tables are locked with `READ LOCAL` to permit concurrent inserts in the case of MyISAM tables. For transactional tables such as InnoDB, `--single-transaction` is a much better option than `--lock-tables` because it does not need to lock the tables at all.

Because `--lock-tables` locks tables for each database separately, this option does not guarantee that the tables in the dump file are logically consistent between databases. Tables in different databases may be dumped in completely different states.

- `--log-error=file_name`
Log warnings and errors by appending them to the named file. The default is to do no logging. This option was added in MySQL 5.1.18.

- **--master-data [=value]**

Use this option to dump a master replication server to produce a dump file that can be used to set up another server as a slave of the master. It causes the dump output to include a `CHANGE MASTER TO` statement that indicates the binary log coordinates (file name and position) of the dumped server. These are the master server coordinates from which the slave should start replicating after you load the dump file into the slave.

If the option value is 2, the `CHANGE MASTER TO` statement is written as an SQL comment, and thus is informative only; it has no effect when the dump file is reloaded. If the option value is 1, the statement is not written as a comment and takes effect when the dump file is reloaded. If no option value is specified, the default value is 1.

This option requires the `RELOAD` privilege and the binary log must be enabled.

The `--master-data` option automatically turns off `--lock-tables`. It also turns on `--lock-all-tables`, unless `--single-transaction` also is specified, in which case, a global read lock is acquired only for a short time at the beginning of the dump (see the description for `--single-transaction`). In all cases, any action on logs happens at the exact moment of the dump.

It is also possible to set up a slave by dumping an existing slave of the master. To do this, use the following procedure on the existing slave:

1. Stop the slave's SQL thread and get its current status:

   ```
   mysql> STOP SLAVE SQL_THREAD;
   mysql> SHOW SLAVE STATUS;
   ```

2. From the output of the `SHOW SLAVE STATUS` statement, the binary log coordinates of the master server from which the new slave should start replicating are the values of the `Relay_Master_Log_File` and `Exec_Master_Log_Pos` fields. Denote those values as `file_name` and `file_pos`.

3. Dump the slave server:

   ```
   shell> mysqldump --master-data=2 --all-databases > dumpfile
   ```

   Using `--master-data=2` works only if binary logging has been enabled on the slave. Otherwise, `mysqldump` fails with the error `Binlogging on server not active`. In this case you must handle any locking issues in another manner, using one or more of `--add-locks`, `--lock-tables`, `--lock-all-tables`, or `--single-transaction`, as required by your application and environment.

4. Restart the slave:

   ```
   mysql> START SLAVE;
   ```

5. On the new slave, load the dump file:

   ```
   shell> mysql < dumpfile
   ```

6. On the new slave, set the replication coordinates to those of the master server obtained earlier:

   ```
   mysql> CHANGE MASTER TO
   ```
The `CHANGE MASTER TO` statement might also need other parameters, such as `MASTER_HOST` to point the slave to the correct master server host. Add any such parameters as necessary.

- **--no-autocommit**

  Enclose the `INSERT` statements for each dumped table within `SET autocommit = 0` and `COMMIT` statements.

- **--no-create-db, -n**

  Suppress the `CREATE DATABASE` statements that are otherwise included in the output if the `--databases` or `--all-databases` option is given.

- **--no-create-info, -t**

  Do not write `CREATE TABLE` statements that create each dumped table.

  **Note**

  This option does not exclude statements creating log file groups or tablespaces from `mysqldump` output; in MySQL 5.1.14 and later, you can use the `--no-tablespaces` option for this purpose.

- **--no-data, -d**

  Do not write any table row information (that is, do not dump table contents). This is useful if you want to dump only the `CREATE TABLE` statement for the table (for example, to create an empty copy of the table by loading the dump file).

- **--no-defaults**

  Do not read any option files. If program startup fails due to reading unknown options from an option file, `--no-defaults` can be used to prevent them from being read.

- **--no-set-names, -N**

  This has the same effect as `--skip-set-charset`.

- **--no-tablespaces, -y**

  This option suppresses all `CREATE LOGFILE GROUP` and `CREATE TABLESPACE` statements in the output of `mysqldump`.

  This option was added in MySQL 5.1.14.

- **--opt**

  This option is shorthand. It is the same as specifying `--add-drop-table --add-locks --create-options --disable-keys --extended-insert --lock-tables --quick --set-charset`. It should give you a fast dump operation and produce a dump file that can be reloaded into a MySQL server quickly.

  *The `--opt` option is enabled by default. Use `--skip-opt` to disable it.* See the discussion at the beginning of this section for information about selectively enabling or disabling a subset of the options affected by `--opt`.

- **--order-by-primary**

  Dump each table’s rows sorted by its primary key, or by its first unique index, if such an index exists. This is useful when dumping a `MyISAM` table to be loaded into an `InnoDB` table, but will make the dump operation take considerably longer.
• **--password [=password], -p [password]**

The password to use when connecting to the server. If you use the short option form (-p), you cannot have a space between the option and the password. If you omit the password value following the --password or -p option on the command line, mysqldump prompts for one.

Specifying a password on the command line should be considered insecure. See Section 6.1.2.1, “End-User Guidelines for Password Security”. You can use an option file to avoid giving the password on the command line.

• **--pipe, -W**

On Windows, connect to the server using a named pipe. This option applies only if the server supports named-pipe connections.

• **--port= port_num, -P port_num**

The TCP/IP port number to use for the connection.

• **--print-defaults**

Print the program name and all options that it gets from option files.

• **--protocol={TCP|SOCKET|PIPE|MEMORY}**

The connection protocol to use for connecting to the server. It is useful when the other connection parameters normally would cause a protocol to be used other than the one you want. For details on the permissible values, see Section 4.2.2, “Connecting to the MySQL Server”.

• **--quick, -q**

This option is useful for dumping large tables. It forces mysqldump to retrieve rows for a table from the server a row at a time rather than retrieving the entire row set and buffering it in memory before writing it out.

• **--quote-names, -Q**

Quote identifiers (such as database, table, and column names) within "" characters. If the ANSI_QUOTES SQL mode is enabled, identifiers are quoted within “” characters. This option is enabled by default. It can be disabled with --skip-quote-names, but this option should be given after any option such as --compatible that may enable --quote-names.

• **--replace**

Write REPLACE statements rather than INSERT statements. This option was added in MySQL 5.1.3.

• **--result-file= file_name, -r file_name**

Direct output to the named file. The result file is created and its previous contents overwritten, even if an error occurs while generating the dump.

This option should be used on Windows to prevent newline “\n” characters from being converted to “\r\n” carriage return/newline sequences.

• **--routines, -R**

Include stored routines (procedures and functions) for the dumped databases in the output. This option requires the SELECT privilege for the mysql.proc table.

The output generated by using --routines contains CREATE PROCEDURE and CREATE FUNCTION statements to create the routines. However, these statements do not include attributes such as the routine creation and modification timestamps, so when the routines are reloaded, they are created with timestamps equal to the reload time.
If you require routines to be created with their original timestamp attributes, do not use `--routines`. Instead, dump and reload the contents of the `mysql.proc` table directly, using a MySQL account that has appropriate privileges for the `mysql` database.

This option was added in MySQL 5.1.2. Before that, stored routines are not dumped. Routine `DEFINER` values are not dumped until MySQL 5.1.8. This means that before 5.1.8, when routines are reloaded, they will be created with the definer set to the reloading user. If you require routines to be re-created with their original definer, dump and load the contents of the `mysql.proc` table directly as described earlier.

Prior to MySQL 5.1.62, this option had no effect when used together with the `--xml` option. (Bug #11760384, Bug #52792)

- `--set-charset`

  Write `SET NAMES default_character_set` to the output. This option is enabled by default. To suppress the `SET NAMES` statement, use `--skip-set-charset`.

- `--shared-memory-base-name=name`

  On Windows, the shared-memory name to use, for connections made using shared memory to a local server. The default value is `MYSQL`. The shared-memory name is case sensitive.

  The server must be started with the `--shared-memory` option to enable shared-memory connections.

- `--single-transaction`

  This option sets the transaction isolation mode to `REPEATABLE READ` and sends a `START TRANSACTION` SQL statement to the server before dumping data. It is useful only with transactional tables such as `InnoDB`, because then it dumps the consistent state of the database at the time when `START TRANSACTION` was issued without blocking any applications.

  When using this option, you should keep in mind that only `InnoDB` tables are dumped in a consistent state. For example, any `MyISAM` or `MEMORY` tables dumped while using this option may still change state.

  While a `--single-transaction` dump is in process, to ensure a valid dump file (correct table contents and binary log coordinates), no other connection should use the following statements: `ALTER TABLE`, `CREATE TABLE`, `DROP TABLE`, `RENAME TABLE`, `TRUNCATE TABLE`. A consistent read is not isolated from those statements, so use of them on a table to be dumped can cause the `SELECT` that is performed by `mysqldump` to retrieve the table contents to obtain incorrect contents or fail.

  The `--single-transaction` option and the `--lock-tables` option are mutually exclusive because `LOCK TABLES` causes any pending transactions to be committed implicitly.

  This option is not supported for MySQL Cluster tables; the results cannot be guaranteed to be consistent due to the fact that the `NDBCLUSTER` storage engine supports only the `READ_COMMITTED` transaction isolation level. You should always use `NDB` backup and restore instead.

  To dump large tables, combine the `--single-transaction` option with the `--quick` option.

- `--skip-comments`

  See the description for the `--comments` option.

- `--skip-opt`

  See the description for the `--opt` option.
• **--socket=**path,**-S**  path

For connections to localhost, the Unix socket file to use, or, on Windows, the name of the named pipe to use.

• **--ssl**

Options that begin with --ssl specify whether to connect to the server using SSL and indicate where to find SSL keys and certificates. See Section 6.4.5, “Command Options for Secure Connections”.

• **--tab=**dir_name,**-T**  dir_name

Produce tab-separated text-format data files. For each dumped table, mysqldump creates a tbl_name.sql file that contains the CREATE TABLE statement that creates the table, and the server writes a tbl_name.txt file that contains its data. The option value is the directory in which to write the files.

Note

This option should be used only when mysqldump is run on the same machine as the mysqld server. Because the server creates files *.txt file in the directory that you specify, the directory must be writable by the server and the MySQL account that you use must have the FILE privilege. Because mysqldump creates *.sql in the same directory, it must be writable by your system login account.

By default, the .txt data files are formatted using tab characters between column values and a newline at the end of each line. The format can be specified explicitly using the --fields-xxx and --lines-terminated-by options.

As of MySQL 5.1.38, column values are converted to the character set specified by the --default-character-set option. Prior to 5.1.38 or if no such option is present, values are dumped using the binary character set. In effect, there is no character set conversion. If a table contains columns in several character sets, the output data file will as well and you may not be able to reload the file correctly.

• **--tables**

Override the --databases or -B option. mysqldump regards all name arguments following the option as table names.

• **--triggers**

Include triggers for each dumped table in the output. This option is enabled by default; disable it with --skip-triggers.

To be able to dump a table's triggers, you must have the TRIGGER privilege for the table.

• **--tz-utc**

This option enables TIMESTAMP columns to be dumped and reloaded between servers in different time zones. mysqldump sets its connection time zone to UTC and adds SET TIME_ZONE='+00:00' to the dump file. Without this option, TIMESTAMP columns are dumped and reloaded in the time zones local to the source and destination servers, which can cause the values to change if the servers are in different time zones. --tz-utc also protects against changes due to daylight saving time. --tz-utc is enabled by default. To disable it, use --skip-tz-utc. This option was added in MySQL 5.1.2.

• **--user=**user_name,**-u**  user_name

The MySQL user name to use when connecting to the server.
mysqldump — A Database Backup Program

• --verbose, -v

Verbose mode. Print more information about what the program does.

• --version, -V

Display version information and exit.

• --where='where_condition', -w 'where_condition'

Dump only rows selected by the given WHERE condition. Quotes around the condition are mandatory if it contains spaces or other characters that are special to your command interpreter.

Examples:

```bash
--where="user='jimf'"
-w "userid>1"
-w "userid<1"
```

• --xml, -X

Write dump output as well-formed XML.

**NULL, 'NULL', and Empty Values:** For a column named column_name, the NULL value, an empty string, and the string value 'NULL' are distinguished from one another in the output generated by this option as follows.

<table>
<thead>
<tr>
<th>Value</th>
<th>XML Representation</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL (unknown value)</td>
<td><code>&lt;field name=&quot;column_name&quot; xsi:nil=&quot;true&quot; /&gt;</code></td>
</tr>
<tr>
<td>' ' (empty string)</td>
<td><code>&lt;field name=&quot;column_name&quot;&gt;\n&lt;/field&gt;</code></td>
</tr>
<tr>
<td>'NULL' (string value)</td>
<td><code>&lt;field name=&quot;column_name&quot;&gt;NULL&lt;/field&gt;</code></td>
</tr>
</tbody>
</table>

Beginning with MySQL 5.1.12, the output from the mysql client when run using the --xml option also follows the preceding rules. (See Section 4.5.1.1, "mysql Options").

Beginning with MySQL 5.1.18, XML output from mysqldump includes the XML namespace, as shown here:

```xml
shell> mysqldump --xml -u root world City
<?xml version="1.0"?>
<mysqldump xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
<database name="world">
<table_structure name="City">
<field Field="ID" Type="int(11)" Null="NO" Key="PRI" Extra="auto_increment" />
<field Field="Name" Type="char(35)" Null="NO" Key="" Default="" Extra="" />
<field Field="CountryCode" Type="char(3)" Null="NO" Key="" Default="" Extra="" />
<field Field="District" Type="char(20)" Null="NO" Key="" Default="" Extra="" />
<field Field="Population" Type="int(11)" Null="NO" Key="" Default="0" Extra="" />
<key Table="City" Non_unique="0" Key_name="PRIMARY" Seq_in_index="1" Column_name="ID" Collation="" Cardinality="4079" Null="" Index_type="BTREE" Comment="" />
<options Name="City" Engine="MyISAM" Version="10" Row_format="Fixed" Rows="4079" Avg_row_length="67" Data_length="273293" Max_data_length="1885882349613951" Index_length="43008" Data_free="0" Auto_increment="4080" Create_time="2007-03-31 01:47:01" Update_time="2007-03-31 01:47:02" Create_options="" Latex_code="latin_swedish_ci" Comment="" />
<table_structure>
<table_data name="City">
<row>
<field name="ID">1</field>
<field name="Name">Kabul</field>
<field name="CountryCode">AFG</field>
```
Prior to MySQL 5.1.62, this option prevented the --routines option from working correctly—that is, no stored routines, triggers, or events could be dumped in XML format. (Bug #11760384, Bug #52792)

You can also set the following variables by using --var_name=value syntax:

- **max_allowed_packet**
  
The maximum size of the buffer for client/server communication. The default is 24MB, the maximum is 1GB.

- **net_buffer_length**
  
The initial size of the buffer for client/server communication. When creating multiple-row INSERT statements (as with the --extended-insert or --opt option), mysqldump creates rows up to net_buffer_length bytes long. If you increase this variable, ensure that the MySQL server net_buffer_length system variable has a value at least this large.

A common use of mysqldump is for making a backup of an entire database:

```
shell> mysqldump db_name > backup-file.sql
```

You can load the dump file back into the server like this:

```
shell> mysql db_name < backup-file.sql
```

Or like this:

```
shell> mysql -e "source /path-to-backup/backup-file.sql" db_name
```

mysqldump is also very useful for populating databases by copying data from one MySQL server to another:

```
shell> mysqldump --opt db_name | mysql --host=remote_host -C db_name
```

It is possible to dump several databases with one command:

```
shell> mysqldump --databases db_name1 [db_name2 ...] > my_databases.sql
```

To dump all databases, use the --all-databases option:

```
shell> mysqldump --all-databases > all_databases.sql
```

For InnoDB tables, mysqldump provides a way of making an online backup:

```
shell> mysqldump --all-databases --master-data --single-transaction > all_databases.sql
```
This backup acquires a global read lock on all tables (using `FLUSH TABLES WITH READ LOCK`) at the beginning of the dump. As soon as this lock has been acquired, the binary log coordinates are read and the lock is released. If long updating statements are running when the `FLUSH` statement is issued, the MySQL server may get stalled until those statements finish. After that, the dump becomes lock free and does not disturb reads and writes on the tables. If the update statements that the MySQL server receives are short (in terms of execution time), the initial lock period should not be noticeable, even with many updates.

For point-in-time recovery (also known as “roll-forward,” when you need to restore an old backup and replay the changes that happened since that backup), it is often useful to rotate the binary log (see Section 5.4.4, “The Binary Log”) or at least know the binary log coordinates to which the dump corresponds:

```shell
shell> mysqldump --all-databases --master-data=2 > all_databases.sql
```

Or:

```shell
shell> mysqldump --all-databases --flush-logs --master-data=2
    > all_databases.sql
```

The `--master-data` and `--single-transaction` options can be used simultaneously, which provides a convenient way to make an online backup suitable for use prior to point-in-time recovery if tables are stored using the InnoDB storage engine.

For more information on making backups, see Section 7.2, “Database Backup Methods”, and Section 7.3, “Example Backup and Recovery Strategy”.

If you encounter problems backing up views, please read the section that covers restrictions on views which describes a workaround for backing up views when this fails due to insufficient privileges. See Section C.4, “Restrictions on Views”.

### 4.5.5 mysqimport — A Data Import Program

The `mysqimport` client provides a command-line interface to the `LOAD DATA INFILE` SQL statement. Most options to `mysqimport` correspond directly to clauses of `LOAD DATA INFILE` syntax. See Section 13.2.6, “LOAD DATA INFILE Syntax”.

Invoke `mysqimport` like this:

```shell
shell> mysqimport [options] db_name textfile1 [textfile2 ...]
```

For each text file named on the command line, `mysqimport` strips any extension from the file name and uses the result to determine the name of the table into which to import the file’s contents. For example, files named `patient.txt`, `patient.text`, and `patient` all would be imported into a table named `patient`.

`mysqimport` supports the following options, which can be specified on the command line or in the `[mysqimport]` and `[client]` groups of an option file. For information about option files used by MySQL programs, see Section 4.2.6, “Using Option Files”.

**Table 4.9 mysqimport Options**

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
<th>Introduced</th>

<td></td>
</tr>
</tbody>
</table>

- --help, -?

Display a help message and exit.

The output generated by using --events contains CREATE EVENT statements to create the events. However, these statements do not include attributes such as the event creation and modification timestamps, so when the events are reloaded, they are created with timestamps equal to the reload time.

If you require events to be created with their original timestamp attributes, do not use --events. Instead, dump and reload the contents of the mysql.event table directly, using a MySQL account that has appropriate privileges for the mysql database.

- --bind-address=ip_address

On a computer having multiple network interfaces, this option can be used to select which interface is employed when connecting to the MySQL server.

This option is supported only in the version of mysqlimport that is supplied with MySQL Cluster, beginning with MySQL Cluster NDB 6.3.4. It is not available in standard MySQL 5.1 releases.

- --character-sets-dir=dir_name

The directory where character sets are installed. See Section 10.5, “Character Set Configuration”.

- --columns=column_list, -c column_list

This option takes a comma-separated list of column names as its value. The order of the column names indicates how to match data file columns with table columns.

- --compress, -C

Compress all information sent between the client and the server if both support compression.

- --debug=[debug_options], -# [debug_options]

Write a debugging log. A typical debug_options string is d:t:o, file_name. The default is d:t:o.

- --debug-check

Print some debugging information when the program exits. This option was added in MySQL 5.1.21.

- --debug-info

Print debugging information and memory and CPU usage statistics when the program exits. This option was added in MySQL 5.1.14.

- --default-character-set=charset_name
Use `charset_name` as the default character set. See Section 10.5, “Character Set Configuration”.

Some options, such as `--opt`, automatically enable `--lock-tables`. If you want to override this, use `--skip-lock-tables` at the end of the option list.

- `--defaults-extra-file=file_name`
  Read this option file after the global option file but (on Unix) before the user option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is the full path name to the file.

- `--defaults-file=file_name`
  Use only the given option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is the full path name to the file.

- `--defaults-group-suffix=stri`
  Read not only the usual option groups, but also groups with the usual names and a suffix of `str`. For example, `mysqlimport` normally reads the [client] and [mysqlimport] groups. If the `--defaults-group-suffix=_other` option is given, `mysqlimport` also reads the [client_other] and [mysqlimport_other] groups.

- `--delete, -D`
  Empty the table before importing the text file.

- `--fields-terminated-by=...`, `--fields-enclosed-by=...`, `--fields-optionally-enclosed-by=...`, `--fields-escaped-by=...`
  These options have the same meaning as the corresponding clauses for `LOAD DATA INFILE`. See Section 13.2.6, “LOAD DATA INFILE Syntax”.

- `--force, -f`
  Ignore errors. For example, if a table for a text file does not exist, continue processing any remaining files. Without `--force`, `mysqlimport` exits if a table does not exist.

- `--host=host_name, -h host_name`
  Import data to the MySQL server on the given host. The default host is `localhost`.

- `--ignore, -i`
  See the description for the `--replace` option.

- `--ignore-lines=N`
  Ignore the first `N` lines of the data file.

- `--lines-terminated-by=...`
  This option has the same meaning as the corresponding clause for `LOAD DATA INFILE`. For example, to import Windows files that have lines terminated with carriage return/linefeed pairs, use `--lines-terminated-by=\r\n`. (You might have to double the backslashes, depending on the escaping conventions of your command interpreter.) See Section 13.2.6, “LOAD DATA INFILE Syntax”.

- `--local, -L`
  Read input files locally from the client host.
Lock all tables for writing before processing any text files. This ensures that all tables are synchronized on the server.

- **--low-priority**

Use LOW_PRIORITY when loading the table. This affects only storage engines that use only table-level locking (such as MyISAM, MEMORY, and MERGE).

- **--no-defaults**

Do not read any option files. If program startup fails due to reading unknown options from an option file, **--no-defaults** can be used to prevent them from being read.

- **--password[=password], -p[password]**

The password to use when connecting to the server. If you use the short option form (-p), you cannot have a space between the option and the password. If you omit the password value following the --password or -p option on the command line, mysqlimport prompts for one.

Specifying a password on the command line should be considered insecure. See Section 6.1.2.1, “End-User Guidelines for Password Security”. You can use an option file to avoid giving the password on the command line.

- **--pipe, -W**

On Windows, connect to the server using a named pipe. This option applies only if the server supports named-pipe connections.

- **--port=port_num, -P port_num**

The TCP/IP port number to use for the connection.

- **--print-defaults**

Print the program name and all options that it gets from option files.

- **--protocol={TCP|SOCKET|PIPE|MEMORY}**

The connection protocol to use for connecting to the server. It is useful when the other connection parameters normally would cause a protocol to be used other than the one you want. For details on the permissible values, see Section 4.2.2, “Connecting to the MySQL Server”.

- **--replace, -r**

The --replace and --ignore options control handling of input rows that duplicate existing rows on unique key values. If you specify --replace, new rows replace existing rows that have the same unique key value. If you specify --ignore, input rows that duplicate an existing row on a unique key value are skipped. If you do not specify either option, an error occurs when a duplicate key value is found, and the rest of the text file is ignored.

- **--shared-memory-base-name=name**

On Windows, the shared-memory name to use, for connections made using shared memory to a local server. The default value is MYSQL. The shared-memory name is case sensitive.

The server must be started with the --shared-memory option to enable shared-memory connections.

- **--silent, -s**

Silent mode. Produce output only when errors occur.
mysqlshow — Display Database, Table, and Column Information

- `--socket=path, -S path`

  For connections to localhost, the Unix socket file to use, or, on Windows, the name of the named pipe to use.

- `--ssl*`

  Options that begin with `--ssl` specify whether to connect to the server using SSL and indicate where to find SSL keys and certificates. See Section 6.4.5, “Command Options for Secure Connections”.

- `--user=user_name, -u user_name`

  The MySQL user name to use when connecting to the server.

- `--use-threads=N`

  Load files in parallel using $N$ threads. This option was added in MySQL 5.1.7.

- `--verbose, -v`

  Verbose mode. Print more information about what the program does.

- `--version, -V`

  Display version information and exit.

Here is a sample session that demonstrates use of `mysqlimport`:

```
shell> mysql -e 'CREATE TABLE imptest(id INT, n VARCHAR(30))' test
shell> ed
100     Max Sydow
101     Count Dracula
w imptest.txt
32
q
shell> od -c imptest.txt
00000000 1 0 0 0 \t   M   a   x       S   y   d   o   w  
   1   0
0000020   1  \t   C   o   u   n   t       D   r   a   c   u   l   a  

shell> mysqlimport --local test imptest.txt
test.imptest: Records: 2  Deleted: 0  Skipped: 0  Warnings: 0
shell> mysql -e 'SELECT * FROM imptest' test
+------+---------------+
| id   | n              |
+------+---------------+
|  100 | Max Sydow      |
|  101 | Count Dracula  |
+------+---------------+
```

4.5.6 `mysqlshow` — Display Database, Table, and Column Information

The `mysqlshow` client can be used to quickly see which databases exist, their tables, or a table’s columns or indexes.

`mysqlshow` provides a command-line interface to several SQL `SHOW` statements. See Section 13.7.5, “SHOW Syntax”. The same information can be obtained by using those statements directly. For example, you can issue them from the `mysql` client program.

Invoke `mysqlshow` like this:

```
shell> mysqlshow [options] [db_name [tbl_name [col_name]]]
```
• If no database is given, a list of database names is shown.
• If no table is given, all matching tables in the database are shown.
• If no column is given, all matching columns and column types in the table are shown.

The output displays only the names of those databases, tables, or columns for which you have some privileges.

If the last argument contains shell or SQL wildcard characters ("*", "?", "%", or "_"), only those names that are matched by the wildcard are shown. If a database name contains any underscores, those should be escaped with a backslash (some Unix shells require two) to get a list of the proper tables or columns. "*" and "?" characters are converted into SQL "%" and "_" wildcard characters. This might cause some confusion when you try to display the columns for a table with a "_" in the name, because in this case, `mysqlshow` shows you only the table names that match the pattern. This is easily fixed by adding an extra "%" last on the command line as a separate argument.

`mysqlshow` supports the following options, which can be specified on the command line or in the `[mysqlshow]` and `[client]` groups of an option file. For information about option files used by MySQL programs, see Section 4.2.6, “Using Option Files”.

<tr>
<td>--version</td>
<td>Display version information and exit</td>
<td></td>
</tr>
</tbody>
</table>

- `--help, -?`  
  Display a help message and exit.

- `--bind-address=ip_address`  
  On a computer having multiple network interfaces, use this option to select which interface to use for connecting to the MySQL server.

  This option is supported only in the version of `mysqlshow` that is supplied with MySQL Cluster, beginning with MySQL Cluster NDB 6.3.4. It is not available in standard MySQL 5.1 releases.

- `--character-sets-dir=dir_name`  
  The directory where character sets are installed. See Section 10.5, “Character Set Configuration”.

- `--compress, -C`  
  Compress all information sent between the client and the server if both support compression.

- `--count`  
  Show the number of rows per table. This can be slow for non-MyISAM tables.

- `--debug[=debug_options], -# [debug_options]`  
  Write a debugging log. A typical `debug_options` string is `d:t:o, file_name`. The default is `d:t:o`.

- `--debug-check`  
  Print some debugging information when the program exits. This option was added in MySQL 5.1.21.

- `--debug-info`  
  Print debugging information and memory and CPU usage statistics when the program exits. This option was added in MySQL 5.1.14.

- `--default-character-set=charset_name`  
  Use `charset_name` as the default character set. See Section 10.5, “Character Set Configuration”.

- `--defaults-extra-file=file_name`  
  Read this option file after the global option file but (on Unix) before the user option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is the full path name to the file.
• **--defaults-file=file_name**
  
  Use only the given option file. If the file does not exist or is otherwise inaccessible, an error occurs. 
  *file_name* is the full path name to the file.

• **--defaults-group-suffix=str**
  
  Read not only the usual option groups, but also groups with the usual names and a suffix of *str*. 
  For example, *mysqlshow* normally reads the [client] and [mysqlshow] groups. If the **--defaults-group-suffix=_other** option is given, *mysqlshow* also reads the [client_other] and [mysqlshow_other] groups.

• **--host=host_name, -h host_name**
  
  Connect to the MySQL server on the given host.

• **--keys, -k**
  
  Show table indexes.

• **--no-defaults**
  
  Do not read any option files. If program startup fails due to reading unknown options from an option file, **--no-defaults** can be used to prevent them from being read.

• **--password[=password], -p[password]**
  
  The password to use when connecting to the server. If you use the short option form (**-p**), you cannot have a space between the option and the password. If you omit the *password* value following the **--password** or **-p** option on the command line, *mysqlshow* prompts for one.

  Specifying a password on the command line should be considered insecure. See Section 6.1.2.1, “End-User Guidelines for Password Security”. You can use an option file to avoid giving the password on the command line.

• **--pipe, -W**
  
  On Windows, connect to the server using a named pipe. This option applies only if the server supports named-pipe connections.

• **--port=port_num, -P port_num**
  
  The TCP/IP port number to use for the connection.

• **--print-defaults**
  
  Print the program name and all options that it gets from option files.

• **--protocol={TCP|SOCKET|PIPE|MEMORY}**
  
  The connection protocol to use for connecting to the server. It is useful when the other connection parameters normally would cause a protocol to be used other than the one you want. For details on the permissible values, see Section 4.2.2, “Connecting to the MySQL Server”.

• **--shared-memory-base-name=name**
  
  On Windows, the shared-memory name to use, for connections made using shared memory to a local server. The default value is *MYSQL*. The shared-memory name is case sensitive.

  The server must be started with the **--shared-memory** option to enable shared-memory connections.

• **--show-table-type, -t**
Show a column indicating the table type, as in SHOW FULL TABLES. The type is BASE TABLE or VIEW.

- **--socket=path, -S path**
  For connections to localhost, the Unix socket file to use, or, on Windows, the name of the named pipe to use.

- **--ssl**
  Options that begin with --ssl specify whether to connect to the server using SSL and indicate where to find SSL keys and certificates. See Section 6.4.5, “Command Options for Secure Connections”.

- **--status, -i**
  Display extra information about each table.

- **--user= user_name, -u user_name**
  The MySQL user name to use when connecting to the server.

- **--verbose, -v**
  Verbose mode. Print more information about what the program does. This option can be used multiple times to increase the amount of information.

- **--version, -V**
  Display version information and exit.

### 4.5.7 mysqlslap — Load Emulation Client

mysqlslap is a diagnostic program designed to emulate client load for a MySQL server and to report the timing of each stage. It works as if multiple clients are accessing the server. mysqlslap is available as of MySQL 5.1.4.

Invoke mysqlslap like this:

```
shell> mysqlslap [options]
```

Some options such as --create or --query enable you to specify a string containing an SQL statement or a file containing statements. If you specify a file, by default it must contain one statement per line. (That is, the implicit statement delimiter is the newline character.) Use the --delimiter option to specify a different delimiter, which enables you to specify statements that span multiple lines or place multiple statements on a single line. You cannot include comments in a file; mysqlslap does not understand them.

mysqlslap runs in three stages:

1. Create schema, table, and optionally any stored programs or data to use for the test. This stage uses a single client connection.

2. Run the load test. This stage can use many client connections.

3. Clean up (disconnect, drop table if specified). This stage uses a single client connection.

Examples:

Supply your own create and query SQL statements, with 50 clients querying and 200 selects for each (enter the command on a single line):
mysqlslap — Load Emulation Client

Let mysqlslap build the query SQL statement with a table of two INT columns and three VARCHAR columns. Use five clients querying 20 times each. Do not create the table or insert the data (that is, use the previous test's schema and data):

```
mysqlslap --create="CREATE TABLE a (b int);INSERT INTO a VALUES (23)"
--query="SELECT * FROM a" --concurrency=50 --iterations=200
```

Tell the program to load the create, insert, and query SQL statements from the specified files, where the `create.sql` file has multiple table creation statements delimited by ';' and multiple insert statements delimited by ';'. The `--query` file will have multiple queries delimited by ';'. Run all the load statements, then run all the queries in the query file with five clients (five times each):

```
mysqlslap --concurrency=5 --iterations=20
--number-int-cols=2 --number-char-cols=3
--auto-generate-sql
```

mysqlslap supports the following options, which can be specified on the command line or in the [mysqlslap] and [client] groups of an option file. For information about option files used by MySQL programs, see Section 4.2.6, "Using Option Files".

<table>

</tbody>
</table>

- **--help, -?**

Displays a help message and exit.

- **--auto-generate-sql, -a**

Generate SQL statements automatically when they are not supplied in files or using command options.

- **--auto-generate-sql-add-autoincrement**

Add an AUTO_INCREMENT column to automatically generated tables. This option was added in MySQL 5.1.18.

- **--auto-generate-sql-execute-number=N**

Specify how many queries to generate automatically. This option was added in MySQL 5.1.18.

- **--auto-generate-sql-guid-primary**

Add a GUID-based primary key to automatically generated tables. This option was added in MySQL 5.1.18.

- **--auto-generate-sql-load-type=type**

Specify the test load type. The permissible values are read (scan tables), write (insert into tables), key (read primary keys), update (update primary keys), or mixed (half inserts, half scanning selects). The default is mixed. This option was added in MySQL 5.1.16.

- **--auto-generate-sql-secondary-indexes=N**
Specify how many secondary indexes to add to automatically generated tables. By default, none are added. This option was added in MySQL 5.1.18.

• **--auto-generate-sql-unique-query-number=N**

How many different queries to generate for automatic tests. For example, if you run a key test that performs 1000 selects, you can use this option with a value of 1000 to run 1000 unique queries, or with a value of 50 to perform 50 different selects. The default is 10. This option was added in MySQL 5.1.18.

• **--auto-generate-sql-unique-write-number=N**

How many different queries to generate for **--auto-generate-sql-write-number**. The default is 10. This option was added in MySQL 5.1.18.

• **--auto-generate-sql-write-number=N**

How many row inserts to perform on each thread. The default is 100. This option was added in MySQL 5.1.16.

• **--commit=N**

How many statements to execute before committing. The default is 0 (no commits are done). This option was added in MySQL 5.1.21.

• **--compress, -C**

Compress all information sent between the client and the server if both support compression.

• **--concurrency=N, -c N**

The number of clients to simulate when issuing the **SELECT** statement.

• **--create=value**

The file or string containing the statement to use for creating the table.

• **--create-schema=value**

The schema in which to run the tests. This option was added in MySQL 5.1.5.

If the **--auto-generate-sql** option is also given, **mysqlslap** drops the schema at the end of the test run. To avoid this, use the **--no-drop** option as well.

• **--csv[=file_name]**

Generate output in comma-separated values format. The output goes to the named file, or to the standard output if no file is given. This option was added in MySQL 5.1.5.

• **--debug[=debug_options], -# [debug_options]**

Write a debugging log. A typical **debug_options** string is **d:t:o, file_name**. The default is **d:t:o,/tmp/mysqlslap.trace**.

• **--debug-check**

Print some debugging information when the program exits. This option was added in MySQL 5.1.21.

• **--debug-info, -T**
Print debugging information and memory and CPU usage statistics when the program exits. This option was added in MySQL 5.1.21.

- `--defaults-extra-file=file_name`

Read this option file after the global option file but (on Unix) before the user option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is the full path name to the file.

- `--defaults-file=file_name`

Use only the given option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is the full path name to the file.

- `--defaults-group-suffix=str`

Read not only the usual option groups, but also groups with the usual names and a suffix of `str`. For example, `mysqlslap` normally reads the `[client]` and `[mysqlslap]` groups. If the `--defaults-group-suffix=_other` option is given, `mysqlslap` also reads the `[client_other]` and `[mysqlslap_other]` groups.

- `--delimiter=str, -F str`

The delimiter to use in SQL statements supplied in files or using command options.

- `--detach=N`

Detach (close and reopen) each connection after each `N` statements. The default is 0 (connections are not detached). This option was added in MySQL 5.1.21.

- `--engine=engine_name, -e engine_name`

The storage engine to use for creating tables.

- `--host=host_name, -h host_name`

Connect to the MySQL server on the given host.

- `--iterations=N, -i N`

The number of times to run the tests.

- `--lock-directory=dir_name`

The directory to use for storing locks. This option was added in MySQL 5.1.5 and removed in 5.1.18.

- `--no-drop`

Prevent `mysqlslap` from dropping any schema it creates during the test run. This option was added in MySQL 5.1.57.

- `--no-defaults`

Do not read any option files. If program startup fails due to reading unknown options from an option file, `--no-defaults` can be used to prevent them from being read.

- `--number-char-cols=N, -x N`

The number of `VARCHAR` columns to use if `--auto-generate-sql` is specified.

- `--number-int-cols=N, -y N`

The number of `INT` columns to use if `--auto-generate-sql` is specified.
Limit each client to approximately this many queries. Query counting takes into account the statement delimiter. For example, if you invoke `mysqlslap` as follows, the `;` delimiter is recognized so that each instance of the query string counts as two queries. As a result, 5 rows (not 10) are inserted.

```
shell> mysqlslap --delimiter=";" --number-of-queries=10
  --query="use test;insert into t values(null)"
```

This option was added in MySQL 5.1.5.

- **--only-print**

  Do not connect to databases. `mysqlslap` only prints what it would have done. This option was added in MySQL 5.1.5.

- **--password[=password], -p[password]**

  The password to use when connecting to the server. If you use the short option form (`-p`), you cannot have a space between the option and the password. If you omit the `password` value following the `--password` or `-p` option on the command line, `mysqlslap` prompts for one.

  Specifying a password on the command line should be considered insecure. See Section 6.1.2.1, “End-User Guidelines for Password Security”. You can use an option file to avoid giving the password on the command line.

- **--pipe, -W**

  On Windows, connect to the server using a named pipe. This option applies only if the server supports named-pipe connections.

- **--port=port_num, -P port_num**

  The TCP/IP port number to use for the connection.

- **--post-query=value**

  The file or string containing the statement to execute after the tests have completed. This execution is not counted for timing purposes. This option was added in MySQL 5.1.18.

- **--post-system=str**

  The string to execute using `system()` after the tests have completed. This execution is not counted for timing purposes. This option was added in MySQL 5.1.21.

- **--pre-query=value**

  The file or string containing the statement to execute before running the tests. This execution is not counted for timing purposes. This option was added in MySQL 5.1.18.

- **--pre-system=str**

  The string to execute using `system()` before running the tests. This execution is not counted for timing purposes. This option was added in MySQL 5.1.21.

- **--preserve-schema**

  Preserve the schema from the `mysqlslap` run. The `--auto-generate-sql` and `--create` options disable this option. This option was added in MySQL 5.1.5 and removed in MySQL 5.1.23.

- **--print-defaults**

  Print the program name and all options that it gets from option files.
MySQL Administrative and Utility Programs

• --protocol={TCP|SOCKET|PIPE|MEMORY}

The connection protocol to use for connecting to the server. It is useful when the other connection parameters normally would cause a protocol to be used other than the one you want. For details on the permissible values, see Section 4.2.2, “Connecting to the MySQL Server”.

• --query=value, -q value

The file or string containing the SELECT statement to use for retrieving data.

• --shared-memory-base-name=name

On Windows, the shared-memory name to use, for connections made using shared memory to a local server. This option applies only if the server supports shared-memory connections.

• --silent, -s

Silent mode. No output.

• --slave

Follow master locks for other mysqlslap clients. Use this option if you are trying to synchronize around one master server with --lock-directory plus NFS. This option was added in MySQL 5.1.5 and removed in 5.1.18.

• --socket=path, -S path

For connections to localhost, the Unix socket file to use, or, on Windows, the name of the named pipe to use.

• --ssl*

Options that begin with --ssl specify whether to connect to the server using SSL and indicate where to find SSL keys and certificates. See Section 6.4.5, “Command Options for Secure Connections”.

• --use-threads

On Unix, the default is to use fork() calls and this option causes pthread calls to be used instead. (On Windows, the default is to use pthread calls and the option has no effect.) This option was added in MySQL 5.1.6 and removed in 5.1.18.

• --user=user_name, -u user_name

The MySQL user name to use when connecting to the server.

• --verbose, -v

Verbose mode. Print more information about what the program does. This option can be used multiple times to increase the amount of information.

• --version, -V

Display version information and exit.

4.6 MySQL Administrative and Utility Programs

This section describes administrative programs and programs that perform miscellaneous utility operations.

4.6.1 innochecksum — Offline InnoDB File Checksum Utility
innochecksum prints checksums for InnoDB files. This tool reads an InnoDB tablespace file, calculates the checksum for each page, compares the calculated checksum to the stored checksum, and reports mismatches, which indicate damaged pages. It was originally developed to speed up verifying the integrity of tablespace files after power outages but can also be used after file copies. Because checksum mismatches will cause InnoDB to deliberately shut down a running server, it can be preferable to use this tool rather than waiting for a server in production usage to encounter the damaged pages.

innochecksum cannot be used on tablespace files that the server already has open. For such files, you should use CHECK TABLE to check tables within the tablespace.

If checksum mismatches are found, you would normally restore the tablespace from backup or start the server and attempt to use mysqldump to make a backup of the tables within the tablespace.

Invoke innochecksum like this:

```
shell> innochecksum [options] file_name
```

innochecksum supports the following options. For options that refer to page numbers, the numbers are zero-based.

- **-c**
  Print a count of the number of pages in the file.
- **-d**
  Debug mode; prints checksums for each page.
- **-e num**
  End at this page number.
- **-p num**
  Check only this page number.
- **-s num**
  Start at this page number.
- **-v**
  Verbose mode; print a progress indicator every five seconds.

### 4.6.2 myisam_ftdump — Display Full-Text Index information

myisam_ftdump displays information about FULLTEXT indexes in MyISAM tables. It reads the MyISAM index file directly, so it must be run on the server host where the table is located. Before using myisam_ftdump, be sure to issue a FLUSH TABLES statement first if the server is running.

myisam_ftdump scans and dumps the entire index, which is not particularly fast. On the other hand, the distribution of words changes infrequently, so it need not be run often.

Invoke myisam_ftdump like this:

```
shell> myisam_ftdump [options] tbl_name index_num
```

The `tbl_name` argument should be the name of a MyISAM table. You can also specify a table by naming its index file (the file with the `.MYI` suffix). If you do not invoke myisam_ftdump in the directory where the table files are located, the table or index file name must be preceded by the path name to the table’s database directory. Index numbers begin with 0.
Example: Suppose that the test database contains a table named mytexttable that has the following definition:

```sql
CREATE TABLE mytexttable
(
  id   INT NOT NULL,
  txt  TEXT NOT NULL,
  PRIMARY KEY (id),
  FULLTEXT (txt),
) ENGINE=MyISAM;
```

The index on id is index 0 and the FULLTEXT index on txt is index 1. If your working directory is the test database directory, invoke myisam_ftdump as follows:

```
shell> myisam_ftdump mytexttable 1
```

If the path name to the test database directory is /usr/local/mysql/data/test, you can also specify the table name argument using that path name. This is useful if you do not invoke myisam_ftdump in the database directory:

```
shell> myisam_ftdump /usr/local/mysql/data/test/mytexttable 1
```

You can use myisam_ftdump to generate a list of index entries in order of frequency of occurrence like this:

```
shell> myisam_ftdump -c mytexttable 1 | sort -r
```

myisam_ftdump supports the following options:

- **--help, -h, -?**
  
  Display a help message and exit.

- **--count, -c**
  
  Calculate per-word statistics (counts and global weights).

- **--dump, -d**
  
  Dump the index, including data offsets and word weights.

- **--length, -l**
  
  Report the length distribution.

- **--stats, -s**
  
  Report global index statistics. This is the default operation if no other operation is specified.

- **--verbose, -v**
  
  Verbose mode. Print more output about what the program does.

### 4.6.3 myisamchk — MyISAM Table-Maintenance Utility

The myisamchk utility gets information about your database tables or checks, repairs, or optimizes them. myisamchk works with MyISAM tables (tables that have .MYD and .MYI files for storing data and indexes).

You can also use the CHECK TABLE and REPAIR TABLE statements to check and repair MyISAM tables. See Section 13.7.2.3, “CHECK TABLE Syntax”, and Section 13.7.2.6, “REPAIR TABLE Syntax”. 
The use of `myisamchk` with partitioned tables is not supported.

**Caution**

It is best to make a backup of a table before performing a table repair operation; under some circumstances the operation might cause data loss. Possible causes include but are not limited to file system errors.

Invoke `myisamchk` like this:

```shell
myisamchk [options] tbl_name ...
```

The `options` specify what you want `myisamchk` to do. They are described in the following sections. You can also get a list of options by invoking `myisamchk --help`.

With no options, `myisamchk` simply checks your table as the default operation. To get more information or to tell `myisamchk` to take corrective action, specify options as described in the following discussion.

`tbl_name` is the database table you want to check or repair. If you run `myisamchk` somewhere other than in the database directory, you must specify the path to the database directory, because `myisamchk` has no idea where the database is located. In fact, `myisamchk` does not actually care whether the files you are working on are located in a database directory. You can copy the files that correspond to a database table into some other location and perform recovery operations on them there.

You can name several tables on the `myisamchk` command line if you wish. You can also specify a table by naming its index file (the file with the `.MYI` suffix). This enables you to specify all tables in a directory by using the pattern `*.MYI`. For example, if you are in a database directory, you can check all the MyISAM tables in that directory like this:

```shell
myisamchk *.MYI
```

If you are not in the database directory, you can check all the tables there by specifying the path to the directory:

```shell
myisamchk /path/to/database_dir/*.MYI
```

You can even check all tables in all databases by specifying a wildcard with the path to the MySQL data directory:

```shell
myisamchk /path/to/datadir/*/*.MYI
```

The recommended way to quickly check all MyISAM tables is:

```shell
myisamchk --silent --fast /path/to/datadir/*/*.MYI
```

If you want to check all MyISAM tables and repair any that are corrupted, you can use the following command:

```shell
myisamchk --silent --force --fast --update-state \ 
   --key_buffer_size=64M --myisam_sort_buffer_size=64M \ 
   --read_buffer_size=1M --write_buffer_size=1M \ 
   /path/to/datadir/*/*.MYI
```

This command assumes that you have more than 64MB free. For more information about memory allocation with `myisamchk`, see Section 4.6.3.6, "myisamchk Memory Usage".

For additional information about using `myisamchk`, see Section 7.6, "MyISAM Table Maintenance and Crash Recovery".
myisamchk — MyISAM Table-Maintenance Utility

Important

You must ensure that no other program is using the tables while you are running myisamchk. The most effective means of doing so is to shut down the MySQL server while running myisamchk, or to lock all tables that myisamchk is being used on.

Otherwise, when you run myisamchk, it may display the following error message:

```
warning: clients are using or haven't closed the table properly
```

This means that you are trying to check a table that has been updated by another program (such as the mysqld server) that hasn't yet closed the file or that has died without closing the file properly, which can sometimes lead to the corruption of one or more MyISAM tables.

If mysqld is running, you must force it to flush any table modifications that are still buffered in memory by using FLUSH TABLES. You should then ensure that no one is using the tables while you are running myisamchk.

However, the easiest way to avoid this problem is to use CHECK TABLE instead of myisamchk to check tables. See Section 13.7.2.3, “CHECK TABLE Syntax”.

myisamchk supports the following options, which can be specified on the command line or in the [myisamchk] group of an option file. For information about option files used by MySQL programs, see Section 4.2.6, “Using Option Files”.

Table 4.12 myisamchk Options

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
<th>Introduced</th>
<th>Deprecated</th>
</tr>
</thead>
<tbody>
<tr>
<td>--analyze</td>
<td>Analyze the distribution of key values</td>

### 4.6.3.1 myisamchk General Options

The options described in this section can be used for any type of table maintenance operation performed by `myisamchk`. The sections following this one describe options that pertain only to specific operations, such as table checking or repairing.

- **--help, -?**
  
  Display a help message and exit. Options are grouped by type of operation.

- **--HELP, -H**
  
  Display a help message and exit. Options are presented in a single list.

- **--debug=debug_options, -# debug_options**
  
  Write a debugging log. A typical `debug_options` string is `d:t:o,file_name`. The default is `d:t:o,/tmp/myisamchk.trace`.

- **--defaults-extra-file=file_name**
  
  Read this option file after the global option file but (on Unix) before the user option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is the full path name to the file.

- **--defaults-file=file_name**
  
  Use only the given option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is the full path name to the file.

- **--defaults-group-suffix=str**
  
  Read not only the usual option groups, but also groups with the usual names and a suffix of `str`. For example, `myisamchk` normally reads the `[myisamchk]` group. If the `--defaults-group-suffix=_other` option is given, `myisamchk` also reads the `[myisamchk_other]` group.

- **--no-defaults**
  
  Do not read any option files. If program startup fails due to reading unknown options from an option file, `--no-defaults` can be used to prevent them from being read.
myisamchk — MyISAM Table-Maintenance Utility

- **--print-defaults**
  Print the program name and all options that it gets from option files.

- **--silent, -s**
  Silent mode. Write output only when errors occur. You can use -s twice (-ss) to make **myisamchk** very silent.

- **--verbose, -v**
  Verbose mode. Print more information about what the program does. This can be used with -d and -e. Use -v multiple times (-vv, -vvv) for even more output.

- **--version, -V**
  Display version information and exit.

- **--wait, -w**
  Instead of terminating with an error if the table is locked, wait until the table is unlocked before continuing. If you are running **mysqld** with external locking disabled, the table can be locked only by another **myisamchk** command.

You can also set the following variables by using **--var_name=value** syntax:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>decode_bits</td>
<td>9</td>
</tr>
<tr>
<td>ft_max_word_len</td>
<td>version-dependent</td>
</tr>
<tr>
<td>ft_min_word_len</td>
<td>4</td>
</tr>
<tr>
<td>ft_stopword_file</td>
<td>built-in list</td>
</tr>
<tr>
<td>key_buffer_size</td>
<td>523264</td>
</tr>
<tr>
<td>myisam_block_size</td>
<td>1024</td>
</tr>
<tr>
<td>myisam_sort_key_blocks</td>
<td>16</td>
</tr>
<tr>
<td>read_buffer_size</td>
<td>262136</td>
</tr>
<tr>
<td>sort_buffer_size</td>
<td>2097144</td>
</tr>
<tr>
<td>sort_key_blocks</td>
<td>16</td>
</tr>
<tr>
<td>stats_method</td>
<td>nulls_unequal</td>
</tr>
<tr>
<td>write_buffer_size</td>
<td>262136</td>
</tr>
</tbody>
</table>

The possible **myisamchk** variables and their default values can be examined with **myisamchk --help**:

**sort_buffer_size** is used when the keys are repaired by sorting keys, which is the normal case when you use **--recover**. As of MySQL 5.1.67, **myisam_sort_buffer_size** is available as an alternative name to **sort_buffer_size**. **myisam_sort_buffer_size** is preferable to **sort_buffer_size** because its name corresponds to the **myisam_sort_buffer_size** server system variable that has a similar meaning. **sort_buffer_size** should be considered deprecated.

**key_buffer_size** is used when you are checking the table with **--extend-check** or when the keys are repaired by inserting keys row by row into the table (like when doing normal inserts). Repairing through the key buffer is used in the following cases:

- You use **--safe-recover**.

- The temporary files needed to sort the keys would be more than twice as big as when creating the key file directly. This is often the case when you have large key values for **CHAR**, **VARCHAR**, or **TEXT**.
columns, because the sort operation needs to store the complete key values as it proceeds. If you have lots of temporary space and you can force `myisamchk` to repair by sorting, you can use the `--sort-recover` option.

Repairing through the key buffer takes much less disk space than using sorting, but is also much slower.

If you want a faster repair, set the `key_buffer_size` and `myisam_sort_buffer_size` variables to about 25% of your available memory. You can set both variables to large values, because only one of them is used at a time.

`myisam_block_size` is the size used for index blocks.

`stats_method` influences how NULL values are treated for index statistics collection when the `--analyze` option is given. It acts like the `myisam_stats_method` system variable. For more information, see the description of `myisam_stats_method` in Section 5.1.4, “Server System Variables”, and Section 8.3.7, “InnoDB and MyISAM Index Statistics Collection”.

`ft_min_word_len` and `ft_max_word_len` indicate the minimum and maximum word length for FULLTEXT indexes. `ft_stopword_file` names the stopword file. These need to be set under the following circumstances.

If you use `myisamchk` to perform an operation that modifies table indexes (such as repair or analyze), the FULLTEXT indexes are rebuilt using the default full-text parameter values for minimum and maximum word length and the stopword file unless you specify otherwise. This can result in queries failing.

The problem occurs because these parameters are known only by the server. They are not stored in MyISAM index files. To avoid the problem if you have modified the minimum or maximum word length or the stopword file in the server, specify the same `ft_min_word_len`, `ft_max_word_len`, and `ft_stopword_file` values to `myisamchk` that you use for `mysqld`. For example, if you have set the minimum word length to 3, you can repair a table with `myisamchk` like this:

```
shell> myisamchk --recover --ft_min_word_len=3 tbl_name.MYI
```

To ensure that `myisamchk` and the server use the same values for full-text parameters, you can place each one in both the `[mysqld]` and `[myisamchk]` sections of an option file:

```
[mysqld]
ft_min_word_len=3

[myisamchk]
ft_min_word_len=3
```

An alternative to using `myisamchk` is to use the `REPAIR TABLE`, `ANALYZE TABLE`, `OPTIMIZE TABLE`, or `ALTER TABLE`. These statements are performed by the server, which knows the proper full-text parameter values to use.

### 4.6.3.2 myisamchk Check Options

`myisamchk` supports the following options for table checking operations:

- `--check`, `-c`

  Check the table for errors. This is the default operation if you specify no option that selects an operation type explicitly.

- `--check-only-changed`, `-C`

  Check only tables that have changed since the last check.
myisamchk — MyISAM Table-Maintenance Utility

- **--extend-check, -e**
  
  Check the table very thoroughly. This is quite slow if the table has many indexes. This option should only be used in extreme cases. Normally, myisamchk or myisamchk --medium-check should be able to determine whether there are any errors in the table.

  If you are using --extend-check and have plenty of memory, setting the key_buffer_size variable to a large value helps the repair operation run faster.

  See also the description of this option under table repair options.

  For a description of the output format, see Section 4.6.3.5, “Obtaining Table Information with myisamchk”.

- **--fast, -F**
  
  Check only tables that haven't been closed properly.

- **--force, -f**
  
  Do a repair operation automatically if myisamchk finds any errors in the table. The repair type is the same as that specified with the --recover or -r option.

- **--information, -i**
  
  Print informational statistics about the table that is checked.

- **--medium-check, -m**
  
  Do a check that is faster than an --extend-check operation. This finds only 99.99% of all errors, which should be good enough in most cases.

- **--read-only, -T**
  
  Do not mark the table as checked. This is useful if you use myisamchk to check a table that is in use by some other application that does not use locking, such as mysqld when run with external locking disabled.

- **--update-state, -U**
  
  Store information in the .MYI file to indicate when the table was checked and whether the table crashed. This should be used to get full benefit of the --check-only-changed option, but you shouldn't use this option if the mysqld server is using the table and you are running it with external locking disabled.

### 4.6.3.3 myisamchk Repair Options

myisamchk supports the following options for table repair operations (operations performed when an option such as --recover or --safe-recover is given):

- **--backup, -B**
  
  Make a backup of the .MYD file as file_name-time.BAK

- **--character-sets-dir=dir_name**
  
  The directory where character sets are installed. See Section 10.5, “Character Set Configuration”.

- **--correct-checksum**
  
  Correct the checksum information for the table.

- **--data-file-length=len, -D len**
  
  Set the data file length.
The maximum length of the data file (when re-creating data file when it is “full”).

• --extend-check, -e

Do a repair that tries to recover every possible row from the data file. Normally, this also finds a lot of garbage rows. Do not use this option unless you are desperate.

See also the description of this option under table checking options.

For a description of the output format, see Section 4.6.3.5, “Obtaining Table Information with myisamchk”.

• --force, -f

Overwrite old intermediate files (files with names like `tbl_name.TMD`) instead of aborting.

• --keys-used=val, -k val

For myisamchk, the option value is a bit-value that indicates which indexes to update. Each binary bit of the option value corresponds to a table index, where the first index is bit 0. An option value of 0 disables updates to all indexes, which can be used to get faster inserts. Deactivated indexes can be reactivated by using myisamchk -r.

• --no-symlinks, -l

Do not follow symbolic links. Normally myisamchk repairs the table that a symlink points to. This option does not exist as of MySQL 4.0 because versions from 4.0 on do not remove symlinks during repair operations.

• --max-record-length=len

Skip rows larger than the given length if myisamchk cannot allocate memory to hold them.

• --parallel-recover, -p

Use the same technique as -r and -n, but create all the keys in parallel, using different threads. *This is beta-quality code. Use at your own risk!*

• --quick, -q

Achieve a faster repair by modifying only the index file, not the data file. You can specify this option twice to force myisamchk to modify the original data file in case of duplicate keys.

• --recover, -r

Do a repair that can fix almost any problem except unique keys that are not unique (which is an extremely unlikely error with MyISAM tables). If you want to recover a table, this is the option to try first. You should try --safe-recover only if myisamchk reports that the table cannot be recovered using --recover. (In the unlikely case that --recover fails, the data file remains intact.)

If you have lots of memory, you should increase the value of myisam_sort_buffer_size.

• --safe-recover, -o

Do a repair using an old recovery method that reads through all rows in order and updates all index trees based on the rows found. This is an order of magnitude slower than --recover, but can handle a couple of very unlikely cases that --recover cannot. This recovery method also uses much less disk space than --recover. Normally, you should repair first using --recover, and then with --safe-recover only if --recover fails.

If you have lots of memory, you should increase the value of key_buffer_size.
• **--set-collation=name**
  Specify the collation to use for sorting table indexes. The character set name is implied by the first part of the collation name.

• **--sort-recover,-n**
  Force myisamchk to use sorting to resolve the keys even if the temporary files would be very large.

• **--tmpdir=dir_name,-t dir_name**
  The path of the directory to be used for storing temporary files. If this is not set, myisamchk uses the value of the TMPDIR environment variable. --tmpdir can be set to a list of directory paths that are used successively in round-robin fashion for creating temporary files. The separator character between directory names is the colon (";") on Unix and the semicolon (";") on Windows, NetWare, and OS/2.

• **--unpack,-u**
  Unpack a table that was packed with myisampack.

### 4.6.3.4 Other myisamchk Options

myisamchk supports the following options for actions other than table checks and repairs:

• **--analyze,-a**
  Analyze the distribution of key values. This improves join performance by enabling the join optimizer to better choose the order in which to join the tables and which indexes it should use. To obtain information about the key distribution, use a myisamchk --description --verbose tbl_name command or the SHOW INDEX FROM tbl_name statement.

• **--block-search=offset,-b offset**
  Find the record that a block at the given offset belongs to.

• **--description,-d**
  Print some descriptive information about the table. Specifying the --verbose option once or twice produces additional information. See Section 4.6.3.5, “Obtaining Table Information with myisamchk”.

• **--set-auto-increment[=value],-A[=value]**
  Force AUTO_INCREMENT numbering for new records to start at the given value (or higher, if there are existing records with AUTO_INCREMENT values this large). If value is not specified, AUTO_INCREMENT numbers for new records begin with the largest value currently in the table, plus one.

• **--sort-index,-S**
  Sort the index tree blocks in high-low order. This optimizes seeks and makes table scans that use indexes faster.

• **--sort-records=N,-R N**
  Sort records according to a particular index. This makes your data much more localized and may speed up range-based SELECT and ORDER BY operations that use this index. (The first time you use this option to sort a table, it may be very slow.) To determine a table's index numbers, use SHOW INDEX, which displays a table's indexes in the same order that myisamchk sees them. Indexes are numbered beginning with 1.

  If keys are not packed (PACK_KEYS=0), they have the same length, so when myisamchk sorts and moves records, it just overwrites record offsets in the index. If keys are packed (PACK_KEYS=1),
myisamchk must unpack key blocks first, then re-create indexes and pack the key blocks again. (In this case, re-creating indexes is faster than updating offsets for each index.)

### 4.6.3.5 Obtaining Table Information with myisamchk

To obtain a description of a MyISAM table or statistics about it, use the commands shown here. The output from these commands is explained later in this section.

- **myisamchk -d tbl_name**
  
  Runs myisamchk in “describe mode” to produce a description of your table. If you start the MySQL server with external locking disabled, myisamchk may report an error for a table that is updated while it runs. However, because myisamchk does not change the table in describe mode, there is no risk of destroying data.

- **myisamchk -dv tbl_name**

  Adding -v runs myisamchk in verbose mode so that it produces more information about the table. Adding -v a second time produces even more information.

- **myisamchk -eis tbl_name**

  Shows only the most important information from a table. This operation is slow because it must read the entire table.

- **myisamchk -eiv tbl_name**

  This is like -eis, but tells you what is being done.

The `tbl_name` argument can be either the name of a MyISAM table or the name of its index file, as described in Section 4.6.3, "myisamchk — MyISAM Table-Maintenance Utility". Multiple `tbl_name` arguments can be given.

Suppose that a table named `person` has the following structure. (The MAX_ROWS table option is included so that in the example output from myisamchk shown later, some values are smaller and fit the output format more easily.)

```sql
CREATE TABLE person
(
id       INT NOT NULL AUTO_INCREMENT,
last_name VARCHAR(20) NOT NULL,
first_name VARCHAR(20) NOT NULL,
birth     DATE,
death     DATE,
PRIMARY KEY (id),
INDEX (last_name, first_name),
INDEX (birth)
) MAX_ROWS = 1000000;
```

Suppose also that the table has these data and index file sizes:

```
-rw-rw---- 1 mysql mysql 9347072 Aug 19 11:47 person.MYD
-rw-rw---- 1 mysql mysql 6066176 Aug 19 11:47 person.MYI
```

**Example of myisamchk -dvv output:**

```
MyISAM file:      person
Record format:    Packed
Character set:    latin1_swedish_ci (8)
File-version:     1
Creation time:    2009-08-19 16:47:41
Recover time:     2009-08-19 16:47:56
Status:           checked,analyzed,optimized keys
Auto increment key: 1 Last value: 306688
```
Explanations for the types of information `myisamchk` produces are given here. “Keyfile” refers to the index file. “Record” and “row” are synonymous, as are “field” and “column.”

The initial part of the table description contains these values:

- **MyISAM file**
  Name of the MyISAM (index) file.

- **Record format**
  The format used to store table rows. The preceding examples use **Fixed length**. Other possible values are **Compressed** and **Packed**. (Packed corresponds to what SHOW TABLE STATUS reports as Dynamic.)

- **Character set**
  The table default character set.

- **File-version**
  Version of MyISAM format. Always 1.

- **Creation time**
  When the data file was created.

- **Recover time**
  When the index/data file was last reconstructed.

- **Status**
  Table status flags. Possible values are crashed, open, changed, analyzed, optimized keys, and sorted index pages.

- **Auto increment key, Last value**
  The key number associated the table’s AUTO_INCREMENT column, and the most recently generated value for this column. These fields do not appear if there is no such column.

- **Data records**
  The number of rows in the table.
• **Deleted blocks**

How many deleted blocks still have reserved space. You can optimize your table to minimize this space. See Section 7.6.4, “MyISAM Table Optimization”.

• **Datafile parts**

For dynamic-row format, this indicates how many data blocks there are. For an optimized table without fragmented rows, this is the same as Data records.

• **Deleted data**

How many bytes of unreclaimed deleted data there are. You can optimize your table to minimize this space. See Section 7.6.4, “MyISAM Table Optimization”.

• **Datafile pointer**

The size of the data file pointer, in bytes. It is usually 2, 3, 4, or 5 bytes. Most tables manage with 2 bytes, but this cannot be controlled from MySQL yet. For fixed tables, this is a row address. For dynamic tables, this is a byte address.

• **Keyfile pointer**

The size of the index file pointer, in bytes. It is usually 1, 2, or 3 bytes. Most tables manage with 2 bytes, but this is calculated automatically by MySQL. It is always a block address.

• **Max datafile length**

How long the table data file can become, in bytes.

• **Max keyfile length**

How long the table index file can become, in bytes.

• **Recordlength**

How much space each row takes, in bytes.

The table description part of the output includes a list of all keys in the table. For each key, `myisamchk` displays some low-level information:

• **Key**

This key's number. This value is shown only for the first column of the key. If this value is missing, the line corresponds to the second or later column of a multiple-column key. For the table shown in the example, there are two table description lines for the second index. This indicates that it is a multiple-part index with two parts.

• **Start**

Where in the row this portion of the index starts.

• **Len**

How long this portion of the index is. For packed numbers, this should always be the full length of the column. For strings, it may be shorter than the full length of the indexed column, because you can index a prefix of a string column. The total length of a multiple-part key is the sum of the Len values for all key parts.

• **Index**

Whether a key value can exist multiple times in the index. Possible values are unique or multip. (multiple).
• **Type**
  What data type this portion of the index has. This is a **MyISAM** data type with the possible values **packed**, **stripped**, or **empty**.

• **Root**
  Address of the root index block.

• **Blocksize**
  The size of each index block. By default this is 1024, but the value may be changed at compile time when MySQL is built from source.

• **Rec/key**
  This is a statistical value used by the optimizer. It tells how many rows there are per value for this index. A unique index always has a value of 1. This may be updated after a table is loaded (or greatly changed) with `myisamchk -a`. If this is not updated at all, a default value of 30 is given.

The last part of the output provides information about each column:

• **Field**
  The column number.

• **Start**
  The byte position of the column within table rows.

• **Length**
  The length of the column in bytes.

• **Nullpos, Nullbit**
  For columns that can be **NULL**, **MyISAM** stores **NULL** values as a flag in a byte. Depending on how many nullable columns there are, there can be one or more bytes used for this purpose. The **Nullpos** and **Nullbit** values, if nonempty, indicate which byte and bit contains that flag indicating whether the column is **NULL**.

  The position and number of bytes used to store **NULL** flags is shown in the line for field 1. This is why there are six **Field** lines for the **person** table even though it has only five columns.

• **Type**
  The data type. The value may contain any of the following descriptors:
  • **constant**
    All rows have the same value.
  • **no endspace**
    Do not store endspace.
  • **no endspace, not_always**
    Do not store endspace and do not do endspace compression for all values.
  • **no endspace, no empty**
    Do not store endspace. Do not store empty values.
• **table-lookup**

The column was converted to an **ENUM**.

• **zerofill**(N)

The most significant N bytes in the value are always 0 and are not stored.

• **no zeros**

Do not store zeros.

• **always zero**

Zero values are stored using one bit.

• **Huff tree**

The number of the Huffman tree associated with the column.

• **Bits**

The number of bits used in the Huffman tree.

The Huff tree and Bits fields are displayed if the table has been compressed with `myisampack`. See Section 4.6.5, “myisampack — Generate Compressed, Read-Only MyISAM Tables”, for an example of this information.

Example of `myisamchk -eiv` output:

```
Checking MyISAM file: person
Data records: 306688  Deleted blocks: 0
  - check file-size
  - check record delete-chain
    No recordlinks
  - check key delete-chain
    block_size 1024:
      - check index reference
        - check data record references index: 1
        Key: 1: Keyblocks used: 98% Packed: 0% Max levels: 3
        - check data record references index: 2
        Key: 2: Keyblocks used: 99% Packed: 97% Max levels: 3
        - check data record references index: 3
        Key: 3: Keyblocks used: 98% Packed: -14% Max levels: 3
      Total: Keyblocks used: 98% Packed: 89%
    - check records and index references
      *** LOTS OF ROW NUMBERS DELETED ***
      Records: 306688  M.recordlength: 25  Packed: 83%
      Recordspace used: 97% Empty space: 2% Blocks/Record: 1.00
      Record blocks: 306688  Delete blocks: 0
      Record data: 7934464  Deleted data: 0
      Lost space: 256512  Linkdata: 1156096

User time 43.08, System time 1.68
Maximum resident set size 0, Integral resident set size 0
Non-physical pagefaults 0, Physical pagefaults 0, Swaps 0
Blocks in 0 out 7, Messages in 0 out 0, Signals 0
Voluntary context switches 0, Involuntary context switches 0
Maximum memory usage: 1046926 bytes (1023k)
```

`myisamchk -eiv` output includes the following information:

• **Data records**
The number of rows in the table.

- **Deleted blocks**
  How many deleted blocks still have reserved space. You can optimize your table to minimize this space. See Section 7.6.4, “MyISAM Table Optimization”.

- **Key**
  The key number.

- **Keyblocks used**
  What percentage of the keyblocks are used. When a table has just been reorganized with `myisamchk`, the values are very high (very near theoretical maximum).

- **Packed**
  MySQL tries to pack key values that have a common suffix. This can only be used for indexes on `CHAR` and `VARCHAR` columns. For long indexed strings that have similar leftmost parts, this can significantly reduce the space used. In the preceding example, the second key is 40 bytes long and a 97% reduction in space is achieved.

- **Max levels**
  How deep the B-tree for this key is. Large tables with long key values get high values.

- **Records**
  How many rows are in the table.

- **M.recordlength**
  The average row length. This is the exact row length for tables with fixed-length rows, because all rows have the same length.

- **Packed**
  MySQL strips spaces from the end of strings. The `Packed` value indicates the percentage of savings achieved by doing this.

- **Recordspace used**
  What percentage of the data file is used.

- **Empty space**
  What percentage of the data file is unused.

- **Blocks/Record**
  Average number of blocks per row (that is, how many links a fragmented row is composed of). This is always 1.0 for fixed-format tables. This value should stay as close to 1.0 as possible. If it gets too large, you can reorganize the table. See Section 7.6.4, “MyISAM Table Optimization”.

- **Recordblocks**
  How many blocks (links) are used. For fixed-format tables, this is the same as the number of rows.

- **Deleteblocks**
  How many blocks (links) are deleted.
• **Recorddata**
  How many bytes in the data file are used.

• **Deleted data**
  How many bytes in the data file are deleted (unused).

• **Lost space**
  If a row is updated to a shorter length, some space is lost. This is the sum of all such losses, in bytes.

• **Linkdata**
  When the dynamic table format is used, row fragments are linked with pointers (4 to 7 bytes each). **Linkdata** is the sum of the amount of storage used by all such pointers.

### 4.6.3.6 myisamchk Memory Usage

Memory allocation is important when you run `myisamchk`. `myisamchk` uses no more memory than its memory-related variables are set to. If you are going to use `myisamchk` on very large tables, you should first decide how much memory you want it to use. The default is to use only about 3MB to perform repairs. By using larger values, you can get `myisamchk` to operate faster. For example, if you have more than 512MB RAM available, you could use options such as these (in addition to any other options you might specify):

```shell
myisamchk --myisam_sort_buffer_size=256M \
--key_buffer_size=512M \
--read_buffer_size=64M \
--write_buffer_size=64M ...
```

Using `--myisam_sort_buffer_size=16M` is probably enough for most cases.

Be aware that `myisamchk` uses temporary files in `TMPDIR`. If `TMPDIR` points to a memory file system, out of memory errors can easily occur. If this happens, run `myisamchk` with the `--tmpdir=dir_name` option to specify a directory located on a file system that has more space.

When performing repair operations, `myisamchk` also needs a lot of disk space:

• Twice the size of the data file (the original file and a copy). This space is not needed if you do a repair with `--quick`; in this case, only the index file is re-created. **This space must be available on the same file system as the original data file**, as the copy is created in the same directory as the original.

• Space for the new index file that replaces the old one. The old index file is truncated at the start of the repair operation, so you usually ignore this space. This space must be available on the same file system as the original data file.

• When using `--recover` or `--sort-recover` (but not when using `--safe-recover`), you need space on disk for sorting. This space is allocated in the temporary directory (specified by `TMPDIR` or `--tmpdir=dir_name`). The following formula yields the amount of space required:

\[(\text{largest_key} + \text{row_pointer_length}) \times \text{number_of_rows} \times 2\]

You can check the length of the keys and the `row_pointer_length` with `myisamchk -dv tbl_name` (see Section 4.6.3.5, “Obtaining Table Information with myisamchk”). The `row_pointer_length` and `number_of_rows` values are the Datafile pointer and Data records values in the table description. To determine the `largest_key` value, check the Key lines in the table description. The `Len` column indicates the number of bytes for each key part. For a multiple-column index, the key size is the sum of the `Len` values for all key parts.
If you have a problem with disk space during repair, you can try --safe-recover instead of --recover.

4.6.4 myisamlog — Display MyISAM Log File Contents

myisamlog processes the contents of a MyISAM log file. To create such a file, start the server with a --log-isam=<log_file> option.

Invoke myisamlog like this:

```
shell> myisamlog [options] [file_name tbl_name ...]
```

The default operation is update (-u). If a recovery is done (-r), all writes and possibly updates and deletes are done and errors are only counted. The default log file name is myisam.log if no log_file argument is given. If tables are named on the command line, only those tables are updated.

myisamlog supports the following options:

- `-?`, `-I`
  Display a help message and exit.

- `-c N`
  Execute only N commands.

- `-f N`
  Specify the maximum number of open files.

- `-i`
  Display extra information before exiting.

- `-o offset`
  Specify the starting offset.

- `-p N`
  Remove N components from path.

- `-r`
  Perform a recovery operation.

- `-R record_pos_file record_pos`
  Specify record position file and record position.

- `-u`
  Perform an update operation.

- `-v`
  Verbose mode. Print more output about what the program does. This option can be given multiple times to produce more and more output.

- `-w write_file`
  Specify the write file.

- `-V`
Display version information.

4.6.5 **myisampack** — Generate Compressed, Read-Only MyISAM Tables

The `myisampack` utility compresses MyISAM tables. `myisampack` works by compressing each column in the table separately. Usually, `myisampack` packs the data file 40% to 70%.

When the table is used later, the server reads into memory the information needed to decompress columns. This results in much better performance when accessing individual rows, because you only have to uncompress exactly one row.

MySQL uses `mmap()` when possible to perform memory mapping on compressed tables. If `mmap()` does not work, MySQL falls back to normal read/write file operations.

Please note the following:

- If the `mysqld` server was invoked with external locking disabled, it is not a good idea to invoke `myisampack` if the table might be updated by the server during the packing process. It is safest to compress tables with the server stopped.
- After packing a table, it becomes read only. This is generally intended (such as when accessing packed tables on a CD).
- `myisampack` does not support partitioned tables.

Invoke `myisampack` like this:

```
shell> myisampack [options] file_name ...
```

Each file name argument should be the name of an index (`.MYI`) file. If you are not in the database directory, you should specify the path name to the file. It is permissible to omit the `.MYI` extension.

After you compress a table with `myisampack`, use `myisamchk -rq` to rebuild its indexes. Section 4.6.3, “myisamchk — MyISAM Table-Maintenance Utility”.

`myisampack` supports the following options. It also reads option files and supports the options for processing them described at Section 4.2.7, “Command-Line Options that Affect Option-File Handling”.

- **--help, -?**
  Display a help message and exit.

- **--backup, -b**
  Make a backup of each table’s data file using the name `tbl_name.OLD`.

- **--character-sets-dir=dir_name**
  The directory where character sets are installed. See Section 10.5, “Character Set Configuration”.

- **--debug[=debug_options], -# [debug_options]**
  Write a debugging log. A typical `debug_options` string is `d:t:o, file_name`. The default is `d:t:o`.

- **--force, -f**
  Produce a packed table even if it becomes larger than the original or if the intermediate file from an earlier invocation of `myisampack` exists. (`myisampack` creates an intermediate file named `tbl_name.TMD` in the database directory while it compresses the table. If you kill `myisampack`, the `.TMD` file might not be deleted.) Normally, `myisampack` exits with an error if it finds that `tbl_name.TMD` exists. With `--force`, `myisampack` packs the table anyway.
• **--join=big_tbl_name, --j big_tbl_name**

Join all tables named on the command line into a single packed table `big_tbl_name`. All tables that are to be combined *must* have identical structure (same column names and types, same indexes, and so forth).

`big_tbl_name` must not exist prior to the join operation. All source tables named on the command line to be merged into `big_tbl_name` must exist. The source tables are read for the join operation but not modified. The join operation does not create a `.frm` file for `big_tbl_name`, so after the join operation finishes, copy the `.frm` file from one of the source tables and name it `big_tbl_name.frm`.

• **--silent, -s**

Silent mode. Write output only when errors occur.

• **--test, -t**

Do not actually pack the table, just test packing it.

• **--tmpdir=dir_name, -T dir_name**

Use the named directory as the location where `myisampack` creates temporary files.

• **--verbose, -v**

Verbose mode. Write information about the progress of the packing operation and its result.

• **--version, -V**

Display version information and exit.

• **--wait, -w**

Wait and retry if the table is in use. If the `mysqld` server was invoked with external locking disabled, it is not a good idea to invoke `myisampack` if the table might be updated by the server during the packing process.

The following sequence of commands illustrates a typical table compression session:

```
shell> ls -l station.*
-rw-rw-r-- 1 monty my         994128 Apr 17 19:00 station.MYD
-rw-rw-r-- 1 monty my          53248 Apr 17 19:00 station.MYI

40 413 4 no zeros 2 9
41 417 4 always zero 2 9
42 421 4 no zeros 2 9
43 425 4 always zero 2 9
myisampack displays the following kinds of information:

- **normal**
  The number of columns for which no extra packing is used.

- **empty-space**
  The number of columns containing values that are only spaces. These occupy one bit.

- **empty-zero**
  The number of columns containing values that are only binary zeros. These occupy one bit.

- **empty-fill**
  The number of integer columns that do not occupy the full byte range of their type. These are changed to a smaller type. For example, a BIGINT column (eight bytes) can be stored as a TINYINT column (one byte) if all its values are in the range from \(-128\) to \(127\).

- **pre-space**
  The number of decimal columns that are stored with leading spaces. In this case, each value contains a count for the number of leading spaces.

- **end-space**
  The number of columns that have a lot of trailing spaces. In this case, each value contains a count for the number of trailing spaces.

- **table-lookup**
  The column had only a small number of different values, which were converted to an ENUM before Huffman compression.

- **zero**
  The number of columns for which all values are zero.

- **Original trees**
  The initial number of Huffman trees.

- **After join**
  The number of distinct Huffman trees left after joining trees to save some header space.

After a table has been compressed, the Field lines displayed by `myisamchk -dvv` include additional information about each column:

- **Type**

</table>
The data type. The value may contain any of the following descriptors:

- **constant**
  All rows have the same value.
- **no endspace**
  Do not store endspace.
- **no endspace, not_always**
  Do not store endspace and do not do endspace compression for all values.
- **no endspace, no empty**
  Do not store endspace. Do not store empty values.
- **table-lookup**
  The column was converted to an **ENUM**.
- **zerofill\((N)\)**
  The most significant \(N\) bytes in the value are always 0 and are not stored.
- **no zeros**
  Do not store zeros.
- **always zero**
  Zero values are stored using one bit.
- **Huff tree**
  The number of the Huffman tree associated with the column.
- **Bits**
  The number of bits used in the Huffman tree.

After you run **myisampack**, use **myisamchk** to re-create any indexes. At this time, you can also sort the index blocks and create statistics needed for the MySQL optimizer to work more efficiently:

```
shell> myisamchk -rq --sort-index --analyze tbl_name.MYI
```

After you have installed the packed table into the MySQL database directory, you should execute **mysqladmin flush-tables** to force **mysqld** to start using the new table.

To unpack a packed table, use the **--unpack** option to **myisamchk**.

### 4.6.6 mysqlaccess — Client for Checking Access Privileges

**mysqlaccess** is a diagnostic tool that Yves Carlier has provided for the MySQL distribution. It checks the access privileges for a host name, user name, and database combination. Note that **mysqlaccess** checks access using only the **user**, **db**, and **host** tables. It does not check table, column, or routine privileges specified in the **tables_priv**, **columns_priv**, or **procs_priv** tables.

Invoke **mysqlaccess** like this:
mysqlaccess supports the following options.

Table 4.13 mysqlaccess Options

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--brief</td>
<td>Generate reports in single-line tabular format</td>
</tr>
<tr>
<td>--commit</td>
<td>Copy the new access privileges from the temporary tables to the original grant tables</td>
</tr>
<tr>
<td>--copy</td>
<td>Reload the temporary grant tables from original ones</td>
</tr>
<tr>
<td>--db</td>
<td>Specify the database name</td>
</tr>
<tr>
<td>--debug</td>
<td>Specify the debug level</td>
</tr>
<tr>
<td>--help</td>
<td>Display help message and exit</td>
</tr>
<tr>
<td>--host</td>
<td>Connect to MySQL server on given host</td>
</tr>
<tr>
<td>--howto</td>
<td>Display some examples that show how to use mysqlaccess</td>
</tr>
<tr>
<td>--old_server</td>
<td>Assume that the server is an old MySQL server (prior to MySQL 3.21)</td>
</tr>
<tr>
<td>--password</td>
<td>Password to use when connecting to server</td>
</tr>
<tr>
<td>--plan</td>
<td>Display suggestions and ideas for future releases</td>
</tr>
<tr>
<td>--preview</td>
<td>Show the privilege differences after making changes to the temporary grant tables</td>
</tr>
<tr>
<td>--relnotes</td>
<td>Display release notes</td>
</tr>
<tr>
<td>--rhost</td>
<td>Connect to MySQL server on given host</td>
</tr>
<tr>
<td>--rollback</td>
<td>Undo the most recent changes to the temporary grant tables.</td>
</tr>
<tr>
<td>--spassword</td>
<td>Password to use when connecting to server as the superuser</td>
</tr>
<tr>
<td>--superuser</td>
<td>Specify the user name for connecting as the superuser</td>
</tr>
<tr>
<td>--table</td>
<td>Generate reports in table format</td>
</tr>
<tr>
<td>--user</td>
<td>MySQL user name to use when connecting to server</td>
</tr>
<tr>
<td>--version</td>
<td>Display version information and exit</td>
</tr>
</tbody>
</table>

- **--help, -?**
  Display a help message and exit.

- **--brief, -b**
  Generate reports in single-line tabular format.

- **--commit**
  Copy the new access privileges from the temporary tables to the original grant tables. The grant tables must be flushed for the new privileges to take effect. (For example, execute a `mysqladmin reload` command.)

- **--copy**
  Reload the temporary grant tables from original ones.

- **--db=db_name, -d db_name**
  Specify the database name.

- **--debug=N**
Specify the debug level. \( N \) can be an integer from 0 to 3.

- `--host=host_name, -h host_name`
  The host name to use in the access privileges.

- `--howto`
  Display some examples that show how to use `mysqlaccess`.

- `--old_server`
  Assume that the server is an old MySQL server (before MySQL 3.21) that does not yet know how to handle full `WHERE` clauses.

- `--password[=password], -p[password]`
  The password to use when connecting to the server. If you omit the `password` value following the `--password` or `-p` option on the command line, `mysqlaccess` prompts for one.

  Specifying a password on the command line should be considered insecure. See Section 6.1.2.1, “End-User Guidelines for Password Security”.

- `--plan`
  Display suggestions and ideas for future releases.

- `--preview`
  Show the privilege differences after making changes to the temporary grant tables.

- `--relnotes`
  Display the release notes.

- `--rhost=host_name, -H host_name`
  Connect to the MySQL server on the given host.

- `--rollback`
  Undo the most recent changes to the temporary grant tables.

- `--spassword[=password], -P[password]`
  The password to use when connecting to the server as the superuser. If you omit the `password` value following the `--spassword` or `-p` option on the command line, `mysqlaccess` prompts for one.

  Specifying a password on the command line should be considered insecure. See Section 6.1.2.1, “End-User Guidelines for Password Security”.

- `--superuser=user_name, -U user_name`
  Specify the user name for connecting as the superuser.

- `--table, -t`
  Generate reports in table format.

- `--user=user_name, -u user_name`
  The user name to use in the access privileges.
mysqlbinlog — Utility for Processing Binary Log Files

• --version, -v

Display version information and exit.

If your MySQL distribution is installed in some nonstandard location, you must change the location where mysqlaccess expects to find the mysql client. Edit the mysqlaccess script at approximately line 18. Search for a line that looks like this:

```bash
$MYSQL = '/usr/local/bin/mysql';    # path to mysql executable
```

Change the path to reflect the location where mysql actually is stored on your system. If you do not do this, a Broken pipe error will occur when you run mysqlaccess.

4.6.7 mysqlbinlog — Utility for Processing Binary Log Files

The server's binary log consists of files containing "events" that describe modifications to database contents. The server writes these files in binary format. To display their contents in text format, use the mysqlbinlog utility. You can also use mysqlbinlog to display the contents of relay log files written by a slave server in a replication setup because relay logs have the same format as binary logs. The binary log and relay log are discussed further in Section 5.4.4, “The Binary Log”, and Section 16.2.2, “Replication Relay and Status Logs”.

Invoke mysqlbinlog like this:

```bash
shell> mysqlbinlog [options] log_file ...
```

For example, to display the contents of the binary log file named binlog.000003, use this command:

```bash
shell> mysqlbinlog binlog.000003
```

The output includes events contained in binlog.000003. For statement-based logging, event information includes the SQL statement, the ID of the server on which it was executed, the timestamp when the statement was executed, how much time it took, and so forth. For row-based logging, the event indicates a row change rather than an SQL statement. See Section 16.1.2, “Replication Formats”, for information about logging modes.

Events are preceded by header comments that provide additional information. For example:

```bash
# at 141
#100309  9:28:36 server id 123  end_log_pos 245
  Query thread_id=3350  exec_time=11  error_code=0
```

In the first line, the number following at indicates the file offset, or starting position, of the event in the binary log file.

The second line starts with a date and time indicating when the statement started on the server where the event originated. For replication, this timestamp is propagated to slave servers. server_id is the server_id value of the server where the event originated. end_log_pos indicates where the next event starts (that is, it is the end position of the current event + 1). thread_id indicates which thread executed the event. exec_time is the time spent executing the event, on a master server. On a slave, it is the difference of the end execution time on the slave minus the beginning execution time on the master. The difference serves as an indicator of how much replication lags behind the master. error_code indicates the result from executing the event. Zero means that no error occurred.

Note

When using event groups, the file offsets of events may be grouped together and the comments of events may be grouped together. Do not mistake these grouped events for blank file offsets.
The output from `mysqlbinlog` can be re-executed (for example, by using it as input to `mysql`) to redo the statements in the log. This is useful for recovery operations after a server crash. For other usage examples, see the discussion later in this section and in Section 7.5, “Point-in-Time (Incremental) Recovery Using the Binary Log”.

Normally, you use `mysqlbinlog` to read binary log files directly and apply them to the local MySQL server. It is also possible to read binary logs from a remote server by using the `--read-from-remote-server` option. To read remote binary logs, the connection parameter options can be given to indicate how to connect to the server. These options are `--host`, `--password`, `--port`, `--protocol`, `--socket`, and `--user`; they are ignored except when you also use the `--read-from-remote-server` option.

When running `mysqlbinlog` against a large binary log, be careful that the filesystem has enough space for the resulting files. To configure the directory that `mysqlbinlog` uses for temporary files, use the `TMPDIR` environment variable.

`mysqlbinlog` supports the following options, which can be specified on the command line or in the `[mysqlbinlog]` and `[client]` groups of an option file. For information about option files used by MySQL programs, see Section 4.2.6, “Using Option Files”.

**Table 4.14 `mysqlbinlog` Options**

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
<th>Introduced</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--base64-output</code></td>
<td>Print binary log entries using base-64 encoding</td>

<tr>
<td>--version</td>
<td>Display version information and exit</td>
<td></td>
</tr>
</tbody>
</table>

- **--help, -?**

Display a help message and exit.

- **--base64-output [=value]**

This option determines when events should be displayed encoded as base-64 strings using BINLOG statements. The option has these permissible values (not case sensitive):

- **AUTO** ("automatic") or **UNSPEC** ("unspecified") displays BINLOG statements automatically when necessary (that is, for format description events and row events). If no **--base64-output** option is given, the effect is the same as **--base64-output=AUTO**.

**Note**

Automatic BINLOG display is the only safe behavior if you intend to use the output of mysqlbinlog to re-execute binary log file contents. The other option values are intended only for debugging or testing purposes because they may produce output that does not include all events in executable form.
• **ALWAYS** displays BINLOG statements whenever possible. If the `--base64-output` option is given without a value, the effect is the same as `--base64-output=ALWAYS`.

• **NEVER** causes BINLOG statements not to be displayed. *mysqlbinlog* exits with an error if a row event is found that must be displayed using BINLOG.

• **DECODE-ROWS** specifies to *mysqlbinlog* that you intend for row events to be decoded and displayed as commented SQL statements by also specifying the `--verbose` option. Like **NEVER**, **DECODE-ROWS** suppresses display of BINLOG statements, but unlike **NEVER**, it does not exit with an error if a row event is found.

The `--base64-output` option was introduced in MySQL 5.1.5, to be given as `--base64-output` or `--skip-base64-output` (with the sense of **AUTO** or **NEVER**). The option values described in the preceding list may be used as of MySQL 5.1.24, with the exception of **UNSPEC** and **DECODE-ROWS**, which are available as of MySQL 5.1.28.

For examples that show the effect of `--base64-output` and `--verbose` on row event output, see Section 4.6.7.2, “*mysqlbinlog* Row Event Display”.

• **--bind-address=ip_address**

On a computer having multiple network interfaces, use this option to select which interface to use for connecting to the MySQL server.

This option is supported only in the version of *mysqlbinlog* that is supplied with MySQL Cluster, beginning with MySQL Cluster NDB 6.3.4. It is not available in standard MySQL 5.1 releases.

• **--character-sets-dir=dir_name**

The directory where character sets are installed. See Section 10.5, “Character Set Configuration”.

• **--database=db_name, -d db_name**

This option causes *mysqlbinlog* to output entries from the binary log (local log only) that occur while `db_name` is been selected as the default database by USE.

The `--database` option for *mysqlbinlog* is similar to the `--binlog-do-db` option for *mysqld*, but can be used to specify only one database. If `--database` is given multiple times, only the last instance is used.

The effects of this option depend on whether the statement-based or row-based logging format is in use, in the same way that the effects of `--binlog-do-db` depend on whether statement-based or row-based logging is in use.

**Statement-based logging.** The `--database` option works as follows:

• While `db_name` is the default database, statements are output whether they modify tables in `db_name` or a different database.

• Unless `db_name` is selected as the default database, statements are not output, even if they modify tables in `db_name`.

• There is an exception for **CREATE DATABASE**, **ALTER DATABASE**, and **DROP DATABASE**. The database being *created*, *altered*, or *dropped* is considered to be the default database when determining whether to output the statement.

Suppose that the binary log was created by executing these statements using statement-based-logging:

```sql
INSERT INTO test.t1 {i} VALUES(100);
```
**mysqlbinlog — Utility for Processing Binary Log Files**

```sql
INSERT INTO db2.t2 (j) VALUES(200);
USE test;
INSERT INTO test.t1 (i) VALUES(101);
INSERT INTO t1 (i) VALUES(102);
INSERT INTO db2.t2 (j) VALUES(201);
USE db2;
INSERT INTO test.t1 (i) VALUES(103);
INSERT INTO db2.t2 (j) VALUES(202);
INSERT INTO t2 (j) VALUES(203);
```

`mysqlbinlog --database=test` does not output the first two `INSERT` statements because there is no default database. It outputs the three `INSERT` statements following `USE test`, but not the three `INSERT` statements following `USE db2`.

`mysqlbinlog --database=db2` does not output the first two `INSERT` statements because there is no default database. It does not output the three `INSERT` statements following `USE test`, but does output the three `INSERT` statements following `USE db2`.

**Row-based logging.** `mysqlbinlog` outputs only entries that change tables belonging to `db_name`. The default database has no effect on this. Suppose that the binary log just described was created using row-based logging rather than statement-based logging. `mysqlbinlog --database=test` outputs only those entries that modify `t1` in the test database, regardless of whether `USE` was issued or what the default database is.

If a server is running with `binlog_format` set to `MIXED` and you want it to be possible to use `mysqlbinlog` with the `--database` option, you must ensure that tables that are modified are in the database selected by `USE`. (In particular, no cross-database updates should be used.)

This option did not work correctly for `mysqlbinlog` with row-based logging prior to MySQL 5.1.37. (Bug #42941)

---

**Note**

Prior to MySQL Cluster NDB 7.0.28 and MySQL Cluster NDB 7.1.17, this option did not work correctly with MySQL Cluster tables unless, unless the binary log was generated using `--log-bin-use-v1-row-events=0` (Bug #13067813)

---

- `--debug[=debug_options],-# [debug_options]`
  
  Write a debugging log. A typical `debug_options` string is `d:t:o,file_name`. The default is `d:t:o,/tmp/mysqlbinlog.trace`.

- `--debug-check`
  
  Print some debugging information when the program exits. This option was added in MySQL 5.1.21.

- `--debug-info`
  
  Print debugging information and memory and CPU usage statistics when the program exits. This option was added in MySQL 5.1.21.

- `--defaults-extra-file=file_name`
  
  Read this option file after the global option file but (on Unix) before the user option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is the full path name to the file.

- `--defaults-file=file_name`
  
  Use only the given option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is the full path name to the file.

- `--defaults-group-suffix=str`
Read not only the usual option groups, but also groups with the usual names and a suffix of `str`. For example, `mysqlbinlog` normally reads the `[client]` and `[mysqlbinlog]` groups. If the `--defaults-group-suffix=_other` option is given, `mysqlbinlog` also reads the `[client_other]` and `[mysqlbinlog_other]` groups.

- **--disable-log-bin, -D**

Disable binary logging. This is useful for avoiding an endless loop if you use the `--to-last-log` option and are sending the output to the same MySQL server. This option also is useful when restoring after a crash to avoid duplication of the statements you have logged.

This option requires that you have the `SUPER` privilege. It causes `mysqlbinlog` to include a `SET sql_log_bin = 0` statement in its output to disable binary logging of the remaining output. The `SET` statement is ineffective unless you have the `SUPER` privilege.

- **--force-if-open, -F**

Read binary log files even if they are open or were not closed properly. This option was added in MySQL 5.1.15.

- **--force-read, -f**

With this option, if `mysqlbinlog` reads a binary log event that it does not recognize, it prints a warning, ignores the event, and continues. Without this option, `mysqlbinlog` stops if it reads such an event.

- **--hexdump, -H**

Display a hex dump of the log in comments, as described in Section 4.6.7.1, “`mysqlbinlog` Hex Dump Format”. The hex output can be helpful for replication debugging. This option was added in MySQL 5.1.2.

- **--host=host_name, -h host_name**

Get the binary log from the MySQL server on the given host.

- **--local-load=dir_name, -l dir_name**

Prepare local temporary files for `LOAD DATA INFILE` in the specified directory.

---

**Important**

These temporary files are not automatically removed by `mysqlbinlog` or any other MySQL program.

- **--no-defaults**

Do not read any option files. If program startup fails due to reading unknown options from an option file, `--no-defaults` can be used to prevent them from being read.

- **--offset=N, -o N**

Skip the first `N` entries in the log.

- **--password[=password], -p[password]**

The password to use when connecting to the server. If you use the short option form (`-p`), you cannot have a space between the option and the password. If you omit the `password` value following the `--password` or `-p` option on the command line, `mysqlbinlog` prompts for one.
Specifying a password on the command line should be considered insecure. See Section 6.1.2.1, “End-User Guidelines for Password Security”. You can use an option file to avoid giving the password on the command line.

- **--port=port_num, -P port_num**

  The TCP/IP port number to use for connecting to a remote server.

- **--position=N**

  Deprecated. Use **--start-position** instead. **--position** is removed in MySQL 5.5.

- **--print-defaults**

  Print the program name and all options that it gets from option files.

- **--protocol={TCP | SOCKET | PIPE | MEMORY}**

  The connection protocol to use for connecting to the server. It is useful when the other connection parameters normally would cause a protocol to be used other than the one you want. For details on the permissible values, see Section 4.2.2, “Connecting to the MySQL Server”.

- **--read-from-remote-server, -R**

  Read the binary log from a MySQL server rather than reading a local log file. Any connection parameter options are ignored unless this option is given as well. These options are **--host, --password, --port, --protocol, --socket**, and **--user**.

  This option requires that the remote server be running. It works only for binary log files on the remote server, not relay log files.

- **--result-file=name, -r name**

  Direct output to the given file.

- **--server-id=id**

  Display only those events created by the server having the given server ID. This option is available as of MySQL 5.1.4.

- **--server-id-bits=N**

  Use only the first \( N \) bits of the server_id to identify the server. If the binary log was written by a mysql with server-id-bits set to less than 32 and user data stored in the most significant bit, running mysqlbinlog with **--server-id-bits** set to 32 enables this data to be seen.

  This option was added in MySQL Cluster NDB 7.0.17 and MySQL Cluster NDB 7.1.6, and is supported only by the versions of mysqlbinlog supplied with these and later releases of MySQL Cluster.

- **--set-charset=charset_name**

  Add a SET NAMES \( \text{charset}_name \) statement to the output to specify the character set to be used for processing log files. This option was added in MySQL 5.1.12.

- **--shared-memory-base-name=name**

  On Windows, the shared-memory name to use, for connections made using shared memory to a local server. The default value is MYSQL. The shared-memory name is case sensitive.

  The server must be started with the **--shared-memory** option to enable shared-memory connections.
This option was added in MySQL 5.1.41.

- **--short-form**, `-s`  
  Display only the statements contained in the log, without any extra information or row-based events. This is for testing only, and should not be used in production systems.

- **--socket=path**, `-S path`  
  For connections to localhost, the Unix socket file to use, or, on Windows, the name of the named pipe to use.

- **--start-datetime=datatime**  
  Start reading the binary log at the first event having a timestamp equal to or later than the `datetime` argument. The `datetime` value is relative to the local time zone on the machine where you run `mysqlbinlog`. The value should be in a format accepted for the `DATETIME` or `TIMESTAMP` data types. For example:

  ```shell> mysqlbinlog --start-datetime="2005-12-25 11:25:56" binlog.000003```

  This option is useful for point-in-time recovery. See Section 7.3, “Example Backup and Recovery Strategy”.

- **--start-position=N**, `-j N`  
  Start reading the binary log at the first event having a position equal to or greater than `N`. This option applies to the first log file named on the command line.

  This option is useful for point-in-time recovery. See Section 7.3, “Example Backup and Recovery Strategy”.

- **--stop-datetime=datatime**  
  Stop reading the binary log at the first event having a timestamp equal to or later than the `datatime` argument. This option is useful for point-in-time recovery. See the description of the `--start-datetime` option for information about the `datetime` value.

  This option is useful for point-in-time recovery. See Section 7.3, “Example Backup and Recovery Strategy”.

- **--stop-position=N**  
  Stop reading the binary log at the first event having a position equal to or greater than `N`. This option applies to the last log file named on the command line.

  This option is useful for point-in-time recovery. See Section 7.3, “Example Backup and Recovery Strategy”.

- **--to-last-log**, `-t`  
  Do not stop at the end of the requested binary log from a MySQL server, but rather continue printing until the end of the last binary log. If you send the output to the same MySQL server, this may lead to an endless loop. This option requires `--read-from-remote-server`.

- **--user=user_name**, `-u user_name`  
  The MySQL user name to use when connecting to a remote server.

- **--verbose**, `-v`
mysqlbinlog — Utility for Processing Binary Log Files

Reconstruct row events and display them as commented SQL statements. If this option is given twice, the output includes comments to indicate column data types and some metadata. This option was added in MySQL 5.1.28.

For examples that show the effect of --base64-output and --verbose on row event output, see Section 4.6.7.2, “mysqlbinlog Row Event Display”.

• --version, -V

Display version information and exit.

In MySQL 5.1, the version number shown for mysqlbinlog is always 3.3.

You can also set the following variable by using --var_name=value syntax:

• open_files_limit

Specify the number of open file descriptors to reserve.

You can pipe the output of mysqlbinlog into the mysql client to execute the events contained in the binary log. This technique is used to recover from a crash when you have an old backup (see Section 7.5, “Point-in-Time (Incremental) Recovery Using the Binary Log”). For example:

```
shell> mysqlbinlog binlog.000001 | mysql -u root -p
```

Or:

```
shell> mysqlbinlog binlog.[0-9]* | mysql -u root -p
```

You can also redirect the output of mysqlbinlog to a text file instead, if you need to modify the statement log first (for example, to remove statements that you do not want to execute for some reason). After editing the file, execute the statements that it contains by using it as input to the mysql program:

```
shell> mysqlbinlog binlog.000001 > tmpfile
shell> ... edit tmpfile ...
shell> mysql -u root -p < tmpfile
```

When mysqlbinlog is invoked with the --start-position option, it displays only those events with an offset in the binary log greater than or equal to a given position (the given position must match the start of one event). It also has options to stop and start when it sees an event with a given date and time. This enables you to perform point-in-time recovery using the --stop-datetime option (to be able to say, for example, “roll forward my databases to how they were today at 10:30 a.m.”).

If you have more than one binary log to execute on the MySQL server, the safe method is to process them all using a single connection to the server. Here is an example that demonstrates what may be unsafe:

```
shell> mysqlbinlog binlog.000001 | mysql -u root -p # DANGER!!
shell> mysqlbinlog binlog.000002 | mysql -u root -p # DANGER!!
```

Processing binary logs this way using multiple connections to the server causes problems if the first log file contains a CREATE TEMPORARY TABLE statement and the second log contains a statement that uses the temporary table. When the first mysql process terminates, the server drops the temporary table. When the second mysql process attempts to use the table, the server reports “unknown table.”

To avoid problems like this, use a single mysql process to execute the contents of all binary logs that you want to process. Here is one way to do so:
Another approach is to write all the logs to a single file and then process the file:

```
shell> mysqlbinlog binlog.000001 binlog.000002 | mysql -u root -p
```

MySQLbinlog can produce output that reproduces a `LOAD DATA INFILE` operation without the original data file. MySQLbinlog copies the data to a temporary file and writes a `LOAD DATA LOCAL INFILE` statement that refers to the file. The default location of the directory where these files are written is system-specific. To specify a directory explicitly, use the `--local-load` option.

Because MySQLbinlog converts `LOAD DATA INFILE` statements to `LOAD DATA LOCAL INFILE` statements (that is, it adds `LOCAL`), both the client and the server that you use to process the statements must be configured with the `LOCAL` capability enabled. See Section 6.1.6, “Security Issues with LOAD DATA LOCAL”.

### Warning

The temporary files created for `LOAD DATA LOCAL` statements are *not* automatically deleted because they are needed until you actually execute those statements. You should delete the temporary files yourself after you no longer need the statement log. The files can be found in the temporary file directory and have names like `original_file_name-#-#`.

#### 4.6.7.1 MySQLbinlog Hex Dump Format

The `--hexdump` option causes MySQLbinlog to produce a hex dump of the binary log contents:

```
shell> mysqlbinlog --hexdump master-bin.000001
```

The hex output consists of comment lines beginning with `#`, so the output might look like this for the preceding command:

```
/*!100019 SET @session.max_insert_delayed_threads=0*/;
/*!150003 SET @OLD_COMPLETION_TYPE=@@COMPLETION_TYPE,COMPLETION_TYPE=0*/;
# at 4
#051024 17:24:13 server id 1 end_log_pos 98
# Position Timestamp Type Master ID Size Master Pos Flags
# 00000004 9d fc 5c 43 0f 01 00 00 00 5e 00 00 00 62 00 00 00 00 00
# 00000017 04 00 35 2e 30 2e 31 35 2d 64 65 62 75 67 2d 6c |..5.0.15.debug.l|
# 00000027 6f 67 00 00 00 00 00 00 00 00 00 00 00 00 00 00 |og..............|
# 00000037 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 |................|
# 00000047 00 00 00 00 9d fc 5c 43 13 38 0d 00 08 00 12 00 |.......C.8......|
#       Start: binlog v 4, server v 5.0.15-debug-log created 051024 17:24:13
#       at startup
ROLLBACK;
```

Hex dump output currently contains the elements in the following list. This format is subject to change. For more information about binary log format, see MySQL Internals: The Binary Log.

- **Position**: The byte position within the log file.
- **Timestamp**: The event timestamp. In the example shown, '9d fc 5c 43' is the representation of '051024 17:24:13' in hexadecimal.
- **Type**: The event type code. In the example shown, '0f' indicates a `FORMAT_DESCRIPTION_EVENT`. The following table lists the possible type codes.

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>UNKNOWN_EVENT</td>
<td>This event should never be present in the log.</td>
</tr>
<tr>
<td>Type</td>
<td>Name</td>
<td>Meaning</td>
</tr>
<tr>
<td>------</td>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>01</td>
<td>START_EVENT_V3</td>
<td>This indicates the start of a log file written by MySQL 4 or earlier.</td>
</tr>
<tr>
<td>02</td>
<td>QUERY_EVENT</td>
<td>The most common type of events. These contain statements executed on the master.</td>
</tr>
<tr>
<td>03</td>
<td>STOP_EVENT</td>
<td>Indicates that master has stopped.</td>
</tr>
<tr>
<td>04</td>
<td>ROTATE_EVENT</td>
<td>Written when the master switches to a new log file.</td>
</tr>
<tr>
<td>05</td>
<td>INTVAR_EVENT</td>
<td>Used for AUTO_INCREMENT values or when the LAST_INSERT_ID() function is used in the statement.</td>
</tr>
<tr>
<td>06</td>
<td>LOAD_EVENT</td>
<td>Used for LOAD_DATA_INFILE in MySQL 3.23.</td>
</tr>
<tr>
<td>07</td>
<td>SLAVE_EVENT</td>
<td>Reserved for future use.</td>
</tr>
<tr>
<td>08</td>
<td>CREATE_FILE_EVENT</td>
<td>Used for LOAD_DATA_INFILE statements. This indicates the start of execution of such a statement.</td>
</tr>
<tr>
<td>09</td>
<td>APPEND_BLOCK_EVENT</td>
<td>Contains data for use in a LOAD_DATA_INFILE statement. The data is stored in the temporary file on the slave.</td>
</tr>
<tr>
<td>0a</td>
<td>EXEC_LOAD_EVENT</td>
<td>Used for LOAD_DATA_INFILE statements. The contents of the temporary file is stored in the table on the slave.</td>
</tr>
<tr>
<td>0b</td>
<td>DELETE_FILE_EVENT</td>
<td>Rollback of a LOAD_DATA_INFILE statement. The temporary file should be deleted on the slave.</td>
</tr>
<tr>
<td>0c</td>
<td>NEW_LOAD_EVENT</td>
<td>Used for LOAD_DATA_INFILE in MySQL 4 and earlier.</td>
</tr>
<tr>
<td>0d</td>
<td>RAND_EVENT</td>
<td>Used to send information about random values if the RAND() function is used in the statement.</td>
</tr>
<tr>
<td>0e</td>
<td>USER_VAR_EVENT</td>
<td>Used to replicate user variables.</td>
</tr>
<tr>
<td>0f</td>
<td>FORMAT_DESCRIPTION_EVENT</td>
<td>This indicates the start of a log file written by MySQL 5 or later.</td>
</tr>
<tr>
<td>10</td>
<td>XID_EVENT</td>
<td>Event indicating commit of an XA transaction.</td>
</tr>
<tr>
<td>11</td>
<td>BEGIN_LOAD_QUERY_EVENT</td>
<td>Used for LOAD_DATA_INFILE statements in MySQL 5 and later.</td>
</tr>
<tr>
<td>12</td>
<td>EXECUTE_LOAD_QUERY_EVENT</td>
<td>Used for LOAD_DATA_INFILE statements in MySQL 5 and later.</td>
</tr>
<tr>
<td>13</td>
<td>TABLE_MAP_EVENT</td>
<td>Information about a table definition. Used in MySQL 5.1.5 and later.</td>
</tr>
<tr>
<td>14</td>
<td>PRE_GA_WRITE_ROWS_EVENT</td>
<td>Row data for a single table that should be created. Used in MySQL 5.1.5 to 5.1.17.</td>
</tr>
<tr>
<td>15</td>
<td>PRE_GA_UPDATE_ROWS_EVENT</td>
<td>Row data for a single table that needs to be updated. Used in MySQL 5.1.5 to 5.1.17.</td>
</tr>
<tr>
<td>16</td>
<td>PRE_GA_DELETE_ROWS_EVENT</td>
<td>Row data for a single table that should be deleted. Used in MySQL 5.1.5 to 5.1.17.</td>
</tr>
<tr>
<td>17</td>
<td>WRITE_ROWS_EVENT</td>
<td>Row data for a single table that should be created. Used in MySQL 5.1.18 and later.</td>
</tr>
<tr>
<td>18</td>
<td>UPDATE_ROWS_EVENT</td>
<td>Row data for a single table that needs to be updated. Used in MySQL 5.1.18 and later.</td>
</tr>
<tr>
<td>19</td>
<td>DELETE_ROWS_EVENT</td>
<td>Row data for a single table that should be deleted. Used in MySQL 5.1.18 and later.</td>
</tr>
<tr>
<td>1a</td>
<td>INCIDENT_EVENT</td>
<td>Something out of the ordinary happened. Added in MySQL 5.1.18.</td>
</tr>
</tbody>
</table>
• Master ID: The server ID of the master that created the event.
• Size: The size in bytes of the event.
• Master Pos: The position of the next event in the original master log file.
• Flags: 16 flags. The following flags are used. The others are reserved for future use.

<table>
<thead>
<tr>
<th>Flag</th>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>LOG_EVENT_BINLOG_IN_USE_F</td>
<td>Log file correctly closed. (Used only in FORMAT_DESCRIPTION_EVENT.) If this flag is set (if the flags are, for example, '01 00') in a FORMAT_DESCRIPTION_EVENT, the log file has not been properly closed. Most probably this is because of a master crash (for example, due to power failure).</td>
</tr>
<tr>
<td>02</td>
<td>Reserved for future use.</td>
<td></td>
</tr>
<tr>
<td>04</td>
<td>LOG_EVENT_THREAD_SPECIFIC</td>
<td>Set if the event is dependent on the connection it was executed in (for example, '04 00'), for example, if the event uses temporary tables.</td>
</tr>
<tr>
<td>08</td>
<td>LOG_EVENT_SUPPRESS_USE_F</td>
<td>Set in some circumstances when the event is not dependent on the default database.</td>
</tr>
</tbody>
</table>

4.6.7.2 mysqlbinlog Row Event Display

The following examples illustrate how mysqlbinlog displays row events that specify data modifications. These correspond to events with the WRITE_ROWS_EVENT, UPDATE_ROWS_EVENT, and DELETE_ROWS_EVENT type codes. The --base64-output=DECODE-ROWS and --verbose options may be used to affect row event output. These options are available as of MySQL 5.1.28.

Suppose that the server is using row-based binary logging and that you execute the following sequence of statements:

```
CREATE TABLE t
(
  id   INT NOT NULL,
  name VARCHAR(20) NOT NULL,
  date DATE NULL
) ENGINE = InnoDB;
START TRANSACTION;
INSERT INTO t VALUES(1, 'apple', NULL);
UPDATE t SET name = 'pear', date = '2009-01-01' WHERE id = 1;
DELETE FROM t WHERE id = 1;
COMMIT;
```

By default, mysqlbinlog displays row events encoded as base-64 strings using BINLOG statements. Omitting extraneous lines, the output for the row events produced by the preceding statement sequence looks like this:

```
shell> mysqlbinlog log_file
...
# at 218
#080828 15:03:08 server id 1  end_log_pos 258  Write_rows: table id 17 flags: STMT_END_F
BINLOG 'fAS3SbBAAAALAAAANoAAAAABEAAAAB48HR1c3QAAXQAAwMPCg1uAQ='
# at 302
#080828 15:03:08 server id 1  end_log_pos 356  Update_rows: table id 17 flags: STMT_END_F
```

387
mysqlbinlog — Utility for Processing Binary Log Files

BINLOG 'fAS3SBMBAAAAALAAAAAC4BAAAAAABEEAABABH1c3QAAXQAAMgA4MgFDCgIUIAAQ='
fAS3SBgBAAAAAxgQAABAAAABAAAABABHR1c3QAAXQAAwMPGcIUIAAQ=
'/*!*/;
# at 400
#080828 15:03:08 server id 1 end_log_pos 442 Delete_rows: table id 17 flags: STMT_END_F

BINLOG 'fAS3SBMBAAAAALAAAAAJABAABABEAAAABAAAABABHR1c3QAAXQAAwMPGcIUIAAQ=
'/*!*/;

To see the row events as comments in the form of “pseudo-SQL” statements, run mysqlbinlog with the --verbose or -v option. The output will contain lines beginning with ###:

```
shell> mysqlbinlog -v log_file
...
# at 218
#080828 15:03:08 server id 1 end_log_pos 258 Write_rows: table id 17 flags: STMT_END_F

BINLOG 'fAS3SBMBAAAAALAAAAAnAABABABABABABH1c3QAAXQAAwMPGcIUIAAQ=
'/*!*/;
### INSERT INTO test.t
### SET
###   @1=1
###   @2='apple'
###   @3=NULL
...
# at 302
#080828 15:03:08 server id 1 end_log_pos 356 Update_rows: table id 17 flags: STMT_END_F

BINLOG 'fAS3SBMBAAAAALAAAAAC4BAAAAAABEEAABABH1c3QAAXQAAwMPGcIUIAAQ=
'/*!*/;
### UPDATE test.t
### WHERE
###   @1=1
###   @2='apple'
###   @3=NULL
### SET
###   @1=1
###   @2='pear'
###   @3='2009:01:01'
...
# at 302
#080828 15:03:08 server id 1 end_log_pos 356 Update_rows: table id 17 flags: STMT_END_F

BINLOG 'fAS3SBMBAAAAALAAAAAJABAABABEAAAABAAAABABHR1c3QAAXQAAwMPGcIUIAAQ=
'/*!*/;
### DELETE FROM test.t
### WHERE
###   @1=1
###   @2='pear'
###   @3='2009:01:01'
```

Specify --verbose or -v twice to also display data types and some metadata for each column. The output will contain an additional comment following each column change:

```
shell> mysqlbinlog -vv log_file
...
# at 218
#080828 15:03:08 server id 1 end_log_pos 258 Write_rows: table id 17 flags: STMT_END_F
```
You can tell `mysqlbinlog` to suppress the `BINLOG` statements for row events by using the `--base64-output=DECODE-ROWS` option. This is similar to `--base64-output=NEVER` but does not exit with an error if a row event is found. The combination of `--base64-output=DECODE-ROWS` and `--verbose` provides a convenient way to see row events only as SQL statements:

```
shell> mysqlbinlog --v --base64-output=DECODE-ROWS log_file
...  
# at 218
#080828 15:03:08 server id 1  end_log_pos 258  Write_rows: table id 17 flags: STMT_END_F
### INSERT INTO test.t
### SET
###   @1=1 /* INT meta=0 nullable=0 is_null=0 */
###   @2='apple' /* STRING(20) meta=0 nullable=0 is_null=0 */
###   @3=NULL /* STRING(20) meta=0 nullable=1 is_null=1 */
### WHERE
###   @1=1 /* INT meta=0 nullable=0 is_null=0 */
###   @2='apple' /* STRING(20) meta=0 nullable=0 is_null=0 */
###   @3='2009:01:01' /* DATE meta=0 nullable=1 is_null=0 */
...  
# at 302
#080828 15:03:08 server id 1  end_log_pos 356  Update_rows: table id 17 flags: STMT_END_F
### UPDATE test.t
### WHERE
###   @1=1 /* INT meta=0 nullable=0 is_null=0 */
###   @2='apple' /* STRING(20) meta=0 nullable=0 is_null=0 */
###   @3='2009:01:01' /* DATE meta=0 nullable=1 is_null=0 */
...  
# at 400
#080828 15:03:08 server id 1  end_log_pos 442  Delete_rows: table id 17 flags: STMT_END_F
### DELETE FROM test.t
### WHERE
###   @1=1 /* INT meta=0 nullable=0 is_null=0 */
###   @2='pear' /* STRING(20) meta=0 nullable=0 is_null=0 */
###   @3='2009:01:01' /* DATE meta=0 nullable=1 is_null=0 */
...```
### WHERE
###   @1=1
###   @2='pear'
###   @3='2009:01:01'

**Note**

You should not suppress BINLOG statements if you intend to re-execute `mysqlbinlog` output.

The SQL statements produced by `--verbose` for row events are much more readable than the corresponding BINLOG statements. However, they do not correspond exactly to the original SQL statements that generated the events. The following limitations apply:

- The original column names are lost and replaced by `@N`, where `N` is a column number.
- Character set information is not available in the binary log, which affects string column display:
  - There is no distinction made between corresponding binary and nonbinary string types (BINARY and CHAR, VARBINARY and VARCHAR, BLOB and TEXT). The output uses a data type of STRING for fixed-length strings and VARSTRING for variable-length strings.
  - For multibyte character sets, the maximum number of bytes per character is not present in the binary log, so the length for string types is displayed in bytes rather than in characters. For example, STRING(4) will be used as the data type for values from either of these column types:

```plaintext
CHAR(4) CHARACTER SET latin1
CHAR(2) CHARACTER SET ucs2
```

- Due to the storage format for events of type UPDATE_ROWS_EVENT, UPDATE statements are displayed with the WHERE clause preceding the SET clause.

Proper interpretation of row events requires the information from the format description event at the beginning of the binary log. Because `mysqlbinlog` does not know in advance whether the rest of the log contains row events, by default it displays the format description event using a BINLOG statement in the initial part of the output.

If the binary log is known not to contain any events requiring a BINLOG statement (that is, no row events), the `--base64-output=NEVER` option can be used to prevent this header from being written.

### 4.6.8 mysqlslowsq — Summarize Slow Query Log Files

The MySQL slow query log contains information about queries that take a long time to execute (see Section 5.4.5, “The Slow Query Log”). `myslqslowsq` parses MySQL slow query log files and prints a summary of their contents.

Normally, `myslqslowsq` groups queries that are similar except for the particular values of number and string data values. It “abstracts” these values to `N` and `'S'` when displaying summary output. The `-a` and `-n` options can be used to modify value abstracting behavior.

Invoke `myslqslowsq` like this:

```bash
shell> mysqlslowsq [options] [log_file ...]
```

`myslqslowsq` supports the following options.

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-a</td>
<td>Do not abstract all numbers to N and strings to S</td>
</tr>
<tr>
<td>-n</td>
<td>Abstract numbers with at least the specified digits</td>
</tr>
</tbody>
</table>
### mysqlslownum — Summarize Slow Query Log Files

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--debug</td>
<td>Write debugging information</td>
</tr>
<tr>
<td>-g</td>
<td>Only consider statements that match the pattern</td>
</tr>
<tr>
<td>--help</td>
<td>Display help message and exit</td>
</tr>
<tr>
<td>-h</td>
<td>Host name of the server in the log file name</td>
</tr>
<tr>
<td>-i</td>
<td>Name of the server instance</td>
</tr>
<tr>
<td>-l</td>
<td>Do not subtract lock time from total time</td>
</tr>
<tr>
<td>-r</td>
<td>Reverse the sort order</td>
</tr>
<tr>
<td>-s</td>
<td>How to sort output</td>
</tr>
<tr>
<td>-t</td>
<td>Display only first num queries</td>
</tr>
<tr>
<td>--verbose</td>
<td>Verbose mode</td>
</tr>
</tbody>
</table>

- **--help**
  Display a help message and exit.
- **-a**
  Do not abstract all numbers to \(N\) and strings to '"S".'
- **--debug, -d**
  Run in debug mode.
- **-g pattern**
  Consider only queries that match the (grep-style) pattern.
- **-h host_name**
  Host name of MySQL server for *-slow.log file name. The value can contain a wildcard. The default is * (match all).
- **-i name**
  Name of server instance (if using mysql.server startup script).
- **-l**
  Do not subtract lock time from total time.
- **-n N**
  Abstract numbers with at least \(N\) digits within names.
- **-r**
  Reverse the sort order.
- **-s sort_type**
  How to sort the output. The value of sort_type should be chosen from the following list:
  - **t, at**: Sort by query time or average query time
  - **l, al**: Sort by lock time or average lock time
  - **r, ar**: Sort by rows sent or average rows sent
• **c**: Sort by count

By default, `mysqldumpslow` sorts by average query time (equivalent to `-s at`).

• **-t N**

Display only the first $N$ queries in the output.

• **--verbose, -v**

Verbose mode. Print more information about what the program does.

Example of usage:

```
shell> mysqldumpslow
```

Reading mysql slow query log from /usr/local/mysql/data/mysqld51-apple-slow.log
Count: 1 Time=4.32s (4s)  Lock=0.00s (0s)  Rows=0.0 (0), root[root]@localhost
insert into t2 select * from t1

Count: 3 Time=2.53s (7s)  Lock=0.00s (0s)  Rows=0.0 (0), root[root]@localhost
insert into t2 select * from t1 limit N

Count: 3 Time=2.13s (6s)  Lock=0.00s (0s)  Rows=0.0 (0), root[root]@localhost
insert into t1 select * from t1

### 4.6.9 mysqlhotcopy — A Database Backup Program

`mysqlhotcopy` is a Perl script that was originally written and contributed by Tim Bunce. It uses `FLUSH TABLES`, `LOCK TABLES`, and `cp` or `scp` to make a database backup. It is a fast way to make a backup of the database or single tables, but it can be run only on the same machine where the database directories are located. `mysqlhotcopy` works only for backing up MyISAM and ARCHIVE tables. It runs on Unix and NetWare.

To use `mysqlhotcopy`, you must have read access to the files for the tables that you are backing up, the `SELECT` privilege for those tables, the `RELOAD` privilege (to be able to execute `FLUSH TABLES`), and the `LOCK TABLES` privilege (to be able to lock the tables).

```
shell> mysqlhotcopy db_name [/path/to/new_directory]

shell> mysqlhotcopy db_name_1 ... db_name_n /path/to/new_directory
```

Back up tables in the given database that match a regular expression:

```
shell> mysqlhotcopy db_name/*.regex/
```

The regular expression for the table name can be negated by prefixing it with a tilde (`~`):

```
shell> mysqlhotcopy db_name/~regex/
```

`mysqlhotcopy` supports the following options, which can be specified on the command line or in the `[mysqlhotcopy]` and `[client]` groups of an option file. For information about option files used by MySQL programs, see Section 4.2.6, “Using Option Files”.

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--addtodest</td>
<td>Do not rename target directory (if it exists); merely add files to it</td>
</tr>
<tr>
<td>Format</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>--allowold</td>
<td>Do not abort if a target exists; rename it by adding an _old suffix</td>
</tr>
<tr>
<td>--checkpoint</td>
<td>Insert checkpoint entries</td>
</tr>
<tr>
<td>--chroot</td>
<td>Base directory of the chroot jail in which mysqld operates</td>
</tr>
<tr>
<td>--debug</td>
<td>Write debugging log</td>
</tr>
<tr>
<td>--dryrun</td>
<td>Report actions without performing them</td>
</tr>
<tr>
<td>--flushlog</td>
<td>Flush logs after all tables are locked</td>
</tr>
<tr>
<td>--help</td>
<td>Display help message and exit</td>
</tr>
<tr>
<td>--host</td>
<td>Connect to MySQL server on given host</td>
</tr>
<tr>
<td>--keepold</td>
<td>Do not delete previous (renamed) target when done</td>
</tr>
<tr>
<td>--method</td>
<td>The method for copying files</td>
</tr>
<tr>
<td>--noindices</td>
<td>Do not include full index files in the backup</td>
</tr>
<tr>
<td>--password</td>
<td>Password to use when connecting to server</td>
</tr>
<tr>
<td>--port</td>
<td>TCP/IP port number to use for connection</td>
</tr>
<tr>
<td>--quiet</td>
<td>Be silent except for errors</td>
</tr>
<tr>
<td>--regexp</td>
<td>Copy all databases with names that match the given regular expression</td>
</tr>
<tr>
<td>--resetmaster</td>
<td>Reset the binary log after locking all the tables</td>
</tr>
<tr>
<td>--resetslave</td>
<td>Reset the master.info file after locking all the tables</td>
</tr>
<tr>
<td>--socket</td>
<td>For connections to localhost, the Unix socket file to use</td>
</tr>
<tr>
<td>--tmpdir</td>
<td>The temporary directory</td>
</tr>
<tr>
<td>--user</td>
<td>MySQL user name to use when connecting to server</td>
</tr>
</tbody>
</table>

- **--help, -?**

  Display a help message and exit.

- **--addtodest**

  Do not rename target directory (if it exists); merely add files to it.

- **--allowold**

  Do not abort if a target exists; rename it by adding an _old suffix.

- **--checkpoint=db_name.tbl_name**

  Insert checkpoint entries into the specified database db_name and table tbl_name.

- **--chroot=dir_name**

  Base directory of the chroot jail in which mysqld operates. The dir_name value should match that of the --chroot option given to mysqld.

- **--debug**

  Enable debug output.

- **--dryrun, -n**

  Report actions without performing them.

- **--flushlog**
Flush logs after all tables are locked.

- **--host=host_name, -h host_name**

  The host name of the local host to use for making a TCP/IP connection to the local server. By default, the connection is made to `localhost` using a Unix socket file.

- **--keepold**

  Do not delete previous (renamed) target when done.

- **--method=command**

  The method for copying files (`cp` or `scp`). The default is `cp`.

- **--noindices**

  Do not include full index files for MyISAM tables in the backup. This makes the backup smaller and faster. The indexes for reloaded tables can be reconstructed later with `myisamchk -r`. 

- **--password=password, -p password**

  The password to use when connecting to the server. The password value is not optional for this option, unlike for other MySQL programs.

  Specifying a password on the command line should be considered insecure. See Section 6.1.2.1, “End-User Guidelines for Password Security”. You can use an option file to avoid giving the password on the command line.

- **--port=port_num, -P port_num**

  The TCP/IP port number to use when connecting to the local server.

- **--quiet, -q**

  Be silent except for errors.

- **--record_log_pos=db_name.tbl_name**

  Record master and slave status in the specified database `db_name` and table `tbl_name`.

- **--regexp=expr**

  Copy all databases with names that match the given regular expression.

- **--resetmaster**

  Reset the binary log after locking all the tables.

- **--resetslave**

  Reset the `master.info` file after locking all the tables.

- **--socket=path, -S path**

  The Unix socket file to use for connections to `localhost`.

- **--suffix=str**

  The suffix to use for names of copied databases.

- **--tmpdir=dir_name**
The temporary directory. The default is /tmp.

- `--user=user_name, -u user_name`

  The MySQL user name to use when connecting to the server.

Use `perldoc` for additional `mysqlhotcopy` documentation, including information about the structure of the tables needed for the `--checkpoint` and `--record_log_pos` options:

```
shell> perldoc mysqlhotcopy
```

### 4.6.10 mysqlmanager — The MySQL Instance Manager

**Important**

MySQL Instance Manager has been deprecated and is removed in MySQL 5.5.

`mysqlmanager` is the MySQL Instance Manager (IM). This program monitors and manages MySQL Database Server instances. MySQL Instance Manager is available for Unix-like operating systems, as well as Windows. It runs as a daemon that listens on a TCP/IP port. On Unix, it also listens on a Unix socket file.

MySQL Instance Manager can be used in place of the `mysqld_safe` script to start and stop one or more instances of MySQL Server. Because Instance Manager can manage multiple server instances, it can also be used in place of the `mysqld_multi` script. Instance Manager offers these capabilities:

- Instance Manager can start and stop instances, and report on the status of instances.
- Server instances can be treated as guarded or unguarded:
  - When Instance Manager starts, it starts each guarded instance. If the instance crashes, Instance Manager detects this and restarts it. When Instance Manager stops, it stops the instance.
  - A nonguarded instance is not started when Instance Manager starts or monitored by it. If the instance crashes after being started, Instance Manager does not restart it. When Instance Manager exits, it does not stop the instance if it is running.

Instances are guarded by default. An instance can be designated as nonguarded by including the `nonguarded` option in the configuration file.

- Instance Manager provides an interactive interface for configuring instances, so that the need to edit the configuration file manually is reduced or eliminated.
- Instance Manager provides remote instance management. That is, it runs on the host where you want to control MySQL Server instances, but you can connect to it from a remote host to perform instance-management operations.

The following sections describe MySQL Instance Manager operation in more detail.

#### 4.6.10.1 MySQL Instance Manager Command Options

**Important**

MySQL Instance Manager has been deprecated and is removed in MySQL 5.5.

The MySQL Instance Manager supports a number of command options. For a brief listing, invoke `mysqlmanager` with the `--help` option. Options may be given on the command line or in the Instance Manager configuration file. On Windows, the standard configuration file is `my.ini` in the directory
where Instance Manager is installed. On Unix, the standard file is /etc/my.cnf. To specify a different configuration file, start Instance Manager with the --defaults-file option.

mysqlmanager supports the following options. The options for managing entries in the password file are described further in Section 4.6.10.4, "Instance Manager User and Password Management".

- **--help**, -?

  Display a help message and exit.

- **--add-user**

  Add a new user (specified with the --username option) to the password file. This option was added in MySQL 5.1.12.

- **--angel-pid-file=file_name**

  The file in which the angel process records its process ID when mysqlmanager runs in daemon mode (that is, when the --run-as-service option is given). The default file name is mysqlmanager.angel.pid.

  If the --angel-pid-file option is not given, the default angel PID file has the same name as the PID file except that any PID file extension is replaced with an extension of .angel.pid. (For example, mysqlmanager.pid becomes mysqlmanager.angel.pid.)

  This option was added in MySQL 5.1.11.

- **--bind-address=IP**

  The IP address to bind to.

- **--check-password-file**

  Check the validity and consistency of the password file. This option was added in MySQL 5.1.12.

- **--clean-password-file**

  Drop all users from the password file. This option was added in MySQL 5.1.12.

- **--debug=debug_options, -# debug_options**

  Write a debugging log. A typical debug_options string is d:t:o, file_name. This option was added in MySQL 5.1.10.

- **--default-mysqld-path=file_name**

  The path name of the MySQL Server binary. This path name is used for all server instance sections in the configuration file for which no mysqld-path option is present. The default value of this option is the compiled-in path name, which depends on how the MySQL distribution was configured. Example: --default-mysqld-path=/usr/sbin/mysqld

- **--defaults-file=file_name**

  Read Instance Manager and MySQL Server settings from the given file. All configuration changes made by the Instance Manager will be written to this file. This must be the first option on the command line if it is used, and the file must exist.

  If this option is not given, Instance Manager uses its standard configuration file. On Windows, the standard file is my.ini in the directory where Instance Manager is installed. On Unix, the standard file is /etc/my.cnf.

- **--drop-user**
Drop a user (specified with the `--username` option) from the password file. This option was added in MySQL 5.1.12.

- `--edit-user`

Change an entry for an existing user (specified with the `--username` option) in the password file. This option was added in MySQL 5.1.12.

- `--install`

On Windows, install Instance Manager as a Windows service. The service name is MySQL Manager.

- `--list-users`

List the users in the password file. This option was added in MySQL 5.1.12.

- `--log=file_name`

The path to the Instance Manager log file. This option has no effect unless the `--run-as-service` option is also given. If the file name specified for the option is a relative name, the log file is created under the directory from which Instance Manager is started. To ensure that the file is created in a specific directory, specify it as a full path name.

If `--run-as-service` is given without `--log`, the log file is `mysqlmanager.log` in the data directory.

If `--run-as-service` is not given, log messages go to the standard output. To capture log output, you can redirect Instance Manager output to a file:

```bash
mysqlmanager > im.log
```

- `--monitoring-interval=seconds`

The interval in seconds for monitoring server instances. The default value is 20 seconds. Instance Manager tries to connect to each monitored (guarded) instance using the nonexisting `MySQL_Instance_Manager` user account to check whether it is available/not hanging. If the result of the connection attempt indicates that the instance is unavailable, Instance Manager performs several attempts to restart the instance.

Normally, the `MySQL_Instance_Manager` account does not exist, so the connection attempts by Instance Manager cause the monitored instance to produce messages in its general query log similar to the following:

```
Access denied for user 'MySQL_Instance_M'@'localhost' »
(using password: YES)
```

The `nonguarded` option in the appropriate server instance section disables monitoring for a particular instance. If the instance dies after being started, Instance Manager will not restart it. Instance Manager tries to connect to a nonguarded instance only when you request the instance's status (for example, with the `SHOW INSTANCES` status).

See Section 4.6.10.5, “MySQL Server Instance Status Monitoring”, for more information.

- `--mysqld-safe-compatible`

Run in a `mysqld_safe`-compatible manner. For details, see Section 4.6.10.3, “Starting the MySQL Server with MySQL Instance Manager”. This option was added in MySQL 5.1.12.

- `--password=password, -p password`
Specify the password for an entry to be added to or modified in the password file. Unlike the `--password/-p` option for most MySQL programs, the password value is required, not optional. See also Section 4.6.10.4, “Instance Manager User and Password Management”. This option was added in MySQL 5.1.12.

- `--password-file=file_name`

  The name of the file where the Instance Manager looks for users and passwords. On Windows, the default is `mysqlmanager.passwd` in the directory where Instance Manager is installed. On Unix, the default file is `/etc/mysqlmanager.passwd`. See also Section 4.6.10.4, “Instance Manager User and Password Management”.

- `--pid-file=file_name`

  The process ID file to use. On Windows, the default file is `mysqlmanager.pid` in the directory where Instance Manager is installed. On Unix, the default is `mysqlmanager.pid` in the data directory.

- `--port=port_num`

  The port number to use when listening for TCP/IP connections from clients. The default port number (assigned by IANA) is 2273.

- `--print-defaults`

  Print the current defaults and exit. This must be the first option on the command line if it is used.

- `--print-password-line`

  Prepare an entry for the password file, print it to the standard output, and exit. You can redirect the output from Instance Manager to a file to save the entry in the file.

  Prior to MySQL 5.1.12, this option was named `--passwd`.

- `--remove`

  On Windows, removes Instance Manager as a Windows service. This assumes that Instance Manager has been run with `--install` previously.

- `--run-as-service`

  On Unix, daemonize and start an angel process. The angel process monitors Instance Manager and restarts it if it crashes. (The angel process itself is simple and unlikely to crash.)

- `--socket=path`

  On Unix, the socket file to use for incoming connections. The default file is named `/tmp/mysqlmanager.sock`. This option has no meaning on Windows.

- `--standalone`

  This option is used on Windows to run Instance Manager in standalone mode. You should specify it when you start Instance Manager from the command line.

- `--user=user_name`

  On Unix, the user name of the system account to use for starting and running `mysqlmanager`. This option generates a warning and has no effect unless you start `mysqlmanager` as `root` (so that it can change its effective user ID), or as the named user. It is recommended that you configure `mysqlmanager` to run using the same account used to run the `mysqld` server. (“User” in this context refers to a system login account, not a MySQL user listed in the grant tables.)
**mysqlmanager — The MySQL Instance Manager**

- **--username=user_name, -u user_name**
  Specify the user name for an entry to be added to or modified in the password file. This option was added in MySQL 5.1.12.

- **--version, -V**
  Display version information and exit.

- **--wait-timeout=N**
  The number of seconds to wait for activity on an incoming connection before closing it. The default is 28800 seconds (8 hours).
  This option was added in MySQL 5.1.7. Before that, the timeout is 30 seconds and cannot be changed.

### 4.6.10.2 MySQL Instance Manager Configuration Files

**Important**
MySQL Instance Manager has been deprecated and is removed in MySQL 5.5.

Instance Manager uses its standard configuration file unless it is started with a **--defaults-file** option that specifies a different file. On Windows, the standard file is `my.ini` in the directory where Instance Manager is installed. On Unix, the standard file is `/etc/my.cnf`.

Instance Manager reads options for itself from the [manager] section of the configuration file, and options for server instances from [mysqld] or [mysqldN] sections. The [manager] section contains any of the options listed in Section 4.6.10.1, “MySQL Instance Manager Command Options”, except for those specified as having to be given as the first option on the command line. Here is a sample [manager] section:

```plaintext
# MySQL Instance Manager options section
[manager]
default-mysqld-path = /usr/local/mysql/libexec/mysqld
socket=/tmp/manager.sock
pid-file=/tmp/manager.pid
password-file = /home/cps/.mysqlmanager.passwd
monitoring-interval = 2
port = 1999
bind-address = 192.168.1.5
```

Each [mysqld] or [mysqldN] instance section specifies options given by Instance Manager to a server instance at startup. These are mainly common MySQL Server options (see Section 5.1.3, “Server Command Options”). In addition, a [mysqldN] section can contain the options in the following list, which are specific to Instance Manager. These options are interpreted by Instance Manager itself; it does not pass them to the server when it attempts to start that server.

**Warning**
The Instance Manager-specific options must not be used in a [mysqld] section. If a server is started without using Instance Manager, it will not recognize these options and will fail to start properly.

- **mysqld-path = file_name**
  The path name of the mysqld server binary to use for the server instance.

- **nonguarded**
  This option disables Instance Manager monitoring functionality for the server instance. By default, an instance is guarded: At Instance Manager start time, it starts the instance. It also monitors
the instance status and attempts to restart it if it fails. At Instance Manager exit time, it stops the instance. None of these things happen for nonguarded instances.

• \textit{shutdown-delay} = \textit{seconds}

The number of seconds Instance Manager should wait for the server instance to shut down. The default value is 35 seconds. After the delay expires, Instance Manager assumes that the instance is hanging and attempts to terminate it. If you use InnoDB with large tables, you should increase this value.

Here are some sample instance sections:

```
[mysqld1]
mysqld-path=/usr/local/mysql/libexec/mysqld
socket=/tmp/mysql.sock
port=3307
server_id=1
skip-stack-trace
core-file
log-bin
log-error
log=mylog
log-slow-queries

[mysqld2]
nonguarded
port=3308
server_id=2
mysqld-path= /home/cps/mysql/trees/mysql-5.1/sql/mysqld
socket = /tmp/mysql.sock5
pid-file = /tmp/hostname.pid5
datadir= /home/cps/mysql_data/data_dir1
language=/home/cps/mysql/trees/mysql-5.1/sql/share/english
log-bin
log=/tmp/fordel.log
```

### 4.6.10.3 Starting the MySQL Server with MySQL Instance Manager

**Important**

MySQL Instance Manager has been deprecated and is removed in MySQL 5.5.

This section discusses how Instance Manager starts server instances when it starts. However, before you start Instance Manager, you should set up a password file for it. Otherwise, you will not be able to connect to Instance Manager to control it after it starts. For details about creating Instance Manager accounts, see Section 4.6.10.4, “Instance Manager User and Password Management”.

On Unix, the \texttt{mysqld} MySQL database server normally is started with the \texttt{mysql.server} script, which usually resides in the \texttt{/etc/init.d/} folder. That script invokes the \texttt{mysqld_safe} script by default. However, you can use Instance Manager instead if you modify the \texttt{/etc/my.cnf} configuration file by adding \texttt{use-manager} to the \texttt{[mysql.server]} section:

```
[mysql.server]
use-manager
```

Before MySQL 5.1.12, Instance Manager always tries to start at least one server instance: When it starts, it reads its configuration file if it exists to find server instance sections and prepare a list of instances. Instance sections have names of the form \texttt{[mysqld]} or \texttt{[mysqldN]}, where \texttt{N} is an unsigned integer (for example, \texttt{[mysqld1]}, \texttt{[mysqld2]}, and so forth).

After preparing the list of instances, Instance Manager starts the guarded instances in the list. If there are no instances, Instance Manager creates an instance named \texttt{mysqld} and attempts to start it with default (compiled-in) configuration values. This means that the Instance Manager cannot find the \texttt{mysqld} program if it is not installed in the default location. (Section 2.1.4, “Installation Layouts”,
The MySQL Instance Manager describes default locations for components of MySQL distributions. If you have installed the MySQL server in a nonstandard location, you should create the Instance Manager configuration file.

The startup behavior just described is similar to that of mysqld_safe, which always attempts to start a server. However, it lacks the flexibility required for some operations because it is not possible to run Instance Manager in such a way that it refrains from starting any server instances. For example, you cannot invoke Instance Manager for the purpose of configuring an instance without also starting it (a task that a MySQL installer application might want to perform). Consequently, MySQL 5.1.12 introduces the following changes:

- A new option, \(--\text{mysqld-safe-compatible}\), may be used to cause Instance Manager to run with startup behavior similar to that used before MySQL 5.1.12: If Instance Manager finds a \([\text{mysqld}]\) instance section in the configuration file, it will start it. If Instance Manager finds no \([\text{mysqld}]\) section, it creates one using default configuration values, writes a \([\text{mysqld}]\) section to the configuration file if it is accessible, and starts the \text{mysqld} instance. Instance Manager also starts any other guarded instances listed in the configuration file.

- Without \(--\text{mysqld-safe-compatible}\), Instance Manager reads its configuration file if it exists and starts instances for any guarded instance sections that it finds. If there are none, it starts no instances.

Instance Manager also stops all guarded server instances when it shuts down.

The permissible options for \([\text{mysqldN}]\) server instance sections are described in Section 4.6.10.2, “MySQL Instance Manager Configuration Files”. In these sections, you can use a special \text{mysqld-path=path-to-mysqld-binary} option that is recognized only by Instance Manager. Use this option to let Instance Manager know where the \text{mysqld} binary resides. If there are multiple instances, it may also be necessary to set other options such as \text{datadir} and \text{port}, to ensure that each instance has a different data directory and TCP/IP port number. Section 5.5, “Running Multiple MySQL Instances on One Machine”, discusses the configuration values that must differ for each instance when you run multiple instance on the same machine.

**Warning**

The \([\text{mysqld}]\) instance section, if it exists, must not contain any Instance Manager-specific options.

The typical Unix startup/shutdown cycle for a MySQL server with the MySQL Instance Manager enabled is as follows:

1. The /etc/init.d/mysql script starts MySQL Instance Manager.
2. Instance Manager starts the guarded server instances and monitors them.
3. If a server instance fails, Instance Manager restarts it.
4. If Instance Manager is shut down (for example, with the /etc/init.d/mysql stop command), it shuts down all server instances.

### 4.6.10.4 Instance Manager User and Password Management

**Important**

MySQL Instance Manager has been deprecated and is removed in MySQL 5.5.

The Instance Manager stores its user information in a password file. On Windows, the default is mysqlmanager.passwd in the directory where Instance Manager is installed. On Unix, the default file is /etc/mysqlmanager.passwd. To specify a different location for the password file, use the \(--\text{password-file}\) option.

If the password file does not exist or contains no password entries, you cannot connect to the Instance Manager.
Entries in the password file have the following format, where the two fields are the account user name and encrypted password, separated by a colon:

```
petr:*35110DC9B4D814DF5DE667E28C72DD2597B5C848
```

Instance Manager password encryption is the same as that used by MySQL Server. It is a one-way operation; no means are provided for decrypting encrypted passwords.

Instance Manager accounts differ somewhat from MySQL Server accounts:

- MySQL Server accounts are associated with a host name, user name, and password (see Section 6.3.1, “User Names and Passwords”).
- Instance Manager accounts are associated with a user name and password only.

This means that a client can connect to Instance Manager with a given user name from any host. To limit connections so that clients can connect only from the local host, start Instance Manager with the `--bind-address=127.0.0.1` option so that it listens only to the local network interface. Remote clients will not be able to connect. Local clients can connect like this:

```
shell> mysql -h 127.0.0.1 -P 2273
```

Before MySQL 5.1.12, the only option for creating password file entries is `--passwd`, which causes Instance Manager to prompt for user name and password values and display the resulting entry. You can save the output in the `/etc/mysqlmanager.passwd` password file to store it. Here is an example:

```
shell> mysqlmanager --passwd >> /etc/mysqlmanager.passwd
```

At the prompts, enter the user name and password for the new Instance Manager user. You must enter the password twice. It does not echo to the screen, so double entry guards against entering a different password than you intend (if the two passwords do not match, no entry is generated).

The preceding command causes the following line to be added to `/etc/mysqlmanager.passwd`:

```
mike:*BBF1F551DD9DD96A01E66EC7DDC073911B6D17BA
```

Use of the `--passwd` option fails if `mysqlmanager` is invoked directly from an IBM 5250 terminal. To work around this, use a command like the following from the command line to generate the password entry:

```
shell> mysql -B --skip-column-name -e 'SELECT CONCAT("user_name",":",PASSWORD("pass_val"));'
```

The output from the command can be used as an entry in the `/etc/mysqlmanager.passwd` file.

Beginning with MySQL 5.1.12, the `--passwd` option is renamed to `--print-password-line` and there are several other options for managing user accounts from the command line. For example, the `--username` and `--password` options are available on the command line for specifying the user name and password for an account entry. You can use them to generate an entry with no prompting like this (type the command on a single line):
If you omit the `--username` or `--password` option, Instance Manager prompts for the required value.

`--print-password-line` causes Instance Manager to send the resulting account entry to its output, which you can append to the password file. The following list describes other account-management options that cause Instance Manager to operate directly on the password file. (These options make Instance Manager scriptable for account-management purposes.) For operations on the password file to succeed, the file must exist and it must be accessible by Instance Manager. (The exception is `--clean-password-file`, which creates the file if it does not exist. Alternatively, if there is no password file, manually create it as an empty file and ensure that its ownership and access modes permit it to be read and written by Instance Manager.) The default password file is used unless you specify a `--password-file` option.

To ensure consistent treatment of the password file, it should be owned by the system account that you use for running Instance Manager to manage server instances, and you should invoke it from that account when you use it to manage accounts in the password file.

- **Create a new user:**
  ```
  mysqlmanager --add-user --username=user_name [--password=password]
  ```
  This command adds a new entry with the given user name and password to the password file. The `--username` (or `-u`) option is required. `mysqlmanager` prompts for the password if it is not given on the command line with the `--password` (or `-p`) option. The command fails if the user already exists.

- **Drop an existing user:**
  ```
  mysqlmanager --drop-user --username=user_name
  ```
  This command removes the entry with the given user name from the password file. The user name is required. The command fails if the user does not exist.

- **Change the password for an existing user:**
  ```
  mysqlmanager --edit-user --username=user_name [--password=password]
  ```
  This command changes the given user's password in the password file. The user name is required. `mysqlmanager` prompts for the password if it is not given on the command line. The command fails if the user does not exist.

- **List existing users:**
  ```
  mysqlmanager --list-users
  ```
  This command lists the user names of the accounts in the password file.

- **Check the password file:**
  ```
  mysqlmanager --check-password-file
  ```
  This command performs a consistency and validity check of the password file. The command fails if there is something wrong with the file.

- **Empty the password file:**
This command empties the password file, which has the effect of dropping all users listed in it. The option creates the password file if it does not exist, so it can be used to initialize a new password file to be used for other account-management operations. Take care not to use this option to reinitialize a file containing accounts that you do not want to drop.

### 4.6.10.5 MySQL Server Instance Status Monitoring

⚠️ **Important**

MySQL Instance Manager has been deprecated and is removed in MySQL 5.5.

To monitor the status of each guarded server instance, the MySQL Instance Manager attempts to connect to the instance at regular intervals using the `MySQL_Instance_Manager@localhost` user account with a password of `check_connection`.

You are not required to create this account for MySQL Server; in fact, it is expected that it will not exist. Instance Manager can tell that a server is operational if the server accepts the connection attempt but refuses access for the account by returning a login error. However, these failed connection attempts are logged by the server to its general query log (see Section 5.4.3, "The General Query Log").

Instance Manager also attempts a connection to nonguarded server instances when you use the `SHOW INSTANCES` or `SHOW INSTANCE STATUS` command. This is the only status monitoring done for nonguarded instances.

Instance Manager knows if a server instance fails at startup because it receives a status from the attempt. For an instance that starts but later crashes, Instance Manager receives a signal because it is the parent process of the instance.

Beginning with MySQL 5.1.12, Instance Manager tracks instance states so that it can determine which commands are permitted for each instance. For example, commands that modify an instance's configuration are permitted only while the instance is offline.

Each instance is in one of the states described in the following table. Guarded instances can be in any of the states. Nonguarded instances can only be offline or online. Instance state information is displayed in the `state` column of the `SHOW INSTANCES` and `SHOW INSTANCE STATUS` commands.

<table>
<thead>
<tr>
<th>State</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>offline</td>
<td>The instance has not been started and is not running.</td>
</tr>
<tr>
<td>starting</td>
<td>The instance is starting (initializing). Nonguarded instances cannot be in this state. A nonguarded instance goes directly from offline to online.</td>
</tr>
<tr>
<td>stopping</td>
<td>The instance is stopping. Nonguarded instances cannot be in this state. A nonguarded instance goes directly from online to offline, or stays offline if startup fails.</td>
</tr>
<tr>
<td>online</td>
<td>The instance has started and is running.</td>
</tr>
<tr>
<td>failed</td>
<td>The instance was online but it crashed and is being restarted by Instance Manager, or else the instance failed to start at all and Instance Manager is again attempting to start it. Nonguarded instances cannot be in this state.</td>
</tr>
<tr>
<td>crashed</td>
<td>Instance Manager failed to start the instance after several attempts. (Instance Manager will try again later.) Nonguarded instances cannot be in this state.</td>
</tr>
<tr>
<td>abandoned</td>
<td>Instance Manager was not able to start the instance, has given up, and will make no further attempts until instructed otherwise. To tell Instance Manager to try again, you must first use <code>STOP INSTANCE</code> to put the instance in offline state, and then use <code>START INSTANCE</code> to start the instance. If it is necessary to make configuration changes for the instance, you must do so after putting the instance offline and before starting it. (Instance Manager accepts configuration-changing commands only for offline instances.) Nonguarded instances cannot be in this state.</td>
</tr>
</tbody>
</table>
4.6.10.6 Connecting to MySQL Instance Manager

Important
MySQL Instance Manager has been deprecated and is removed in MySQL 5.5.

After you set up a password file for the MySQL Instance Manager and Instance Manager is running, you can connect to it. The MySQL client/server protocol is used to communicate with the Instance Manager. For example, you can connect to it using the standard `mysql` client program:

```
shell> mysql --port=2273 --host=im.example.org --user=mysql --password
```

Instance Manager supports the version of the MySQL client/server protocol used by the client tools and libraries distributed with MySQL 4.1 or later, so other programs that use the MySQL C API also can connect to it.

4.6.10.7 MySQL Instance Manager Commands

Important
MySQL Instance Manager has been deprecated and is removed in MySQL 5.5.

After you connect to MySQL Instance Manager, you can issue commands. The following general principles apply to Instance Manager command execution:

- Commands that take an instance name fail if the name is not a valid instance name.
- Commands that take an instance name (other than `CREATE INSTANCE`) fail if the instance does not exist.
- As of MySQL 5.1.12, commands for an instance require that the instance be in an appropriate state. You cannot configure or start an instance that is not offline. You cannot start an instance that is online.
- Instance Manager maintains information about instance configuration in an internal (in-memory) cache. Initially, this information comes from the configuration file if it exists, but some commands change the configuration of an instance. Commands that modify the configuration file fail if the file does not exist or is not accessible to Instance Manager.
- As of MySQL 5.1.12, configuration-changing commands modify both the in-memory cache and the server instance section recorded in the configuration file to maintain consistency between them. For this to occur, the instance must be offline and the configuration file must be accessible and not malformed. If the configuration file cannot be updated, the command fails and the cache remains unchanged.
- On Windows, the standard file is `my.ini` in the directory where Instance Manager is installed. On Unix, the standard configuration file is `/etc/my.cnf`. To specify a different configuration file, start Instance Manager with the `--defaults-file` option.
- If a `[mysqld]` instance section exists in the configuration file, it must not contain any Instance Manager-specific options (see Section 4.6.10.2, “MySQL Instance Manager Configuration Files”). Therefore, you must not add any of these options if you change the configuration for an instance named `mysqld`.

The following list describes the commands that Instance Manager accepts, with examples.

- `CREATE INSTANCE instance_name [option_name=[option_value], ...]`

  This command configures a new instance by creating an `[instance_name]` section in the configuration file. The command fails if `instance_name` is not a valid instance name or the instance already exists.
The created section instance is empty if no options are given. Otherwise, the options are added to the section. Options should be given in the same format used when you write options in option files. (See Section 4.2.6, “Using Option Files” for a description of the permissible syntax.) If you specify multiple options, separate them by commas.

For example, to create an instance section named [mysqld98], you might write something like this were you to modify the configuration file directly:

```
[mysqld98]
basedir=/var/mysql98
```

To achieve the same effect using CREATE INSTANCE, issue this command to Instance Manager:

```
mysql> CREATE INSTANCE mysqld98 basedir="/var/mysql98";
Query OK, 0 rows affected (0,00 sec)
```

CREATE INSTANCE creates the instance but does not start it.

If the instance name is the (deprecated) name mysql, the option list cannot include any options that are specific to Instance Manager, such as nonguarded (see Section 4.6.10.2, “MySQL Instance Manager Configuration Files”).

This command was added in MySQL 5.1.12.

• DROP INSTANCE instance_name

This command removes the configuration for instance_name from the configuration file.

```
mysql> DROP INSTANCE mysqld98;
Query OK, 0 rows affected (0,00 sec)
```

The command fails if instance_name is not a valid instance name, the instance does not exist, or is not offline.

This command was added in MySQL 5.1.12.

• START INSTANCE instance_name

This command attempts to start an offline instance. The command is asynchronous; it does not wait for the instance to start.

```
mysql> START INSTANCE mysqld4;
Query OK, 0 rows affected (0,00 sec)
```

• STOP INSTANCE instance_name

This command attempts to stop an instance. The command is synchronous; it waits for the instance to stop.

```
mysql> STOP INSTANCE mysqld4;
Query OK, 0 rows affected (0,00 sec)
```

• SHOW INSTANCES

Shows the names and status of all loaded instances.

```
mysql> SHOW INSTANCES;
+---------------+---------+
| instance_name | status  |
+---------------+---------+
```
SHOW INSTANCE STATUS instance_name

Shows status and version information for an instance.

```sql
mysql> SHOW INSTANCE STATUS mysqld3;
+---------------+--------+---------+
| instance_name | status | version |
+---------------+--------+---------+
| mysqld3       | online | unknown |
+---------------+--------+---------+
```

SHOW INSTANCE OPTIONS instance_name

Shows the options used by an instance.

```sql
mysql> SHOW INSTANCE OPTIONS mysqld3;
+---------------+---------------------------------------------------+
| option_name   | value                                             |
+---------------+---------------------------------------------------+
| instance_name | mysqld3                                           |
| mysqld-path   | /home/cps/mysql/trees/mysql-4.1/sql/mysqld        |
| port          | 3309                                              |
| socket        | /tmp/mysql.sock3                                   |
| pid-file      | hostname.pid3                                      |
| datadir       | /home/cps/mysql_data/data_dir1/                   |
| language      | /home/cps/mysql/trees/mysql-4.1/sql/share/english  |
+---------------+---------------------------------------------------+
```

SHOW instance_name LOG FILES

The command lists all log files used by the instance. The result set contains the path to the log file and the log file size. If no log file path is specified in the instance section of the configuration file (for example, `log=/var/mysql.log`), the Instance Manager tries to guess its placement. If Instance Manager is unable to guess the log file placement you should specify the log file location explicitly by using a log option in the appropriate instance section of the configuration file.

```sql
mysql> SHOW mysqld LOG FILES;
+-------------+------------------------------------+----------+
| Logfile     | Path                               | Filesize |
+-------------+------------------------------------+----------+
| ERROR LOG   | /home/cps/var/mysql/owlet.err      | 9186     |
| GENERAL LOG | /home/cps/var/mysql/owlet.log      | 471503   |
| SLOW LOG    | /home/cps/var/mysql/owlet-slow.log | 4463     |
+-------------+------------------------------------+----------+
```

SHOW ... LOG FILES displays information only about log files. If a server instance uses log tables (see Section 5.4.1, “Selecting General Query and Slow Query Log Output Destinations”), no information about those tables is shown.

Log options are described in Section 5.1.3, “Server Command Options”.

SHOW instance_name LOG {ERROR | SLOW | GENERAL} size[,offset_from_end]

This command retrieves a portion of the specified log file. Because most users are interested in the latest log messages, the `size` parameter defines the number of bytes to retrieve from the end of the log. To retrieve data from the middle of the log file, specify the optional `offset_from_end` parameter. The following example retrieves 21 bytes of data, starting 23 bytes before the end of the log file and ending 2 bytes before the end:
• **SET instance_name.option_name[=option_value]**

This command edits the specified instance's configuration section to change or add instance options. The option is added to the section if it is not already present. Otherwise, the new setting replaces the existing one.

mysql> SET myqld2.port=3322;
Query OK, 0 rows affected (0.00 sec)

As of MySQL 5.1.12, you can specify multiple options (separated by commas), and **SET** can be used only for offline instances. Each option must indicate the instance name:

mysql> SET myqld2.port=3322, myqld3.nonguarded;
Query OK, 0 rows affected (0.00 sec)

Before MySQL 5.1.12, only a single option can be specified. Also, changes made to the configuration file do not take effect until the MySQL server is restarted. In addition, these changes are not stored in the instance manager's local cache of instance settings until a **FLUSH INSTANCES** command is executed.

• **UNSET instance_name.option_name**

This command removes an option from an instance's configuration section.

mysql> UNSET myqld2.port;
Query OK, 0 rows affected (0.00 sec)

As of MySQL 5.1.12, you can specify multiple options (separated by commas), and **UNSET** can be used only for offline instances. Each option must indicate the instance name:

mysql> UNSET myqld2.port, myqld4.nonguarded;
Query OK, 0 rows affected (0.00 sec)

Before MySQL 5.1.12, only a single option can be specified. Also, changes made to the configuration file do not take effect until the MySQL server is restarted. In addition, these changes are not stored in the instance manager's local cache of instance settings until a **FLUSH INSTANCES** command is executed.

• **FLUSH INSTANCES**

As of MySQL 5.1.12, **FLUSH INSTANCES** cannot be used unless all instances are offline. The command causes Instance Manager to reread the configuration file, update its in-memory configuration cache, and start any guarded instances.

Before MySQL 5.1.12, this command forces Instance Manager reread the configuration file and to refresh internal structures. This command should be performed after editing the configuration file. The command does not restart instances.
4.6.11 mysql_convert_table_format — Convert Tables to Use a Given Storage Engine

mysql_convert_table_format converts the tables in a database to use a particular storage engine (MyISAM by default). mysql_convert_table_format is written in Perl and requires that the DBI and DBD::mysql Perl modules be installed (see Section 2.15, “Perl Installation Notes”).

Invoke mysql_convert_table_format like this:

```
shell> mysql_convert_table_format [options] db_name
```

The db_name argument indicates the database containing the tables to be converted.

mysql_convert_table_format supports the options described in the following list.

- **--help**
  Display a help message and exit.

- **--force**
  Continue even if errors occur.

- **--host=host_name**
  Connect to the MySQL server on the given host.

- **--password=password**
  The password to use when connecting to the server. Note that the password value is not optional for this option, unlike for other MySQL programs.

  Specifying a password on the command line should be considered insecure. See Section 6.1.2.1, “End-User Guidelines for Password Security”. You can use an option file to avoid giving the password on the command line.

- **--port=port_num**
  The TCP/IP port number to use for the connection.

- **--socket=path**
  For connections to localhost, the Unix socket file to use.

- **--type=engine_name**
  Specify the storage engine that the tables should be converted to use. The default is MyISAM if this option is not given.

- **--user=user_name**
  The MySQL user name to use when connecting to the server.

- **--verbose**
  Verbose mode. Print more information about what the program does.

- **--version**
  Display version information and exit.

4.6.12 mysql_find_rows — Extract SQL Statements from Files
mysql_find_rows reads files containing SQL statements and extracts statements that match a given regular expression or that contain USE db_name or SET statements. The utility was written for use with update log files (as used prior to MySQL 5.0) and as such expects statements to be terminated with semicolon (;) characters. It may be useful with other files that contain SQL statements as long as statements are terminated with semicolons.

Invoke mysql_find_rows like this:

```
shell> mysql_find_rows [options] [file_name ...]
```

Each file_name argument should be the name of file containing SQL statements. If no file names are given, mysql_find_rows reads the standard input.

Examples:

```
mysql_find_rows --regexp=problem_table --rows=20 < update.log
mysql_find_rows --regexp=problem_table update-log.1 update-log.2
```

mysql_find_rows supports the following options:

- **--help, --Information**
  Display a help message and exit.
- **--regexp=pattern**
  Display queries that match the pattern.
- **--rows=N**
  Quit after displaying N queries.
- **--skip-use-db**
  Do not include USE db_name statements in the output.
- **--start_row=N**
  Start output from this row.

4.6.13 mysql_fix_extensions — Normalize Table File Name Extensions

mysql_fix_extensions converts the extensions for MyISAM (or ISAM) table files to their canonical forms. It looks for files with extensions matching any lettercase variant of .frm, .myd, .myi, .isd, and .ism and renames them to have extensions of .frm, .MYD, .MYI, .ISD, and .ISM, respectively. This can be useful after transferring the files from a system with case-insensitive file names (such as Windows) to a system with case-sensitive file names.

Invoke mysql_fix_extensions like this, where data_dir is the path name to the MySQL data directory.

```
shell> mysql_fix_extensions data_dir
```

4.6.14 mysql_setpermission — Interactively Set Permissions in Grant Tables

mysql_setpermission is a Perl script that was originally written and contributed by Luuk de Boer. It interactively sets permissions in the MySQL grant tables. mysql_setpermission is written in Perl and requires that the DBI and DBD::mysql Perl modules be installed (see Section 2.15, “Perl Installation Notes”).
Invoke `mysql_setpermission` like this:

```
shell> mysql_setpermission [options]
```

`options` should be either `--help` to display the help message, or options that indicate how to connect to the MySQL server. The account used when you connect determines which permissions you have when attempting to modify existing permissions in the grant tables.

`mysql_setpermissions` also reads options from the `[client]` and `[perl]` groups in the `.my.cnf` file in your home directory, if the file exists.

`mysql_setpermission` supports the following options:

• `--help`
  Display a help message and exit.

• `--host=host_name`
  Connect to the MySQL server on the given host.

• `--password=password`
  The password to use when connecting to the server. Note that the password value is not optional for this option, unlike for other MySQL programs.

  Specifying a password on the command line should be considered insecure. See Section 6.1.2.1, “End-User Guidelines for Password Security”. You can use an option file to avoid giving the password on the command line.

• `--port=port_num`
  The TCP/IP port number to use for the connection.

• `--socket=path`
  For connections to `localhost`, the Unix socket file to use.

• `--user=user_name`
  The MySQL user name to use when connecting to the server.

4.6.15 `mysql_waitpid` — Kill Process and Wait for Its Termination

`mysql_waitpid` signals a process to terminate and waits for the process to exit. It uses the `kill()` system call and Unix signals, so it runs on Unix and Unix-like systems.

Invoke `mysql_waitpid` like this:

```
shell> mysql_waitpid [options] pid wait_time
```

`mysql_waitpid` sends signal 0 to the process identified by `pid` and waits up to `wait_time` seconds for the process to terminate. `pid` and `wait_time` must be positive integers.

If process termination occurs within the wait time or the process does not exist, `mysql_waitpid` returns 0. Otherwise, it returns 1.

If the `kill()` system call cannot handle signal 0, `mysql_waitpid()` uses signal 1 instead.

`mysql_waitpid` supports the following options:

• `--help, -?, -I`
mysql_zap — Kill Processes That Match a Pattern

mysql_zap kills processes that match a pattern. It uses the ps command and Unix signals, so it runs on Unix and Unix-like systems.

Invoke mysql_zap like this:

```
shell> mysql_zap [-signal] [-?Ift] pattern
```

A process matches if its output line from the ps command contains the pattern. By default, mysql_zap asks for confirmation for each process. Respond y to kill the process, or q to exit mysql_zap. For any other response, mysql_zap does not attempt to kill the process.

If the -signal option is given, it specifies the name or number of the signal to send to each process. Otherwise, mysql_zap tries first with TERM (signal 15) and then with KILL (signal 9).

mysql_zap supports the following additional options:

- **--help, -?, -I**
  Display a help message and exit.

- **-f**
  Force mode. mysql_zap attempts to kill each process without confirmation.

- **-t**
  Test mode. Display information about each process but do not kill it.

### 4.6.16 mysql_zap — Kill Processes That Match a Pattern

#### 4.7 MySQL Program Development Utilities

This section describes some utilities that you may find useful when developing MySQL programs.

In shell scripts, you can use the my_print_defaults program to parse option files and see what options would be used by a given program. The following example shows the output that my_print_defaults might produce when asked to show the options found in the [client] and [mysql] groups:

```
shell> my_print_defaults client mysql
--port=3306
--socket=/tmp/mysql.sock
--no-auto-rehash
```

Note for developers: Option file handling is implemented in the C client library simply by processing all options in the appropriate group or groups before any command-line arguments. This works well for programs that use the last instance of an option that is specified multiple times. If you have a C or C++ program that handles multiply specified options this way but that doesn't read option files, you need add only two lines to give it that capability. Check the source code of any of the standard MySQL clients to see how to do this.

412
Several other language interfaces to MySQL are based on the C client library, and some of them provide a way to access option file contents. These include Perl and Python. For details, see the documentation for your preferred interface.

4.7.1 msql2mysql — Convert mSQL Programs for Use with MySQL

Initially, the MySQL C API was developed to be very similar to that for the mSQL database system. Because of this, mSQL programs often can be converted relatively easily for use with MySQL by changing the names of the C API functions.

The msql2mysql utility performs the conversion of mSQL C API function calls to their MySQL equivalents. msql2mysql converts the input file in place, so make a copy of the original before converting it. For example, use msql2mysql like this:

```
shell> cp client-prog.c client-prog.c.orig
shell> msql2mysql client-prog.c
client-prog.c converted
```

Then examine client-prog.c and make any post-conversion revisions that may be necessary.

msql2mysql uses the replace utility to make the function name substitutions. See Section 4.8.2, "replace — A String-Replacement Utility".

4.7.2 mysql_config — Display Options for Compiling Clients

mysql_config provides you with useful information for compiling your MySQL client and connecting it to MySQL. It is a shell script, so it is available only on Unix and Unix-like systems.

mysql_config supports the following options.

• --cflags

  Compiler flags to find include files and critical compiler flags and defines used when compiling the libmysqlclient library. The options returned are tied to the specific compiler that was used when the library was created and might clash with the settings for your own compiler. Use --include for more portable options that contain only include paths.

• --include

  Compiler options to find MySQL include files.

• --libmysqld-libs,--embedded

  Libraries and options required to link with the MySQL embedded server.

• --libs

  Libraries and options required to link with the MySQL client library.

• --libs_r

  Libraries and options required to link with the thread-safe MySQL client library.

• --plugindir

  The default plugin directory path name, defined when configuring MySQL. This option was added in MySQL 5.1.24.

• --port

  The default TCP/IP port number, defined when configuring MySQL.
my_print_defaults — Display Options from Option Files

- **--socket**
  
The default Unix socket file, defined when configuring MySQL.

- **--version**
  
  Version number for the MySQL distribution.

If you invoke `mysql_config` with no options, it displays a list of all options that it supports, and their values:

```
shell> mysql_config
Usage: /usr/local/mysql/bin/mysql_config [options]
Options:
  --cflags         [-I/usr/local/mysql/include/mysql -mcpu=pentiumpro]
  --include        [-I/usr/local/mysql/include/mysql]
  --libs           [-L/usr/local/mysql/lib/mysql -lmysqlclient -lz
                        -lcrypt -lnsl -lm]
  --libs_r         [-L/usr/local/mysql/lib/mysql -lmysqlclient_r
                        -lz -lpthread -lcrypt -lnsl -lm -lpthread]
  --socket         [/tmp/mysql.sock]
  --port           [3306]
  --version        [5.1.69]
  --libmysqld-libs [-L/usr/local/mysql/lib/mysql -lmysqld -ldl
                        -lz -lpthread -lcrypt -lnsl -lm -lpthread -lrt]
```

You can use `mysql_config` within a command line using backticks to include the output that it produces for particular options. For example, to compile and link a MySQL client program, use `mysql_config` as follows:

```
gcc -c `mysql_config --cflags` progname.c
gcc -o progname progname.o `mysql_config --libs`
```

### 4.7.3 my_print_defaults — Display Options from Option Files

`my_print_defaults` displays the options that are present in option groups of option files. The output indicates what options will be used by programs that read the specified option groups. For example, the `mysqlcheck` program reads the `[mysqlcheck]` and `[client]` option groups. To see what options are present in those groups in the standard option files, invoke `my_print_defaults` like this:

```
shell> my_print_defaults mysqlcheck client
  --user=myusername
  --password=secret
  --host=localhost
```

The output consists of options, one per line, in the form that they would be specified on the command line.

`my_print_defaults` supports the following options.

- **--help, -?**
  
  Display a help message and exit.

- **--config-file=file_name, --defaults-file=file_name, -c file_name**
  
  Read only the given option file.

- **--debug=debug_options, -# debug_options**
  
  Write a debugging log. A typical `debug_options` string is `d:t:o, file_name`. The default is `d:t:o,/tmp/my_print_defaults.trace`.
resolve_stack_dump — Resolve Numeric Stack Trace Dump to Symbols

- `--defaults-extra-file=file_name, --extra-file=file_name, -e file_name`
  Read this option file after the global option file but (on Unix) before the user option file.
- `--defaults-group-suffix=suffix, -g suffix`
  In addition to the groups named on the command line, read groups that have the given suffix.
- `--no-defaults, -n`
  Return an empty string.
- `--verbose, -v`
  Verbose mode. Print more information about what the program does.
- `--version, -V`
  Display version information and exit.

### 4.7.4 resolve_stack_dump — Resolve Numeric Stack Trace Dump to Symbols

resolve_stack_dump resolves a numeric stack dump to symbols.

Invoke `resolve_stack_dump` like this:

```shell
shell> resolve_stack_dump [options] symbols_file [numeric_dump_file]
```

The symbols file should include the output from the `nm --numeric-sort mysqld` command. The numeric dump file should contain a numeric stack track from `mysqld`. If no numeric dump file is named on the command line, the stack trace is read from the standard input.

resolve_stack_dump supports the following options.

- `--help, -h`
  Display a help message and exit.
- `--numeric-dump-file=file_name, -n file_name`
  Read the stack trace from the given file.
- `--symbols-file=file_name, -s file_name`
  Use the given symbols file.
- `--version, -V`
  Display version information and exit.

For more information, see [Section 22.4.1.5, “Using a Stack Trace”](#).

### 4.8 Miscellaneous Programs

#### 4.8.1 perror — Explain Error Codes

For most system errors, MySQL displays, in addition to an internal text message, the system error code in one of the following styles:
You can find out what the error code means by examining the documentation for your system or by using the `perror` utility.

`perror` prints a description for a system error code or for a storage engine (table handler) error code. Invoke `perror` like this:

```
shell> perror [options] errorcode ...
```

Example:

```
shell> perror 13 64
OS error code 13:  Permission denied
OS error code 64:  Machine is not on the network
```

To obtain the error message for a MySQL Cluster error code, invoke `perror` with the `--ndb` option:

```
shell> perror --ndb errorcode
```

The meaning of system error messages may be dependent on your operating system. A given error code may mean different things on different operating systems.

`perror` supports the following options.

- `--help`, `--info`, `-I`, `-?`
  Display a help message and exit.

- `--ndb`
  Print the error message for a MySQL Cluster error code.

- `--silent`, `-s`
  Silent mode. Print only the error message.

- `--verbose`, `-v`
  Verbose mode. Print error code and message. This is the default behavior.

- `--version`, `-V`
  Display version information and exit.

### 4.8.2 replace — A String-Replacement Utility

The `replace` utility program changes strings in place in files or on the standard input.

Invoke `replace` in one of the following ways:

```
shell> replace from to [from to] ... -- file_name [file_name] ...
shell> replace from to [from to] ... < file_name
```

`from` represents a string to look for and `to` represents its replacement. There can be one or more pairs of strings.

Use the `--` option to indicate where the string-replacement list ends and the file names begin. In this case, any file named on the command line is modified in place, so you may want to make a copy of
the original before converting it. `replace` prints a message indicating which of the input files it actually modifies.

If the `--` option is not given, `replace` reads the standard input and writes to the standard output.

`replace` uses a finite state machine to match longer strings first. It can be used to swap strings. For example, the following command swaps `a` and `b` in the given files, `file1` and `file2`:

```shell
shell> replace a b b a -- file1 file2 ...
```

The `replace` program is used by `msql2mysql`. See Section 4.7.1, “`msql2mysql — Convert mSQL Programs for Use with MySQL`”.

`replace` supports the following options.

- `-?`, `-I`
  Display a help message and exit.

- `-#debug_options`
  Enable debugging.

- `-s`
  Silent mode. Print less information what the program does.

- `-v`
  Verbose mode. Print more information about what the program does.

- `-V`
  Display version information and exit.

### 4.8.3 `resolveip — Resolve Host name to IP Address or Vice Versa`

The `resolveip` utility resolves host names to IP addresses and vice versa.

Invoke `resolveip` like this:

```shell
shell> resolveip [options] {host_name|ip-addr} ...
```

`resolveip` supports the following options.

- `--help`, `--info`, `-?`, `-I`
  Display a help message and exit.

- `--silent`, `-s`
  Silent mode. Produce less output.

- `--version`, `-V`
  Display version information and exit.

End of Product Lifecycle.  Active development for MySQL Database Server version 5.1 has ended. Oracle offers various support offerings which may be of interest. For details and more information, see the MySQL section of the Lifetime Support Policy for Oracle Technology Products (http://www.oracle.com/us/support/lifetime-support/index.html). Please consider upgrading to a recent version.

MySQL Server (mysql) is the main program that does most of the work in a MySQL installation. This chapter provides an overview of MySQL Server and covers general server administration:

• Server configuration
• The data directory, particularly the mysql system database
• The server log files
• Management of multiple servers on a single machine

For additional information on administrative topics, see also:

• Chapter 6, Security
• Chapter 7, Backup and Recovery
• Chapter 16, Replication

5.1 The MySQL Server

419
mysqld is the MySQL server. The following discussion covers these MySQL server configuration topics:

- Startup options that the server supports. You can specify these options on the command line, through configuration files, or both.

- Server system variables. These variables reflect the current state and values of the startup options, some of which can be modified while the server is running.

- Server status variables. These variables contain counters and statistics about runtime operation.

- How to set the server SQL mode. This setting modifies certain aspects of SQL syntax and semantics, for example for compatibility with code from other database systems, or to control the error handling for particular situations.

- The server shutdown process. There are performance and reliability considerations depending on the type of table (transactional or nontransactional) and whether you use replication.

**Note**

Not all storage engines are supported by all MySQL server binaries and configurations. To find out how to determine which storage engines your MySQL server installation supports, see Section 13.7.5.17, “SHOW ENGINES Syntax”.

### 5.1.1 Server Option and Variable Reference

The following table provides a list of all the command line options, server and status variables applicable within mysqld.

The table lists command-line options (Cmd-line), options valid in configuration files (Option file), server system variables (System Var), and status variables (Status Var) in one unified list, with notification of where each option variablename is valid. If a server option set on the command line or in an option file differs from the name of the corresponding server system or status variable, the variable name is noted immediately below the corresponding option. For status variables, the scope of the variable is shown (Scope) as either global, session, or both. Please see the corresponding sections for details on setting and using the options and variables. Where appropriate, a direct link to further information on the item as available.

For a version of this table that is specific to MySQL Cluster, see Section 17.3.2.5, “MySQL Cluster mysqld Option and Variable Reference”.

*This option is dynamic, but only the server should set this information. You should not set the value of this variable manually.

*This option is dynamic, but only the server should set this information. You should not set the value of this variable manually.*
5.1.2 Server Configuration Defaults

The MySQL server has many operating parameters, which you can change at server startup using command-line options or configuration files (option files). It is also possible to change many parameters at runtime. For general instructions on setting parameters at startup or runtime, see Section 5.1.3, “Server Command Options”, and Section 5.1.4, “Server System Variables”.

MySQL provides a number of preconfigured option files that can be used as a basis for tuning the MySQL server. Look for files named my-small.cnf, my-medium.cnf, my-large.cnf, and my-huge.cnf, which are sample option files for small, medium, large, and very large systems. On Windows, the extension is .ini rather than .cnf.

Note

On Windows, the .ini or .cnf option file extension might not be displayed.

For a binary distribution, look for the sample files in or under your installation directory. If you have a source distribution, look in the support-files directory. To use a sample file as a base configuration file, rename a copy of it and place the copy in the appropriate location. Regarding names and appropriate location, see the general information provided in Section 4.2.6, “Using Option Files”. That section also describes option file format and syntax.

5.1.3 Server Command Options

When you start the mysqld server, you can specify program options using any of the methods described in Section 4.2.3, “Specifying Program Options”. The most common methods are to provide options in an option file or on the command line. However, in most cases it is desirable to make sure that the server uses the same options each time it runs. The best way to ensure this is to list them in an option file. See Section 4.2.6, “Using Option Files”. That section also describes option file format and syntax.

mysqld reads options from the [mysqld] and [server] groups. mysqld_safe reads options from the [mysqld], [server], [mysqld_safe], and [safe_mysqld] groups. mysql.server reads options from the [mysqld] and [mysql.server] groups.

An embedded MySQL server usually reads options from the [server], [embedded], and [xxxxx_SERVER] groups, where xxxxx is the name of the application into which the server is embedded.

mysqld accepts many command options. For a brief summary, execute mysqld --help. To see the full list, use mysqld --verbose --help.

The following list shows some of the most common server options. Additional options are described in other sections:

- Options that affect security: See Section 6.1.4, “Security-Related mysqld Options and Variables”.
- SSL-related options: See Section 6.4.5, “Command Options for Secure Connections”.
- Binary log control options: See Section 5.4.4, “The Binary Log”.
- Replication-related options: See Section 16.1.3, “Replication and Binary Logging Options and Variables”.
- Options for loading plugins such as pluggable storage engines: See Section 5.1.8.1, “Installing and Uninstalling Plugins”.
- Options specific to particular storage engines: See Section 14.6.8, “InnoDB Startup Options and System Variables”, Section 14.5.1, “MyISAM Startup Options”, and MySQL Server Options for MySQL Cluster.
Some options control the size of buffers or caches. For a given buffer, the server might need to allocate internal data structures. These structures typically are allocated from the total memory allocated to the buffer, and the amount of space required might be platform dependent. This means that when you assign a value to an option that controls a buffer size, the amount of space actually available might differ from the value assigned. In some cases, the amount might be less than the value assigned. It is also possible that the server will adjust a value upward. For example, if you assign a value of 0 to an option for which the minimal value is 1024, the server will set the value to 1024.

Values for buffer sizes, lengths, and stack sizes are given in bytes unless otherwise specified.

Some options take file name values. Unless otherwise specified, the default file location is the data directory if the value is a relative path name. To specify the location explicitly, use an absolute path name. Suppose that the data directory is /var/mysql/data. If a file-valued option is given as a relative path name, it will be located under /var/mysql/data. If the value is an absolute path name, its location is as given by the path name.

You can also set the values of server system variables at server startup by using variable names as options. To assign a value to a server system variable, use an option of the form --var_name=value. For example, --key_buffer_size=32M sets the key_buffer_size variable to a value of 32MB.

When you assign a value to a variable, MySQL might automatically correct the value to stay within a given range, or adjust the value to the closest permissible value if only certain values are permitted.

To restrict the maximum value to which a system variable can be set at runtime with the SET statement, specify this maximum by using an option of the form --maximum-var_name=value at server startup.

You can change the values of most system variables for a running server with the SET statement. See Section 13.7.4.1, “SET Syntax for Variable Assignment”.

Section 5.1.4, “Server System Variables”, provides a full description for all variables, and additional information for setting them at server startup and runtime. Section 8.12.2, “Tuning Server Parameters”, includes information on optimizing the server by tuning system variables.

• --help, -?

Command-Line Format | --help
---|---
Display a short help message and exit. Use both the --verbose and --help options to see the full message.

• --allow-suspicious-udfs

Command-Line Format | --allow-suspicious-udfs
---|---
Permitted Values | Type Boolean
Default | FALSE

This option controls whether user-defined functions that have only an xxx symbol for the main function can be loaded. By default, the option is off and only UDFs that have at least one auxiliary symbol can be loaded; this prevents attempts at loading functions from shared object files other than those containing legitimate UDFs. See Section 22.3.2.6, “UDF Security Precautions”.

• --ansi

Command-Line Format | --ansi
---|---
Use standard (ANSI) SQL syntax instead of MySQL syntax. For more precise control over the server SQL mode, use the --sql-mode option instead. See Section 1.8, “MySQL Standards Compliance”, and Section 5.1.7, “Server SQL Modes”.

Server Command Options

- **--basedir=dir_name, --basedir=dir_name**

  **Command-Line Format**: `--basedir=dir_name`

  **System Variable**: `basedir`

  **Variable**: Global
  **Scope**: Dynamic
  **Dynamic**: No
  **Permitted Values**: `directory name`

  The path to the MySQL installation directory. All paths are usually resolved relative to this directory.

- **--big-tables**

  **Command-Line Format**: `--big-tables`

  **System Variable**: `big_tables`

  **Variable**: Session
  **Scope**: Dynamic
  **Dynamic**: Yes
  **Permitted Values**: `boolean`
  **Default**: OFF

  Enable large result sets by saving all temporary sets in files. This option prevents most "table full" errors, but also slows down queries for which in-memory tables would suffice. Since MySQL 3.23.2, the server is able to handle large result sets automatically by using memory for small temporary tables and switching to disk tables where necessary.

- **--bind-address=addr**

  **Command-Line Format**: `--bind-address=addr`

  **Permitted Values**: `string`
  **Default**: 0.0.0.0

  The MySQL server listens on a single network socket for TCP/IP connections. This socket is bound to a single address, but it is possible for an address to map onto multiple network interfaces. The default address is 0.0.0.0. To specify an address explicitly, use the `--bind-address=addr` option at server startup, where `addr` is an IPv4 address or a host name. If `addr` is a host name, the server resolves the name to an IPv4 address and binds to that address.

  The server treats different types of addresses as follows:

  - If the address is 0.0.0.0, the server accepts TCP/IP connections on all server host IPv4 interfaces.
  - If the address is a “regular” IPv4 address (such as 127.0.0.1), the server accepts TCP/IP connections only for that particular IPv4 address.

  If you intend to bind the server to a specific address, be sure that the `mysql.user` grant table contains an account with administrative privileges that you can use to connect to that address. Otherwise, you will not be able to shut down the server. For example, if you bind to 0.0.0.0, you can connect to the server using all existing accounts. But if you bind to 127.0.0.1, the server accepts connections only on that address. In this case, first make sure that the 'root'@'127.0.0.1' account is present in the `mysql.user` table so that you can still connect to the server to shut it down.
- `--binlog-format={ROW|STATEMENT|MIXED}`

Specify whether to use row-based, statement-based, or mixed replication (statement-based was the default prior to MySQL 5.1.12; in 5.1.12, the default was changed to mixed replication; in 5.1.29, the default was changed back to statement-based). See Section 16.1.2, “Replication Formats”. This option was added in MySQL 5.1.5.

Under some conditions, changing this variable at runtime is not possible, or causes replication to fail. See Section 5.4.4.2, “Setting The Binary Log Format”, for more information.

**Important**

Setting the binary logging format without enabling binary logging prevents the MySQL server from starting. This is a known issue in MySQL 5.1 which is fixed in MySQL 5.5. (Bug #42928)

**MySQL Cluster.** The default value for this option in all MySQL Cluster NDB 6.1 through 7.1 releases is MIXED. See Section 17.6.2, “General Requirements for MySQL Cluster Replication”, for more information.

- **--bootstrap**

  **Command-Line Format**

  ```
  --bootstrap
  ```

  This option is used by the `mysql_install_db` program to create the MySQL privilege tables without having to start a full MySQL server.

  This option is unavailable if MySQL was configured with the `--disable-grant-options` option. See Section 2.11.4, “MySQL Source-Configuration Options”.

- **--character-sets-dir=dir_name**

  **Command-Line Format**

  ```
  --character-sets-dir=dir_name
  ```

  **System Variable**

<table>
<thead>
<tr>
<th>Name</th>
<th>character_sets_dir</th>
</tr>
</thead>
</table>
  
  **Variable**

  | Global Scope | Dynamic No Variable |
  
  **Permitted Values**

  | Type      | directory name |
  
  The directory where character sets are installed. See Section 10.5, “Character Set Configuration”.

- **--character-set-client-handshake**

  **Command-Line Format**

  ```
  --character-set-client-handshake
  ```
Server Command Options

<table>
<thead>
<tr>
<th>Permitted Values</th>
<th>Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>--skip-character-set-client-handshake</strong>; this makes MySQL behave like MySQL 4.0.</td>
<td><strong>boolean</strong></td>
<td><strong>TRUE</strong></td>
</tr>
</tbody>
</table>

Do not ignore character set information sent by the client. To ignore client information and use the default server character set, use `--skip-character-set-client-handshake`; this makes MySQL behave like MySQL 4.0.

- **--character-set-filesystem=charset_name**

  **Introduced** 5.1.6

  **Command-Line Format**
  ```
  --character-set-filesystem=name
  ```

  **System Variable**
  - **Name**: `character_set_filesystem`
  - **Variable**: Global, Session
  - **Scope**: Dynamic
  - **Dynamic Variable**: Yes
  - **Type**: `string`
  - **Permitted Values**: `binary`

  The file system character set. This option sets the `character_set_filesystem` system variable. It was added in MySQL 5.1.6.

- **--character-set-server=charset_name, -C charset_name**

  **Command-Line Format**
  ```
  --character-set-server
  ```

  **System Variable**
  - **Name**: `character_set_server`
  - **Variable**: Global, Session
  - **Scope**: Dynamic
  - **Dynamic Variable**: Yes
  - **Type**: `string`
  - **Permitted Values**: `latin1`

  Use `charset_name` as the default server character set. See Section 10.5, “Character Set Configuration”. If you use this option to specify a nondefault character set, you should also use `--collation-server` to specify the collation.

- **--chroot=dir_name, -r dir_name**

  **Command-Line Format**
  ```
  --chroot=dir_name
  ```

  **Permitted Values**
  - **Type**: directory name

  Put the `mysqld` server in a closed environment during startup by using the `chroot()` system call. This is a recommended security measure. Use of this option somewhat limits `LOAD DATA INFILE` and `SELECT ... INTO OUTFILE`.

- **--collation-server=collation_name**

  **Command-Line Format**
  ```
  --collation-server
  ```

  **System Variable**
  - **Name**: `collation_server`
  - **Variable**: Global, Session
  - **Scope**: 451
**Server Command Options**

<table>
<thead>
<tr>
<th>Dynamic</th>
<th>Yes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable</td>
<td></td>
</tr>
</tbody>
</table>

**Permitted Values**

<table>
<thead>
<tr>
<th>Type</th>
<th>string</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>latin1_swedish_ci</td>
</tr>
</tbody>
</table>

Use `collation_name` as the default server collation. See Section 10.5, “Character Set Configuration”.

- **--console**

  **Command-Line Format**
 
  `--console`

  **Platform Specific**
  
  Windows

  (Windows only.) Write error log messages to `stderr` and `stdout`. `mysqld` does not close the console window if this option is used.

  If both `--log-error` and `--console` are specified, whichever option is given last takes precedence.

- **--core-file**

  **Command-Line Format**
  
  `--core-file`

  **Permitted Values**
  
<table>
<thead>
<tr>
<th>Type</th>
<th>boolean</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>OFF</td>
</tr>
</tbody>
</table>

  Write a core file if `mysqld` dies. The name and location of the core file is system dependent. On Linux, a core file named `core.pid` is written to the current working directory of the process, which for `mysqld` is the data directory. `pid` represents the process ID of the server process. On OS X, a core file named `core.pid` is written to the `/cores` directory. On Solaris, use the `coreadm` command to specify where to write the core file and how to name it.

  For some systems, to get a core file you must also specify the `--core-file-size` option to `mysqld_safe`. See Section 4.3.2, "mysqld_safe — MySQL Server Startup Script". On some systems, such as Solaris, you do not get a core file if you are also using the `--user` option. There might be additional restrictions or limitations. For example, it might be necessary to execute `ulimit -c unlimited` before starting the server. Consult your system documentation.

- **--datadir=dir_name, -h dir_name**

  **Command-Line Format**
  
  `--datadir=dir_name`

  **System Variable**
  
<table>
<thead>
<tr>
<th>Name</th>
<th>datadir</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
<tr>
<td>Variable</td>
<td></td>
</tr>
</tbody>
</table>

  **Permitted Values**
  
<table>
<thead>
<tr>
<th>Type</th>
<th>directory name</th>
</tr>
</thead>
</table>

  The path to the data directory.

- **--debug=[debug_options], -# [debug_options]**

  **Command-Line Format**
  
  `--debug=[debug_options]`

  **System Variable**
  
<table>
<thead>
<tr>
<th>Name</th>
<th>debug</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Scope</td>
<td></td>
</tr>
</tbody>
</table>
If MySQL is configured with `--with-debug`, you can use this option to get a trace file of what `mysqld` is doing. A typical `debug_options` string is `d,t,o, file_name`. The default is `d:t:i:o,/tmp/mysqld.trace` on Unix and `d:t:i:O,\mysqld.trace` on Windows.

As of MySQL 5.1.12, using `--with-debug` to configure MySQL with debugging support enables you to use the `--debug="d,parser_debug"` option when you start the server. This causes the Bison parser that is used to process SQL statements to dump a parser trace to the server’s standard error output. Typically, this output is written to the error log.

This option may be given multiple times. Values that begin with `+` or `−` are added to or subtracted from the previous value. For example, `--debug=T --debug=+P` sets the value to `P:T`.

For more information, see Section 22.4.3, “The DBUG Package”.

- `--debug-sync-timeout [=N]`
  Controls whether the Debug Sync facility for testing and debugging is enabled. Use of Debug Sync requires that MySQL be configured with the `--enable-debug-sync` option (see Section 2.11.4, “MySQL Source-Configuration Options”). If Debug Sync is not compiled in, this option is not available. The option value is a timeout in seconds. The default value is 0, which disables Debug Sync. To enable it, specify a value greater than 0; this value also becomes the default timeout for individual synchronization points. If the option is given without a value, the timeout is set to 300 seconds.

  For a description of the Debug Sync facility and how to use synchronization points, see MySQL Internals: Test Synchronization.

  This option was added in MySQL 5.1.41.

- `--default-character-set=charset_name`
  Use `charset_name` as the default character set. This option is deprecated in favor of `--character-set-server`. See Section 10.5, “Character Set Configuration”. `--default-character-set` is removed in MySQL 5.5.

- `--default-collation=collation_name`
  Use `collation_name` as the default collation. This option is deprecated in favor of `--character-set-server`. See Section 10.5, “Character Set Configuration”. `--default-collation` is removed in MySQL 5.5.
Use `collation_name` as the default collation. This option is deprecated in favor of `--collation-server`. See Section 10.5, “Character Set Configuration”. `--default-collation` is removed in MySQL 5.5.

- `--default-storage-engine=type`

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--default-storage-engine=name</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name storage_engine</td>
</tr>
<tr>
<td></td>
<td>Variable Global, Session</td>
</tr>
<tr>
<td></td>
<td>Scope</td>
</tr>
<tr>
<td></td>
<td>Dynamic Yes</td>
</tr>
<tr>
<td></td>
<td>Variable</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type enumeration</td>
</tr>
<tr>
<td></td>
<td>Default MyISAM</td>
</tr>
</tbody>
</table>

Set the default storage engine (table type) for tables. See Chapter 14, Storage Engines.

- `--default-table-type=type`

<table>
<thead>
<tr>
<th>Deprecated</th>
<th>5.0.0, by default-storage-engine</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--default-table-type=name</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type string</td>
</tr>
</tbody>
</table>

This option is a synonym for `--default-storage-engine`. It is deprecated and removed in MySQL 5.5.

- `--default-time-zone=timezone`

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--default-time-zone=name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Permitted Values</td>
<td>Type string</td>
</tr>
</tbody>
</table>

Set the default server time zone. This option sets the global `time_zone` system variable. If this option is not given, the default time zone is the same as the system time zone (given by the value of the `system_time_zone` system variable).

- `--defaults-extra-file=file_name`

Read this option file after the global option file but (on Unix) before the user option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is the full path name to the file.

- `--defaults-file=file_name`

Use only the given option file. If the file does not exist or is otherwise inaccessible, an error occurs. `file_name` is the full path name to the file.

- `--defaults-group-suffix=str`

Read not only the usual option groups, but also groups with the usual names and a suffix of `str`. For example, `mysqld` normally reads the `[mysqld]` group. If the `--defaults-group-suffix=_other` option is given, `mysqld` also reads the `[mysqld_other]` group.

- `--delay-key-write[={OFF|ON|ALL}]`

| Command-Line Format | --delay-key-write={OFF|ON|ALL} |
|---------------------|--------------------------------|
| System Variable     | Name delay_key_write           |
### Server Command Options

<table>
<thead>
<tr>
<th>Variable</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Yes</th>
<th>Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Permited Values</td>
<td>Type</td>
<td>enumeration</td>
<td>Default</td>
<td>ON</td>
</tr>
<tr>
<td>Valid</td>
<td>Values</td>
<td>ON</td>
<td>OFF</td>
<td>ALL</td>
</tr>
</tbody>
</table>

Specify how to use delayed key writes. Delayed key writing causes key buffers not to be flushed between writes for MyISAM tables. OFF disables delayed key writes. ON enables delayed key writes for those tables that were created with the `DELAY_KEY_WRITE` option. ALL delays key writes for all MyISAM tables. See Section 8.12.2, “Tuning Server Parameters”, and Section 14.5.1, “MyISAM Startup Options”.

**Note**

If you set this variable to ALL, you should not use MyISAM tables from within another program (such as another MySQL server or `myisamchk`) when the tables are in use. Doing so leads to index corruption.

* **--des-key-file=file_name**

**Command-Line Format**

```
--des-key-file=file_name
```

Read the default DES keys from this file. These keys are used by the `DES_ENCRYPT()` and `DES_DECRYPT()` functions.

* **--enable-locking**

This option is deprecated. Use `--external-locking` instead.

* **--enable-named-pipe**

**Command-Line Format**

```
--enable-named-pipe
```

Platform Specific: Windows

Enable support for named pipes. This option applies only on Windows. For MySQL 5.1.20 and earlier, this option is available only when using the `mysqld-nt` and `mysqld-debug` servers that support named-pipe connections. For MySQL 5.1.21 and later, `mysqld-nt` is not available, but support is included in the standard `mysqld` and `mysqld-debug` servers.

* **--enable-pstack**

**Deprecation**

5.1.54

**Command-Line Format**

```
--enable-pstack
```

**Permitted Values**

<table>
<thead>
<tr>
<th>Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>FALSE</td>
</tr>
</tbody>
</table>

This option is nonfunctional. It is deprecated as of MySQL 5.1.54 and removed in MySQL 5.5.

* **--engine-condition-pushdown={ON|OFF}**

**Command-Line Format**

```
--engine-condition-pushdown
```

### Server Command Options

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>engine_condition_pushdown</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable</td>
<td>Global, Session</td>
<td></td>
</tr>
<tr>
<td>Scope</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Dynamic Variable</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type</td>
<td>boolean</td>
</tr>
<tr>
<td>Default</td>
<td>ON</td>
<td></td>
</tr>
</tbody>
</table>

Sets the `engine_condition_pushdown` system variable. For more information, see Section 8.2.1.5, “Engine Condition Pushdown Optimization”.

- `--event-scheduler [=value]`

<table>
<thead>
<tr>
<th>Introduced</th>
<th>5.1.6</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--event-scheduler [=value]</code></td>
</tr>
</tbody>
</table>

Enable or disable, and start or stop, the event scheduler. This option was added in MySQL 5.1.6. Note that its permitted values and behavior changed in MySQL 5.1.11, and again in MySQL 5.1.12.

For detailed information, see The `--event-scheduler` Option.

- `--exit-info [=flags], -T [flags]`

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th><code>--exit-info [=flags]</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Permitted Values</td>
<td>Type integer</td>
</tr>
</tbody>
</table>

This is a bit mask of different flags that you can use for debugging the `mysqld` server. Do not use this option unless you know exactly what it does!

- `--external-locking`

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th><code>--external-locking</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Permitted Values</td>
<td>Type boolean</td>
</tr>
<tr>
<td>Default</td>
<td>FALSE</td>
</tr>
</tbody>
</table>

Enable external locking (system locking), which is disabled by default. If you use this option on a system on which `lockd` does not fully work (such as Linux), it is easy for `mysqld` to deadlock.

To disable external locking explicitly, use `--skip-external-locking`.

External locking affects only `MyISAM` table access. For more information, including conditions under which it can and cannot be used, see Section 8.11.4, “External Locking.”
Server Command Options

- **--flush**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--flush</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>flush</td>
</tr>
<tr>
<td>Variable</td>
<td>Global</td>
</tr>
<tr>
<td>Scope</td>
<td></td>
</tr>
<tr>
<td>Dynamic Variable</td>
<td>Yes</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type</td>
</tr>
<tr>
<td>Default</td>
<td>OFF</td>
</tr>
</tbody>
</table>

Flush (synchronize) all changes to disk after each SQL statement. Normally, MySQL does a write of all changes to disk only after each SQL statement and lets the operating system handle the synchronizing to disk. See Section B.5.3.3, “What to Do If MySQL Keeps Crashing”.

- **--gdb**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--gdb</th>
</tr>
</thead>
<tbody>
<tr>
<td>Permitted Values</td>
<td>Type</td>
</tr>
<tr>
<td>Default</td>
<td>FALSE</td>
</tr>
</tbody>
</table>

Install an interrupt handler for SIGINT (needed to stop mysqld with ^C to set breakpoints) and disable stack tracing and core file handling. See Section 22.4, “Debugging and Porting MySQL”.

- **--general-log[=(0|1)]**

<table>
<thead>
<tr>
<th>Introduced</th>
<th>5.1.12</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--general-log</td>
</tr>
<tr>
<td>System Variable</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>general_log</td>
</tr>
<tr>
<td>Variable</td>
<td>Global</td>
</tr>
<tr>
<td>Scope</td>
<td></td>
</tr>
<tr>
<td>Dynamic Variable</td>
<td>Yes</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type</td>
</tr>
<tr>
<td>Default</td>
<td>OFF</td>
</tr>
</tbody>
</table>

Specify the initial general query log state. With no argument or an argument of 1, the --general-log option enables the log. If omitted or given with an argument of 0, the option disables the log. This option was added in MySQL 5.1.12.

- **--init-file=file_name**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--init-file=file_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>init_file</td>
</tr>
<tr>
<td>Variable</td>
<td>Global</td>
</tr>
<tr>
<td>Scope</td>
<td></td>
</tr>
<tr>
<td>Dynamic Variable</td>
<td>No</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type</td>
</tr>
</tbody>
</table>

Read SQL statements from this file at startup. Each statement must be on a single line and should not include comments.
Server Command Options

This option is unavailable if MySQL was configured with the `--disable-grant-options` option. See Section 2.11.4, “MySQL Source-Configuration Options”.

- **--innodb-xxx**

Set an option for the InnoDB storage engine. The InnoDB options are listed in Section 14.6.8, “InnoDB Startup Options and System Variables”.

- **--install [service_name]**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>Windows</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--install [service_name]</code></td>
<td></td>
</tr>
</tbody>
</table>

(Windows only) Install the server as a Windows service that starts automatically during Windows startup. The default service name is MySQL if no `service_name` value is given. For more information, see Section 2.3.6.7, “Starting MySQL Server as a Microsoft Windows Service”.

**Note**

If the server is started with the `--defaults-file` and `--install` options, `--install` must be first.

- **--install-manual [service_name]**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>Windows</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--install-manual [service_name]</code></td>
<td></td>
</tr>
</tbody>
</table>

(Windows only) Install the server as a Windows service that must be started manually. It does not start automatically during Windows startup. The default service name is MySQL if no `service_name` value is given. For more information, see Section 2.3.6.7, “Starting MySQL Server as a Microsoft Windows Service”.

**Note**

If the server is started with the `--defaults-file` and `--install-manual` options, `--install-manual` must be first.

- **--language=lang_name, -L lang_name**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--language=lang_name</code></td>
<td></td>
</tr>
</tbody>
</table>

**System Variable**

<table>
<thead>
<tr>
<th>Name</th>
<th>value</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>language</code></td>
<td></td>
</tr>
</tbody>
</table>

**Variable**

<table>
<thead>
<tr>
<th>Global Scope</th>
<th></th>
</tr>
</thead>
</table>

**Dynamic Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>value</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory name</td>
<td>/usr/local/mysql/share/mysql/english/</td>
</tr>
</tbody>
</table>

The language to use for error messages. `lang_name` can be given as the language name or as the full path name to the directory where the language files are installed. See Section 10.2, “Setting the Error Message Language”.

- **--large-pages**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--large-pages</code></td>
<td></td>
</tr>
</tbody>
</table>

**System Variable**

<table>
<thead>
<tr>
<th>Name</th>
<th>value</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>large_pages</code></td>
<td></td>
</tr>
</tbody>
</table>
Server Command Options

<table>
<thead>
<tr>
<th>Variable</th>
<th>Global Scope</th>
<th>Dynamic Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Platform Specific</th>
<th>Linux</th>
</tr>
</thead>
<tbody>
<tr>
<td>Permitted Values (Linux)</td>
<td>Type: boolean</td>
</tr>
<tr>
<td></td>
<td>Default: FALSE</td>
</tr>
</tbody>
</table>

Some hardware/operating system architectures support memory pages greater than the default (usually 4KB). The actual implementation of this support depends on the underlying hardware and operating system. Applications that perform a lot of memory accesses may obtain performance improvements by using large pages due to reduced Translation Lookaside Buffer (TLB) misses.

MySQL supports only the Linux implementation of large page support (which is called HugeTLB in Linux). See Section 8.12.5.2, “Enabling Large Page Support”.

--large-pages is disabled by default.

- --local-service

Command-Line Format

(Windows only) A --local-service option following the service name causes the server to run using the LocalService Windows account that has limited system privileges. This account is available only for Windows XP or newer. If both --defaults-file and --local-service are given following the service name, they can be in any order. See Section 2.3.6.7, “Starting MySQL Server as a Microsoft Windows Service”.

- --log[=file_name], -l [file_name]

As of MySQL 5.1.29, the --log option is deprecated and is removed (along with the log system variable) in MySQL 5.6. Instead, use the --general_log option to enable the general query log and the --general_log_file=file_name option to set the general query log file name.
- **--log-error[=file_name]**

  **Command-Line Format**  
  --log-error[=file_name]

  **System Variable**  
  Name  log_error  
  Variable  Global  
  Scope  
  DynamicNo  
  Variable  

  **Permitted Values**  
  Type  file name

  Log errors and startup messages to this file. See Section 5.4.2, “The Error Log”. If you omit the file name, MySQL uses host_name.err. If the file name has no extension, the server adds an extension of .err.

- **--log-isam[=file_name]**

  **Command-Line Format**  
  --log-isam[=file_name]

  **Permitted Values**  
  Type  file name

  Log all MyISAM changes to this file (used only when debugging MyISAM).

- **--log-long-format**

  **Deprecated**  
  4.1.0

  **Command-Line Format**  
  --log-long-format

  Log extra information to the binary log and slow query log, if they have been activated. For example, the user name and timestamp are logged for all queries. This option is deprecated, as it now represents the default logging behavior. (See the description for --log-short-format.) The --log-queries-not-using-indexes option is available for the purpose of logging queries that do not use indexes to the slow query log. **--log-long-format** is removed in MySQL 5.5.

- **--log-output[=value,...]**

  **Introduced**  
  5.1.6

  **Command-Line Format**  
  --log-output=name

  **System Variable**  
  Name  log_output  
  Variable  Global  
  Scope  
  DynamicYes  
  Variable  

  **Permitted Values**  
  Type  set

  Default  FILE

  Valid Values  
  TABLE
  FILE
  NONE

  This option determines the destination for general query log and slow query log output. The option value can be given as one or more of the words TABLE, FILE, or NONE. If the option is given without a value, the default is FILE. (For MySQL 5.1.6 through 5.1.20, the default is TABLE.) TABLE select logging to the general_log and slow_log tables in the mysql database as a destination. FILE selects logging to log files as a destination. NONE disables logging. If NONE is present in the option
value, it takes precedence over any other words that are present. TABLE and FILE can both be
given to select to both log output destinations.

This option selects log output destinations, but does not enable log output. To do that, use the --general_log and --slow_query_log options. For FILE logging, the --general_log_file
and --slow_query_log_file options determine the log file location. (Before MySQL 5.1.29,
enable the logs with the --log and --log-slow-queries options. The options take an optional
file name argument to specify the log file name.) For more information, see Section 5.4.1, "Selecting
General Query and Slow Query Log Output Destinations".

The --log-output option was added in MySQL 5.1.6.

• --log-queries-not-using-indexes

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--log-queries-not-using-indexes</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable (&gt;= 5.1.11)</td>
<td>Name  log_queries_not_using_indexes</td>
</tr>
<tr>
<td></td>
<td>Variable Global</td>
</tr>
<tr>
<td></td>
<td>Scope</td>
</tr>
<tr>
<td></td>
<td>DynamicYes</td>
</tr>
<tr>
<td></td>
<td>Variable</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type  boolean</td>
</tr>
<tr>
<td></td>
<td>Default OFF</td>
</tr>
</tbody>
</table>

If you are using this option with the slow query log enabled, queries that are expected to retrieve all
rows are logged. See Section 5.4.5, "The Slow Query Log". This option does not necessarily mean
that no index is used. For example, a query that uses a full index scan uses an index but would be
logged because the index would not limit the number of rows.

• --log-short-format

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--log-short-format</th>
</tr>
</thead>
<tbody>
<tr>
<td>Permitted Values</td>
<td>Type  boolean</td>
</tr>
<tr>
<td></td>
<td>Default FALSE</td>
</tr>
</tbody>
</table>

Log less information to the slow query log, if it has been activated.

• --log-slow-admin-statements

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--log-slow-admin-statements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Permitted Values</td>
<td>Type  boolean</td>
</tr>
<tr>
<td></td>
<td>Default OFF</td>
</tr>
</tbody>
</table>

Include slow administrative statements in the statements written to the slow query log. Administrative
statements include ALTER TABLE, ANALYZE TABLE, CHECK TABLE, CREATE INDEX, DROP
INDEX, OPTIMIZE TABLE, and REPAIR TABLE.

• --log-slow-queries[=file_name]

<table>
<thead>
<tr>
<th>Deprecated</th>

### Server Command Options

**Dynamic Variable**

<table>
<thead>
<tr>
<th>System Variable (&gt;= 5.1.23)</th>
<th>Name</th>
<th>log_slow_queries</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable</td>
<td>Global</td>
<td></td>
</tr>
<tr>
<td>Dynamic Variable</td>
<td>Yes</td>
<td></td>
</tr>
</tbody>
</table>

**Permitted Values**

| Type | boolean |

This option enables logging to the slow query log, which contains entries for all queries that have taken more than `long_query_time` seconds to execute. See the descriptions of the `--log-long-format` and `--log-short-format` options for details.

The log output destination can be selected with the `--log-output` option as of MySQL 5.1.6. Before 5.1.6, logging occurs to the slow query log file. If you omit the file name, MySQL uses `host_name-slow.log` as the file name. See Section 5.4.1, “Selecting General Query and Slow Query Log Output Destinations”, and Section 5.4.5, “The Slow Query Log”.

As of MySQL 5.1.29, the `--log-slow-queries` option is deprecated and is removed (along with the `log_slow_queries` system variable) in MySQL 5.6. Instead, use the `--slow_query_log` option to enable the slow query log and the `--slow_query_log_file=file_name` option to set the slow query log file name.

- **--log-tc=file_name**

**Command-Line Format**

<table>
<thead>
<tr>
<th>--log-tc=file_name</th>
</tr>
</thead>
</table>

**Permitted Values**

<table>
<thead>
<tr>
<th>Type</th>
<th>file name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>tc.log</td>
</tr>
</tbody>
</table>

The name of the memory-mapped transaction coordinator log file (for XA transactions that affect multiple storage engines when the binary log is disabled). The default name is `tc.log`. The file is created under the data directory if not given as a full path name. This option is unused.

- **--log-tc-size=size**

**Command-Line Format**

<table>
<thead>
<tr>
<th>--log-tc-size=##</th>
</tr>
</thead>
</table>

**Permitted Values**

<table>
<thead>
<tr>
<th>Type</th>
<th>integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>24576</td>
</tr>
<tr>
<td>Max Value</td>
<td>4294967295</td>
</tr>
</tbody>
</table>

**Permitted Values (32-bit platforms)**

<table>
<thead>
<tr>
<th>Type</th>
<th>integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>24576</td>
</tr>
<tr>
<td>Max Value</td>
<td>18446744073709547520</td>
</tr>
</tbody>
</table>

The size in bytes of the memory-mapped transaction coordinator log. The default size is 24KB.

- **--log-warnings[=level], -W [level]**

**Command-Line Format**

<table>
<thead>
<tr>
<th>--log-warnings[=#]</th>
</tr>
</thead>
</table>

**System Variable**

<table>
<thead>
<tr>
<th>Name</th>
<th>log_warnings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Scope</td>
<td>462</td>
</tr>
</tbody>
</table>

This option enables logging warnings. See the descriptions of the `--log-long-format` and `--log-short-format` options for details.
Print out warnings such as *Aborted connection...* to the error log. This option is enabled (1) by default. To disable it, use `--log-warnings=0`. Specifying the option without a level value increments the current value by 1. Enabling this option by setting it greater than 0 is recommended, for example, if you use replication (you get more information about what is happening, such as messages about network failures and reconnections). If the value is greater than 1, aborted connections are written to the error log. See Section B.5.2.11, "Communication Errors and Aborted Connections".

If a slave server was started with `--log-warnings` enabled, the slave prints messages to the error log to provide information about its status, such as the binary log and relay log coordinates where it starts its job, when it is switching to another relay log, when it reconnects after a disconnect, and so forth. As of MySQL 5.1.38, the server logs messages about statements that are unsafe for statement-based logging if `--log-warnings` is greater than 0.

- **--low-priority-updates**

  Give table-modifying operations (`INSERT`, `REPLACE`, `DELETE`, `UPDATE`) lower priority than selects. This can also be done using `{INSERT | REPLACE | DELETE | UPDATE} LOW_PRIORITY ...` to lower the priority of only one query, or by `SET LOW_PRIORITY_UPDATES=1` to change the priority in one thread. This affects only storage engines that use only table-level locking (`MyISAM`, `MEMORY`, `MERGE`). See Section 8.11.2, "Table Locking Issues".

- **--min-examined-row-limit=number**

  Introduced 5.1.21

  Command-Line Format  `--min-examined-row-limit=#`

  System Variable  Name `min_examined_row_limit`
### Server Command Options

<table>
<thead>
<tr>
<th>Variable</th>
<th>Global, Session Scope</th>
<th>Dynamic Variable</th>
<th>Yes</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Permitted Values (32-bit platforms)</th>
<th>Type</th>
<th>integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>Min Value</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>Max Value</td>
<td>4294967295</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Permitted Values (64-bit platforms)</th>
<th>Type</th>
<th>integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>Min Value</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>Max Value</td>
<td>18446744073709547520</td>
<td></td>
</tr>
</tbody>
</table>

When this option is set, queries which examine fewer than `number` rows are not written to the slow query log. The default is 0.

This option was introduced in MySQL 5.1.21.

- `--memlock`

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--memlock</th>
</tr>
</thead>
<tbody>
<tr>
<td>Permitted Values</td>
<td>Type boolean</td>
</tr>
<tr>
<td>Default</td>
<td>FALSE</td>
</tr>
</tbody>
</table>

Lock the `mysqld` process in memory. This option might help if you have a problem where the operating system is causing `mysqld` to swap to disk.

`--memlock` works on systems that support the `mlockall()` system call; this includes Solaris, most Linux distributions that use a 2.4 or newer kernel, and perhaps other Unix systems. On Linux systems, you can tell whether or not `mlockall()` (and thus this option) is supported by checking to see whether or not it is defined in the system `mman.h` file, like this:

```shell
grep mlockall /usr/include/sys/mman.h
```

If `mlockall()` is supported, you should see in the output of the previous command something like the following:

```c
extern int mlockall (int __flags) __THROW;
```

**Important**

Use of this option may require you to run the server as `root`, which, for reasons of security, is normally not a good idea. See Section 6.1.5, “How to Run MySQL as a Normal User”. On Linux and perhaps other systems, you can avoid the need to run the server as `root` by changing the `limits.conf` file. See the notes regarding the memlock limit in Section 8.12.5.2, “Enabling Large Page Support”.

464
You must not try to use this option on a system that does not support the `mlockall()` system call; if you do so, `mysqld` will very likely crash as soon as you try to start it.

* **--myisam-block-size=N**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--myisam-block-size=</th>
</tr>
</thead>
<tbody>
<tr>
<td>Permitted Values</td>
<td>Type: integer</td>
</tr>
<tr>
<td></td>
<td>Default: 1024</td>
</tr>
<tr>
<td></td>
<td>Min Value: 1024</td>
</tr>
<tr>
<td></td>
<td>Max Value: 16384</td>
</tr>
</tbody>
</table>

The block size to be used for MyISAM index pages.

* **--myisam-recover=[option[,option]...]**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--myisam-recover=[name]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Permitted Values</td>
<td>Type: enumeration</td>
</tr>
<tr>
<td></td>
<td>Default: OFF</td>
</tr>
<tr>
<td></td>
<td>Valid Values: OFF, DEFAULT, BACKUP, FORCE, QUICK</td>
</tr>
</tbody>
</table>

Set the MyISAM storage engine recovery mode. The option value is any combination of the values of DEFAULT, BACKUP, FORCE, or QUICK. If you specify multiple values, separate them by commas. Specifying the option with no argument is the same as specifying DEFAULT, and specifying with an explicit value of "" disables recovery (same as not giving the option). If recovery is enabled, each time `mysqld` opens a MyISAM table, it checks whether the table is marked as crashed or was not closed properly. (The last option works only if you are running with external locking disabled.) If this is the case, `mysqld` runs a check on the table. If the table was corrupted, `mysqld` attempts to repair it.

The following options affect how the repair works.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEFAULT</td>
<td>Recovery without backup, forcing, or quick checking.</td>
</tr>
<tr>
<td>BACKUP</td>
<td>If the data file was changed during recovery, save a backup of the <code>tbl_name.MYD</code> file as <code>tbl_name-datetime.BAK</code>.</td>
</tr>
<tr>
<td>FORCE</td>
<td>Run recovery even if we would lose more than one row from the <code>.MYD</code> file.</td>
</tr>
<tr>
<td>QUICK</td>
<td>Do not check the rows in the table if there are not any delete blocks.</td>
</tr>
</tbody>
</table>

Before the server automatically repairs a table, it writes a note about the repair to the error log. If you want to be able to recover from most problems without user intervention, you should use the options BACKUP, FORCE. This forces a repair of a table even if some rows would be deleted, but it keeps the old data file as a backup so that you can later examine what happened.

See Section 14.5.1, “MyISAM Startup Options”. 
Server Command Options

- **--no-defaults**

  Do not read any option files. If program startup fails due to reading unknown options from an option file, **--no-defaults** can be used to prevent them from being read.

- **--old-alter-table**

  **Command-Line Format**
  ```
  --old-alter-table
  ```

  **System Variable**
  - Name: `old_alter_table`
  - Variable: Global, Session
  - Scope: Dynamic
  - Type: boolean

  **Permitted Values**
  - Default: OFF

  When this option is given, the server does not use the optimized method of processing an `ALTER TABLE` operation. It reverts to using a temporary table, copying over the data, and then renaming the temporary table to the original, as used by MySQL 5.0 and earlier. For more information on the operation of `ALTER TABLE`, see Section 13.1.7, "ALTER TABLE Syntax".

- **--old-style-user-limits**

  **Command-Line Format**
  ```
  --old-style-user-limits
  ```

  **Permitted Values**
  - Type: boolean
  - Default: FALSE

  Enable old-style user limits. (Before MySQL 5.0.3, account resource limits were counted separately for each host from which a user connected rather than per account row in the `user` table.) See Section 6.3.4, "Setting Account Resource Limits".

- **--one-thread**

  **Command-Line Format**
  ```
  --one-thread
  ```

  Only use one thread (for debugging under Linux). This option is available only if the server is built with debugging enabled. See Section 22.4, "Debugging and Porting MySQL".

  As of MySQL 5.1.17, this option is deprecated and is removed in MySQL 5.6. Use **--thread_handling=no-threads** instead.

- **--open-files-limit=count**

  **Command-Line Format**
  ```
  --open-files-limit=#
  ```

  **System Variable**
  - Name: `open_files_limit`
  - Variable: Global
  - Scope: Dynamic
  - Type: integer

  **Permitted Values**
  - Default: 0
  - Min: 0
  - Value: 466
Server Command Options

| Max Value | platform dependent |
|

Changes the number of file descriptors available to `mysqld`. You should try increasing the value of this option if `mysqld` gives you the error `Too many open files`. `mysqld` uses the option value to reserve descriptors with `setrlimit()`. Internally, the maximum value for this option is the maximum unsigned integer value, but the actual maximum is platform dependent. If the requested number of file descriptors cannot be allocated, `mysqld` writes a warning to the error log.

`mysqld` may attempt to allocate more than the requested number of descriptors (if they are available), using the values of `max_connections` and `table_open_cache` to estimate whether more descriptors will be needed.

On Unix, the value cannot be set less than `ulimit -n`.

- **`--partition[=value]`**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th><code>--partition</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Disabled by</td>
<td><code>skip-partition</code></td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type <code>boolean</code></td>
</tr>
<tr>
<td></td>
<td>Default <code>ON</code></td>
</tr>
</tbody>
</table>

Enables or disables user-defined partitioning support in the MySQL Server.

- **`--pid-file=file_name`**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th><code>--pid-file=file_name</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name <code>pid_file</code></td>
</tr>
<tr>
<td></td>
<td>Variable <code>Global</code></td>
</tr>
<tr>
<td></td>
<td>Scope DynamicNo</td>
</tr>
<tr>
<td></td>
<td>Variable</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type <code>file name</code></td>
</tr>
</tbody>
</table>

The path name of the process ID file. The server creates the file in the data directory unless an absolute path name is given to specify a different directory. This file is used by other programs such as `mysqld_safe` to determine the server’s process ID.

- **`--plugin-xxx`**

  Specifies an option that pertains to a server plugin. For example, many storage engines can be built as plugins, and for such engines, options for them can be specified with a `--plugin` prefix. Thus, the `--innodb_file_per_table` option for InnoDB can be specified as `--plugin-innodb_file_per_table`.

  For boolean options that can be enabled or disabled, the `--skip` prefix and other alternative formats are supported as well (see Section 4.2.5, “Program Option Modifiers”). For example, `--skip-plugin-innodb_file_per_table` disables `innodb_file_per_table`.

  The rationale for the `--plugin` prefix is that it enables plugin options to be specified unambiguously if there is a name conflict with a built-in server option. For example, were a plugin writer to name a plugin “sql” and implement a “mode” option, the option name might be `--sql-mode`, which would conflict with the built-in option of the same name. In such cases, references to the conflicting name are resolved in favor of the built-in option. To avoid the ambiguity, users can specify the plugin option as `--plugin-sql-mode`. Use of the `--plugin` prefix for plugin options is recommended to avoid any question of ambiguity.
• \texttt{--plugin-load=plugin\_list}

\begin{tabular}{|l|l|}
\hline
\textbf{Introduced} & 5.1.18 \\
\textbf{Command-Line Format} & \texttt{--plugin-load=plugin\_list} \\
\textbf{Permitted Values} & \begin{tabular}{l}
\textbf{Type} \hspace{1cm} \textbf{string}
\end{tabular} \\
\hline
\end{tabular}

This option tells the server to load the named plugins at startup. All plugins to load must be named in the same \texttt{--plugin-load} option. If multiple \texttt{--plugin-load} options are given, only the last one is used.

The option value is a semicolon-separated list of \texttt{name=plugin\_library} and \texttt{plugin\_library} values. Each \texttt{name} is the name of a plugin to load, and \texttt{plugin\_library} is the name of the library object file that contains the plugin code. If a plugin library is named without any preceding plugin name, the server loads all plugins in the library. The server looks for plugin library files in the directory named by the \texttt{plugin\_dir} system variable.

For example, if plugins named \texttt{myplug1} and \texttt{myplug2} have library files \texttt{myplug1.so} and \texttt{myplug2.so}, use this option to perform an early plugin load:

\begin{verbatim}
shell> mysqld --plugin-load="myplug1=myplug1.so;myplug2=myplug2.so"
\end{verbatim}

Quotes are used around the argument value here because otherwise semicolon (;) is interpreted as a special character by some command interpreters. (Unix shells treat it as a command terminator, for example.)

Each named plugin is loaded for a single invocation of \texttt{mysqld} only. After a restart, the plugin is not loaded unless \texttt{--plugin-load} is used again. This is in contrast to \texttt{INSTALL PLUGIN}, which adds an entry to the \texttt{mysql.plugins} table to cause the plugin to be loaded for every normal server startup.

Under normal startup, the server determines which plugins to load by reading the \texttt{mysql.plugins} system table. If the server is started with the \texttt{--skip-grant-tables} option, it does not consult the \texttt{mysql.plugins} table and does not load plugins listed there. \texttt{--plugin-load} enables plugins to be loaded even when \texttt{--skip-grant-tables} is given. \texttt{--plugin-load} also enables plugins to be loaded at startup under configurations when plugins cannot be loaded at runtime.

For additional information about plugin loading, see Section 5.1.8.1, “Installing and Uninstalling Plugins”.

This option was added in MySQL 5.1.18.

• \texttt{--port=port\_num, -P port\_num}

\begin{tabular}{|l|l|}
\hline
\textbf{Command-Line Format} & \texttt{--port=\#} \\
\textbf{System Variable} & \begin{tabular}{l}
\textbf{Name} \hspace{1cm} \textbf{port} \\
\textbf{Variable} Global \\
\textbf{Scope} \\
\textbf{DynamicNo} \\
\textbf{Variable}
\end{tabular} \\
\textbf{Permitted Values} & \begin{tabular}{l}
\textbf{Type} \hspace{1cm} \textbf{integer} \\
\textbf{Default} \hspace{1cm} 3306 \\
\textbf{Min Value} \hspace{1cm} 0 \\
\textbf{Max Value} \hspace{1cm} 65535
\end{tabular} \\
\hline
\end{tabular}
The port number to use when listening for TCP/IP connections. On Unix and Unix-like systems, the port number must be 1024 or higher unless the server is started by the root system user.

- **--port-open-timeout=num**

  | Introduced | 5.1.5 |
  | Command-Line Format | --port-open-timeout=\# |
  | Permitted Values | Type integer |
  | Default | 0 |

On some systems, when the server is stopped, the TCP/IP port might not become available immediately. If the server is restarted quickly afterward, its attempt to reopen the port can fail. This option indicates how many seconds the server should wait for the TCP/IP port to become free if it cannot be opened. The default is not to wait. This option was added in MySQL 5.1.5.

- **--print-defaults**

  Print the program name and all options that it gets from option files.

- **--remove [service_name]**

  | Command-Line Format | --remove [service_name] |
  | Platform Specific | Windows |

  (Windows only) Remove a MySQL Windows service. The default service name is MySQL if no service_name value is given. For more information, see Section 2.3.6.7, “Starting MySQL Server as a Microsoft Windows Service”.

- **--safe-mode**

  | Command-Line Format | --safe-mode |

  Skip some optimization stages. This option is deprecated and is removed in MySQL 5.6.

- **--safe-show-database**

  | Deprecated | 4.0.2 |
  | Command-Line Format | --safe-show-database |
  | Permitted Values | Type boolean |

  This option is deprecated and does not do anything because there is a SHOW DATABASES privilege that can be used to control access to database names on a per-account basis. See Section 6.2.1, “Privileges Provided by MySQL”. --safe-show-database is removed in MySQL 5.5.

- **--safe-user-create**

  | Command-Line Format | --safe-user-create |
  | Permitted Values | Type boolean |
  | Default | FALSE |

  If this option is enabled, a user cannot create new MySQL users by using the GRANT statement unless the user has the INSERT privilege for the mysql.user table or any column in the table. If you want a user to have the ability to create new users that have those privileges that the user has the right to grant, you should grant the user the following privilege:
GRANT INSERT(user) ON mysql.user TO '{user_name}'@'{host_name}';

This ensures that the user cannot change any privilege columns directly, but has to use the GRANT statement to give privileges to other users.

• **--secure-auth**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--secure-auth</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>secure_auth</td>
</tr>
<tr>
<td>Variable Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic Variable</td>
<td>Yes</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>boolean</td>
</tr>
<tr>
<td>Default</td>
<td>OFF</td>
</tr>
</tbody>
</table>

This option causes the server to block connections by clients that attempt to use accounts that have passwords stored in the old (pre-4.1) format. Use it to prevent all use of passwords employing the old format (and hence insecure communication over the network).

Server startup fails with an error if this option is enabled and the privilege tables are in pre-4.1 format. See Section B.5.2.4, “Client does not support authentication protocol”.

The mysql client also has a --secure-auth option, which prevents connections to a server if the server requires a password in old format for the client account.

• **--secure-file-priv=dir_name**

<table>
<thead>
<tr>
<th>Introduced</th>
<th>5.1.17</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--secure-file-priv=dir_name</td>
</tr>
<tr>
<td>System Variable</td>
<td>secure_file_priv</td>
</tr>
<tr>
<td>Variable Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic Variable</td>
<td>No</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>string</td>
</tr>
<tr>
<td>Default</td>
<td>empty</td>
</tr>
<tr>
<td>Valid Values</td>
<td>empty</td>
</tr>
<tr>
<td>Values</td>
<td>dir_name</td>
</tr>
</tbody>
</table>

This option limits the effect of the LOAD DATA and SELECT ... INTO OUTFILE statements and the LOAD_FILE() function to work only with files in the specified directory.

This option was added in MySQL 5.1.17.

• **--shared-memory**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--shared_memory={0,1}</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>shared_memory</td>
</tr>
<tr>
<td>Variable Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic Variable</td>
<td>No</td>
</tr>
<tr>
<td>Variable</td>
<td>470</td>
</tr>
</tbody>
</table>
**Server Command Options**

<table>
<thead>
<tr>
<th>Platform Specific</th>
<th>Windows</th>
</tr>
</thead>
<tbody>
<tr>
<td>Permitted Values</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>boolean</td>
</tr>
<tr>
<td>Default</td>
<td>FALSE</td>
</tr>
</tbody>
</table>

Enable shared-memory connections by local clients. This option is available only on Windows.

- `--shared-memory-base-name=name`

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--shared_memory_base_name=name</code></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>System Variable</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>shared_memory_base_name</td>
</tr>
<tr>
<td>Variable</td>
<td>Global</td>
</tr>
<tr>
<td>Scope</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Platform Specific</th>
<th>Windows</th>
</tr>
</thead>
<tbody>
<tr>
<td>Permitted Values</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>string</td>
</tr>
<tr>
<td>Default</td>
<td>MYSQL</td>
</tr>
</tbody>
</table>

The name of shared memory to use for shared-memory connections. This option is available only on Windows. The default name is `MYSQL`. The name is case sensitive.

- `--skip-concurrent-insert`

Turn off the ability to select and insert at the same time on MyISAM tables. (This is to be used only if you think you have found a bug in this feature.) See Section 8.11.3, "Concurrent Inserts".

- `--skip-event-scheduler`

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--skip-event-scheduler</code></td>
<td></td>
</tr>
<tr>
<td><code>--disable-event-scheduler</code></td>
<td></td>
</tr>
</tbody>
</table>

Turns the Event Scheduler OFF. This is not the same as disabling the Event Scheduler, which requires setting `--event-scheduler=DISABLED`; see The `--event-scheduler` Option, for more information.

- `--skip-grant-tables`

This option causes the server to start without using the privilege system at all, which gives anyone with access to the server unrestricted access to all databases. You can cause a running server to start using the grant tables again by executing `mysqladmin flush-privileges` or `mysqladmin reload` command from a system shell, or by issuing a MySQL `FLUSH PRIVILEGES` statement after connecting to the server. This option also suppresses loading of user-defined functions (UDFs) and plugins that were installed with the `INSTALL PLUGIN` statement. Beginning with MySQL 5.1.17, it also suppresses scheduled events. To cause plugins to be loaded anyway, use the `--plugin-load` option.

`FLUSH PRIVILEGES` might be executed implicitly by other actions performed after startup. For example, `mysql_upgrade` flushes the privileges during the upgrade procedure.

`--skip-grant-tables` is unavailable if MySQL was configured with the `--disable-grant-options` option. See Section 2.11.4, "MySQL Source-Configuration Options".

- `--skip-host-cache`
Disable use of the internal host cache for faster name-to-IP resolution. In this case, the server performs a DNS lookup every time a client connects. See Section 8.12.6.2, “DNS Lookup Optimization and the Host Cache”.

- **--skip-innodb**

Disable the **InnoDB** storage engine. In this case, the server will not start if the default storage engine is set to **InnoDB**. Use **--default-storage-engine** to set the default to some other engine if necessary.

- **--skip-merge**

Disable the **MERGE** storage engine. This option was added in MySQL 5.1.12 and removed in 5.1.14.

- **--skip-name-resolve**

Do not resolve host names when checking client connections. Use only IP addresses. If you use this option, all **Host** column values in the grant tables must be IP addresses or **localhost**. See Section 8.12.6.2, “DNS Lookup Optimization and the Host Cache”.

Depending on the network configuration of your system and the **Host** values for your accounts, clients may need to connect using an explicit **--host** option, such as **--host=localhost** or **--host=127.0.0.1**.

- **--skip-networking**

Do not listen for TCP/IP connections at all. All interaction with **mysql** must be made using named pipes or shared memory (on Windows) or Unix socket files (on Unix). This option is highly recommended for systems where only local clients are permitted. See Section 8.12.6.2, “DNS Lookup Optimization and the Host Cache”.

- **--skip-partition**

**Command-Line Format**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>--skip-partition</strong></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command-Line Format</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>--disable-partition</strong></td>
</tr>
</tbody>
</table>

Disables user-defined partitioning. Partitioned tables can be seen using **SHOW TABLES** or by querying the **INFORMATION_SCHEMA.TABLES** table, but cannot be created or modified, nor can data in such tables be accessed. All partition-specific columns in the **INFORMATION_SCHEMA.PARTITIONS** table display **NULL**.

Since **DROP TABLE** removes table definition (**.frm**) files, this statement works on partitioned tables even when partitioning is disabled using the option. The statement, however, does not remove **.par** files associated with partitioned tables in such cases. For this reason, you should avoid dropping partitioned tables with partitioning disabled, or take action to remove the orphaned **.par** files manually.

- **--ssl**

Options that begin with **--ssl** specify whether to permit clients to connect using SSL and indicate where to find SSL keys and certificates. See Section 6.4.5, “Command Options for Secure Connections”.

- **--standalone**

**Command-Line Format**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Command-Line Format</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>--standalone</strong></td>
</tr>
</tbody>
</table>

**Platform Specific**

| Windows |

Available on Windows only; instructs the MySQL server not to run as a service.
An attempt to connect to the host 127.0.0.1 normally resolves to the localhost account. However, this fails if the server is run with the --skip-name-resolve option, so make sure that an account exists that can accept a connection. For example, to be able to connect as root using --host=127.0.0.1 or --host=::1, create these accounts:

```sql
CREATE USER 'root'@'127.0.0.1' IDENTIFIED BY 'root-password';
CREATE USER 'root'@'::1' IDENTIFIED BY 'root-password';
```

• **--symbolic-links**, **--skip-symbolic-links**

**Command-Line Format**

```
--symbolic-links
```

Enable or disable symbolic link support. This option has different effects on Windows and Unix:

- On Windows, enabling symbolic links enables you to establish a symbolic link to a database directory by creating a `db_name.sym` file that contains the path to the real directory. See Section 8.12.4.3, “Using Symbolic Links for Databases on Windows”.

- On Unix, enabling symbolic links means that you can link a MyISAM index file or data file to another directory with the `INDEX DIRECTORY` or `DATA DIRECTORY` options of the `CREATE TABLE` statement. If you delete or rename the table, the files that its symbolic links point to also are deleted or renamed. See Section 8.12.4.2, “Using Symbolic Links for MyISAM Tables on Unix”.

• **--skip-safemalloc**

**Command-Line Format**

```
--skip-safemalloc
```

If MySQL is configured with `--with-debug=full`, all MySQL programs check for memory overruns during each memory allocation and memory freeing operation. This checking is very slow, so for the server you can avoid it when you do not need it by using the `--skip-safemalloc` option.

• **--skip-show-database**

**Command-Line Format**

```
--skip-show-database
```

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>Variable</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>skip_show_database</td>
<td>Global</td>
<td>No</td>
<td>No</td>
<td></td>
</tr>
</tbody>
</table>

This option sets the `skip_show_database` system variable that controls who is permitted to use the `SHOW DATABASES` statement. See Section 5.1.4, “Server System Variables”.

• **--skip-stack-trace**

**Command-Line Format**

```
--skip-stack-trace
```

Do not write stack traces. This option is useful when you are running `mysqld` under a debugger. On some systems, you also must use this option to get a core file. See Section 22.4, “Debugging and Porting MySQL”.

• **--skip-thread-priority**

**Deprecated**

```
5.1.29
```

**Command-Line Format**

```
--skip-thread-priority
```

This option has been deprecated.
Server Command Options

Disable using thread priorities for faster response time. This option is deprecated as of MySQL 5.1.29 and is removed in MySQL 5.6.

Prior to MySQL 5.1.29, mysqld makes a large number of invalid calls to thread scheduling routines on Linux. These calls do not affect performance noticeably but may be a source of "noise" for debugging tools. For example, they can overwhelm other information of more interest in kernel logs. To avoid these calls, start the server with the `--skip-thread-priority` option.

• `--slow-query-log={0|1}]`

  | Introduced          | 5.1.12 |
  | Command-Line Format | `--slow-query-log (>= 5.1.29)` |
  | System Variable     | Name `slow_query_log` |
  |                     | Variable Global |
  |                     | Scope |
  |                     | DynamicYes |
  |                     | Variable |
  | Permitted Values    | Type `boolean` |
  |                     | Default `OFF` |

Specify the initial slow query log state. With no argument or an argument of 1, the `--slow-query-log` option enables the log. If omitted or given with an argument of 0, the option disables the log. This option was added in MySQL 5.1.12.

• `--socket=path`

  | Command-Line Format | `--socket={file_name|pipe_name}` |
  | System Variable     | Name `socket` |
  |                     | Variable Global |
  |                     | Scope |
  |                     | DynamicNo |
  |                     | Variable |
  | Permitted Values    | Type `string` |
  |                     | Default `/tmp/mysql.sock` |

On Unix, this option specifies the Unix socket file to use when listening for local connections. The default value is `/tmp/mysql.sock`. If this option is given, the server creates the file in the data directory unless an absolute path name is given to specify a different directory. On Windows, the option specifies the pipe name to use when listening for local connections that use a named pipe. The default value is `MySQL` (not case sensitive).

• `--sql-mode=value[,value[,value...]]`

  | Command-Line Format | `--sql-mode=name` |
  | System Variable     | Name `sql_mode` |
  |                     | Variable Global, Session |
  |                     | Scope |
  |                     | DynamicYes |
  |                     | Variable |
  | Permitted Values    | Type `set` |
  |                     | Default `'` |
Server Command Options

<table>
<thead>
<tr>
<th>Valid Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALLOW_INVALID_DATES</td>

</tr>
<tr>
<td>REAL_AS_FLOAT</td>
</tr>
<tr>
<td>STRICT_ALL_TABLES</td>
</tr>
<tr>
<td>STRICT_TRANS_TABLES</td>
</tr>
</tbody>
</table>

Set the SQL mode. See Section 5.1.7, "Server SQL Modes".

Note

MySQL installation programs may configure the SQL mode during the installation process. If the SQL mode differs from the default or from what you expect, check for a setting in an option file that the server reads at startup.

- **--sysdate-is-now**

<table>
<thead>
<tr>
<th>Introduced</th>
<th>5.1.8</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--sysdate-is-now</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type boolean</td>
</tr>
<tr>
<td></td>
<td>Default FALSE</td>
</tr>
</tbody>
</table>

SYSDATE() by default returns the time at which it executes, not the time at which the statement in which it occurs begins executing. This differs from the behavior of NOW(). This option causes SYSDATE() to be an alias for NOW(). For information about the implications for binary logging and replication, see the description for SYSDATE() in Section 12.7, “Date and Time Functions” and for SET TIMESTAMP in Section 5.1.4, “Server System Variables”.

This option was added in MySQL 5.1.8.

- **--tc-heuristic-recover={COMMIT|ROLLBACK}**

| Command-Line Format | --tc-heuristic-recover=name |
Server Command Options

Permitted Values

<table>
<thead>
<tr>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>enumeration</td>
</tr>
</tbody>
</table>

Default

| COMMIT                  |

Valid Values

| ROLLBACK                |

The type of decision to use in the heuristic recovery process. This option is unused.

- **--temp-pool**

Command-Line Format

| --temp-pool              |

Permitted Values

| boolean                |

Default

| TRUE                    |

This option causes most temporary files created by the server to use a small set of names, rather than a unique name for each new file. This works around a problem in the Linux kernel dealing with creating many new files with different names. With the old behavior, Linux seems to “leak” memory, because it is being allocated to the directory entry cache rather than to the disk cache. As of MySQL 5.1.31, this option is ignored except on Linux.

- **--transaction-isolation=level**

Command-Line Format

| --transaction-isolation=level |

Permitted Values

| enumeration             |

Default

| REPEATABLE-READ         |

Valid Values

| READ-UNCOMMITTED        |
|                         |
| READ-COMMITTED          |
| REPEATABLE-READ         |
| SERIALIZABLE            |

Sets the default transaction isolation level. The level value can be READ-UNCOMMITTED, READ-COMMITTED, REPEATABLE-READ, or SERIALIZABLE. See Section 13.3.6, “SET TRANSACTION Syntax”.

The default transaction isolation level can also be set at runtime using the SET TRANSACTION statement or by setting the tx_isolation system variable.

- **--tmpdir=dir_name, -t dir_name**

Command-Line Format

| --tmpdir=dir_name        |

System Variable

| Name: tmpdir              |
| Variable: Global Scope    |

Permitted Values

| directory name            |

The path of the directory to use for creating temporary files. It might be useful if your default /tmp directory resides on a partition that is too small to hold temporary tables. This option accepts several paths that are used in round-robin fashion. Paths should be separated by colon characters (:) on Unix and semicolon characters (;) on Windows, NetWare, and OS/2. If the MySQL server is acting as a replication slave, you should not set --tmpdir to point to a directory on a memory-based file system or to a directory that is cleared when the server host restarts. For more information about the storage location of temporary files, see Section B.5.3.5, “Where MySQL Stores Temporary Files”. A
replication slave needs some of its temporary files to survive a machine restart so that it can replicate temporary tables or \texttt{LOAD DATA INFILE} operations. If files in the temporary file directory are lost when the server restarts, replication fails.

\begin{itemize}
\item \texttt{--user={user\_name|user\_id},-u \{user\_name|user\_id\}}
\end{itemize}

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--user=name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Permitted Values</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>string</td>
</tr>
</tbody>
</table>

Run the \texttt{mysqld} server as the user having the name \texttt{user\_name} or the numeric user ID \texttt{user\_id}. ("User" in this context refers to a system login account, not a MySQL user listed in the grant tables.)

This option is \textit{mandatory} when starting \texttt{mysqld} as \texttt{root}. The server changes its user ID during its startup sequence, causing it to run as that particular user rather than as \texttt{root}. See \textit{Section 6.1.1, “Security Guidelines”}.

To avoid a possible security hole where a user adds a \texttt{--user=root} option to a \texttt{my.cnf} file (thus causing the server to run as \texttt{root}), \texttt{mysqld} uses only the first \texttt{--user} option specified and produces a warning if there are multiple \texttt{--user} options. Options in \texttt{/etc/my.cnf} and \texttt{$MYSQL\_HOME/my.cnf} are processed before command-line options, so it is recommended that you put a \texttt{--user} option in \texttt{/etc/my.cnf} and specify a value other than \texttt{root}. The option in \texttt{/etc/my.cnf} is found before any other \texttt{--user} options, which ensures that the server runs as a user other than \texttt{root}, and that a warning results if any other \texttt{--user} option is found.

\begin{itemize}
\item \texttt{--verbose, -v}
\end{itemize}

Use this option with the \texttt{--help} option for detailed help.

\begin{itemize}
\item \texttt{--version, -V}
\end{itemize}

Display version information and exit.

\section*{5.1.4 Server System Variables}

The MySQL server maintains many system variables that indicate how it is configured. Each system variable has a default value. System variables can be set at server startup using options on the command line or in an option file. Most of them can be changed dynamically while the server is running by means of the \texttt{SET} statement, which enables you to modify operation of the server without having to stop and restart it. You can refer to system variable values in expressions.

There are several ways to see the names and values of system variables:

\begin{itemize}
\item To see the values that a server will use based on its compiled-in defaults and any option files that it reads, use this command:

\begin{verbatim}
mysqld --verbose --help
\end{verbatim}

\item To see the values that a server will use based on its compiled-in defaults, ignoring the settings in any option files, use this command:

\begin{verbatim}
mysqld --no-defaults --verbose --help
\end{verbatim}

\item To see the current values used by a running server, use the \texttt{SHOW VARIABLES} statement.
\end{itemize}

This section provides a description of each system variable. Variables with no version indicated are present in all MySQL 5.1 releases.

The following table lists all available system variables.
<table>
<thead>

*This option is dynamic, but only the server should set this information. You should not set the value of this variable manually.

For additional system variable information, see these sections:

- Section 5.1.5, “Using System Variables”, discusses the syntax for setting and displaying system variable values.
- Section 5.1.5.2, “Dynamic System Variables”, lists the variables that can be set at runtime.
- Information on tuning system variables can be found in Section 8.12.2, “Tuning Server Parameters”.
- Section 14.6.8, “InnoDB Startup Options and System Variables”, lists InnoDB system variables.
- MySQL Cluster System Variables, lists system variables which are specific to MySQL Cluster.
- For information on server system variables specific to replication, see Section 16.1.3, “Replication and Binary Logging Options and Variables”.
Note

Some of the following variable descriptions refer to “enabling” or “disabling” a variable. These variables can be enabled with the `SET` statement by setting them to **ON** or **1**, or disabled by setting them to **OFF** or **0**. However, to set such a variable on the command line or in an option file, you must set it to **1** or **0**; setting it to **ON** or **OFF** will not work. For example, on the command line, `--delay_key_write=1` works but `--delay_key_write=ON` does not.

Some system variables control the size of buffers or caches. For a given buffer, the server might need to allocate internal data structures. These structures typically are allocated from the total memory allocated to the buffer, and the amount of space required might be platform dependent. This means that when you assign a value to a system variable that controls a buffer size, the amount of space actually available might differ from the value assigned. In some cases, the amount might be less than the value assigned. It is also possible that the server will adjust a value upward. For example, if you assign a value of 0 to a variable for which the minimal value is 1024, the server will set the value to 1024.

Values for buffer sizes, lengths, and stack sizes are given in bytes unless otherwise specified.

Some system variables take file name values. Unless otherwise specified, the default file location is the data directory if the value is a relative path name. To specify the location explicitly, use an absolute path name. Suppose that the data directory is `/var/mysql/data`. If a file-valued variable is given as a relative path name, it will be located under `/var/mysql/data`. If the value is an absolute path name, its location is as given by the path name.

- **autocommit**

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>autocommit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable</td>
<td>Session</td>
<td>Scope</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
<td>Variable</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type</td>
<td>boolean</td>
</tr>
<tr>
<td>Default</td>
<td>ON</td>
<td></td>
</tr>
</tbody>
</table>

The autocommit mode. If set to 1, all changes to a table take effect immediately. If set to 0, you must use `COMMIT` to accept a transaction or `ROLLBACK` to cancel it. If `autocommit` is 0 and you change it to 1, MySQL performs an automatic `COMMIT` of any open transaction. Another way to begin a transaction is to use a `START TRANSACTION` or `BEGIN` statement. See Section 13.3.1, "START TRANSACTION, COMMIT, and ROLLBACK Syntax".

By default, client connections begin with `autocommit` set to 1. To cause clients to begin with a default of 0, set the server’s `init_connect` system variable:

```
SET GLOBAL init_connect='SET autocommit=0';
```

The `init_connect` variable can also be set on the command line or in an option file. To set the variable as just shown using an option file, include these lines:

```
[mysqld]
init_connect='SET autocommit=0'
```

The content of `init_connect` is not executed for users that have the `SUPER` privilege.

- **automatic_sp_privileges**

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>automatic_sp_privileges</th>
</tr>
</thead>
</table>
When this variable has a value of 1 (the default), the server automatically grants the EXECUTE and ALTER ROUTINE privileges to the creator of a stored routine, if the user cannot already execute and alter or drop the routine. (The ALTER ROUTINE privilege is required to drop the routine.) The server also automatically drops those privileges from the creator when the routine is dropped. If automatic_sp_privileges is 0, the server does not automatically add or drop these privileges.

The creator of a routine is the account used to execute the CREATE statement for it. This might not be the same as the account named as the DEFINER in the routine definition.

See also Section 19.2.2, “Stored Routines and MySQL Privileges”.

- `back_log`

The number of outstanding connection requests MySQL can have. This comes into play when the main MySQL thread gets very many connection requests in a very short time. It then takes some time (although very little) for the main thread to check the connection and start a new thread. The `back_log` value indicates how many requests can be stacked during this short time before MySQL momentarily stops answering new requests. You need to increase this only if you expect a large number of connections in a short period of time.

In other words, this value is the size of the listen queue for incoming TCP/IP connections. Your operating system has its own limit on the size of this queue. The manual page for the Unix `listen()` system call should have more details. Check your OS documentation for the maximum value for this variable. `back_log` cannot be set higher than your operating system limit.

- `basedir`

Command-Line Format: `--basedir=dir_name`
The MySQL installation base directory. This variable can be set with the --basedir option. Relative path names for other variables usually are resolved relative to the base directory.

- **big_tables**

  If set to 1, all temporary tables are stored on disk rather than in memory. This is a little slower, but the error *The table tbl_name is full* does not occur for SELECT operations that require a large temporary table. The default value for a new connection is 0 (use in-memory temporary tables). Normally, you should never need to set this variable, because in-memory tables are automatically converted to disk-based tables as required.

  ![Note]

  This variable was formerly named sql_big_tables.

- **bulk_insert_buffer_size**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--bulk_insert_buffer_size=#</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable Name</td>
<td>bulk_insert_buffer_size</td>
</tr>
<tr>
<td>Variable Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic Variable</td>
<td>Yes</td>
</tr>
<tr>
<td>Permitted Values (32-bit platforms) Type</td>
<td>integer</td>
</tr>
<tr>
<td>Default</td>
<td>8388608</td>
</tr>
<tr>
<td>Min Value</td>
<td>0</td>
</tr>
<tr>
<td>Max Value</td>
<td>4294967295</td>
</tr>
<tr>
<td>Permitted Values (64-bit platforms) Type</td>
<td>integer</td>
</tr>
<tr>
<td>Default</td>
<td>8388608</td>
</tr>
<tr>
<td>Min Value</td>
<td>0</td>
</tr>
<tr>
<td>Max Value</td>
<td>18446744073709547520</td>
</tr>
</tbody>
</table>

  **MyISAM** uses a special tree-like cache to make bulk inserts faster for INSERT ... SELECT, INSERT ... VALUES (...), (...), ..., and LOAD DATA INFILE when adding data to nonempty tables. This variable limits the size of the cache tree in bytes per thread. Setting it to 0 disables this optimization. The default value is 8MB.

- **character_set_client**

  | System Variable Name     | character_set_client        |
  | Variable Scope           | Global, Session              |
  | Dynamic Variable         | Yes                          |
  | Permitted Values Type     | string                       |

  The character set for statements that arrive from the client. The session value of this variable is set using the character set requested by the client when the client connects to the server. (Many
clients support a `--default-character-set` option to enable this character set to be specified explicitly. See also Section 10.1.4, "Connection Character Sets and Collations".) The global value of the variable is used to set the session value in cases when the client-requested value is unknown or not available, or the server is configured to ignore client requests:

- The client is from a version of MySQL older than MySQL 4.1, and thus does not request a character set.
- The client requests a character set not known to the server. For example, a Japanese-enabled client requests `sjis` when connecting to a server not configured with `sjis` support.
- `mysqld` was started with the `--skip-character-set-client-handshake` option, which causes it to ignore client character set configuration. This reproduces MySQL 4.0 behavior and is useful should you wish to upgrade the server without upgrading all the clients.

`ucs2` cannot be used as a client character set, which means that it also does not work for `SET NAMES` or `SET CHARACTER SET`.

```
• character_set_connection
```

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>Variable Global, Session Scope Dynamic</th>
<th>Variable</th>
<th>Permitted Values</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>character_set_connection</td>
<td></td>
<td></td>
<td></td>
<td>string</td>
<td></td>
</tr>
</tbody>
</table>

The character set for the current connection. Used for literals that do not have an explicit character set specification and for number-to-string conversion.

```
• character_set_database
```

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>Variable Global, Session Scope Dynamic</th>
<th>Variable</th>
<th>Permitted Values</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>character_set_database</td>
<td></td>
<td></td>
<td></td>
<td>string</td>
<td></td>
</tr>
</tbody>
</table>

This option is dynamic, but only the server should set this information. You should not set the value of this variable manually.

The character set used by the default database. The server sets this variable whenever the default database changes. If there is no default database, the variable has the same value as `character_set_server`.

```
• character_set_filesystem
```

<table>
<thead>
<tr>
<th>Introduced</th>
<th>Command-Line Format</th>
<th>System Variable</th>
<th>Name</th>
<th>Variable Global, Session Scope Dynamic</th>
<th>Variable</th>
<th>Permitted Values</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1.6</td>
<td><code>--character-setfilesystem=name</code></td>
<td>character_set_filesystem</td>
<td></td>
<td></td>
<td></td>
<td>string</td>
<td></td>
</tr>
</tbody>
</table>

"
The file system character set. This variable is used to interpret string literals that refer to file names, such as in the `LOAD DATA INFILE` and `SELECT ... INTO OUTFILE` statements and the `LOAD_FILE()` function. Such file names are converted from `character_set_client` to `character_set_filesystem` before the file opening attempt occurs. The default value is `binary`, which means that no conversion occurs. For systems on which multibyte file names are permitted, a different value may be more appropriate. For example, if the system represents file names using UTF-8, set `character_set_filesystem` to `'utf8'`. This variable was added in MySQL 5.1.6.

- **character_set_results**

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>Character Set Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable</td>
<td><code>character_set_results</code></td>
<td>Global, Session</td>
</tr>
<tr>
<td>Scope</td>
<td></td>
<td>DynamicYes</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type</td>
<td><code>string</code></td>
</tr>
</tbody>
</table>

  The character set used for returning query results such as result sets or error messages to the client.

- **character_set_server**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--character-set-server</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name</td>
</tr>
<tr>
<td></td>
<td><code>character_set_server</code></td>
</tr>
<tr>
<td>Variable</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Scope</td>
<td>DynamicYes</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td><code>string</code></td>
</tr>
<tr>
<td>Default</td>
<td><code>latin1</code></td>
</tr>
</tbody>
</table>

  The server's default character set.

- **character_set_system**

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>Character Set System</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable</td>
<td><code>character_set_system</code></td>
<td>Global</td>
</tr>
<tr>
<td>Scope</td>
<td></td>
<td>DynamicNo</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type</td>
<td><code>string</code></td>
</tr>
<tr>
<td></td>
<td>Default</td>
<td><code>utf8</code></td>
</tr>
</tbody>
</table>

  The character set used by the server for storing identifiers. The value is always `utf8`.

- **character_sets_dir**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--character-sets-dir=dir_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name</td>
</tr>
<tr>
<td></td>
<td><code>character_sets_dir</code></td>
</tr>
<tr>
<td>Variable</td>
<td>Global</td>
</tr>
<tr>
<td>Scope</td>
<td></td>
</tr>
</tbody>
</table>

  The directory where the server looks for character set files.
Server System Variables

- **collation_connection**
  - **System Variable**
    - **Name**: `collation_connection`
    - **Variable**: Global, Session
    - **Dynamic**: Yes
    - **Permitted Values**
      - **Type**: `string`
  - The collation of the connection character set.

- **collation_database**
  - **System Variable**
    - **Name**: `collation_database`
    - **Variable**: Global, Session
    - **Dynamic**: Yes
    - **Footnote**: This option is dynamic, but only the server should set this information. You should not set the value of this variable manually.
    - **Permitted Values**
      - **Type**: `string`
  - The collation used by the default database. The server sets this variable whenever the default database changes. If there is no default database, the variable has the same value as `collation_server`.

- **collation_server**
  - **Command-Line Format**: `--collation-server` (default: `latin1_swedish_ci`)
  - **System Variable**
    - **Name**: `collation_server`
    - **Variable**: Global, Session
    - **Dynamic**: Yes
    - **Permitted Values**
      - **Type**: `string`
  - The server's default collation.

- **completion_type**
  - **Command-Line Format**: `--completion_type=*
  - **System Variable**
    - **Name**: `completion_type`
    - **Variable**: Global, Session
    - **Permitted Values**
      - **Type**: `string`
### Completion Type

The transaction completion type. This variable can take the values shown in the following table.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>COMMIT and ROLLBACK are unaffected. This is the default value.</td>
</tr>
<tr>
<td>1</td>
<td>COMMIT and ROLLBACK are equivalent to COMMIT AND CHAIN and ROLLBACK AND CHAIN, respectively. (A new transaction starts immediately with the same isolation level as the just-terminated transaction.)</td>
</tr>
<tr>
<td>2</td>
<td>COMMIT and ROLLBACK are equivalent to COMMIT RELEASE and ROLLBACK RELEASE, respectively. (The server disconnects after terminating the transaction.)</td>
</tr>
</tbody>
</table>

completion_type affects transactions that begin with START TRANSACTION or BEGIN and end with COMMIT or ROLLBACK. It does not apply to implicit commits resulting from execution of the statements listed in Section 13.3.3, “Statements That Cause an Implicit Commit”. It also does not apply for XA COMMIT, XA ROLLBACK, or when autocommit=1.

- concurrent_insert

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--concurrent_insert[=#]</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name concurrent_insert</td>
</tr>
<tr>
<td></td>
<td>Variable Global</td>
</tr>
<tr>
<td></td>
<td>Scope Global</td>
</tr>
<tr>
<td></td>
<td>DynamicYes Variable</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type integer</td>
</tr>
<tr>
<td>Default</td>
<td>1</td>
</tr>
<tr>
<td>Valid Values</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>2</td>
</tr>
</tbody>
</table>

If 1 (the default), MySQL permits INSERT and SELECT statements to run concurrently for MyISAM tables that have no free blocks in the middle of the data file. If you start mysqld with --skip-new, this variable is set to 0.

This variable can take three integer values.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Disables concurrent inserts</td>
</tr>
<tr>
<td>1</td>
<td>(Default) Enables concurrent insert for MyISAM tables that do not have holes</td>
</tr>
<tr>
<td>2</td>
<td>Enables concurrent inserts for all MyISAM tables, even those that have holes. For a table with a hole, new rows are inserted at the end of the table if it is in use by another thread. Otherwise, MySQL acquires a normal write lock and inserts the row into the hole.</td>
</tr>
</tbody>
</table>
See also Section 8.11.3, “Concurrent Inserts”.

- **connect_timeout**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--connect_timeout=#</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name connect_timeout</td>
</tr>
<tr>
<td></td>
<td>Variable Global</td>
</tr>
<tr>
<td></td>
<td>Scope Dynamic</td>
</tr>
<tr>
<td></td>
<td>Variable Yes</td>
</tr>
</tbody>
</table>

Permitted Values (<= 5.1.22)  

<table>
<thead>
<tr>
<th>Type</th>
<th>integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>5</td>
</tr>
<tr>
<td>Min Value</td>
<td>2</td>
</tr>
<tr>
<td>Max Value</td>
<td>3153600</td>
</tr>
</tbody>
</table>

Permitted Values (>= 5.1.23)  

<table>
<thead>
<tr>
<th>Type</th>
<th>integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>10</td>
</tr>
<tr>
<td>Min Value</td>
<td>2</td>
</tr>
<tr>
<td>Max Value</td>
<td>3153600</td>
</tr>
</tbody>
</table>

The number of seconds that the `mysqld` server waits for a connect packet before responding with `Bad handshake`. The default value is 10 seconds as of MySQL 5.1.23 and 5 seconds before that.

Increasing the `connect_timeout` value might help if clients frequently encounter errors of the form `Lost connection to MySQL server at 'XXX', system error: errno`.

- **datadir**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--datadir=dir_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name datadir</td>
</tr>
<tr>
<td></td>
<td>Variable Global</td>
</tr>
<tr>
<td></td>
<td>Scope Dynamic</td>
</tr>
<tr>
<td></td>
<td>Variable No</td>
</tr>
</tbody>
</table>

Permitted Values  

<table>
<thead>
<tr>
<th>Type</th>
<th>directory name</th>
</tr>
</thead>
</table>

The MySQL data directory. This variable can be set with the `--datadir` option.

- **date_format**

This variable is unused.

- **datetime_format**

This variable is unused.

- **debug**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--debug=[debug_options]</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name debug</td>
</tr>
</tbody>
</table>
### Server System Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Global, Session Scope</th>
<th>Dynamic</th>
<th>Yes</th>
<th>Variable</th>
</tr>
</thead>
</table>

#### Permitted Values

<table>
<thead>
<tr>
<th>(Unix)</th>
<th>Type</th>
<th>string</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>d:t:i:o,/tmp/mysqld.trace</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>(Windows)</th>
<th>Type</th>
<th>string</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>d:t:i:0,\mysqld.trace</td>
<td></td>
</tr>
</tbody>
</table>

This variable indicates the current debugging settings. It is available only for servers built with debugging support. The initial value comes from the value of instances of the `--debug` option given at server startup. The global and session values may be set at runtime; the SUPER privilege is required, even for the session value.

Assigning a value that begins with `+` or `−` cause the value to added to or subtracted from the current value:

```sql
mysql> SET debug = 'T';
mysql> SELECT @@debug;
+---------+
| @@debug |
| T       |
+---------+
mysql> SET debug = '+P';
mysql> SELECT @@debug;
+---------+
| @@debug |
| P:T     |
+---------+
mysql> SET debug = '-P';
mysql> SELECT @@debug;
+---------+
| @@debug |
| T       |
+---------+
```

This variable was added in MySQL 5.1.7.

- **debug_sync**

<table>
<thead>
<tr>
<th>Introduced</th>
<th>5.1.41</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name</td>
</tr>
<tr>
<td>Variable</td>
<td>Global, Session Scope</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type</td>
</tr>
</tbody>
</table>

This variable is the user interface to the Debug Sync facility. Use of Debug Sync requires that MySQL be configured with the `--enable-debug-sync` option (see Section 2.11.4, "MySQL Source-Configuration Options"). If Debug Sync is not compiled in, this system variable is not available.
The global variable value is read only and indicates whether the facility is enabled. By default, Debug Sync is disabled and the value of `debug_sync` is OFF. If the server is started with `--debug-sync-timeout=N`, where `N` is a timeout value greater than 0, Debug Sync is enabled and the value of `debug_sync` is `ON - current signal` followed by the signal name. Also, `N` becomes the default timeout for individual synchronization points.

The session value can be read by any user and will have the same value as the global variable. The session value can be set by users that have the `SUPER` privilege to control synchronization points.

For a description of the Debug Sync facility and how to use synchronization points, see MySQL Internals: Test Synchronization.

This variable was added in MySQL 5.1.41.

- **default_week_format**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--default_week_format=#</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td><strong>Name</strong>: default_week_format</td>
</tr>
<tr>
<td></td>
<td><strong>Scope</strong>: Global, Session</td>
</tr>
<tr>
<td>Dynamic Variable</td>
<td><strong>Yes</strong></td>
</tr>
<tr>
<td>Permitted Values</td>
<td><strong>Type</strong>: integer</td>
</tr>
<tr>
<td></td>
<td><strong>Default</strong>: 0</td>
</tr>
<tr>
<td></td>
<td><strong>Min Value</strong>: 0</td>
</tr>
<tr>
<td></td>
<td><strong>Max Value</strong>: 7</td>
</tr>
</tbody>
</table>

The default mode value to use for the `WEEK()` function. See Section 12.7, “Date and Time Functions”.

- **delay_key_write**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--delay-key-write[=name]</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td><strong>Name</strong>: delay_key_write</td>
</tr>
<tr>
<td></td>
<td><strong>Variable</strong>: Global</td>
</tr>
<tr>
<td>Dynamic Variable</td>
<td><strong>Yes</strong></td>
</tr>
<tr>
<td>Permitted Values</td>
<td><strong>Type</strong>: enumeration</td>
</tr>
<tr>
<td></td>
<td><strong>Default</strong>: ON</td>
</tr>
<tr>
<td></td>
<td><strong>Valid Values</strong>: ON, OFF, ALL</td>
</tr>
</tbody>
</table>

This option applies only to MyISAM tables. It can have one of the following values to affect handling of the `DELAY_KEY_WRITE` table option that can be used in `CREATE TABLE` statements.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OFF</td>
<td><code>DELAY_KEY_WRITE</code> is ignored.</td>
</tr>
</tbody>
</table>
Server System Variables

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ON</td>
<td>MySQL honors any <code>DELAY_KEY_WRITE</code> option specified in <code>CREATE TABLE</code> statements. This is the default value.</td>
</tr>
<tr>
<td>ALL</td>
<td>All new opened tables are treated as if they were created with the <code>DELAY_KEY_WRITE</code> option enabled.</td>
</tr>
</tbody>
</table>

If `DELAY_KEY_WRITE` is enabled for a table, the key buffer is not flushed for the table on every index update, but only when the table is closed. This speeds up writes on keys a lot, but if you use this feature, you should add automatic checking of all MyISAM tables by starting the server with the `--myisam-recover` option (for example, `--myisam-recover=BACKUP,FORCE`). See Section 5.1.3, “Server Command Options”, and Section 14.5.1, “MyISAM Startup Options”.

**Warning**

If you enable external locking with `--external-locking`, there is no protection against index corruption for tables that use delayed key writes.

- **delayed_insert_limit**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th><code>--delayed_insert_limit=#</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>delay_insert_limit</td>
</tr>
<tr>
<td>Name</td>
<td><code>delayed_insert_limit</code></td>
</tr>
<tr>
<td>Variable</td>
<td>Global</td>
</tr>
<tr>
<td>Scope</td>
<td>Dynamic</td>
</tr>
<tr>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>(32-bit platforms)</td>
</tr>
<tr>
<td>Type</td>
<td>integer</td>
</tr>
<tr>
<td>Default</td>
<td>100</td>
</tr>
<tr>
<td>Min Value</td>
<td>1</td>
</tr>
<tr>
<td>Max Value</td>
<td>4294967295</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>(64-bit platforms)</td>
</tr>
<tr>
<td>Type</td>
<td>integer</td>
</tr>
<tr>
<td>Default</td>
<td>100</td>
</tr>
<tr>
<td>Min Value</td>
<td>1</td>
</tr>
<tr>
<td>Max Value</td>
<td>18446744073709547520</td>
</tr>
</tbody>
</table>

After inserting `delayed_insert_limit` delayed rows, the `INSERT DELAYED` handler thread checks whether there are any `SELECT` statements pending. If so, it permits them to execute before continuing to insert delayed rows.

- **delayed_insert_timeout**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th><code>--delayed_insert_timeout=#</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>delay_insert_timeout</td>
</tr>
<tr>
<td>Name</td>
<td><code>delayed_insert_timeout</code></td>
</tr>
<tr>
<td>Variable</td>
<td>Global</td>
</tr>
<tr>
<td>Scope</td>
<td>Dynamic</td>
</tr>
<tr>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type integer</td>
</tr>
</tbody>
</table>

500
Server System Variables

---

**Default** 300

How many seconds an `INSERT DELAYED` handler thread should wait for `INSERT` statements before terminating.

- **delayed_queue_size**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th><code>--delayed_queue_size=#</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name <code>delayed_queue_size</code></td>
</tr>
<tr>
<td></td>
<td>Variable Global</td>
</tr>
<tr>
<td></td>
<td>Scope Dynamic Variable</td>
</tr>
<tr>
<td><strong>Permitted Values</strong></td>
<td>Type <code>integer</code></td>
</tr>
<tr>
<td>(32-bit platforms)</td>
<td>Default 1000</td>
</tr>
<tr>
<td></td>
<td>Min Value 1</td>
</tr>
<tr>
<td></td>
<td>Max Value 4294967295</td>
</tr>
<tr>
<td><strong>Permitted Values</strong></td>
<td>Type <code>integer</code></td>
</tr>
<tr>
<td>(64-bit platforms)</td>
<td>Default 1000</td>
</tr>
<tr>
<td></td>
<td>Min Value 1</td>
</tr>
<tr>
<td></td>
<td>Max Value 18446744073709547520</td>
</tr>
</tbody>
</table>

This is a per-table limit on the number of rows to queue when handling `INSERT DELAYED` statements. If the queue becomes full, any client that issues an `INSERT DELAYED` statement waits until there is room in the queue again.

- **div_precision_increment**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th><code>--div_precision_increment=#</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name <code>div_precision_increment</code></td>
</tr>
<tr>
<td></td>
<td>Variable Global, Session</td>
</tr>
<tr>
<td></td>
<td>Dynamic Variable</td>
</tr>
<tr>
<td><strong>Permitted Values</strong></td>
<td>Type <code>integer</code></td>
</tr>
<tr>
<td></td>
<td>Default 4</td>
</tr>
<tr>
<td></td>
<td>Min Value 0</td>
</tr>
<tr>
<td></td>
<td>Max Value 30</td>
</tr>
</tbody>
</table>

This variable indicates the number of digits by which to increase the scale of the result of division operations performed with the `/` operator. The default value is 4. The minimum and maximum values are 0 and 30, respectively. The following example illustrates the effect of increasing the default value.

```sql
mysql> SELECT 1/7;
+--------+
| 0.1428 |
+--------+
```
### Server System Variables

For more information, see Section 22.4.3, “The DBUG Package”.

- **engine_condition_pushdown**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>--engine-condition-pushdown</td>
<td>engine_condition_pushdown</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Variable</th>
<th>Scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global, Session</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Dynamic</th>
<th>Permitted Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>boolean</td>
</tr>
</tbody>
</table>

The engine condition pushdown optimization enables processing for certain comparisons to be “pushed down” to the storage engine level for more efficient execution. For more information, see Section 8.2.1.5, “Engine Condition Pushdown Optimization”.

Engine condition pushdown is used only by the **NDBCLUSTER** storage engine. Enabling this optimization on a MySQL Server acting as a MySQL Cluster SQL node causes **WHERE** conditions on unindexed columns to be evaluated on the cluster's data nodes and only the rows that match to be sent back to the SQL node that issued the query. This greatly reduces the amount of cluster data that must be sent over the network, increasing the efficiency with which results are returned.

The **engine_condition_pushdown** variable controls whether engine condition pushdown is enabled. By default, this variable is **ON** (1). Setting it to **OFF** (0) disables pushdown.

- **error_count**

The number of errors that resulted from the last statement that generated messages. This variable is read only. See Section 13.7.5.18, “SHOW ERRORS Syntax”.

- **event_scheduler**

<table>
<thead>
<tr>
<th>Introduced</th>
<th>Command-Line Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1.6</td>
<td>--event-scheduler[=value]</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>event_scheduler</td>
<td>Global</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Dynamic</th>
<th>Permitted Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>enumeration</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Default</th>
<th>Valid Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>OFF</td>
<td>ON</td>
</tr>
</tbody>
</table>

Server System Variables

---

**DISABLED**

This variable indicates the status of the Event Scheduler; as of MySQL 5.1.12, possible values are **ON**, **OFF**, and **DISABLED**, with the default being **OFF**. This variable and its effects on the Event Scheduler's operation are discussed in greater detail in the Overview section of the Events chapter.

This variable was added in MySQL 5.1.6.

- **expire_logs_days**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>--expire_logs_days= #</td>
<td>expire_logs_days</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global Scope</td>
<td></td>
</tr>
<tr>
<td>Dynamic Variable</td>
<td>Yes</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Permitted Values</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>integer</td>
</tr>
<tr>
<td>Min Value</td>
<td>0</td>
</tr>
<tr>
<td>Max Value</td>
<td>99</td>
</tr>
</tbody>
</table>

  The number of days for automatic binary log file removal. The default is 0, which means “no automatic removal.” Possible removals happen at startup and when the binary log is flushed. Log flushing occurs as indicated in Section 5.4, “MySQL Server Logs”.

  To remove binary log files manually, use the `PURGE BINARY LOGS` statement. See Section 13.4.1.1, “PURGE BINARY LOGS Syntax”.

- **flush**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>--flush</td>
<td>flush</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global Scope</td>
<td></td>
</tr>
<tr>
<td>Dynamic Variable</td>
<td>Yes</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Permitted Values</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>boolean</td>
</tr>
<tr>
<td>Default</td>
<td>OFF</td>
</tr>
</tbody>
</table>

  If **ON**, the server flushes (synchronizes) all changes to disk after each SQL statement. Normally, MySQL does a write of all changes to disk only after each SQL statement and lets the operating system handle the synchronizing to disk. See Section B.5.3.3, “What to Do If MySQL Keeps Crashing”. This variable is set to **ON** if you start `mysqld` with the **--flush** option.

- **flush_time**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>--flush_time= #</td>
<td>flush_time</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global Scope</td>
<td></td>
</tr>
</tbody>
</table>

  If **ON**, the server flushes (synchronizes) all changes to disk after each SQL statement. Normally, MySQL does a write of all changes to disk only after each SQL statement and lets the operating system handle the synchronizing to disk. See Section B.5.3.3, “What to Do If MySQL Keeps Crashing”. This variable is set to **ON** if you start `mysqld` with the **--flush** option.
If this is set to a nonzero value, all tables are closed every `flush_time` seconds to free up resources and synchronize unflushed data to disk. This option is best used only on systems with minimal resources.

- **foreign_key_checks**

If set to 1 (the default), foreign key constraints for InnoDB tables are checked. If set to 0, foreign key constraints are ignored, with a couple of exceptions. When re-creating a table that was dropped, an error is returned if the table definition does not conform to the foreign key constraints referencing the table. Likewise, an `ALTER TABLE` operation returns an error if a foreign key definition is incorrectly formed. For more information, see Section 13.1.17.3, “Using FOREIGN KEY Constraints”.

Disabling foreign key checking can be useful for reloading InnoDB tables in an order different from that required by their parent/child relationships. See Section 14.6.6.6, “InnoDB and FOREIGN KEY Constraints”.

Setting `foreign_key_checks` to 0 also affects data definition statements: `DROP SCHEMA` drops a schema even if it contains tables that have foreign keys that are referred to by tables outside the schema, and `DROP TABLE` drops tables that have foreign keys that are referred to by other tables.

**Note**

Setting `foreign_key_checks` to 1 does not trigger a scan of the existing table data. Therefore, rows added to the table while `foreign_key_checks = 0` will not be verified for consistency.

- **ft_boolean_syntax**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--ft_boolean_syntax=name</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name ft_boolean_syntax</td>

<tr>
<td></td>
<td>DynamicYes Variable</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type string</td>
</tr>
<tr>
<td></td>
<td>Default + -&gt;&lt;()~:*&quot;&amp;]</td>
</tr>
</tbody>
</table>

The list of operators supported by boolean full-text searches performed using `IN BOOLEAN MODE`. See Section 12.9.2, “Boolean Full-Text Searches”.

The default variable value is '+ -><()~:*"&]. The rules for changing the value are as follows:

- Operator function is determined by position within the string.
• The replacement value must be 14 characters.
• Each character must be an ASCII nonalphanumeric character.
• Either the first or second character must be a space.
• No duplicates are permitted except the phrase quoting operators in positions 11 and 12. These two characters are not required to be the same, but they are the only two that may be.
• Positions 10, 13, and 14 (which by default are set to “;”, “&”, and “|”) are reserved for future extensions.

• `ft_max_word_len`

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--ft_max_word_len=#</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name <code>ft_max_word_len</code></td>
</tr>
<tr>
<td></td>
<td>Variable Global</td>
</tr>
<tr>
<td></td>
<td>Scope</td>
</tr>
<tr>
<td></td>
<td>DynamicNo</td>
</tr>
<tr>
<td></td>
<td>Variable</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type <code>integer</code></td>
</tr>
<tr>
<td></td>
<td>Min 10</td>
</tr>
</tbody>
</table>

The maximum length of the word to be included in a `FULLTEXT` index.

**Note**

FULLTEXT indexes must be rebuilt after changing this variable. Use `REPAIR TABLE tbl_name QUICK`.

• `ft_min_word_len`

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--ft_min_word_len=#</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name <code>ft_min_word_len</code></td>
</tr>
<tr>
<td></td>
<td>Variable Global</td>
</tr>
<tr>
<td></td>
<td>Scope</td>
</tr>
<tr>
<td></td>

<td>Variable</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type <code>integer</code></td>
</tr>
<tr>
<td></td>
<td>Default 4</td>
</tr>
<tr>
<td></td>
<td>Min 1</td>
</tr>
</tbody>
</table>

The minimum length of the word to be included in a `FULLTEXT` index.

**Note**

FULLTEXT indexes must be rebuilt after changing this variable. Use `REPAIR TABLE tbl_name QUICK`.

• `ft_query_expansion_limit`
### Server System Variables

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>Variable</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Permitted Values</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>ft_query_expansion_limit</td>
<td>Global</td>
<td>Global</td>
<td>No</td>
<td>Type integer</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Default 20</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Min Value 0</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Max Value 1000</td>
</tr>
</tbody>
</table>

The number of top matches to use for full-text searches performed using `WITH QUERY EXPANSION`.

- **ft_stopword_file**

  **Command-Line Format**
  
  `--ft_stopword_file=file_name`

  **System Variable**
  
<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Permitted Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>ft_stopword_file</td>
<td>Global</td>
<td>Global</td>
<td>No</td>
<td>Type file name</td>
</tr>
</tbody>
</table>

  The file from which to read the list of stopwords for full-text searches. The server looks for the file in the data directory unless an absolute path name is given to specify a different directory. All the words from the file are used; comments are not honored. By default, a built-in list of stopwords is used (as defined in the `storage/myisam/ft_static.c` file). Setting this variable to the empty string ("") disables stopword filtering. See also [Section 12.9.4, “Full-Text Stopwords”](#).

  **Note**
  
  FULLTEXT indexes must be rebuilt after changing this variable or the contents of the stopword file. Use `REPAIR TABLE tbl_name QUICK`.

- **general_log**

  **Introduced**
  
  5.1.12

  **Command-Line Format**
  
  `--general-log`

  **System Variable**
  
<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Permitted Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>general_log</td>
<td>Global</td>
<td>Global</td>
<td>Yes</td>
<td>Type boolean</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Default OFF</td>
</tr>
</tbody>
</table>

  Whether the general query log is enabled. The value can be 0 (or OFF) to disable the log or 1 (or ON) to enable the log. The default value depends on whether the `--general_log` option is given (`--log` before MySQL 5.1.29). The destination for log output is controlled by the `log_output` system variable; if that value is NONE, no log entries are written even if the log is enabled. The `general_log` variable was added in MySQL 5.1.12.
### Server System Variables

**general_log_file**

<table>
<thead>
<tr>
<th>Introduced</th>
<th>5.1.12</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td><code>--general-log-file=file_name</code> (&gt;= 5.1.29)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>Variable</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Yes</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>general_log_file</td>
<td>Global</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Permitted Values</th>
<th>Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>file name</td>
<td>host_name.log</td>
</tr>
</tbody>
</table>

The name of the general query log file. The default value is `host_name.log`, but the initial value can be changed with the `--general-log-file` option (`--log` before MySQL 5.1.29). This variable was added in MySQL 5.1.12.

**group_concat_max_len**

| Command-Line Format | `--group_concat_max_len=#` |

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>Variable</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Yes</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>group_concat_max_len</td>
<td>Global, Session</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Permitted Values</th>
<th>Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>(32-bit platforms)</td>
<td>integer</td>
<td>1024</td>
</tr>
<tr>
<td>Min Value</td>
<td>4</td>
<td></td>
</tr>
<tr>
<td>Max Value</td>
<td>4294967295</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Permitted Values</th>
<th>Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>(64-bit platforms)</td>
<td>integer</td>
<td>1024</td>
</tr>
<tr>
<td>Min Value</td>
<td>4</td>
<td></td>
</tr>
<tr>
<td>Max Value</td>
<td>18446744073709547520</td>
<td></td>
</tr>
</tbody>
</table>

The maximum permitted result length in bytes for the `GROUP_CONCAT()` function. The default is 1024.

**have_archive**

**YES** if `mysqld` supports `ARCHIVE` tables, **NO** if not. This variable was removed in MySQL 5.1.14.

**have_blackhole_engine**

**YES** if `mysqld` supports `BLACKHOLE` tables, **NO** if not. This variable was removed in MySQL 5.1.14.

**have_compress**

**YES** if the `zlib` compression library is available to the server, **NO** if not. If not, the `COMPRESS()` and `UNCOMPRESS()` functions cannot be used.
Server System Variables

- **have_community_features**
  
  **YES** if statement profiling capability is present, **NO** if not. If present, the `profiling` system variable controls whether this capability is enabled or disabled. See Section 13.7.5.33, "SHOW PROFILES Syntax".

  This variable was added in MySQL 5.1.24. It is renamed to `have_profiling` in MySQL 5.5.

- **have_crypt**
  
  **YES** if the `crypt()` system call is available to the server, **NO** if not. If not, the `ENCRYPT()` function cannot be used.

- **have_csv**
  
  **YES** if `mysqld` supports CSV tables, **NO** if not.

  This variable is deprecated and is removed in MySQL 5.6. Use `SHOW ENGINES` instead.

- **have_dynamic_loading**
  
  **YES** if `mysqld` supports dynamic loading of plugins, **NO** if not. This variable was added in MySQL 5.1.10.

- **have_example_engine**
  
  **YES** if `mysqld` supports EXAMPLE tables, **NO** if not. This variable was removed in MySQL 5.1.14.

- **have_federated_engine**
  
  **YES** if `mysqld` supports FEDERATED tables, **NO** if not. This variable was removed in MySQL 5.1.14.

- **have_geometry**
  
  **YES** if the server supports spatial data types, **NO** if not.

- **have_innodb**
  
  **YES** if `mysqld` supports InnoDB tables. **DISABLED** if `--skip-innodb` is used.

  This variable is deprecated and is removed in MySQL 5.6. Use `SHOW ENGINES` instead.

- **have_isam**
  
  This variable appears only for reasons of backward compatibility. It is always **NO** because ISAM tables are no longer supported. This variable was removed in MySQL 5.1.7.

- **have_merge_engine**
  
  **YES** if `mysqld` supports MERGE tables. **DISABLED** if `--skip-merge` is used. This variable was removed in MySQL 5.1.3.

- **have_openssl**
  
  **YES** if `mysqld` supports SSL connections, **NO** if not. As of MySQL 5.1.17, this variable is an alias for `have_ssl`.

- **have_partitioning**
  
  **YES** if `mysqld` supports partitioning. Added in MySQL 5.1.1 as `have_partition_engine` and renamed to `have_partitioning` in 5.1.6.

  This variable is deprecated and is removed in MySQL 5.6. Use `SHOW PLUGINS` instead. For more information, see Chapter 18, Partitioning.
• **have_query_cache**

  YES if `mysqld` supports the query cache, NO if not.

• **have_row_based_replication**

<table>
<thead>
<tr>
<th>Introduced</th>
<th>5.1.5</th>
</tr>
</thead>
<tbody>
<tr>
<td>Removed</td>
<td>5.1.15</td>
</tr>
</tbody>
</table>

| System Variable | Name          | have_row_based_replication |
|-----------------|---------------|
| Variable        | Global Scope  |
| Dynamic Variable| No            |

**Permitted Values**

<table>
<thead>
<tr>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
</tr>
</tbody>
</table>

YES if the server can perform replication using row-based binary logging. If the value is NO, the server can use only statement-based logging. See Section 16.1.2, “Replication Formats”. This variable was added in MySQL 5.1.5 and removed in 5.1.15.

• **have_raid**

This variable appears only for reasons of backward compatibility. It is always NO because RAID tables are no longer supported. This variable was removed in MySQL 5.1.7.

• **have_rtree_keys**

YES if RTREE indexes are available, NO if not. (These are used for spatial indexes in MyISAM tables.)

• **have_ssl**

YES if `mysqld` supports SSL connections, NO if not. DISABLED indicates that the server was compiled with SSL support, but was not started with the appropriate `--ssl-xxx` options. For more information, see Section 6.4.2, “Building MySQL with Support for Secure Connections”.

This variable was added in MySQL 5.1.17. Before that, use have_openssl.

• **have_symmlink**

YES if symbolic link support is enabled, NO if not. This is required on Unix for support of the DATA DIRECTORY and INDEX DIRECTORY table options, and on Windows for support of data directory symlinks. If the server is started with the `--skip-symbolic-links` option, the value is DISABLED.

• **hostname**

<table>
<thead>
<tr>
<th>Introduced</th>
<th>5.1.17</th>
</tr>
</thead>
</table>

| System Variable | Name          | hostname |
|-----------------|---------------|
| Variable        | Global Scope  |
| Dynamic Variable| No            |

**Permitted Values**

<table>
<thead>
<tr>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
</tr>
</tbody>
</table>

The server sets this variable to the server host name at startup. This variable was added in MySQL 5.1.17.

• **identity**
This variable is a synonym for the `last_insert_id` variable. It exists for compatibility with other database systems. You can read its value with `SELECT @@identity`, and set it using `SET identity`.

- **init_connect**

  **Command-Line Format**
  `--init-connect=name`

  **System Variable**
<table>
<thead>
<tr>
<th>Name</th>
<th><code>init_connect</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable</td>
<td>Global</td>
</tr>
<tr>
<td>Scope</td>
<td>Dynamic</td>
</tr>
<tr>
<td>Yes</td>
<td></td>
</tr>
</tbody>
</table>

  **Permitted Values**
  | Type | string |

  A string to be executed by the server for each client that connects. The string consists of one or more SQL statements, separated by semicolon characters. For example, each client session begins by default with autocommit mode enabled. There is no global `autocommit` system variable to specify that autocommit should be disabled by default, but `init_connect` can be used to achieve the same effect:

  ```
  SET GLOBAL init_connect='SET autocommit=0';
  ```

  The `init_connect` variable can also be set on the command line or in an option file. To set the variable as just shown using an option file, include these lines:

  ```
  [mysqld]
  init_connect='SET autocommit=0'
  ```

  The content of `init_connect` is not executed for users that have the `SUPER` privilege. This is done so that an erroneous value for `init_connect` does not prevent all clients from connecting. For example, the value might contain a statement that has a syntax error, thus causing client connections to fail. Not executing `init_connect` for users that have the `SUPER` privilege enables them to open a connection and fix the `init_connect` value.

  The server discards any result sets produced by statements in the value of `init_connect`.

- **init_file**

  **Command-Line Format**
  `--init-file=file_name`

  **System Variable**
<table>
<thead>
<tr>
<th>Name</th>
<th><code>init_file</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable</td>
<td>Global</td>
</tr>
<tr>
<td>Scope</td>
<td>Dynamic</td>
</tr>
<tr>
<td>No</td>
<td></td>
</tr>
</tbody>
</table>

  **Permitted Values**
  | Type | file name |

  The name of the file specified with the `--init-file` option when you start the server. This should be a file containing SQL statements that you want the server to execute when it starts. Each statement must be on a single line and should not include comments. For more information, see the description of `--init-file`.

  Note that the `--init-file` option is unavailable if MySQL was configured with the `--disable-grant-options` option. See Section 2.11.4, “MySQL Source-Configuration Options”.

- **innodb_XXX**
**InnoDB** system variables are listed in Section 14.6.8, “InnoDB Startup Options and System Variables”. These variables control many aspects of storage, memory use, and I/O patterns for **InnoDB** tables, and are especially important in MySQL 5.5 and higher, where InnoDB is the default storage engine.

- **insert_id**

  The value to be used by the following **INSERT** or **ALTER TABLE** statement when inserting an **AUTO_INCREMENT** value. This is mainly used with the binary log.

- **interactive_timeout**

  The number of seconds the server waits for activity on an interactive connection before closing it. An interactive client is defined as a client that uses the **CLIENT_INTERACTIVE** option to **mysql_real_connect()**. See also **wait_timeout**.

- **join_buffer_size**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--join_buffer_size=#</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name: <strong>join_buffer_size</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Variable</strong> Global, Session</td>
</tr>
<tr>
<td></td>
<td><strong>Scope</strong> Dynamic</td>
</tr>
<tr>
<td><strong>Permitted Values</strong></td>
<td><strong>Type</strong> integer</td>
</tr>
<tr>
<td></td>
<td><strong>Default</strong> 131072</td>
</tr>
<tr>
<td></td>
<td><strong>Min Value</strong> 8200</td>
</tr>
<tr>
<td></td>
<td><strong>Max Value</strong> 4294967295</td>
</tr>
</tbody>
</table>

  Permitted Values (<= 5.1.22)

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--join_buffer_size=#</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name: <strong>join_buffer_size</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Variable</strong> Global, Session</td>
</tr>
<tr>
<td></td>
<td><strong>Scope</strong> Dynamic</td>
</tr>
<tr>

<td><strong>Type</strong> integer</td>
</tr>
<tr>
<td></td>
<td><strong>Default</strong> 131072</td>
</tr>
<tr>
<td></td>
<td><strong>Min Value</strong> 8200</td>
</tr>
<tr>
<td></td>
<td><strong>Max Value</strong> 4294967295</td>
</tr>
</tbody>
</table>

  Permitted Values (Windows, 32-bit platforms, >= 5.1.23)

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--join_buffer_size=#</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name: <strong>join_buffer_size</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Variable</strong> Global, Session</td>
</tr>
<tr>
<td></td>
<td><strong>Scope</strong> Dynamic</td>
</tr>
<tr>
<td><strong>Permitted Values</strong></td>
<td><strong>Type</strong> integer</td>
</tr>
<tr>
<td></td>
<td><strong>Default</strong> 131072</td>
</tr>
<tr>
<td></td>
<td><strong>Min Value</strong> 8200</td>
</tr>
<tr>
<td></td>
<td><strong>Max Value</strong> 4294967295</td>
</tr>
</tbody>
</table>

  Permitted Values (Windows, 64-bit platforms, >= 5.1.23)
The minimum size of the buffer that is used for plain index scans, range index scans, and joins that do not use indexes and thus perform full table scans. Normally, the best way to get fast joins is to add indexes. Increase the value of `join_buffer_size` to get a faster full join when adding indexes is not possible. One join buffer is allocated for each full join between two tables. For a complex join between several tables for which indexes are not used, multiple join buffers might be necessary.

There is no gain from setting the buffer larger than required to hold each matching row, and all joins allocate at least the minimum size, so use caution in setting this variable to a large value globally. It is better to keep the global setting small and change to a larger setting only in sessions that are doing large joins. Memory allocation time can cause substantial performance drops if the global size is larger than needed by most queries that use it.

The maximum permissible setting for `join_buffer_size` is 4GB−1. As of MySQL 5.1.23, larger values are permitted for 64-bit platforms (except 64-bit Windows, for which large values are truncated to 4GB−1 with a warning).

For additional information about join buffering, see Section 8.2.1.8, “Nested-Loop Join Algorithms”.

- `keep_files_on_create`

If a MyISAM table is created with no `DATA DIRECTORY` option, the `.MYD` file is created in the database directory. By default, if MyISAM finds an existing `.MYD` file in this case, it overwrites it. The same applies to `.MYI` files for tables created with no `INDEX DIRECTORY` option. To suppress this behavior, set the `keep_files_on_create` variable to `ON` (1), in which case MyISAM will not overwrite existing files and returns an error instead. The default value is `OFF` (0).
If a **MyISAM** table is created with a **DATA DIRECTORY** or **INDEX DIRECTORY** option and an existing .MYD or .MYI file is found, MyISAM always returns an error. It will not overwrite a file in the specified directory.

This variable was added in MySQL 5.1.23.

- **key_buffer_size**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--key_buffer_size=</code></td>
<td><code>key_buffer_size</code></td>
</tr>
</tbody>

<td>integer</td>
<td>8</td>
<td>8</td>
<td>4294967295</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Permitted Values</strong> (32-bit platforms, &gt;= 5.1.23)</th>
<th><strong>Type</strong></th>
<th><strong>Default</strong></th>
<th><strong>Min Value</strong></th>
<th><strong>Max Value</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>key_buffer_size</td>
<td>integer</td>
<td>8</td>
<td>8</td>
<td>4294967295</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Permitted Values</strong> (64-bit platforms, &gt;= 5.1.23)</th>
<th><strong>Type</strong></th>
<th><strong>Default</strong></th>
<th><strong>Min Value</strong></th>
<th><strong>Max Value</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>key_buffer_size</td>
<td>integer</td>
<td>8</td>
<td>8</td>
<td>OS_PER_PROCESS_LIMIT</td>
</tr>
</tbody>
</table>

Index blocks for **MyISAM** tables are buffered and are shared by all threads. **key_buffer_size** is the size of the buffer used for index blocks. The key buffer is also known as the key cache.

The maximum permissible setting for **key_buffer_size** is 4GB – 1 on 32-bit platforms. As of MySQL 5.1.23, larger values are permitted for 64-bit platforms, except 64-bit Windows prior to MySQL 5.1.31, for which large values are truncated to 4GB – 1 with a warning. As of MySQL 5.1.31, larger values are also permitted for 64-bit Windows. The effective maximum size might be less, depending on your available physical RAM and per-process RAM limits imposed by your operating system or hardware platform. The value of this variable indicates the amount of memory requested. Internally, the server allocates as much memory as possible up to this amount, but the actual allocation might be less.

You can increase the value to get better index handling for all reads and multiple writes; on a system whose primary function is to run MySQL using the **MyISAM** storage engine, 25% of the machine’s total memory is an acceptable value for this variable. However, you should be aware that, if you make the value too large (for example, more than 50% of the machine’s total memory), your system might start to page and become extremely slow. This is because MySQL relies on the operating system to perform file system caching for data reads, so you must leave some room for the file
system cache. You should also consider the memory requirements of any other storage engines that you may be using in addition to MyISAM.

For even more speed when writing many rows at the same time, use LOCK TABLES. See Section 8.2.2.1, “Speed of INSERT Statements”.

You can check the performance of the key buffer by issuing a SHOW STATUS statement and examining the Key_read_requests, Key_reads, Key_write_requests, and Key_writes status variables. (See Section 13.7.5, “SHOW Syntax”.) The Key_reads/Key_read_requests ratio should normally be less than 0.01. The Key_writes/Key_write_requests ratio is usually near 1 if you are using mostly updates and deletes, but might be much smaller if you tend to do updates that affect many rows at the same time or if you are using the DELAY_KEY_WRITE table option.

The fraction of the key buffer in use can be determined using key_buffer_size in conjunction with the Key_blocks_unused status variable and the buffer block size, which is available from the key_cache_block_size system variable:

\[
1 - \left(\frac{\text{Key_blocks_unused} \times \text{key_cache_block_size}}{\text{key_buffer_size}}\right)
\]

This value is an approximation because some space in the key buffer is allocated internally for administrative structures. Factors that influence the amount of overhead for these structures include block size and pointer size. As block size increases, the percentage of the key buffer lost to overhead tends to decrease. Larger blocks result in a smaller number of read operations (because more keys are obtained per read), but conversely an increase in reads of keys that are not examined (if not all keys in a block are relevant to a query).

It is possible to create multiple MyISAM key caches. The size limit of 4GB applies to each cache individually, not as a group. See Section 8.10.1, “The MyISAM Key Cache”.

- key_cache_age_threshold

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--key_cache_age_threshold=#</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>key_cache_age_threshold</td>
</tr>
<tr>
<td>Variable</td>
<td>Global</td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic Variable</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Permitted Values (32-bit platforms)

<table>
<thead>
<tr>
<th>Type</th>
<th>integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>300</td>
</tr>
<tr>
<td>Min</td>
<td>100</td>
</tr>
<tr>
<td>Max</td>
<td>4294967295</td>
</tr>
</tbody>
</table>

Permitted Values (64-bit platforms)

<table>
<thead>
<tr>
<th>Type</th>
<th>integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>300</td>
</tr>
<tr>
<td>Min</td>
<td>100</td>
</tr>
<tr>
<td>Max</td>
<td>18446744073709547520</td>
</tr>
</tbody>
</table>

This value controls the demotion of buffers from the hot sublist of a key cache to the warm sublist. Lower values cause demotion to happen more quickly. The minimum value is 100. The default value is 300. See Section 8.10.1, “The MyISAM Key Cache”.
### key_cache_block_size

**Command-Line Format**  
`--key_cache_block_size=#`

**System Variable**  
Name: `key_cache_block_size`

<table>
<thead>
<tr>
<th>Variable</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Type</th>
<th>Default</th>
<th>Min Value</th>
<th>Max Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global</td>
<td>Yes</td>
<td>integer</td>
<td>1024</td>
<td>512</td>
<td>16384</td>
<td></td>
</tr>
</tbody>
</table>

The size in bytes of blocks in the key cache. The default value is 1024. See Section 8.10.1, “The MyISAM Key Cache”.

### key_cache_division_limit

**Command-Line Format**  
`--key_cache_division_limit=#`

**System Variable**  
Name: `key_cache_division_limit`

<table>
<thead>
<tr>
<th>Variable</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Type</th>
<th>Default</th>
<th>Min Value</th>
<th>Max Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global</td>
<td>Yes</td>
<td>integer</td>
<td>100</td>
<td>1</td>
<td>100</td>
<td></td>
</tr>
</tbody>
</table>

The division point between the hot and warm sublists of the key cache buffer list. The value is the percentage of the buffer list to use for the warm sublist. Permissible values range from 1 to 100. The default value is 100. See Section 8.10.1, “The MyISAM Key Cache”.

### language

**Command-Line Format**  
`--language=name`

**System Variable**  
Name: `language`

<table>
<thead>
<tr>
<th>Variable</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Type</th>
<th>Default</th>
<th>Permitted Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global</td>
<td>No</td>
<td>directory name</td>
<td>/usr/local/mysql/share/mysql/english/</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The directory where error messages are located. See Section 10.2, “Setting the Error Message Language”.
Server System Variables

- **large_files_support**

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>Variable Scope</th>
<th>Dynamic Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>large_files_support</code></td>
<td>Global</td>
<td>No</td>
</tr>
</tbody>
</table>

  Whether **mysql** was compiled with options for large file support.

- **large_pages**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>Name</th>
<th>Variable Scope</th>
<th>Dynamic Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--large-pages</code></td>
<td><code>large_pages</code></td>
<td>Global</td>
<td>No</td>
</tr>
</tbody>
</table>

  Whether large page support is enabled (via the `--large-pages` option). See Section 8.12.5.2, "Enabling Large Page Support".

- **large_page_size**

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>Variable Scope</th>
<th>Dynamic Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>large_page_size</code></td>
<td>Global</td>
<td>No</td>
</tr>
</tbody>
</table>

  If large page support is enabled, this shows the size of memory pages. Large memory pages are supported only on Linux; on other platforms, the value of this variable is always 0. See Section 8.12.5.2, "Enabling Large Page Support".

- **last_insert_id**

  The value to be returned from **LAST_INSERT_ID()**. This is stored in the binary log when you use **LAST_INSERT_ID()** in a statement that updates a table. Setting this variable does not update the value returned by the **mysql_insert_id()** C API function.

- **lc_time_names**

<table>
<thead>
<tr>
<th>Introduced</th>
<th>System Variable</th>
<th>Name</th>
<th>Variable Scope</th>
<th>Dynamic Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1.12</td>
<td></td>
<td><code>lc_time_names</code></td>
<td>Global, Session</td>
<td>Yes</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Introduced</th>
<th>System Variable</th>
<th>Name</th>
<th>Variable Scope</th>
<th>Dynamic Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1.12</td>
<td></td>
<td><code>lc_time_names</code></td>
<td>Global, Session</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Server System Variables

<table>
<thead>
<tr>
<th>Permitted Values</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>string</td>
</tr>
</tbody>
</table>

This variable specifies the locale that controls the language used to display day and month names and abbreviations. This variable affects the output from the `DATE_FORMAT()`, `DAYNAME()` and `MONTHNAME()` functions. Locale names are POSIX-style values such as 'ja_JP' or 'pt_BR'. The default value is 'en_US' regardless of your system's locale setting. For further information, see Section 10.7, “MySQL Server Locale Support”. This variable was added in MySQL 5.1.12.

- **license**

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>Variable</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>license</td>
<td>Global</td>
<td></td>
<td>No</td>
<td>Dynamic</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Permitted Values</th>
<th>Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>string</td>
<td>GPL</td>
</tr>
</tbody>
</table>

The type of license the server has.

- **local_infile**

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>Variable</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>local_infile</td>
<td>Global</td>
<td></td>
<td>Yes</td>
<td>Dynamic</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Permitted Values</th>
<th>Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>boolean</td>
<td>true</td>
</tr>
</tbody>
</table>

Whether `LOCAL` is supported for `LOAD DATA INFILE` statements. If this variable is disabled, clients cannot use `LOCAL` in `LOAD DATA` statements. While the default for this variable is `true`, whether `LOAD DATA INFILE LOCAL` is actually permitted depends on how MySQL was compiled, as well as a number of settings on both the server and the client; see Section 6.1.6, “Security Issues with `LOAD DATA LOCAL`”, for details.

- **locked_in_memory**

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>Variable</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>locked_in_memory</td>
<td>Global</td>
<td></td>
<td>No</td>
<td>Dynamic</td>
</tr>
</tbody>
</table>

Whether `mysqld` was locked in memory with `--memlock`.

- **log**

<table>
<thead>
<tr>
<th>Deprecated</th>
<th>5.1.29, by general-log</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--log[=file_name]</td>
</tr>
<tr>
<td>System Variable (&lt;= 5.1.22)</td>
<td>Name log</td>
</tr>
<tr>
<td></td>
<td>Variable Global</td>
</tr>
</tbody>
</table>

517
Server System Variables

| System Variable (>= 5.1.23) | Dynamic
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Name log</td>
<td>No</td>
</tr>
<tr>
<td>Variable Global Scope</td>
<td></td>
</tr>
<tr>
<td>Dynamic Yes</td>
<td></td>
</tr>
</tbody>
</table>

Permitted Values

| Type file name |

Whether logging of all statements to the general query log is enabled. See Section 5.4.3, “The General Query Log”.

This variable is deprecated as of MySQL 5.1.29 and is removed in MySQL 5.6. Use `general_log` instead.

• `log_bin_trust_function_creators`

Command-Line Format

```
--log-bin-trust-function-creators
```

<table>
<thead>
<tr>
<th>Name log_bin_trust_function_creators</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable Global Scope</td>
</tr>
<tr>
<td>Dynamic Yes</td>
</tr>
</tbody>
</table>

Permitted Values

| Type boolean |

Default FALSE

This variable applies when binary logging is enabled. It controls whether stored function creators can be trusted not to create stored functions that will cause unsafe events to be written to the binary log. If set to 0 (the default), users are not permitted to create or alter stored functions unless they have the SUPER privilege in addition to the CREATE ROUTINE or ALTER ROUTINE privilege. A setting of 0 also enforces the restriction that a function must be declared with the DETERMINISTIC characteristic, or with the READS SQL DATA or NO SQL characteristic. If the variable is set to 1, MySQL does not enforce these restrictions on stored function creation. This variable also applies to trigger creation. See Section 19.7, “Binary Logging of Stored Programs”.

• `log_bin_trust_routine_creators`

This is the old name for `log_bin_trust_function_creators`. This variable is deprecated and is removed in MySQL 5.5.

• `log_error`

Command-Line Format

```
--log-error [=file_name]
```

<table>
<thead>
<tr>
<th>Name log_error</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable Global Scope</td>
</tr>
<tr>
<td>Dynamic No</td>
</tr>
</tbody>
</table>

Permitted Values

| Type file name |

The location of the error log, or empty if the server is writing error message to the standard error output. See Section 5.4.2, “The Error Log”.

• `log_output`
### Server System Variables

<table>
<thead>
<tr>
<th>Introduced</th>
<th>5.1.6</th>
</tr>
</thead>
</table>

#### Command-Line Format

--log-output=name

#### System Variable

<table>
<thead>
<tr>
<th>Name</th>
<th>log_output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
</tbody>
</table>

#### Permitted Values

<table>
<thead>
<tr>
<th>Type</th>
<th>set</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>FILE</td>
</tr>
<tr>
<td>Values</td>
<td>TABLE, FILE, NONE</td>
</tr>
</tbody>
</table>

The destination for general query log and slow query log output. The value can be a comma-separated list of one or more of the words **TABLE** (log to tables), **FILE** (log to files), or **NONE** (do not log to tables or files). The default value is **FILE. NONE**, if present, takes precedence over any other specifiers. If the value is **NONE** log entries are not written even if the logs are enabled. If the logs are not enabled, no logging occurs even if the value of `log_output` is not **NONE**. For more information, see Section 5.4.1, “Selecting General Query and Slow Query Log Output Destinations”. This variable was added in MySQL 5.1.6.

* log_queries_not_using_indexes

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--log-queries-not-using-indexes</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>log_queries_not_using_indexedes</td>
</tr>
<tr>
<td>Variable</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Whether queries that do not use indexes are logged to the slow query log. See Section 5.4.5, “The Slow Query Log”. This variable was added in MySQL 5.1.11.

* log_slow_queries

<table>
<thead>
<tr>
<th>Deprecated</th>
<th>5.29, by slow-query-log</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--log-slow-queries [=name]</td>
</tr>
<tr>
<td>System Variable</td>
<td>log_slow_queries</td>
</tr>
<tr>
<td>Variable</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>No</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>System Variable</th>
<th>log_slow_queries</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Server System Variables

Permitted Values | Type   | boolean
---|---|---
Whether slow queries should be logged. “Slow” is determined by the value of the long_query_time variable. See Section 5.4.5, “The Slow Query Log”.

This variable is deprecated as of MySQL 5.1.29 and is removed in MySQL 5.6. Use slow_query_log instead.

- **log_warnings**

  Command-Line Format ---log-warnings[=#]

  System Variable

  - Name: log_warnings
  - Variable: Global, Session
  - Scope: Global, Session
  - Dynamic: Yes
  - Variable

  Permitted Values (32-bit platforms)

  - Type: integer
  - Default: 1
  - Min Value: 0
  - Max Value: 4294967295

  Permitted Values (64-bit platforms)

  - Type: integer
  - Default: 1
  - Min Value: 0
  - Max Value: 18446744073709551615

  Whether to produce additional warning messages to the error log. This variable is enabled (1) by default and can be disabled by setting it to 0. As of MySQL 5.1.38, the server logs messages about statements that are unsafe for statement-based logging if the value is greater than 0. Aborted connections and access-denied errors for new connection attempts are logged if the value is greater than 1.

- **long_query_time**

  Command-Line Format ---long_query_time=#

  System Variable

  - Name: long_query_time
  - Variable: Global, Session
  - Scope: Global, Session
  - Dynamic: Yes
  - Variable

  Permitted Values

  - Type: numeric
  - Default: 10
  - Min Value: 0

  If a query takes longer than this many seconds, the server increments the Slow_queries status variable. If the slow query log is enabled, the query is logged to the slow query log file. This value is measured in real time, not CPU time, so a query that is under the threshold on a lightly loaded system might be above the threshold on a heavily loaded one. The default value of
**long_query_time** is 10. Beginning with MySQL 5.1.21, the minimum is 0, and the value can be specified to a resolution of microseconds. For logging to a file, times are written including the microseconds part. For logging to tables, only integer times are written; the microseconds part is ignored. Prior to MySQL 5.1.21, the minimum value is 1, and the value for this variable must be an integer. See Section 5.4.5, “The Slow Query Log”.

• **low_priority_updates**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--low-priority-updates</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name: low_priority_updates</td>
</tr>
<tr>
<td></td>
<td>Variable: Global, Session</td>
</tr>
<tr>
<td></td>
<td>Scope:</td>
</tr>
<tr>
<td></td>
<td>Dynamic: Yes</td>
</tr>
<tr>
<td></td>
<td>Variable:</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type: boolean</td>
</tr>
<tr>
<td></td>
<td>Default: FALSE</td>
</tr>
</tbody>
</table>

If set to 1, all INSERT, UPDATE, DELETE, and LOCK TABLE WRITE statements wait until there is no pending SELECT or LOCK TABLE READ on the affected table. This affects only storage engines that use only table-level locking (such as MyISAM, MEMORY, and MEMORY). This variable previously was named sql_low_priority_updates.

• **lower_case_file_system**

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name: lower_case_file_system</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable: Global</td>
<td></td>
</tr>
<tr>
<td>Scope:</td>
<td></td>
</tr>
<tr>
<td>Dynamic: No</td>
<td></td>
</tr>
<tr>
<td>Variable:</td>
<td></td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type: boolean</td>
</tr>
</tbody>
</table>

This variable describes the case sensitivity of file names on the file system where the data directory is located. OFF means file names are case sensitive, ON means they are not case sensitive. This variable is read only because it reflects a file system attribute and setting it would have no effect on the file system.

• **lower_case_table_names**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--lower_case_table_names[=#]</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name: lower_case_table_names</td>
</tr>
<tr>
<td></td>
<td>Variable: Global</td>
</tr>
<tr>
<td></td>
<td>Scope:</td>
</tr>
<tr>
<td></td>
<td>Dynamic: No</td>
</tr>
<tr>
<td></td>
<td>Variable:</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type: integer</td>
</tr>
<tr>
<td></td>
<td>Default: 0</td>
</tr>
<tr>
<td></td>
<td>Min Value: 0</td>
</tr>
<tr>
<td></td>
<td>Max Value: 2</td>
</tr>
</tbody>
</table>

If set to 0, table names are stored as specified and comparisons are case sensitive. If set to 1, table names are stored in lowercase on disk and comparisons are not case sensitive. If set to 2, table
names are stored as given but compared in lowercase. This option also applies to database names and table aliases. For additional information, see Section 9.2.2, “Identifier Case Sensitivity”.

On Windows the default value is 1. On OS X, the default value is 2.

You should not set lower_case_table_names to 0 if you are running MySQL on a system where the data directory resides on a case-insensitive file system (such as on Windows or OS X). It is an unsupported combination that could result in a hang condition when running an `INSERT INTO ... SELECT ... FROM tbl_name` operation with the wrong `tbl_name` letter case. With MyISAM, accessing table names using different letter cases could cause index corruption.

If you are using InnoDB tables, you should set this variable to 1 on all platforms to force names to be converted to lowercase. Prior to MySQL Cluster NDB 6.3.35, MySQL Cluster NDB 7.0.15, and MySQL Cluster NDB 7.1.4, this is also true for tables using the NDB storage engine.

The setting of this variable has no effect on replication filtering options. See Section 16.2.3, “How Servers Evaluate Replication Filtering Rules”, for more information.

You should not use different settings for lower_case_table_names on replication masters and slaves. In particular, you should not do this when the slave uses a case-sensitive file system, as this can cause replication to fail. For more information, see Section 16.4.1.38, “Replication and Variables”.

- **max_allowed_packet**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--max_allowed_packet=#</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name: max_allowed_packet</td>
</tr>
<tr>
<td></td>
<td>Variable: Global, Session</td>
</tr>
<tr>
<td></td>
<td>Scope: Yes, Session</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Permitted Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type: integer</td>
</tr>
<tr>
<td>Default: 1048576</td>
</tr>
<tr>
<td>Min Value: 1024</td>
</tr>
<tr>
<td>Max Value: 1073741824</td>
</tr>
</tbody>
</table>

The maximum size of one packet or any generated/intermediate string.

The packet message buffer is initialized to `net_buffer_length` bytes, but can grow up to `max_allowed_packet` bytes when needed. This value by default is small, to catch large (possibly incorrect) packets.

You must increase this value if you are using large BLOB columns or long strings. It should be as big as the largest BLOB you want to use. The protocol limit for `max_allowed_packet` is 1GB. The value should be a multiple of 1024; nonmultiples are rounded down to the nearest multiple.

When you change the message buffer size by changing the value of the `max_allowed_packet` variable, you should also change the buffer size on the client side if your client program permits it. The default `max_allowed_packet` value built in to the client library is 1GB, but individual client programs might override this. For example, `mysql` and `mysqldump` have defaults of 16MB and 24MB, respectively. They also enable you to change the client-side value by setting `max_allowed_packet` on the command line or in an option file.

As of MySQL 5.1.31, the session value of this variable is read only. Before 5.1.31, setting the session value is permitted but has no effect. The client can receive up to as many bytes as the
session value. However, the server will not send to the client more bytes than the current global `max_allowed_packet` value. (The global value could be less than the session value if the global value is changed after the client connects.)

- **max_connect_errors**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--max_connect_errors=#</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>System Variable</strong></td>
<td>Name: <code>max_connect_errors</code></td>
</tr>
<tr>
<td></td>
<td>Variable: Global</td>
</tr>
<tr>
<td></td>
<td>Dynamic: Yes</td>
</tr>
</tbody>
</table>

**Permitted Values (32-bit platforms)**

- **Type**: integer
- **Default**: 10
- **Min Value**: 1
- **Max Value**: 4294967295

**Permitted Values (64-bit platforms)**

- **Type**: integer
- **Default**: 10
- **Min Value**: 1
- **Max Value**: 18446744073709547520

If more than this many successive connection requests from a host are interrupted without a successful connection, the server blocks that host from further connections. You can unblock blocked hosts by flushing the host cache. To do so, issue a `FLUSH HOSTS` statement or execute a `mysqladmin flush-hosts` command. If a connection is established successfully within fewer than `max_connect_errors` attempts after a previous connection was interrupted, the error count for the host is cleared to zero. However, once a host is blocked, flushing the host cache is the only way to unblock it.

- **max_connections**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--max_connections=#</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>System Variable</strong></td>
<td>Name: <code>max_connections</code></td>
</tr>
<tr>
<td></td>
<td>Variable: Global</td>
</tr>
<tr>
<td></td>
<td>Dynamic: Yes</td>
</tr>
</tbody>
</table>

**Permitted Values (<= 5.1.14)**

- **Type**: integer
- **Default**: 100
- **Min Value**: 1
- **Max Value**: 16384

**Permitted Values (>= 5.1.15, <= 5.1.16)**

- **Type**: integer
- **Default**: 151
### max_connections

<table>
<thead>
<tr>
<th>Min Value</th>
<th>Max Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>16384</td>
</tr>
</tbody>
</table>

**Permitted Values (>= 5.1.17)**

<table>
<thead>
<tr>
<th>Type</th>
<th>Default</th>
<th>Min Value</th>
<th>Max Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>integer</td>
<td>151</td>
<td>1</td>
<td>100000</td>
</tr>
</tbody>
</table>

The maximum permitted number of simultaneous client connections. By default, this is 151, beginning with MySQL 5.1.15. (Previously, the default was 100.) See Section B.5.2.7, “Too many connections”, for more information.

Increasing this value increases the number of file descriptors that `mysqld` requires. See Section 8.4.3.1, “How MySQL Opens and Closes Tables”, for comments on file descriptor limits.

- **max_delayed_threads**

**Command-Line Format**

```
--max_delayed_threads=#
```

**System Variable**

- **Name**: max_delayed_threads
- **Variable**: Global, Session
- **Scope**: Global, Session
- **Dynamic**: Yes

**Permitted Values**

<table>
<thead>
<tr>
<th>Type</th>
<th>Default</th>
<th>Min Value</th>
<th>Max Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>integer</td>
<td>20</td>
<td>0</td>
<td>16384</td>
</tr>
</tbody>
</table>

Do not start more than this number of threads to handle `INSERT DELAYED` statements. If you try to insert data into a new table after all `INSERT DELAYED` threads are in use, the row is inserted as if the `DELAYED` attribute was not specified. If you set this to 0, MySQL never creates a thread to handle `DELAYED` rows; in effect, this disables `DELAYED` entirely.

For the `SESSION` value of this variable, the only valid values are 0 or the `GLOBAL` value.

- **max_error_count**

**Command-Line Format**

```
--max_error_count=#
```

**System Variable**

- **Name**: max_error_count
- **Variable**: Global, Session
- **Scope**: Global, Session
- **Dynamic**: Yes

**Permitted Values**

<table>
<thead>
<tr>
<th>Type</th>
<th>Default</th>
<th>Min Value</th>
<th>Max Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>integer</td>
<td>64</td>
<td>0</td>
<td>16384</td>
</tr>
</tbody>
</table>
The maximum number of error, warning, and note messages to be stored for display by the `SHOW ERRORS` and `SHOW WARNINGS` statements.

- `max_heap_table_size`

  **Command-Line Format**
  ```
  --max_heap_table_size=#
  ```

  **System Variable**
  - **Name**: `max_heap_table_size`
  - **Variable**: Global, Session
  - **Scope**: Dynamic
  - **Variable**: Yes

  **Permitted Values (32-bit platforms)**
  - **Type**: integer
  - **Default**: 16777216
  - **Min Value**: 16384
  - **Max Value**: 4294967295

  **Permitted Values (64-bit platforms)**
  - **Type**: integer
  - **Default**: 16777216
  - **Min Value**: 16384
  - **Max Value**: 1844674407370954752

  This variable sets the maximum size to which user-created `MEMORY` tables are permitted to grow. The value of the variable is used to calculate `MEMORY` table `MAX_ROWS` values. Setting this variable has no effect on any existing `MEMORY` table, unless the table is re-created with a statement such as `CREATE TABLE` or altered with `ALTER TABLE` or `TRUNCATE TABLE`. A server restart also sets the maximum size of existing `MEMORY` tables to the global `max_heap_table_size` value.

  This variable is also used in conjunction with `tmp_table_size` to limit the size of internal in-memory tables. See Section 8.4.4, “Internal Temporary Table Use in MySQL”.

  `max_heap_table_size` is not replicated. See Section 16.4.1.22, “Replication and MEMORY Tables”, and Section 16.4.1.38, “Replication and Variables”, for more information.

- `max_insert_delayed_threads`

  **System Variable**
  - **Name**: `max_insert_delayed_threads`
  - **Variable**: Global, Session
  - **Scope**: Dynamic
  - **Variable**: Yes

  This variable is a synonym for `max_delayed_threads`.

- `max_join_size`
### Server System Variables

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--max_join_size=#</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>System Variable</strong></td>
<td>Name: max_join_size</td>
</tr>
<tr>
<td></td>
<td>Variable: Global, Session</td>
</tr>
<tr>
<td></td>
<td>Scope: Dynamic, Variable</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Permitted Values</strong></th>
<th>Type: integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default: 4294967295</td>
<td></td>
</tr>
<tr>
<td>Min Value: 1</td>
<td></td>
</tr>
<tr>
<td>Max Value: 4294967295</td>
<td></td>
</tr>
</tbody>
</table>

Do not permit statements that probably need to examine more than `max_join_size` rows (for single-table statements) or row combinations (for multiple-table statements) or that are likely to do more than `max_join_size` disk seeks. By setting this value, you can catch statements where keys are not used properly and that would probably take a long time. Set it if your users tend to perform joins that lack a `WHERE` clause, that take a long time, or that return millions of rows.

Setting this variable to a value other than `DEFAULT` resets the value of `sql_big_selects` to 0. If you set the `sql_big_selects` value again, the `max_join_size` variable is ignored.

If a query result is in the query cache, no result size check is performed, because the result has previously been computed and it does not burden the server to send it to the client.

This variable previously was named `sql_max_join_size`.

- `max_length_for_sort_data`

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--max_length_for_sort_data=#</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>System Variable</strong></td>
<td>Name: max_length_for_sort_data</td>
</tr>
<tr>
<td></td>
<td>Variable: Global, Session</td>
</tr>
<tr>
<td></td>
<td>Scope: Dynamic, Variable</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Permitted Values</strong></th>
<th>Type: integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default: 1024</td>
<td></td>
</tr>
<tr>
<td>Min Value: 4</td>
<td></td>
</tr>
<tr>
<td>Max Value: 8388608</td>
<td></td>
</tr>
</tbody>
</table>

The cutoff on the size of index values that determines which `filesort` algorithm to use. See Section 8.2.1.11, “ORDER BY Optimization”.

- `max_long_data_size`

| Introduced | 5.1.57        |
| Deprecated | 5.1.57        |
| Command-Line Format | --max_long_data_size=# |
| **System Variable** | Name: max_long_data_size |

526
Server System Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Global Scope</th>
<th>Dynamic Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_prepared_stmt_count</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

**Permitted Values**

- **Type**: integer
- **Default**: 16382
- **Min Value**: 0
- **Max Value**: 1048576

This variable limits the total number of prepared statements in the server. (The sum of the number of prepared statements across all sessions.) It can be used in environments where there is the potential for denial-of-service attacks based on running the server out of memory by preparing huge numbers of statements. If the value is set lower than the current number of prepared statements, existing statements are not affected and can be used, but no new statements can be prepared until the current number drops below the limit. The default value is 16,382. The permissible range of values is from 0 to 1 million. Setting the value to 0 disables prepared statements. This variable was added in MySQL 5.1.10.

- **max_relay_log_size**

**Command-Line Format**

```
--max_relay_log_size=#
```

**System Variable**

- **Name**: max_relay_log_size
- **Variable Global Scope**: Global
- **Dynamic Variable**: Yes

**Permitted Values**

- **Type**: integer
- **Default**: 0

This variable limits the size of the relay log file. Raising this variable permits the relay log file to grow larger than the default 100 MB. If the relay log fills, the server is stopped. The default value is 0, which means the relay log is limited to 100 MB. Setting the value to 0 disables the relay log.

---

The maximum size of parameter values that can be sent with the `mysql_stmt_send_long_data()` C API function. If not set at server startup, the default is the value of the `max_allowed_packet` system variable. This variable is deprecated. In MySQL 5.6, it is removed and the maximum parameter size is controlled by `max_allowed_packet`.

---

```
• max_prepared_stmt_count
```

---

```
• max_relay_log_size
```

---

527
If a write by a replication slave to its relay log causes the current log file size to exceed the value of this variable, the slave rotates the relay logs (closes the current file and opens the next one). If `max_relay_log_size` is 0, the server uses `max_binlog_size` for both the binary log and the relay log. If `max_relay_log_size` is greater than 0, it constrains the size of the relay log, which enables you to have different sizes for the two logs. You must set `max_relay_log_size` to between 4096 bytes and 1GB (inclusive), or to 0. The default value is 0. See Section 16.2.1, “Replication Implementation Details”.

- **max_seeks_for_key**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--max_seeks_for_key=#</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td><code>max_seeks_for_key</code></td>
</tr>
<tr>
<td>Variable</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic Variable</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>integer</td>
</tr>
<tr>
<td>Default</td>
<td>4294967295</td>
</tr>
<tr>
<td>Min Value</td>
<td>1</td>
</tr>
<tr>
<td>Max Value</td>
<td>4294967295</td>
</tr>
</tbody>
</table>

Limit the assumed maximum number of seeks when looking up rows based on a key. The MySQL optimizer assumes that no more than this number of key seeks are required when searching for matching rows in a table by scanning an index, regardless of the actual cardinality of the index (see Section 13.7.5.23, “SHOW INDEX Syntax”). By setting this to a low value (say, 100), you can force MySQL to prefer indexes instead of table scans.

- **max_sort_length**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--max_sort_length=#</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td><code>max_sort_length</code></td>
</tr>
<tr>
<td>Variable</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic Variable</td>
<td>Yes</td>
</tr>
<tr>
<td>Type</td>
<td>integer</td>
</tr>
<tr>
<td>Default</td>
<td>1024</td>
</tr>
<tr>
<td>Min Value</td>
<td>1</td>
</tr>
<tr>
<td>Max Value</td>
<td>18446744073709547520</td>
</tr>
</tbody>
</table>
The number of bytes to use when sorting data values. The server uses only the first `max_sort_length` bytes of each value and ignores the rest. Consequently, values that differ only after the first `max_sort_length` bytes compare as equal for `GROUP BY`, `ORDER BY`, and `DISTINCT` operations.

- `max_sp_recursion_depth`

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>--max_sp_recursion_depth[#]</code></td>
</tr>
<tr>
<td>System Variable</td>
<td><code>max_sp_recursion_depth</code></td>
</tr>
<tr>
<td>Variable Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic Variable</td>
<td>Yes</td>
</tr>
<tr>

<td>Type</td>
</tr>
<tr>
<td></td>
<td><code>integer</code></td>
</tr>
<tr>
<td></td>
<td>Default</td>
</tr>
<tr>
<td></td>
<td>0</td>
</tr>
<tr>
<td></td>
<td>Max Value</td>
</tr>
<tr>
<td></td>
<td>255</td>
</tr>
</tbody>
</table>

The number of times that any given stored procedure may be called recursively. The default value for this option is 0, which completely disables recursion in stored procedures. The maximum value is 255.

Stored procedure recursion increases the demand on thread stack space. If you increase the value of `max_sp_recursion_depth`, it may be necessary to increase thread stack size by increasing the value of `thread_stack` at server startup.

- `max_tmp_tables`

This variable is unused.

- `max_user_connections`

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>--max_user_connections=#</code></td>
</tr>
<tr>
<td>System Variable</td>

<tr>
<td></td>
<td>0</td>
</tr>
<tr>
<td></td>
<td>Max Value</td>
</tr>
<tr>
<td></td>
<td>4294967295</td>
</tr>
</tbody>
</table>

The maximum number of simultaneous connections permitted to any given MySQL user account. A value of 0 (the default) means “no limit.”
This variable has a global value that can be set at server startup or runtime. It also has a read-only session value that indicates the effective simultaneous-connection limit that applies to the account associated with the current session. The session value is initialized as follows:

- If the user account has a nonzero MAX_USER_CONNECTIONS resource limit, the session max_user_connections value is set to that limit.
- Otherwise, the session max_user_connections value is set to the global value.

Account resource limits are specified using the GRANT statement. See Section 6.3.4, "Setting Account Resource Limits", and Section 13.7.1.3, "GRANT Syntax".

• max_write_lock_count

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--max_write_lock_count=#</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>max_write_lock_count</td>

<td>0</td>
</tr>
<tr>
<td>Min Value</td>
<td>0</td>
</tr>
<tr>
<td>Max Value</td>
<td>4294967295</td>
</tr>
</tbody>
</table>
**Permitted Values (64-bit platforms)**

<table>
<thead>
<tr>
<th>Type</th>
<th>integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>0</td>
</tr>
<tr>
<td>Min Value</td>
<td>0</td>
</tr>
<tr>
<td>Max Value</td>
<td>18446744073709547520</td>
</tr>
</tbody>
</table>

Queries that examine fewer than this number of rows are not logged to the slow query log. This variable was added in MySQL 5.1.21.

- **multi_range_count**

  **Command-Line Format**

  `--multi_range_count=#`

  **System Variable**

<table>
<thead>
<tr>
<th>Name</th>
<th>multi_range_count</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic Variable</td>
<td>Yes</td>
</tr>
</tbody>
</table>

  **Permitted Values**

<table>
<thead>
<tr>
<th>Type</th>
<th>integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>256</td>
</tr>
<tr>
<td>Min Value</td>
<td>1</td>
</tr>
<tr>
<td>Max Value</td>
<td>4294967295</td>
</tr>
</tbody>
</table>

  The maximum number of ranges to send to a table handler at once during range selects. The default value is 256. Sending multiple ranges to a handler at once can improve the performance of certain selects dramatically. This is especially true for the NDBCLUSTER table handler, which needs to send the range requests to all nodes. Sending a batch of those requests at once reduces communication costs significantly.

  This variable is deprecated in MySQL 5.1, and is no longer supported in MySQL 5.5, in which arbitrarily long lists of ranges can be processed.

- **myisam_data_pointer_size**

  **Command-Line Format**

  `--myisam_data_pointer_size=#`

  **System Variable**

<table>
<thead>
<tr>
<th>Name</th>
<th>myisam_data_pointer_size</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic Variable</td>
<td>Yes</td>
</tr>
</tbody>
</table>

  **Permitted Values**

<table>
<thead>
<tr>
<th>Type</th>
<th>integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>6</td>
</tr>
<tr>
<td>Min Value</td>
<td>2</td>
</tr>
<tr>
<td>Max Value</td>
<td>7</td>
</tr>
</tbody>
</table>

  The default pointer size in bytes, to be used by `CREATE TABLE` for MyISAM tables when no `MAX_ROWS` option is specified. This variable cannot be less than 2 or larger than 7. The default value is 6. See Section B.5.2.12, “The table is full”.
### Server System Variables

- **myisam_max_sort_file_size**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--myisam_max_sort_file_size=#</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name myisam_max_sort_file_size</td>
</tr>
<tr>
<td></td>
<td>Variable Global Scope DynamicYes Variable</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>(32-bit platforms) Type integer Default 2147483648</td>
</tr>
<tr>
<td></td>
<td>(64-bit platforms) Type integer Default 922372036854775807</td>
</tr>
</tbody>
</table>

  The maximum size of the temporary file that MySQL is permitted to use while re-creating a **MyISAM** index (during `REPAIR TABLE`, `ALTER TABLE`, or `LOAD DATA INFILE`). If the file size would be larger than this value, the index is created using the key cache instead, which is slower. The value is given in bytes.

  If **MyISAM** index files exceed this size and disk space is available, increasing the value may help performance. The space must be available in the file system containing the directory where the original index file is located.

- **myisam_mmap_size**

  | Introduced | 5.1.43 |
  | Command-Line Format | --myisam_mmap_size=# |
  | System Variable     | Name myisam_mmap_size |
  |                     | Variable Global Scope Dynamic No Variable |
  | Permitted Values    | (32-bit platforms) Type integer Default 4294967295 Min Value 7 Max Value 4294967295 |
  |                     | (64-bit platforms) Type integer Default 18446744073709547520 Min Value 7 Max Value 18446744073709547520 |

  The maximum amount of memory to use for memory mapping compressed **MyISAM** files. If many compressed **MyISAM** tables are used, the value can be decreased to reduce the likelihood of memory-swapping problems. This variable was added in MySQL 5.1.43.

- **myisam_recover_options**

  | System Variable | Name myisam_recover_options | 532 |

  ```sql
  System Variable
  Name myisam_recover_options
  ```
The value of the `--myisam-recover` option. See Section 5.1.3, “Server Command Options”.

• **myisam_repair_threads**

  Command-Line Format
  `--myisam_repair_threads=#`

  System Variable
  Name `myisam_repair_threads`
  Variable Global, Session Scope
  Dynamic Yes Variable

  Permitted Values (32-bit platforms)
  Type `integer`
  Default `1`
  Min Value `1`
  Max Value `4294967295`

  Permitted Values (64-bit platforms)
  Type `integer`
  Default `1`
  Min Value `1`
  Max Value `18446744073709547520`

  If this value is greater than 1, MyISAM table indexes are created in parallel (each index in its own thread) during the Repair by sorting process. The default value is 1.

  Note
  Multi-threaded repair is still beta-quality code.

• **myisam_sort_buffer_size**

  Command-Line Format
  `--myisam_sort_buffer_size=#`

  System Variable
  Name `myisam_sort_buffer_size`
  Variable Global, Session Scope
  Dynamic Yes Variable

  Permitted Values (Windows)
  Type `integer`
  Default `8388608`
  Min Value `4096`
  Max Value `4294967295`
Server System Variables

<table>
<thead>
<tr>
<th>Permitted Values (Other, 32-bit platforms)</th>
<th>Type</th>
<th>integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>8388608</td>
<td></td>
</tr>
<tr>
<td>Min Value</td>
<td>4096</td>
<td></td>
</tr>
<tr>
<td>Max Value</td>
<td>4294967295</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Permitted Values (Other, 64-bit platforms)</th>
<th>Type</th>
<th>integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>8388608</td>
<td></td>
</tr>
<tr>
<td>Min Value</td>
<td>4096</td>
<td></td>
</tr>
<tr>
<td>Max Value</td>
<td>18446744073709547520</td>
<td></td>
</tr>
</tbody>
</table>

The size of the buffer that is allocated when sorting MyISAM indexes during a REPAIR TABLE or when creating indexes with CREATE INDEX or ALTER TABLE.

The maximum permissible setting for myisam_sort_buffer_size is 4GB−1. As of MySQL 5.1.23, larger values are permitted for 64-bit platforms (except 64-bit Windows, for which large values are truncated to 4GB−1 with a warning).

- myisam_stats_method

  Command-Line Format
  --myisam_stats_method=name

  System Variable
  Name myisam_stats_method
  Variable Global, Session
  Scope Dynamic
  Yes
  Variable

  Permitted Values
  Type enumeration
  Default nulls_unequal
  Valid Values
  nulls_equal
  nulls_unequal
  nulls_ignored

  How the server treats NULL values when collecting statistics about the distribution of index values for MyISAM tables. This variable has three possible values, nulls_equal, nulls_unequal, and nulls_ignored. For nulls_equal, all NULL index values are considered equal and form a single value group that has a size equal to the number of NULL values. For nulls_unequal, NULL values are considered unequal, and each NULL forms a distinct value group of size 1. For nulls_ignored, NULL values are ignored.

  The method that is used for generating table statistics influences how the optimizer chooses indexes for query execution, as described in Section 8.3.7, “InnoDB and MyISAM Index Statistics Collection”.

  Any unique prefix of a valid value may be used to set the value of this variable.

- myisam_use_mmap

  Introduced 5.1.4

  Command-Line Format
  --myisam_use_mmap

  System Variable
  Name myisam_use_mmap
<table>
<thead>
<tr>
<th>Variable</th>
<th>Global Scope</th>
<th>Dynamic Variable</th>
<th>Permitted Values</th>
<th>Type</th>
<th>Default</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>net_buffer_length</td>
<td>Global, Session</td>
<td>Yes</td>
<td>integer</td>
<td>16384</td>
<td>1024</td>
<td>1048576</td>
</tr>
</tbody>
</table>

Each client thread is associated with a connection buffer and result buffer. Both begin with a size given by `net_buffer_length`, but are dynamically enlarged up to `max_allowed_packet` bytes as needed. The result buffer shrinks to `net_buffer_length` after each SQL statement.

This variable should not normally be changed, but if you have very little memory, you can set it to the expected length of statements sent by clients. If statements exceed this length, the connection buffer is automatically enlarged. The maximum value to which `net_buffer_length` can be set is 1MB.

As of MySQL 5.1.31, the session value of this variable is read only. Before 5.1.31, setting the session value is permitted but has no effect.

- `net_read_timeout`
The number of seconds to wait for more data from a connection before aborting the read. Before MySQL 5.1.41, this timeout applies only to TCP/IP connections, not to connections made through Unix socket files, named pipes, or shared memory. When the server is reading from the client, `net_read_timeout` is the timeout value controlling when to abort. When the server is writing to the client, `net_write_timeout` is the timeout value controlling when to abort. See also `slave_net_timeout`.

On Linux, the `NO_ALARM` build flag affects timeout behavior as indicated in the description of the `net_retry_count` system variable.

- `net_retry_count`

If a read or write on a communication port is interrupted, retry this many times before giving up. This value should be set quite high on FreeBSD because internal interrupts are sent to all threads.

On Linux, the `NO_ALARM` build flag (`-DNO_ALARM`) modifies how the binary treats both `net_read_timeout` and `net_write_timeout`. With this flag enabled, neither timer cancels the current statement until after the failing connection has been waited on an additional `net_retry_count` times. This means that the effective timeout value becomes \((\text{timeout setting}) \times (\text{net_retry_count}+1)\).
Server System Variables

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--net_write_timeout=#</th>
</tr>
</thead>
<tbody>

<td></td>
</tr>
</tbody>
</table>

The number of seconds to wait for a block to be written to a connection before aborting the write. Before MySQL 5.1.41, this timeout applies only to TCP/IP connections, not to connections made using Unix socket files, named pipes, or shared memory. See also `net_read_timeout`.

On Linux, the `NO_ALARM` build flag affects timeout behavior as indicated in the description of the `net_retry_count` system variable.

- **new**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--new</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>new</td>
</tr>
<tr>
<td>Variable</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Scope</td>
<td></td>
</tr>
<tr>
<td>Dynamic Variable</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**Disabled by**

| skip-new |

**Permitted Values**

<table>
<thead>
<tr>
<th>Type</th>
<th>boolean</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>FALSE</td>
</tr>
</tbody>
</table>

This variable was used in MySQL 4.0 to turn on some 4.1 behaviors, and is retained for backward compatibility. Its value is always OFF.

In MySQL Cluster 5.1.12 and later, setting this variable to ON makes it possible to employ partitioning types other than KEY or LINEAR KEY with NDB tables. This feature is experimental only, and not supported in production. For additional information, see User-defined partitioning and the NDB storage engine (MySQL Cluster).

- **old**

| Introduced | 5.1.18 |
| Command-Line Format | --old |

**System Variable**

<table>
<thead>
<tr>
<th>Name</th>
<th>old</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable</td>
<td>Global</td>
</tr>
<tr>
<td>Scope</td>
<td></td>
</tr>
<tr>
<td>Dynamic Variable</td>
<td>No</td>
</tr>
</tbody>
</table>

old is a compatibility variable. It is disabled by default, but can be enabled at startup to revert the server to behaviors present in older versions.
When \texttt{old} is enabled, it changes the default scope of index hints to that used prior to MySQL 5.1.17. That is, index hints with no \texttt{FOR} clause apply only to how indexes are used for row retrieval and not to resolution of \texttt{ORDER BY} or \texttt{GROUP BY} clauses. (See Section \ref{index-hints}, “Index Hints”.) Take care about enabling this in a replication setup. With statement-based binary logging, having different modes for the master and slaves might lead to replication errors.

This variable was added as \texttt{old_mode} in MySQL 5.1.17 and renamed to \texttt{old} in MySQL 5.1.18.

- \texttt{old_alter_table}

  \begin{table}[h]
  \centering
  \begin{tabular}{|l|l|l|}
  \hline
  \textbf{Command-Line Format} & \texttt{--old-alter-table}  \\
  \hline
  \textbf{System Variable} & \textbf{Name} & \texttt{old_alter_table}  \\
  \hline
  & \textbf{Variable} & Global, Session  \\
  & \textbf{Scope} &  \\
  & \textbf{Dynamic} & Yes  \\
  & \textbf{Variable} &  \\
  \hline
  \textbf{Permitted Values} & \textbf{Type} & boolean  \\
  \hline
  & \textbf{Default} & OFF  \\
  \hline
  \end{tabular}
  \end{table}

  When this variable is enabled, the server does not use the optimized method of processing an \texttt{ALTER TABLE} operation. It reverts to using a temporary table, copying over the data, and then renaming the temporary table to the original, as used by MySQL 5.0 and earlier. For more information on the operation of \texttt{ALTER TABLE}, see Section \ref{alter-table-syntax}, “\texttt{ALTER TABLE} Syntax”.

- \texttt{old_passwords}

  \begin{table}[h]
  \centering
  \begin{tabular}{|l|l|l|}
  \hline
  \textbf{System Variable} & \textbf{Name} & \texttt{old_passwords}  \\
  \hline
  & \textbf{Variable} & Global, Session  \\
  & \textbf{Scope} &  \\
  & \textbf{Dynamic} & Yes  \\
  & \textbf{Variable} &  \\
  \hline
  \textbf{Permitted Values} & \textbf{Type} & boolean  \\
  \hline
  & \textbf{Default} & 0  \\
  \hline
  \end{tabular}
  \end{table}

  This variable controls the password hashing method used by the \texttt{PASSWORD()} function. It also influences password hashing performed by \texttt{CREATE USER} and \texttt{GRANT} statements that specify a password using an \texttt{IDENTIFIED BY} clause.

  The value determines whether or not to use “old” native MySQL password hashing. A value of 0 (or \texttt{OFF}) causes passwords to be encrypted using the format available from MySQL 4.1 on. A value of 1 (or \texttt{ON}) causes password encryption to use the older pre-4.1 format.

  If \texttt{old_passwords=1, PASSWORD(str)} returns the same value as \texttt{OLD_PASSWORD(str)}. The latter function is not affected by the value of \texttt{old_passwords}.

  For information about hashing formats, see Section \ref{password-hashing}, “Password Hashing in MySQL”.

- \texttt{one_shot}

  This is not a variable, but it can be used when setting some variables. It is described in Section \ref{set-syntax}, “SET Syntax for Variable Assignment”.

- \texttt{open_files_limit}

  \begin{table}[h]
  \centering
  \begin{tabular}{|l|l|}
  \hline
  \textbf{Command-Line Format} & \texttt{--open-files-limit=##}  \\
  \hline
  \end{tabular}
  \end{table}
### Server System Variables

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>Type</th>
<th>Default</th>
<th>Min Value</th>
<th>Max Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>open_files_limit</td>
<td>Global</td>
<td>integer</td>
<td>0</td>
<td>0</td>
<td>platform dependent</td>
</tr>
</tbody>
</table>

The number of files that the operating system permits `mysqld` to open. This is the real value permitted by the system and might be different from the value you gave using the `--open-files-limit` option to `mysqld` or `mysqld_safe`. The value is 0 on systems where MySQL cannot change the number of open files.

- **optimizer_prune_level**

  **Command-Line Format**
  ```
  --optimizer_prune_level[=#]
  ```

  **System Variable**
  - Name: `optimizer_prune_level`
  - Variable: Global, Session
  - Dynamic: Yes

  **Permitted Values**
  - Type: `boolean`
  - Default: `1`

  Controls the heuristics applied during query optimization to prune less-promising partial plans from the optimizer search space. A value of 0 disables heuristics so that the optimizer performs an exhaustive search. A value of 1 causes the optimizer to prune plans based on the number of rows retrieved by intermediate plans.

- **optimizer_search_depth**

  **Command-Line Format**
  ```
  --optimizer_search_depth[=#]
  ```

  **System Variable**
  - Name: `optimizer_search_depth`
  - Variable: Global, Session
  - Dynamic: Yes

  **Permitted Values**
  - Type: `integer`
  - Default: `62`
  - Min Value: `0`
  - Max Value: `63`

  The maximum depth of search performed by the query optimizer. Values larger than the number of relations in a query result in better query plans, but take longer to generate an execution plan for a query. Values smaller than the number of relations in a query return an execution plan quicker,
but the resulting plan may be far from being optimal. If set to 0, the system automatically picks a reasonable value. If set to 63, the optimizer switches to the algorithm used in MySQL 5.0.0 (and previous versions) for performing searches. The value of 63 is deprecated and will be treated as invalid in a future MySQL release.

- **optimizer_switch**

<table>
<thead>
<tr>
<th>Introduced</th>
<th>5.1.34</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--optimizer_switch=value</td>
</tr>
<tr>
<td>System Variable</td>
<td>Name</td>
</tr>
<tr>
<td></td>
<td>Variable</td>
</tr>
<tr>
<td></td>
<td>Dynamic Variable</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>Valid Values: index_merge={on</td>
</tr>
<tr>
<td></td>
<td>index_merge_intersection={on</td>
</tr>
<tr>
<td></td>
<td>index_merge_sort_union={on</td>
</tr>
<tr>
<td></td>
<td>index_merge_union={on</td>
</tr>
</tbody>
</table>

The **optimizer_switch** system variable enables control over optimizer behaviors. The value of this variable is a set of flags, each of which has a value of **on** or **off** to indicate whether the corresponding optimizer behavior is enabled or disabled. This variable has global and session values and can be changed at runtime. The global default can be set at server startup.

To see the current set of optimizer flags, select the variable value:

```
mysql> SELECT @@optimizer_switch;
+---------------------------+
|@@optimizer_switch: index_merge=on, index_merge_union=on, |
| index_merge_sort_union=on, index_merge_intersection=on |
+---------------------------+
```

For more information about the syntax of this variable and the optimizer behaviors that it controls, see Section 8.9.2, “Controlling Switchable Optimizations”.

- **pid_file**

<table>
<thead>
<tr>
<th>Introduced</th>
<th>5.1.2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--pid-file=file_name</td>
</tr>
<tr>
<td>System Variable</td>
<td>Name</td>
</tr>
<tr>
<td></td>
<td>Variable</td>
</tr>
<tr>
<td></td>
<td>Dynamic Variable</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type</td>
</tr>
</tbody>
</table>

The path name of the process ID (PID) file. This variable can be set with the **--pid-file** option.

- **plugin_dir**

<table>
<thead>
<tr>
<th>Introduced</th>
<th>5.1.2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command-Line Format</td>
<td>--plugin_dir=dir_name</td>
</tr>
<tr>
<td>System Variable</td>
<td>Name</td>
</tr>
</tbody>
</table>

### Server System Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Global Scope</th>
<th>Dynamic Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>No</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Permitted Values (&lt;= 5.1.1)</th>
<th>Type</th>
<th>directory name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Permitted Values (Windows, &gt;= 5.1.2)</th>
<th>Type</th>
<th>directory name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default BASEDIR/lib/plugin</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Permitted Values (Other, &gt;= 5.1.2)</th>
<th>Type</th>
<th>directory name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default BASEDIR/lib/mysql/plugin</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The path name of the plugin directory. This variable was added in MySQL 5.1.2.

If the plugin directory is writable by the server, it may be possible for a user to write executable code to a file in the directory using `SELECT ... INTO DUMPFILE`. This can be prevented by making `plugin_dir` read only to the server or by setting `--secure-file-priv` to a directory where `SELECT` writes can be made safely.

- **port**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--port=#</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name port</td>
</tr>
<tr>
<td>Variable Global Scope</td>
<td>No</td>
</tr>
<tr>
<td>Dynamic No Variable</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Permitted Values</th>
<th>Type integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default 3306</td>
<td></td>
</tr>
<tr>
<td>Min Value 0</td>
<td></td>
</tr>
<tr>
<td>Max Value 65535</td>
<td></td>
</tr>
</tbody>
</table>

The number of the port on which the server listens for TCP/IP connections. This variable can be set with the `--port` option.

- **preload_buffer_size**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--preload_buffer_size=#</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name preload_buffer_size</td>
</tr>
<tr>
<td>Variable Global, Session Scope</td>
<td>Yes</td>
</tr>
<tr>
<td>Dynamic Yes Variable</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Permitted Values</th>
<th>Type integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default 32768</td>
<td></td>
</tr>
<tr>
<td>Min Value 1024</td>
<td></td>
</tr>
<tr>
<td>Max Value 1073741824</td>
<td></td>
</tr>
</tbody>
</table>
The size of the buffer that is allocated when preloading indexes.

- **prepared_stmt_count**

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Permitted Values</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>prepared_stmt_count</strong></td>
<td>Global</td>
<td>Global</td>
<td>No</td>
<td>integer</td>
<td>integer</td>
</tr>
</tbody>
</table>

The current number of prepared statements. (The maximum number of statements is given by the max_prepared_stmt_count system variable.) This variable was added in MySQL 5.1.10. In MySQL 5.1.14, it was converted to the global Prepared_stmt_count status variable.

- **profiling**

If set to 0 or `OFF` (the default), statement profiling is disabled. If set to 1 or `ON`, statement profiling is enabled and the `SHOW PROFILE` and `SHOW PROFILES` statements provide access to profiling information. See Section 13.7.5.33, “SHOW PROFILES Syntax”. This variable was added in MySQL 5.1.24.

- **profiling_history_size**

The number of statements for which to maintain profiling information if profiling is enabled. The default value is 15. The maximum value is 100. Setting the value to 0 effectively disables profiling. See Section 13.7.5.33, “SHOW PROFILES Syntax”. This variable was added in MySQL 5.1.24.

- **protocol_version**

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Permitted Values</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>protocol_version</strong></td>
<td>Global</td>
<td>Global</td>
<td>No</td>
<td>integer</td>
<td>integer</td>
</tr>
</tbody>
</table>

The version of the client/server protocol used by the MySQL server.

- **pseudo_thread_id**

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Permitted Values</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>pseudo_thread_id</strong></td>
<td>Session</td>
<td>Session</td>
<td>Yes</td>
<td>integer</td>
<td>integer</td>
</tr>
</tbody>
</table>

This variable is for internal server use.

- **query_alloc_block_size**

Command-Line Format: `--query_alloc_block_size=#`
### Server System Variables

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>Variable Scope</th>
<th>Dynamic Variable</th>
<th>Type</th>
<th>Default</th>
<th>Min Value</th>
<th>Max Value</th>
<th>Permitted Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>query_alloc_block_size</td>
<td>query_alloc_block_size</td>
<td>Global, Session</td>
<td>Yes</td>
<td>integer</td>
<td>8192</td>
<td>1024</td>
<td>4294967295</td>
<td>(32-bit platforms)</td>
</tr>
<tr>
<td>query_cache_limit</td>
<td>query_cache_limit</td>
<td>Global</td>
<td>Yes</td>
<td>integer</td>
<td>1048576</td>
<td>0</td>
<td>4294967295</td>
<td>Do not cache results that are larger than this number of bytes. The default value is 1MB.</td>
</tr>
</tbody>
</table>

The allocation size of memory blocks that are allocated for objects created during statement parsing and execution. If you have problems with memory fragmentation, it might help to increase this parameter.

- query_cache_limit

**Command-Line Format**

```
--query_cache_limit=#
```
### query_cache_min_res_unit

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--query_cache_min_res_unit=#</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name query_cache_min_res_unit</td>
</tr>
<tr>
<td></td>
<td>Variable Global Scope</td>
</tr>
<tr>
<td></td>
<td>DynamicYes Variable</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type integer</td>
</tr>
<tr>
<td>(32-bit platforms)</td>
<td>Default 4096</td>
</tr>
<tr>
<td></td>
<td>Min Value 512</td>
</tr>
<tr>
<td></td>
<td>Max Value 4294967295</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type integer</td>
</tr>
<tr>
<td>(64-bit platforms)</td>
<td>Default 4096</td>
</tr>
<tr>
<td></td>
<td>Min Value 512</td>
</tr>
<tr>
<td></td>
<td>Max Value 18446744073709547520</td>
</tr>
</tbody>
</table>

The minimum size (in bytes) for blocks allocated by the query cache. The default value is 4096 (4KB). Tuning information for this variable is given in Section 8.10.3.3, “Query Cache Configuration”.

### query_cache_size

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--query_cache_size=#</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name query_cache_size</td>
</tr>
<tr>
<td></td>
<td>Variable Global Scope</td>
</tr>
<tr>
<td></td>
<td>DynamicYes Variable</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type integer</td>
</tr>
<tr>
<td>(32-bit platforms)</td>
<td>Default 0</td>
</tr>
<tr>
<td></td>
<td>Min Value 0</td>
</tr>
<tr>
<td></td>
<td>Max Value 4294967295</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type integer</td>
</tr>
<tr>
<td>(64-bit platforms)</td>
<td>Default 0</td>
</tr>
<tr>
<td></td>
<td>Min Value 0</td>
</tr>
<tr>
<td></td>
<td>Max Value 18446744073709547520</td>
</tr>
</tbody>
</table>

The amount of memory allocated for caching query results. The default value is 0, which disables the query cache. The permissible values are multiples of 1024; other values are rounded down to the nearest multiple. query_cache_size bytes of memory are allocated even if query_cache_type is set to 0. See Section 8.10.3.3, “Query Cache Configuration”, for more information.
The query cache needs a minimum size of about 40KB to allocate its structures. (The exact size depends on system architecture.) If you set the value of `query_cache_size` too small, a warning will occur, as described in Section 8.10.3.3, “Query Cache Configuration”.

- **query_cache_type**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th><code>--query_cache_type=#</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name: <code>query_cache_type</code></td>
</tr>
<tr>
<td></td>
<td>Variable: Global, Session</td>
</tr>
<tr>
<td></td>
<td>Scope: Dynamic</td>
</tr>
<tr>
<td></td>
<td>Dynamic: Yes</td>
</tr>
<tr>
<td></td>
<td>Variable:</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type: enumeration</td>
</tr>
<tr>
<td></td>
<td>Default: 1</td>
</tr>
<tr>
<td></td>
<td>Valid: 0</td>
</tr>
<tr>
<td></td>
<td>Values: 1</td>
</tr>
<tr>
<td></td>
<td>2</td>
</tr>
</tbody>
</table>

  Set the query cache type. Setting the `GLOBAL` value sets the type for all clients that connect thereafter. Individual clients can set the `SESSION` value to affect their own use of the query cache. Possible values are shown in the following table.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 or OFF</td>
<td>Do not cache results in or retrieve results from the query cache. Note that this does not deallocate the query cache buffer. To do that, you should set <code>query_cache_size</code> to 0.</td>
</tr>
<tr>
<td>1 or ON</td>
<td>Cache all cacheable query results except for those that begin with <code>SELECT SQL_NO_CACHE</code>.</td>
</tr>
<tr>
<td>2 or DEMAND</td>
<td>Cache results only for cacheable queries that begin with <code>SELECT SQL_CACHE</code>.</td>
</tr>
</tbody>
</table>

  This variable defaults to `ON`.

  Any unique prefix of a valid value may be used to set the value of this variable.

- **query_cache_wlock_invalidate**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th><code>--query_cache_wlock_invalidate</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name: <code>query_cache_wlock_invalidate</code></td>
</tr>
<tr>
<td></td>
<td>Variable: Global, Session</td>
</tr>
<tr>
<td></td>
<td>Scope: Dynamic</td>
</tr>
<tr>
<td></td>
<td>Dynamic: Yes</td>
</tr>
<tr>
<td></td>
<td>Variable:</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type: boolean</td>
</tr>
<tr>
<td></td>
<td>Default: FALSE</td>
</tr>
</tbody>
</table>

  Normally, when one client acquires a WRITE lock on a MyISAM table, other clients are not blocked from issuing statements that read from the table if the query results are present in the query cache. Setting this variable to 1 causes acquisition of a WRITE lock for a table to invalidate any queries in the query cache that refer to the table. This forces other clients that attempt to access the table to wait while the lock is in effect.
### Server System Variables

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--query_prealloc_size=#</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name: <code>query_prealloc_size</code></td>
</tr>
<tr>
<td></td>
<td>Variable: Global, Session</td>
</tr>
<tr>
<td></td>
<td>Scope: System Variable</td>
</tr>
<tr>
<td></td>
<td>Dynamic: Yes</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Permitted Values (32-bit platforms)</th>
<th>Type: integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default: 8192</td>
<td></td>
</tr>
<tr>
<td>Min Value: 8192</td>
<td></td>
</tr>
<tr>
<td>Max Value: 4,294,967,295</td>
<td></td>
</tr>
<tr>
<td>Block Size: 1024</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Permitted Values (64-bit platforms)</th>
<th>Type: integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default: 8192</td>
<td></td>
</tr>
<tr>
<td>Min Value: 8192</td>
<td></td>
</tr>
<tr>
<td>Max Value: 18,446,744,073,709,547,520</td>
<td></td>
</tr>
<tr>
<td>Block Size: 1024</td>
<td></td>
</tr>
</tbody>
</table>

The size of the persistent buffer used for statement parsing and execution. This buffer is not freed between statements. If you are running complex queries, a larger `query_prealloc_size` value might be helpful in improving performance, because it can reduce the need for the server to perform memory allocation during query execution operations.

- **rand_seed1**

  The `rand_seed1` and `rand_seed2` variables exist as session variables only, and can be set but not read. Beginning with MySQL 5.1.18, the variables—but not their values—are shown in the output of `SHOW VARIABLES`.

  The purpose of these variables is to support replication of the `RAND()` function. For statements that invoke `RAND()`, the master passes two values to the slave, where they are used to seed the random number generator. The slave uses these values to set the session variables `rand_seed1` and `rand_seed2` so that `RAND()` on the slave generates the same value as on the master.

- **rand_seed2**

  See the description for `rand_seed1`.

- **range_alloc_block_size**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--range_alloc_block_size=#</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name: <code>range_alloc_block_size</code></td>
</tr>
<tr>
<td></td>
<td>Variable: Global, Session</td>
</tr>
<tr>
<td></td>
<td>Scope: System Variable</td>
</tr>
<tr>
<td></td>
<td>Dynamic: Yes</td>
</tr>
</tbody>
</table>

</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>131072</td>
<td></td>
</tr>
<tr>
<td>Min Value</td>
<td>8200</td>
<td></td>
</tr>
<tr>
<td>Max Value</td>
<td>2147479552</td>
<td></td>
</tr>
</tbody>
</table>

Each thread that does a sequential scan for a MyISAM table allocates a buffer of this size (in bytes) for each table it scans. If you do many sequential scans, you might want to increase this value, which defaults to 131072. The value of this variable should be a multiple of 4KB. If it is set to a value that is not a multiple of 4KB, its value will be rounded down to the nearest multiple of 4KB.

This option is also used in the following context for all storage engines:

- For caching the indexes in a temporary file (not a temporary table), when sorting rows for ORDER BY.
- For bulk insert into partitions.
- For caching results of nested queries.

and in one other storage engine-specific way: to determine the memory block size for MEMORY tables.

The maximum permissible setting for read_buffer_size is 2GB.

For more information about memory use during different operations, see Section 8.12.5.1, “How MySQL Uses Memory”.

- **read_only**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--read_only</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name: read_only</td>
</tr>
<tr>
<td></td>
<td>Variable: Global</td>
</tr>
<tr>
<td></td>
<td>Scope: Global</td>
</tr>
</tbody>
</table>
When the `read_only` system variable is enabled, the server permits no client updates except from users who have the `SUPER` privilege. This variable is disabled by default.

Even with `read_only` enabled, the server permits these operations:

- Updates performed by slave threads, if the server is a replication slave. In replication setups, it can be useful to enable `read_only` on slave servers to ensure that slaves accept updates only from the master server and not from clients.

- Use of `ANALYZE TABLE` or `OPTIMIZE TABLE` statements. The purpose of read-only mode is to prevent changes to table structure or contents. Analysis and optimization do not qualify as such changes. This means, for example, that consistency checks on read-only replication slaves can be performed with `mysqlcheck --all-databases --analyze`.

- Operations on `TEMPORARY` tables.

- Inserts into the log tables (`mysql.general_log` and `mysql.slow_log`; see Section 5.4.1, “Selecting General Query and Slow Query Log Output Destinations”).

`read_only` exists only as a `GLOBAL` variable, so changes to its value require the `SUPER` privilege. Changes to `read_only` on a master server are not replicated to slave servers. The value can be set on a slave server independent of the setting on the master.

---

**Important**

As of MySQL 5.1, enabling `read_only` prevents users not having the `SUPER` privilege from using account-management statements such as `CREATE USER` or `SET PASSWORD`. This is not the case for MySQL 5.0. When replicating from a MySQL 5.0 master to a MySQL 5.1 or later slave, check whether this will have an impact on your applications.

As of MySQL 5.1.15, the following conditions apply to attempts to enable `read_only`:

- The attempt fails and an error occurs if you have any explicit locks (acquired with `LOCK TABLES`) or have a pending transaction.

- The attempt blocks while other clients hold explicit table locks or have pending transactions, until the locks are released and the transactions end. While the attempt to enable `read_only` is pending, requests by other clients for table locks or to begin transactions also block until `read_only` has been set.

- `read_only` can be enabled while you hold a global read lock (acquired with `FLUSH TABLES WITH READ LOCK`) because that does not involve table locks.

- `read_rnd_buffer_size`
When reading rows from a MyISAM table in sorted order following a key-sorting operation, the rows are read through this buffer to avoid disk seeks. See Section 8.2.1.11, “ORDER BY Optimization”. Setting the variable to a large value can improve ORDER BY performance by a lot. However, this is a buffer allocated for each client, so you should not set the global variable to a large value. Instead, change the session variable only from within those clients that need to run large queries.

The maximum permissible setting for `read_rnd_buffer_size` is 2GB.

For more information about memory use during different operations, see Section 8.12.5.1, “How MySQL Uses Memory”.

- `relay_log_purge`

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--relay_log_purge</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>relay_log_purge</td>
</tr>
<tr>
<td>Variable Global</td>

</tbody>
</table>
## Server System Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Max Value</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>18446744073709547520</td>
</tr>
</tbody>
</table>

The maximum amount of space to use for all relay logs.

- **report_host**

  **Command-Line Format**
  --report-host=host_name

  **System Variable** (>= 5.1.24)
  **Name** report_host
  **Variable Scope** Global
  **Dynamic Variable** No

  **Permitted Values**
  **Type** string

  The value of the `--report-host` option. This variable was added in MySQL 5.1.24.

- **report_password**

  **Command-Line Format**
  --report-password=name

  **System Variable** (>= 5.1.24)
  **Name** report_password
  **Variable Scope** Global
  **Dynamic Variable** No

  **Permitted Values**
  **Type** string

  The value of the `--report-password` option. Not the same as the password for the MySQL replication user account. This variable was added in MySQL 5.1.24.

- **report_port**

  **Command-Line Format**
  --report-port=#

  **System Variable** (>= 5.1.24)
  **Name** report_port
  **Variable Scope** Global
  **Dynamic Variable** No

  **Permitted Values**
  **Type** integer
  **Default** 3306
  **Min Value** 0
  **Max Value** 65535

  The value of the `--report-port` option. This variable was added in MySQL 5.1.24.

- **report_user**

  **Command-Line Format**
  --report-user=name

  **System Variable** (>= 5.1.24)
  **Name** report_user
  **550**
Server System Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Global Scope</th>
<th>Dynamic Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Permitted Values**  
Type: string

The value of the `--report-user` option. This variable was added in MySQL 5.1.24.

- **secure_auth**

  **Command-Line Format**  
  `--secure-auth`

  **System Variable**  
  Name: `secure_auth`
  
  Variable Global Scope  
  Dynamic Yes Variable

  **Permitted Values**  
  Type: boolean  
  Default: OFF

  If this variable is enabled, the server blocks connections by clients that attempt to use accounts that have passwords stored in the old (pre-4.1) format.

  Enable this variable to prevent all use of passwords employing the old format (and hence insecure communication over the network).

  Server startup fails with an error if this variable is enabled and the privilege tables are in pre-4.1 format. See Section B.5.2.4, “Client does not support authentication protocol”.

- **secure_file_priv**

  **Introduced**  
  5.1.17

  **Command-Line Format**  
  `--secure-file-priv=dir_name`

  **System Variable**  
  Name: `secure_file_priv`
  
  Variable Global Scope  
  Dynamic No Variable

  **Permitted Values**  
  Type: string  
  Default: empty  
  Valid Values: empty, dir_name

  This variable is used to limit the effect of data import and export operations, such as those performed by the `LOAD DATA` and `SELECT ... INTO OUTFILE` statements and the `LOAD_FILE()` function. By default, this variable is empty. If set to the name of a directory, it limits import and export operations to work only with files in that directory.

  This variable was added in MySQL 5.1.17.

- **server_id**

  **Command-Line Format**  
  `--server-id=#`

  **System Variable**  
  Name: `server_id`
Server System Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Yes</th>
</tr>
</thead>
</table>

**Permitted Values**

<table>
<thead>
<tr>
<th>Type</th>
<th>Default</th>
<th>Min Value</th>
<th>Max Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>integer</td>
<td>0</td>
<td>0</td>
<td>4294967295</td>
</tr>
</tbody>
</table>

The server ID, used in replication to give each master and slave a unique identity. This variable is set by the `--server-id` option. For each server participating in replication, you should pick a positive integer in the range from 1 to $2^{32} - 1$ to act as that server's ID.

- **shared_memory**

**Command-Line Format**

```
--shared_memory[={0,1}]
```

**System Variable**

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>shared_memory</td>
<td>Global</td>
<td>Global</td>
<td>No</td>
<td></td>
</tr>
</tbody>
</table>

**Platform Specific**

Windows

**Permitted Values**

<table>
<thead>
<tr>
<th>Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolean</td>
<td>FALSE</td>
</tr>
</tbody>
</table>

(Windows only.) Whether the server permits shared-memory connections.

- **shared_memory_base_name**

**Command-Line Format**

```
--shared_memory_base_name=name
```

**System Variable**

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>shared_memory_base_name</td>
<td>Global</td>
<td>Global</td>
<td>No</td>
<td></td>
</tr>
</tbody>
</table>

**Platform Specific**

Windows

**Permitted Values**

<table>
<thead>
<tr>
<th>Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>MYSQL</td>
</tr>
</tbody>
</table>

(Windows only.) The name of shared memory to use for shared-memory connections. This is useful when running multiple MySQL instances on a single physical machine. The default name is MYSQL. The name is case sensitive.

- **skip_external_locking**

**Command-Line Format**

```
--skip-external-locking
```

**System Variable**

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Scope</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>skip_external_locking</td>
<td>Global</td>
<td>Global</td>
<td>552</td>
</tr>
</tbody>
</table>
This is **OFF** if `mysqld` uses external locking (system locking), **ON** if external locking is disabled. This affects only **MyISAM** table access.

This variable is set by the `--external-locking` or `--skip-external-locking` option. External locking is disabled by default.

External locking affects only **MyISAM** table access. For more information, including conditions under which it can and cannot be used, see Section 8.11.4, “External Locking”.

- **skip_name_resolve**

  **Command-Line Format** | `--skip-name-resolve`
  **System Variable** | **Name** `skip_name_resolve`
  **Variable** | Global
  **Scope** | Dynamic
  **Permitted Values** | Type boolean
  **Default** | **OFF**

  This variable is set from the value of the `--skip-name-resolve` option. If it is **OFF**, `mysqld` resolves host names when checking client connections. If it is **ON**, `mysqld` uses only IP numbers; in this case, all **Host** column values in the grant tables must be IP addresses or `localhost`. See Section 8.12.6.2, “DNS Lookup Optimization and the Host Cache”.

  This variable was added in MySQL 5.1.46.

- **skip_networking**

  **Command-Line Format** | `--skip-networking`
  **System Variable** | **Name** `skip_networking`
  **Variable** | Global
  **Scope** | Dynamic
  **Permitted Values** | Type boolean
  **Default** | **ON**

  This is **ON** if the server permits only local (non-TCP/IP) connections. On Unix, local connections use a Unix socket file. On Windows, local connections use a named pipe or shared memory. On NetWare, only TCP/IP connections are supported, so do not set this variable to **ON**. This variable can be set to **ON** with the `--skip-networking` option.

- **skip_show_database**

  **Command-Line Format** | `--skip-show-database`
  **System Variable** | **Name** `skip_show_database`
  **Variable** | Global
  **Scope** | Dynamic
  **Permitted Values** | Type boolean
  **Default** | **OFF**
This prevents people from using the `SHOW DATABASES` statement if they do not have the `SHOW DATABASES` privilege. This can improve security if you have concerns about users being able to see databases belonging to other users. Its effect depends on the `SHOW DATABASES` privilege: if the variable value is `ON`, the `SHOW DATABASES` statement is permitted only to users who have the `SHOW DATABASES` privilege, and the statement displays all database names. If the value is `OFF`, `SHOW DATABASES` is permitted to all users, but displays the names of only those databases for which the user has the `SHOW DATABASES` or other privilege. (Note that any global privilege is considered a privilege for the database.)

- **slow_launch_time**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--slow_launch_time=#</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name slow_launch_time</td>
</tr>
<tr>
<td></td>
<td>Variable Global</td>
</tr>
<tr>
<td></td>
<td>Scope Dynamic</td>
</tr>
<tr>
<td></td>
<td>Variable Yes</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type integer</td>
</tr>
<tr>
<td></td>
<td>Default 2</td>
</tr>
</tbody>
</table>

If creating a thread takes longer than this many seconds, the server increments the `Slow_launch_threads` status variable.

- **slow_query_log**

| Introduced | 5.1.12 |
| Command-Line Format | --slow-query-log (>= 5.1.29) |
| System Variable | Name slow_query_log |
| Variable Global |
| Dynamic Yes Variable |
| Permitted Values | Type boolean |
| Default OFF |

Whether the slow query log is enabled. The value can be 0 (or `OFF`) to disable the log or 1 (or `ON`) to enable the log. The default value depends on whether the `--slow_query_log` option is given (`--log-slow-queries` before MySQL 5.1.29). The destination for log output is controlled by the `log_output` system variable; if that value is `NONE`, no log entries are written even if the log is enabled. The `slow_query_log` variable was added in MySQL 5.1.12.

“Slow” is determined by the value of the `long_query_time` variable. See Section 5.4.5, “The Slow Query Log”.

- **slow_query_log_file**

| Introduced | 5.1.12 |
| Command-Line Format | --slow-query-log-file=file_name |
| System Variable | Name slow_query_log_file |
| Variable Global |
| Scope |

554
Server System Variables

<table>
<thead>
<tr>
<th>Permitted Values</th>
<th>Dynamic</th>
<th>Yes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable</td>
<td>Type</td>
<td>file name</td>
</tr>
<tr>
<td></td>
<td>Default</td>
<td>host_name-slow.log</td>
</tr>
</tbody>
</table>

The name of the slow query log file. The default value is host_name-slow.log, but the initial value can be changed with the --slow_query_log_file option (--log-slow-queries before MySQL 5.1.29). This variable was added in MySQL 5.1.12.

- **socket**

| Command-Line Format | --socket={file_name|pipe_name} |
|---------------------|--------------------------------|
| System Variable     | Name | socket |
|                     | Variable | Global |
|                     | Scope   |       |
|                     | Dynamic | No    |
|                     | Variable |       |
| Permitted Values    | Type   | string |
|                     | Default | /tmp/mysql.sock |

On Unix platforms, this variable is the name of the socket file that is used for local client connections. The default is /tmp/mysql.sock. (For some distribution formats, the directory might be different, such as /var/lib/mysql for RPMs.)

On Windows, this variable is the name of the named pipe that is used for local client connections. The default value is MySQL (not case sensitive).

- **sort_buffer_size**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--sort_buffer_size=#</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name</td>
</tr>
<tr>
<td></td>
<td>Variable</td>
</tr>
<tr>
<td></td>
<td>Scope</td>
</tr>
<tr>
<td></td>
<td>Dynamic</td>
</tr>
<tr>
<td>Permitted Values (&lt;= 5.1.22)</td>
<td>Type</td>
</tr>
<tr>
<td></td>
<td>Default</td>
</tr>
<tr>
<td></td>
<td>Min Value</td>
</tr>
<tr>
<td></td>
<td>Max Value</td>
</tr>
</tbody>
</table>

Permitted Values (Windows, >= 5.1.23)

<table>
<thead>
<tr>
<th>Permitted Values (Windows, &gt;= 5.1.23)</th>
<th>Type</th>
<th>integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>2097144</td>
<td></td>
</tr>
<tr>
<td>Min Value</td>
<td>32768</td>
<td></td>
</tr>
<tr>
<td>Max Value</td>
<td>4294967295</td>
<td></td>
</tr>
</tbody>
</table>

Permitted Values (Other, 32-bit platforms, >= 5.1.23)

<table>
<thead>
<tr>
<th>Permitted Values (Other, 32-bit platforms, &gt;= 5.1.23)</th>
<th>Type</th>
<th>integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>2097144</td>
<td></td>
</tr>
</tbody>
</table>
Each session that needs to do a sort allocates a buffer of this size. `sort_buffer_size` is not specific to any storage engine and applies in a general manner for optimization. See Section 8.2.1.11, “ORDER BY Optimization”, for example.

If you see many `Sort_merge_passes` per second in `SHOW GLOBAL STATUS` output, you can consider increasing the `sort_buffer_size` value to speed up `ORDER BY` or `GROUP BY` operations that cannot be improved with query optimization or improved indexing. The entire buffer is allocated even if it is not all needed, so setting it larger than required globally will slow down most queries that sort. It is best to increase it as a session setting, and only for the sessions that need a larger size. On Linux, there are thresholds of 256KB and 2MB where larger values may significantly slow down memory allocation, so you should consider staying below one of those values. Experiment to find the best value for your workload. See Section B.5.3.5, “Where MySQL Stores Temporary Files”.

The maximum permissible setting for `sort_buffer_size` is 4GB–1. As of MySQL 5.1.23, larger values are permitted for 64-bit platforms (except 64-bit Windows, for which large values are truncated to 4GB–1 with a warning).

- `sql_auto_is_null`

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>sql_auto_is_null</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable Scope</td>
<td>Session</td>
<td>Dynamic Yes</td>
</tr>
<tr>
<td>Dynamic Variable</td>
<td><code>boolean</code></td>
<td><code>1</code></td>
</tr>
</tbody>
</table>

If this variable is set to 1 (the default), then after a statement that successfully inserts an automatically generated `AUTO_INCREMENT` value, you can find that value by issuing a statement of the following form:

```
SELECT * FROM tbl_name WHERE auto_col IS NULL
```

If the statement returns a row, the value returned is the same as if you invoked the `LAST_INSERT_ID()` function. For details, including the return value after a multiple-row insert, see Section 12.14, “Information Functions”. If no `AUTO_INCREMENT` value was successfully inserted, the `SELECT` statement returns no row.

The behavior of retrieving an `AUTO_INCREMENT` value by using an `IS NULL` comparison is used by some ODBC programs, such as Access. See Obtaining Auto-Increment Values. This behavior can be disabled by setting `sql_auto_is_null` to 0.

- `sql_big_selects`
### Server System Variables

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>Variable</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_big_selects</td>
<td>sql_big_selects</td>
<td>Session</td>
<td></td>
<td>Yes</td>
<td>boolean</td>
<td>1</td>
</tr>
</tbody>
</table>

If set to 0, MySQL aborts `SELECT` statements that are likely to take a very long time to execute (that is, statements for which the optimizer estimates that the number of examined rows exceeds the value of `max_join_size`). This is useful when an inadvisable `WHERE` statement has been issued. The default value for a new connection is 1, which permits all `SELECT` statements.

If you set the `max_join_size` system variable to a value other than `DEFAULT`, `sql_big_selects` is set to 0.

- **sql_buffer_result**

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>Variable</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_buffer_result</td>
<td>sql_buffer_result</td>
<td>Session</td>
<td></td>
<td>Yes</td>
<td>boolean</td>
<td>0</td>
</tr>
</tbody>
</table>

If set to 1, `sql_buffer_result` forces results from `SELECT` statements to be put into temporary tables. This helps MySQL free the table locks early and can be beneficial in cases where it takes a long time to send results to the client. The default value is 0.

- **sql_log_bin**

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>Variable</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_log_bin</td>
<td>sql_log_bin</td>
<td>Session</td>
<td></td>
<td>Yes</td>
<td>boolean</td>
<td></td>
</tr>
</tbody>
</table>

If set to 0, no logging is done to the binary log for the client. The client must have the `SUPER` privilege to set this option. The default value is 1.

- **sql_log_off**

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>Variable</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_log_off</td>
<td>sql_log_off</td>
<td>Session</td>
<td></td>
<td>Yes</td>
<td>boolean</td>
<td>0</td>
</tr>
</tbody>
</table>
If set to 1, no logging is done to the general query log for this client. The client must have the `SUPER` privilege to set this option. The default value is 0.

- **sql_log_update**

<table>
<thead>
<tr>
<th>Deprecated</th>
<th>5.0.0, by <code>sql_log_bin</code></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>System Variable</strong></td>
<td><strong>Name</strong> <code>sql_log_update</code></td>
</tr>
<tr>
<td></td>
<td><strong>Variable</strong> Session</td>
</tr>
<tr>
<td></td>
<td><strong>Scope</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Dynamic</strong> Yes</td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><strong>Yes</strong></td>
</tr>
</tbody>
</table>

| **Permitted Values** | **Type** boolean |

This variable is deprecated, and is mapped to `sql_log_bin`. It is removed in MySQL 5.5.

- **sql_mode**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th><code>--sql-mode=name</code></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>System Variable</strong></td>
<td><strong>Name</strong> <code>sql_mode</code></td>

<td></td>
</tr>
</tbody>
</table>
Server System Variables

**STRICT_TRANS_TABLES**

The current server SQL mode, which can be set dynamically. For details, see Section 5.1.7, “Server SQL Modes”.

**Note**

MySQL installation programs may configure the SQL mode during the installation process. If the SQL mode differs from the default or from what you expect, check for a setting in an option file that the server reads at startup.

- **sql_notes**

  If set to 1 (the default), warnings of Note level increment warning_count and the server records them. If set to 0, Note warnings do not increment warning_count and the server does not record them. mysql dump includes output to set this variable to 0 so that reloading the dump file does not produce warnings for events that do not affect the integrity of the reload operation.

- **sql_quote_show_create**

  If set to 1 (the default), the server quotes identifiers for SHOW CREATE TABLE and SHOW CREATE DATABASE statements. If set to 0, quoting is disabled. This option is enabled by default so that replication works for identifiers that require quoting. See Section 13.7.5.12, “SHOW CREATE TABLE Syntax”, and Section 13.7.5.8, “SHOW CREATE DATABASE Syntax”.

- **sql_safe_updates**

  If set to 1, MySQL aborts UPDATE or DELETE statements that do not use a key in the WHERE clause or a LIMIT clause. (Specifically, UPDATE statements must have a WHERE clause that uses a key or a LIMIT clause, or both. DELETE statements must have both.) This makes it possible to catch UPDATE or DELETE statements where keys are not used properly and that would probably change or delete a large number of rows. The default value is 0.

- **sql_select_limit**

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>Variable</th>
<th>Scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_select_limit</td>
<td>sql_select_limit</td>
<td>Global, Session</td>
<td></td>
</tr>
</tbody>
</table>

  Dynamic

  Variable

  Type integer

  The maximum number of rows to return from SELECT statements. The default value for a new connection is the maximum number of rows that the server permits per table, which depends on the server configuration and may be affected if the server build was configured with --with-big-tables. Typical default values are \((2^{32})-1\) or \((2^{64})-1\). If you have changed the limit, the default value can be restored by assigning a value of DEFAULT.

  If a SELECT has a LIMIT clause, the LIMIT takes precedence over the value of sql_select_limit.

- **sql_warnings**

  This variable controls whether single-row INSERT statements produce an information string if warnings occur. The default is 0. Set the value to 1 to produce an information string.

- **ssl_ca**

<table>
<thead>
<tr>
<th>Introduced</th>
<th>5.1.11</th>
</tr>
</thead>
</table>
### Server System Variables

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--ssl-ca=file_name</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>System Variable</strong></td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>ssl_ca</td>
</tr>
<tr>
<td>Variable</td>
<td>Global</td>
</tr>
<tr>
<td><strong>Scope</strong></td>
<td>Dynamic</td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td>No</td>
</tr>
<tr>
<td><strong>Permitted Values</strong></td>
<td><strong>Type</strong> file name</td>
</tr>
</tbody>
</table>

The path to a file with a list of trusted SSL CAs. This variable was added in MySQL 5.1.11.

- **ssl_capath**  
  - **Introduced** 5.1.11  
  - **Command-Line Format** --ssl-capath=dir_name  
  - **System Variable** Name ssl_capath  
<table>
<thead>
<tr>
<th>Variable</th>
<th>Global</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Scope</strong></td>
<td>Dynamic</td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td>No</td>
</tr>
</tbody>
</table>
  - **Permitted Values** **Type** directory name  

The path to a directory that contains trusted SSL CA certificates in PEM format. This variable was added in MySQL 5.1.11.

- **ssl_cert**  
  - **Introduced** 5.1.11  
  - **Command-Line Format** --ssl-cert=file_name  
  - **System Variable** Name ssl_cert  
<table>
<thead>
<tr>
<th>Variable</th>
<th>Global</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Scope</strong></td>
<td>Dynamic</td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td>No</td>
</tr>
</tbody>
</table>
  - **Permitted Values** **Type** file name  

The name of the SSL certificate file to use for establishing a secure connection. This variable was added in MySQL 5.1.11.

- **ssl_cipher**  
  - **Introduced** 5.1.11  
  - **Command-Line Format** --ssl-cipher=name  
  - **System Variable** Name ssl_cipher  
<table>
<thead>
<tr>
<th>Variable</th>
<th>Global</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Scope</strong></td>
<td>Dynamic</td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td>No</td>
</tr>
</tbody>
</table>
  - **Permitted Values** **Type** string  

A list of permissible ciphers to use for SSL encryption. This variable was added in MySQL 5.1.11.

- **ssl_key**
### Server System Variables

<table>
<thead>
<tr>
<th>Introduced</th>
<th>5.1.11</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command-Line Format</strong></td>
<td><code>--ssl-key=file_name</code></td>
</tr>
<tr>
<td><strong>System Variable</strong></td>
<td><strong>Name</strong> <code>ssl_key</code></td>
</tr>
<tr>
<td></td>
<td><strong>Variable</strong> Global</td>
</tr>
<tr>
<td></td>
<td><strong>Scope</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Dynamic</strong> No</td>
</tr>
<tr>
<td></td>
<td><strong>Variable</strong></td>
</tr>
<tr>
<td><strong>Permitted Values</strong></td>
<td><strong>Type</strong> <code>file name</code></td>
</tr>
</tbody>
</table>

The name of the SSL key file to use for establishing a secure connection. This variable was added in MySQL 5.1.11.

#### storage_engine

<table>
<thead>
<tr>
<th><strong>System Variable</strong></th>
<th><strong>Name</strong> <code>storage_engine</code></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Variable</strong></td>
<td>Global, Session</td>
</tr>
<tr>
<td><strong>Scope</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Dynamic</strong></td>
<td>Yes</td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Permitted Values</strong></td>
<td><strong>Type</strong> <code>enumeration</code></td>
</tr>
<tr>
<td></td>
<td><strong>Default</strong> <code>MyISAM</code></td>
</tr>
</tbody>
</table>

The default storage engine (table type). To set the storage engine at server startup, use the `--default-storage-engine` option. See Section 5.1.3, “Server Command Options”.

To see which storage engines are available and enabled, use the `SHOW ENGINES` statement or query the `INFORMATION_SCHEMA.ENGINES` table.

#### sync Frm

<table>
<thead>
<tr>
<th><strong>Command-Line Format</strong></th>
<th><code>--sync-frm</code></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>System Variable</strong></td>
<td><strong>Name</strong> <code>sync_frm</code></td>
</tr>
<tr>
<td></td>
<td><strong>Variable</strong> Global</td>
</tr>
<tr>
<td></td>
<td><strong>Scope</strong></td>
</tr>
<tr>
<td></td>
<td><strong>Dynamic</strong> Yes</td>
</tr>
<tr>
<td></td>
<td><strong>Variable</strong></td>
</tr>
<tr>
<td><strong>Permitted Values</strong></td>
<td><strong>Type</strong> <code>boolean</code></td>
</tr>
<tr>
<td></td>
<td><strong>Default</strong> <code>TRUE</code></td>
</tr>
</tbody>
</table>

If this variable is set to 1, when any nontemporary table is created its `.frm` file is synchronized to disk (using `fdatasync()`). This is slower but safer in case of a crash. The default is 1.

#### system_time_zone

<table>
<thead>
<tr>
<th><strong>System Variable</strong></th>
<th><strong>Name</strong> <code>system_time_zone</code></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Variable</strong></td>
<td>Global</td>
</tr>
<tr>
<td><strong>Scope</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Dynamic</strong></td>
<td>No</td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Permitted Values</strong></td>
<td><strong>Type</strong> <code>string</code></td>
</tr>
</tbody>
</table>
The server system time zone. When the server begins executing, it inherits a time zone setting from the machine defaults, possibly modified by the environment of the account used for running the server or the startup script. The value is used to set `system_time_zone`. Typically the time zone is specified by the `TZ` environment variable. It also can be specified using the `--timezone` option of the `mysqld_safe` script.

The `system_time_zone` variable differs from `time_zone`. Although they might have the same value, the latter variable is used to initialize the time zone for each client that connects. See Section 10.6, “MySQL Server Time Zone Support”.

- **table_cache**

| Deprecated | 5.1.3, by `table_open_cache` |
| Removed    | 5.1.3                         |
| Command-Line Format | `--table_cache=#`            |
| System Variable | Name `table_cache`          |
| Scope       | Global                       |
| Dynamic     | Yes                          |
| Variable    | `table_cache`                |

<table>
<thead>
<tr>
<th>Permitted Values</th>
<th>Type</th>
<th>integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>64</td>
<td></td>
</tr>
<tr>
<td>Min Value</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>Max Value</td>
<td>524288</td>
<td></td>
</tr>
</tbody>
</table>

This is the old name of `table_open_cache` before MySQL 5.1.3. From 5.1.3 on, use `table_open_cache` instead.

- **table_definition_cache**

<table>
<thead>
<tr>
<th>Introduced</th>
<th>5.1.3</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name <code>table_definition_cache</code></td>
</tr>
<tr>
<td>Scope</td>
<td>Global</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Permitted Values (&lt;= 5.1.24)</th>
<th>Type</th>
<th>integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>128</td>
<td></td>
</tr>
<tr>
<td>Min Value</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>Max Value</td>
<td>524288</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Permitted Values (&gt;= 5.1.25)</th>
<th>Type</th>
<th>integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>256</td>
<td></td>
</tr>
<tr>
<td>Min Value</td>
<td>256</td>
<td></td>
</tr>
<tr>
<td>Max Value</td>
<td>524288</td>
<td></td>
</tr>
</tbody>
</table>
The number of table definitions (from `.frm` files) that can be stored in the definition cache. If you use a large number of tables, you can create a large table definition cache to speed up opening of tables. The table definition cache takes less space and does not use file descriptors, unlike the normal table cache. This variable was added in MySQL 5.1.3. The minimum and default values are 1 and 128 before MySQL 5.1.25. The minimum and default are both 256 as of MySQL 5.1.25.

• **table_lock_wait_timeout**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--table_lock_wait_timeout=#</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name table_lock_wait_timeout</td>
</tr>
<tr>
<td></td>
<td>Variable Global</td>
</tr>
<tr>
<td></td>
<td>Scope</td>
</tr>
<tr>
<td></td>
<td>DynamicYes</td>
</tr>
<tr>
<td></td>
<td>Variable</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type integer</td>
</tr>
<tr>
<td></td>
<td>Default 50</td>
</tr>
<tr>
<td></td>
<td>Min Value 1</td>
</tr>
<tr>
<td></td>
<td>Max Value 1073741824</td>
</tr>
</tbody>
</table>

This variable is unused.

• **table_open_cache**

<table>
<thead>
<tr>
<th>Introduced</th>
<th>5.1.3</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name  table_open_cache</td>
</tr>
<tr>
<td></td>
<td>Variable Global</td>
</tr>
<tr>
<td></td>
<td>Scope</td>
</tr>
<tr>
<td></td>
<td>DynamicYes</td>
</tr>
<tr>
<td></td>
<td>Variable</td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type integer</td>
</tr>
<tr>
<td></td>
<td>Default 64</td>
</tr>
<tr>
<td></td>
<td>Min Value 1</td>
</tr>
<tr>
<td></td>
<td>Max Value 524288</td>
</tr>
</tbody>
</table>

The number of open tables for all threads. Increasing this value increases the number of file descriptors that `mysqld` requires. You can check whether you need to increase the table cache by checking the `Opened_tables` status variable. See Section 5.1.6, “Server Status Variables”. If the value of `Opened_tables` is large and you do not use `FLUSH TABLES` often (which just forces all tables to be closed and reopened), then you should increase the value of the `table_open_cache` variable. For more information about the table cache, see Section 8.4.3.1, “How MySQL Opens and Closes Tables”. Before MySQL 5.1.3, this variable is called `table_cache`.

• **table_type**

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name  table_type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Scope</td>
<td></td>
</tr>
</tbody>
</table>

Server System Variables

<table>
<thead>
<tr>
<th>Permitted Values</th>
<th>Type</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>DynamicYes</td>
<td>Yes</td>
<td></td>
</tr>
</tbody>
</table>

This variable is a synonym for `storage_engine`, which is the preferred name; `table_type` is deprecated and is removed in MySQL 5.5.

- **thread_cache_size**

  **Command-Line Format**  
  `--thread_cache_size=#`

  **System Variable**  
  Name `thread_cache_size`

  **Variable** Global

  **Scope**  
  DynamicYes

  **Variable**  
  Dynamic

  **Permitted Values**  
  Type `integer`

  Default `0`

  Min Value `0`

  Max Value `16384`

  How many threads the server should cache for reuse. When a client disconnects, the client's threads are put in the cache if there are fewer than `thread_cache_size` threads there. Requests for threads are satisfied by reusing threads taken from the cache if possible, and only when the cache is empty is a new thread created. This variable can be increased to improve performance if you have a lot of new connections. Normally, this does not provide a notable performance improvement if you have a good thread implementation. However, if your server sees hundreds of connections per second you should normally set `thread_cache_size` high enough so that most new connections use cached threads. By examining the difference between the `Connections` and `Threads_created` status variables, you can see how efficient the thread cache is. For details, see Section 5.1.6, “Server Status Variables”.

- **thread_concurrency**

  **Command-Line Format**  
  `--thread_concurrency=#`

  **System Variable**  
  Name `thread_concurrency`

  **Variable** Global

  **Scope**  
  DynamicNo

  **Variable**  
  Dynamic

  **Permitted Values**  
  Type `integer`

  Default `10`

  Min Value `1`

  Max Value `512`

  This variable is specific to Solaris systems, for which `mysqld` invokes the `thr_setconcurrency()` with the variable value. This function enables applications to give the threads system a hint about the desired number of threads that should be run at the same time.

- **thread_handling**
### Server System Variables

<table>
<thead>
<tr>
<th>Introduced</th>
<th>5.1.17</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command-Line Format</strong></td>
<td><code>--thread_handling=name</code></td>
</tr>
<tr>
<td><strong>System Variable (&gt;= 5.1.17)</strong></td>
<td>Name: <code>thread_handling</code></td>
</tr>
<tr>
<td></td>
<td>Variable: Global</td>
</tr>
<tr>
<td></td>
<td>Scope: Dynamic</td>
</tr>
<tr>
<td></td>
<td>Variable: No</td>
</tr>
<tr>
<td><strong>Permitted Values</strong></td>
<td>Type: <code>enumeration</code></td>
</tr>
<tr>
<td></td>
<td>Default: <code>one-thread-per-connection</code></td>
</tr>
<tr>
<td></td>
<td>Valid Values: <code>no-threads</code>, <code>one-thread-per-connection</code></td>
</tr>
</tbody>
</table>

The thread-handling model used by the server for connection threads. The permissible values are `no-threads` (the server uses a single thread to handle one connection) and `one-thread-per-connection` (the server uses one thread to handle each client connection). `no-threads` is useful for debugging under Linux; see Section 22.4, “Debugging and Porting MySQL”. This variable was added in MySQL 5.1.17.

- **thread_stack**

| **Command-Line Format** | `--thread_stack=#` |
| **System Variable** | Name: `thread_stack` |
| | Variable: Global |
| | Scope: Dynamic |
| | Variable: No |
| **Permitted Values (32-bit platforms)** | Type: `integer` |
| | Default: 196608 |
| | Min Value: 131072 |
| | Max Value: 4294967295 |
| **Permitted Values (64-bit platforms)** | Type: `integer` |
| | Default: 262144 |
| | Min Value: 131072 |
| | Max Value: 18446744073709547520 |
| **Block Size** | 1024 |

The stack size for each thread. Many of the limits detected by the `crash-me` test are dependent on this value. See Section 8.13.2, “The MySQL Benchmark Suite”. The default of 192KB (256KB for 64-bit systems) is large enough for normal operation. If the thread stack size is too small, it limits the complexity of the SQL statements that the server can handle, the recursion depth of stored procedures, and other memory-consuming actions.
Server System Variables

- **time_format**
  
  This variable is unused.

- **time_zone**

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>Variable</th>
<th>Scope</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>time_zone</td>
<td>Global, Session</td>
<td></td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Variable</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type</td>
<td>string</td>
<td></td>
</tr>
</tbody>
</table>

  The current time zone. This variable is used to initialize the time zone for each client that connects. By default, the initial value of this is 'SYSTEM' (which means, “use the value of system_time_zone”). The value can be specified explicitly at server startup with the **--default-time-zone** option. See Section 10.6, “MySQL Server Time Zone Support”.

- **timed_mutexes**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>Name</th>
<th>Variable</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>--timed_mutexes</td>
<td>timed_mutexes</td>
<td>Global</td>
<td></td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type</td>
<td>boolean</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Default</td>
<td>OFF</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

  This variable controls whether InnoDB mutexes are timed. If this variable is set to 0 or OFF (the default), mutex timing is disabled. If the variable is set to 1 or ON, mutex timing is enabled. With timing enabled, the os_wait_times value in the output from `SHOW ENGINE INNODB MUTEX` indicates the amount of time (in ms) spent in operating system waits. Otherwise, the value is 0.

- **timestamp**

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>Variable</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>timestamp</td>
<td>Session</td>
<td></td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Variable</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Permitted Values</td>
<td>Type</td>
<td>numeric</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

  Set the time for this client. This is used to get the original timestamp if you use the binary log to restore rows. `timestamp_value` should be a Unix epoch timestamp (a value like that returned by `UNIX_TIMESTAMP()`, not a value in 'YYYY-MM-DD hh:mm:ss' format) or DEFAULT.

  Setting `timestamp` to a constant value causes it to retain that value until it is changed again. Setting `timestamp` to DEFAULT causes its value to be the current date and time as of the time it is accessed.

  ***SET timestamp*** affects the value returned by `NOW()` but not by `SYSDATE()`. This means that timestamp settings in the binary log have no effect on invocations of `SYSDATE()`. The server can be started with the **--sysdate-is-now** option to cause `SYSDATE()` to be an alias for `NOW()`, in which case ***SET timestamp*** affects both functions.
### Server System Variables

- **tmp_table_size**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--tmp_table_size=#</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name tmp_table_size</td>
</tr>
<tr>
<td></td>
<td>Variable Global, Session</td>
</tr>
<tr>
<td></td>
<td>Scope DynamicYes</td>
</tr>
<tr>
<td></td>
<td>Variable Yes</td>
</tr>
<tr>
<td>Permitted Values (&lt;= 5.1.11)</td>
<td>Type integer</td>
</tr>
<tr>
<td></td>
<td>Default 33554432</td>
</tr>
<tr>
<td></td>
<td>Min Value 1024</td>
</tr>
<tr>
<td></td>
<td>Max Value 4294967295</td>
</tr>
<tr>
<td>Permitted Values (&gt;= 5.1.12, &lt;= 5.1.36)</td>
<td>Type integer</td>
</tr>
<tr>
<td></td>
<td>Default 16777216</td>
</tr>
<tr>
<td></td>
<td>Min Value 1024</td>
</tr>
<tr>
<td></td>
<td>Max Value 4294967295</td>
</tr>
<tr>
<td>Permitted Values (&gt;= 5.1.37, &lt;= 5.1.55)</td>
<td>Type integer</td>
</tr>
<tr>
<td></td>
<td>Default 16777216</td>
</tr>
<tr>
<td></td>
<td>Min Value 1024</td>
</tr>
<tr>
<td></td>
<td>Max Value 9223372036854775807</td>
</tr>
<tr>
<td>Permitted Values (&gt;= 5.1.56)</td>
<td>Type integer</td>
</tr>
<tr>
<td></td>
<td>Default 16777216</td>
</tr>
<tr>
<td></td>
<td>Min Value 1024</td>
</tr>
<tr>
<td></td>
<td>Max Value 18446744073709551615</td>
</tr>
</tbody>
</table>

The maximum size of internal in-memory temporary tables. This variable does not apply to user-created MEMORY tables.

The actual limit is determined as the minimum of tmp_table_size and max_heap_table_size. If an in-memory temporary table exceeds the limit, MySQL automatically converts it to an on-disk MyISAM table. Increase the value of tmp_table_size (and max_heap_table_size if necessary) if you do many advanced GROUP BY queries and you have lots of memory.

You can compare the number of internal on-disk temporary tables created to the total number of internal temporary tables created by comparing the values of the Created_tmp_disk_tables and Created_tmp_tables variables.

See also Section 8.4.4, “Internal Temporary Table Use in MySQL”.

- **tmpdir**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--tmpdir=dir_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name tmpdir</td>
</tr>
</tbody>
</table>

567
### Server System Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Permitted Values</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Global</td>
<td>No</td>
<td></td>
<td>directory name</td>
</tr>
</tbody>
</table>

The directory used for temporary files and temporary tables. This variable can be set to a list of several paths that are used in round-robin fashion. Paths should be separated by colon characters (":") on Unix and semicolon characters (";") on Windows, NetWare, and OS/2.

The multiple-directory feature can be used to spread the load between several physical disks. If the MySQL server is acting as a replication slave, you should not set `tmpdir` to point to a directory on a memory-based file system or to a directory that is cleared when the server host restarts. A replication slave needs some of its temporary files to survive a machine restart so that it can replicate temporary tables or `LOAD DATA INFILE` operations. If files in the temporary file directory are lost when the server restarts, replication fails. You can set the slave's temporary directory using the `slave_load_tmpdir` variable. In that case, the slave will not use the general `tmpdir` value and you can set `tmpdir` to a nonpermanent location.

- **transaction_alloc_block_size**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--transaction_alloc_block_size=#</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name transaction_alloc_block_size</td>
</tr>
<tr>
<td>Variable</td>
<td>transaction_alloc_block_size</td>
</tr>
<tr>
<td>Scope</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Dynamic Variable</td>
<td>Yes</td>
</tr>
<tr>
<td>Permitted Values (32-bit platforms)</td>
<td>Type integer</td>
</tr>
<tr>
<td>Default</td>
<td>8192</td>
</tr>
<tr>
<td>Min Value</td>
<td>1024</td>
</tr>
<tr>
<td>Max Value</td>
<td>4294967295</td>
</tr>
<tr>
<td>Block Size</td>
<td>1024</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Permitted Values (64-bit platforms)</th>
<th>Type integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>8192</td>
</tr>
<tr>
<td>Min Value</td>
<td>1024</td>
</tr>
<tr>
<td>Max Value</td>
<td>18446744073709547520</td>
</tr>
<tr>
<td>Block Size</td>
<td>1024</td>
</tr>
</tbody>
</table>

  The amount in bytes by which to increase a per-transaction memory pool which needs memory. See the description of `transaction_prealloc_size`.

- **transaction_prealloc_size**

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--transaction_prealloc_size=#</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name transaction_prealloc_size</td>
</tr>
</tbody>
</table>

568
### Server System Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Global, Session Scope</th>
</tr>
</thead>
<tbody>
<tr>

<td>Yes</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Permitted Values (32-bit platforms)</th>
<th>Type</th>
<th>integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>4096</td>
<td></td>
</tr>
<tr>
<td>Min Value</td>
<td>1024</td>
<td></td>
</tr>
<tr>
<td>Max Value</td>
<td>4294967295</td>
<td></td>
</tr>
<tr>
<td>Block Size</td>
<td>1024</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Permitted Values (64-bit platforms)</th>
<th>Type</th>
<th>integer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>4096</td>
<td></td>
</tr>
<tr>
<td>Min Value</td>
<td>1024</td>
<td></td>
</tr>
<tr>
<td>Max Value</td>
<td>18446744073709547520</td>
<td></td>
</tr>
<tr>
<td>Block Size</td>
<td>1024</td>
<td></td>
</tr>
</tbody>
</table>

There is a per-transaction memory pool from which various transaction-related allocations take memory. The initial size of the pool in bytes is `transaction_prealloc_size`. For every allocation that cannot be satisfied from the pool because it has insufficient memory available, the pool is increased by `transaction_alloc_block_size` bytes. When the transaction ends, the pool is truncated to `transaction_prealloc_size` bytes.

By making `transaction_prealloc_size` sufficiently large to contain all statements within a single transaction, you can avoid many `malloc()` calls.

- **tx_isolation**

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>tx_isolation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable Global, Session Scope</td>
<td>Yes</td>
<td></td>
</tr>
<tr>
<td>Dynamic Variable</td>
<td>Yes</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Permitted Values</th>
<th>Type</th>
<th>enumeration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>REPEATABLE-READ</td>
<td></td>
</tr>
<tr>
<td>Valid Values</td>
<td>READ-UNCOMMITTED, READ-COMMITTED, REPEATABLE-READ, SERIALIZABLE</td>
<td></td>
</tr>
</tbody>
</table>

The default transaction isolation level. Defaults to `REPEATABLE-READ`.

This variable can be set directly, or indirectly using the `SET TRANSACTION` statement. See Section 13.3.6, “SET TRANSACTION Syntax”. If you set `tx_isolation` directly to an isolation level name that contains a space, the name should be enclosed within quotation marks, with the space replaced by a dash. For example:
SET tx_isolation = 'READ-COMMITTED';

Any unique prefix of a valid value may be used to set the value of this variable.

The default transaction isolation level can also be set at startup using the `--transaction-isolation` server option.

- `unique_checks`

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Name</th>
<th>unique_checks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable</td>
<td>Session</td>
<td>Scope</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
<td>Variable</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Permitted Values</th>
<th>Type</th>
<th>boolean</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>1</td>
<td></td>
</tr>
</tbody>
</table>

If set to 1 (the default), uniqueness checks for secondary indexes in InnoDB tables are performed. If set to 0, storage engines are permitted to assume that duplicate keys are not present in input data. If you know for certain that your data does not contain uniqueness violations, you can set this to 0 to speed up large table imports to InnoDB.

Setting this variable to 0 does not require storage engines to ignore duplicate keys. An engine is still permitted to check for them and issue duplicate-key errors if it detects them.

- `updatable_views_with_limit`

<table>
<thead>
<tr>
<th>Command-Line Format</th>
<th>--updatable_views_with_limit=#</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Variable</td>
<td>Name updatable_views_with_limit</td>
</tr>
<tr>
<td>Variable</td>
<td>Global, Session</td>
</tr>
<tr>
<td>Scope</td>
<td>Dynamic</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Yes</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Permitted Values</th>
<th>Type</th>
<th>boolean</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>1</td>
<td></td>
</tr>
</tbody>
</table>

This variable controls whether updates to a view can be made when the view does not contain all columns of the primary key defined in the underlying table, if the update statement contains a LIMIT clause. (Such updates often are generated by GUI tools.) An update is an UPDATE or DELETE statement. Primary key here means a PRIMARY KEY, or a UNIQUE index in which no column can contain NULL.

The variable can have two values:

- 1 or YES: Issue a warning only (not an error message). This is the default value.
- 0 or NO: Prohibit the update.

- `version`

The version number for the server. The value might also include a suffix indicating server build or configuration information. `–log` indicates that one or more of the general log, slow query log, or binary log are enabled. `–debug` indicates that the server was built with debugging support enabled.

- `version_comment`
### System Variable: `version_comment`

<table>
<thead>
<tr>
<th>Name</th>
<th>Version</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Permitted Values</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>version_comment</code></td>
<td><code>Global</code></td>
<td>No</td>
<td>No</td>
<td><code>string</code></td>
<td></td>
</tr>
</tbody>
</table>

The `configure` script has a `--with-comment` option that permits a comment to be specified when building MySQL. This variable contains the value of that comment.

- **version_compile_machine**

### System Variable: `version_compile_machine`

<table>
<thead>
<tr>
<th>Name</th>
<th>Version</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Permitted Values</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>version_compile_machine</code></td>
<td><code>Global</code></td>
<td>No</td>
<td>No</td>
<td><code>string</code></td>
<td></td>
</tr>
</tbody>
</table>

The type of machine or architecture on which MySQL was built.

- **version_compile_os**

### System Variable: `version_compile_os`

<table>
<thead>
<tr>
<th>Name</th>
<th>Version</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Permitted Values</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>version_compile_os</code></td>
<td><code>Global</code></td>
<td>No</td>
<td>No</td>
<td><code>string</code></td>
<td></td>
</tr>
</tbody>
</table>

The type of operating system on which MySQL was built.

- **wait_timeout**

### Command-Line Format

```
--wait_timeout=#
```

### System Variable: `wait_timeout`

<table>
<thead>
<tr>
<th>Name</th>
<th>Version</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Permitted Values</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>wait_timeout</code></td>
<td><code>Global, Session</code></td>
<td>Yes</td>
<td>Yes</td>
<td><code>integer</code></td>
<td></td>
</tr>
</tbody>
</table>

Default: `28800`  
Min Value: `1`  
Max Value: `2147483`

(Windows)

### Permitted Values

<table>
<thead>
<tr>
<th>Name</th>
<th>Version</th>
<th>Scope</th>
<th>Dynamic</th>
<th>Permitted Values</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>wait_timeout</code></td>
<td><code>Global, Session</code></td>
<td>Yes</td>
<td>Yes</td>
<td><code>integer</code></td>
<td></td>
</tr>
</tbody>
</table>

Default: `28800`  
Min Value: `1`

(Other)
The number of seconds the server waits for activity on a noninteractive connection before closing it. Before MySQL 5.1.41, this timeout applies only to TCP/IP connections, not to connections made through Unix socket files, named pipes, or shared memory.

On thread startup, the session wait_timeout value is initialized from the global wait_timeout value or from the global interactive_timeout value, depending on the type of client (as defined by the CLIENT_INTERACTIVE connect option to mysql_real_connect()). See also interactive_timeout.

• warning_count

The number of errors, warnings, and notes that resulted from the last statement that generated messages. This variable is read only. See Section 13.7.5.42, “SHOW WARNINGS Syntax”.

5.1.5 Using System Variables

The MySQL server maintains many system variables that indicate how it is configured. Section 5.1.4, “Server System Variables”, describes the meaning of these variables. Each system variable has a default value. System variables can be set at server startup using options on the command line or in an option file. Most of them can be changed dynamically while the server is running by means of the SET statement, which enables you to modify operation of the server without having to stop and restart it. You can also use system variable values in expressions.

There are two scopes in which system variables exist. Global variables affect the overall operation of the server. Session variables affect its operation for individual client connections. A given system variable can have both a global and a session value. Global and session system variables are related as follows:

• When the server starts, it initializes each global variable to its default value. These defaults can be changed by options specified on the command line or in an option file. (See Section 4.2.3, “Specifying Program Options”.)

• The server also maintains a set of session variables for each client that connects. The client’s session variables are initialized at connect time using the current values of the corresponding global variables. For example, a client’s SQL mode is controlled by the session sql_mode value, which is initialized when the client connects to the value of the global sql_mode value.

For some system variables, the session value is not initialized from the corresponding global value; if so, that is indicated in the variable description.

System variable values can be set globally at server startup by using options on the command line or in an option file. When you use a startup option to set a variable that takes a numeric value, the value can be given with a suffix of K, M, or G (either uppercase or lowercase) to indicate a multiplier of 1024, 1024^2 or 1024^3; that is, units of kilobytes, megabytes, or gigabytes, respectively. Thus, the following command starts the server with a query cache size of 16 megabytes and a maximum packet size of one gigabyte:

```
mysqld --query_cache_size=16M --max_allowed_packet=1G
```

Within an option file, those variables are set like this:

```
[mysqld]
query_cache_size=16M
max_allowed_packet=1G
```

The lettercase of suffix letters does not matter; 16M and 16m are equivalent, as are 1G and 1g.
To restrict the maximum value to which a system variable can be set at runtime with the `SET` statement, specify this maximum by using an option of the form `--maximum-var_name=value` at server startup. For example, to prevent the value of `query_cache_size` from being increased to more than 32MB at runtime, use the option `--maximum-query_cache_size=32M`.

Many system variables are dynamic and can be changed at runtime by using the `SET` statement. For a list, see Section 5.1.5.2, “Dynamic System Variables”. To change a system variable with `SET`, refer to it by name, optionally preceded by a modifier:

- To indicate that a variable is a global variable, precede its name by the `GLOBAL` keyword or the `@@global.` qualifier:

  ```
  SET GLOBAL max_connections = 1000;
  SET @@global.max_connections = 1000;
  ```

  The `SUPER` privilege is required to set global variables.

- To indicate that a variable is a session variable, precede its name by the `SESSION` keyword or either the `@@session.` or `@@` qualifier:

  ```
  SET SESSION sql_mode = 'TRADITIONAL';
  SET @@session.sql_mode = 'TRADITIONAL';
  SET @@sql_mode = 'TRADITIONAL';
  ```

  Setting a session variable normally requires no special privilege, although there are exceptions that require the `SUPER` privilege (such as `sql_log_bin`). A client can change its own session variables, but not those of any other client.

- `LOCAL` and `@@local.` are synonyms for `SESSION` and `@@session.`

- If no modifier is present, `SET` changes the session variable. If the variable has no session value, an error occurs.

  ```
  mysql> SET max_connections = 1000;
 >Error 1229 (HY000): Variable 'max_connections' is a GLOBAL variable and should be set with SET GLOBAL
  ```

- An error occurs if you:
  - Use `SET GLOBAL` (or `@@global.`) when setting a variable that has only a session value
  - Omit `GLOBAL` (or `@@global.`) or `PERSIST` (or `@@persist.`) when setting a variable that has only a global value
  - Use `SET SESSION` (or `@@SESSION.`) when setting a variable that has only a global value

  The preceding modifiers apply only to system variables. It is not permitted to apply them to user-defined variables, stored procedure or function parameters, or stored program local variables. An error occurs for such attempts.

  A `SET` statement can contain multiple variable assignments, separated by commas. This statement assigns values to a user-defined variable and a system variable:

  ```
  SET @x = 1, SESSION sql_mode = '';
  ```

  If you set multiple system variables, the most recent `GLOBAL` or `SESSION` modifier in the statement is used for following assignments that have no modifier specified.

  Examples of multiple-variable assignment:
Using System Variables

SET GLOBAL sort_buffer_size = 1000000, SESSION sort_buffer_size = 1000000;
SET @@global.sort_buffer_size = 1000000, @@local.sort_buffer_size = 1000000;
SET GLOBAL max_connections = 1000, sort_buffer_size = 1000000;

If any variable assignment in a SET statement fails, the entire statement fails and no variables are changed.

If you change a session system variable, the value remains in effect within your session until you change the variable to a different value or the session ends. The change has no effect on other sessions.

If you change a global system variable, the value is remembered and used for new connections until you change the variable to a different value or the server restarts. The change is visible to any client that accesses the global variable. However, the change affects the corresponding session variable only for clients that connect after the change. The global variable change does not affect the session variable for any client that is currently connected (not even the session within which the SET GLOBAL statement occurred).

To make a global system variable setting permanent so that it applies across server restarts, you should also set it in an option file.

To set a GLOBAL value to the compiled-in MySQL default value or a SESSION variable to the current corresponding GLOBAL value, set the variable to the value DEFAULT. For example, the following two statements are identical in setting the session value of max_join_size to the current global value:

SET @@session.max_join_size=DEFAULT;
SET @@session.max_join_size=@@global.max_join_size;

Not all system variables can be set to DEFAULT. In such cases, assigning DEFAULT results in an error.

It is not permitted to assign DEFAULT to user-defined variables, and not supported for stored procedure or function parameters or stored program local variables. This results in an error for user-defined variables, and the results are undefined for parameters or local variables.

To refer to the value of a system variable in expressions, use one of the @@-modifiers. For example, you can retrieve values in a SELECT statement like this:

SELECT @@global.sql_mode, @@session.sql_mode, @@sql_mode;

When you refer to a system variable in an expression as @@var_name (that is, when you do not specify @@global. or @@session.), MySQL returns the session value if it exists and the global value otherwise. This differs from SET @@var_name = value, which always refers to the session value.

Suffixes for specifying a value multiplier can be used when setting a variable at server startup, but not to set the value with SET at runtime. On the other hand, with SET you can assign a variable's value using an expression, which is not true when you set a variable at server startup. For example, the first of the following lines is legal at server startup, but the second is not:

shell> mysql --max_allowed_packet=16M
shell> mysql --max_allowed_packet=16*1024*1024

Conversely, the second of the following lines is legal at runtime, but the first is not:

mysql> SET GLOBAL max_allowed_packet=16M;
mysql> SET GLOBAL max_allowed_packet=16*1024*1024;

Note
Some system variables can be enabled with the SET statement by setting them to ON or 1, or disabled by setting them to OFF or 0. However, to set such a variable on the command line or in an option file, you must set it to 1 or 0;
Using System Variables

setting it to `ON` or `OFF` will not work. For example, on the command line, `--delay_key_write=1` works but `--delay_key_write=ON` does not.

To display system variable names and values, use the `SHOW VARIABLES` statement:

```
mysql> SHOW VARIABLES;
+---------------------------------+-----------------------------------+
| Variable_name                   | Value                             |
+---------------------------------+-----------------------------------+
| auto_increment_increment        | 1                                 |
| auto_increment_offset           | 1                                 |
| automatic_sp_privileges         | ON                                |

| wait_timeout                    | 28800                             |
+---------------------------------+-----------------------------------+
```

With a `LIKE` clause, the statement displays only those variables that match the pattern. To obtain a specific variable name, use a `LIKE` clause as shown:

```
SHOW VARIABLES LIKE 'max_join_size';
SHOW SESSION VARIABLES LIKE 'max_join_size';
```

To get a list of variables whose name match a pattern, use the “%” wildcard character in a `LIKE` clause:

```
SHOW VARIABLES LIKE '%size%';
SHOW GLOBAL VARIABLES LIKE '%size%';
```

Wildcard characters can be used in any position within the pattern to be matched. Strictly speaking, because “_” is a wildcard that matches any single character, you should escape it as “\_” to match it literally. In practice, this is rarely necessary.

For `SHOW VARIABLES`, if you specify neither `GLOBAL` nor `SESSION`, MySQL returns `SESSION` values.

The reason for requiring the `GLOBAL` keyword when setting `GLOBAL`-only variables but not when retrieving them is to prevent problems in the future. If we were to remove a `SESSION` variable that has the same name as a `GLOBAL` variable, a client with the `SUPER` privilege might accidentally change the `GLOBAL` variable rather than just the `SESSION` variable for its own connection. If we add a `SESSION` variable with the same name as a `GLOBAL` variable, a client that intends to change the `GLOBAL` variable might find only its own `SESSION` variable changed.
5.1.5.1 Structured System Variables

A structured variable differs from a regular system variable in two respects:

- Its value is a structure with components that specify server parameters considered to be closely related.
- There might be several instances of a given type of structured variable. Each one has a different name and refers to a different resource maintained by the server.

MySQL supports one structured variable type, which specifies parameters governing the operation of key caches. A key cache structured variable has these components:

- `key_buffer_size`
- `key_cache_block_size`
- `key_cache_division_limit`
- `key_cache_age_threshold`

This section describes the syntax for referring to structured variables. Key cache variables are used for syntax examples, but specific details about how key caches operate are found elsewhere, in Section 8.10.1, “The MyISAM Key Cache”.

To refer to a component of a structured variable instance, you can use a compound name in `instance_name.component_name` format. Examples:

- `hot_cache.key_buffer_size`
- `hot_cache.key_cache_block_size`
- `cold_cache.key_cache_block_size`

For each structured system variable, an instance with the name of `default` is always predefined. If you refer to a component of a structured variable without any instance name, the `default` instance is used. Thus, `default.key_buffer_size` and `key_buffer_size` both refer to the same system variable.

Structured variable instances and components follow these naming rules:

- For a given type of structured variable, each instance must have a name that is unique within variables of that type. However, instance names need not be unique across structured variable types. For example, each structured variable has an instance named `default`, so `default` is not unique across variable types.

- The names of the components of each structured variable type must be unique across all system variable names. If this were not true (that is, if two different types of structured variables could share component member names), it would not be clear which default structured variable to use for references to member names that are not qualified by an instance name.

- If a structured variable instance name is not legal as an unquoted identifier, refer to it as a quoted identifier using backticks. For example, `hot-cache` is not legal, but `hot-cache` is.

- `global`, `session`, and `local` are not legal instance names. This avoids a conflict with notation such as `@@global.var_name` for referring to nonstructured system variables.

Currently, the first two rules have no possibility of being violated because the only structured variable type is the one for key caches. These rules will assume greater significance if some other type of structured variable is created in the future.

With one exception, you can refer to structured variable components using compound names in any context where simple variable names can occur. For example, you can assign a value to a structured variable using a command-line option:
Using System Variables

shell> mysqld --hot_cache.key_buffer_size=64K

In an option file, use this syntax:

```
[mysqld]
hot_cache.key_buffer_size=64K
```

If you start the server with this option, it creates a key cache named `hot_cache` with a size of 64KB in addition to the default key cache that has a default size of 8MB.

Suppose that you start the server as follows:

shell> mysqld --key_buffer_size=256K --extra_cache.key_buffer_size=128K --extra_cache.key_cache_block_size=2048

In this case, the server sets the size of the default key cache to 256KB. (You could also have written `--default.key_buffer_size=256K`.) In addition, the server creates a second key cache named `extra_cache` that has a size of 128KB, with the size of block buffers for caching table index blocks set to 2048 bytes.

The following example starts the server with three different key caches having sizes in a 3:1:1 ratio:

shell> mysqld --key_buffer_size=6M --hot_cache.key_buffer_size=2M --cold_cache.key_buffer_size=2M

Structured variable values may be set and retrieved at runtime as well. For example, to set a key cache named `hot_cache` to a size of 10MB, use either of these statements:

```
mysql> SET GLOBAL hot_cache.key_buffer_size = 10*1024*1024;
mysql> SET @@global.hot_cache.key_buffer_size = 10*1024*1024;
```

To retrieve the cache size, do this:

```
mysql> SELECT @@global.hot_cache.key_buffer_size;
```

However, the following statement does not work. The variable is not interpreted as a compound name, but as a simple string for a `LIKE` pattern-matching operation:

```
mysql> SHOW GLOBAL VARIABLES LIKE 'hot_cache.key_buffer_size';
```

This is the exception to being able to use structured variable names anywhere a simple variable name may occur.

5.1.5.2 Dynamic System Variables

Many server system variables are dynamic and can be set at runtime using `SET GLOBAL` or `SET SESSION`. You can also obtain their values using `SELECT`. See Section 5.1.5, "Using System Variables".

The following table shows the full list of all dynamic system variables. The last column indicates for each variable whether `GLOBAL` or `SESSION` (or both) apply. The table also lists session options that can be set with the `SET` statement. Section 5.1.4, “Server System Variables”, discusses these options.

Variables that have a type of “string” take a string value. Variables that have a type of “numeric” take a numeric value. Variables that have a type of “boolean” can be set to 0, 1, `ON` or `OFF`. (If you set them on the command line or in an option file, use the numeric values.) Variables that are marked as “enumeration” normally should be set to one of the available values for the variable, but can also be set to the number that corresponds to the desired enumeration value. For enumerated system
variables, the first enumeration value corresponds to 0. This differs from ENUM columns, for which the first enumeration value corresponds to 1.

Table 5.3 Dynamic Variable Summary

### 5.1.6 Server Status Variables

The MySQL server maintains many status variables that provide information about its operation. You can view these variables and their values by using the `SHOW [GLOBAL | SESSION] STATUS` statement (see [Section 13.7.5.37, “SHOW STATUS Syntax”](#)). The optional `GLOBAL` keyword aggregates the values over all connections, and `SESSION` shows the values for the current connection.

```
mysql> SHOW GLOBAL STATUS;
+-----------------+-------------+
| Variable_name   | Value       |
|-----------------+-------------|
| Aborted_clients | 0           |
| Aborted_connects| 0           |
| Bytes_received  | 155372598   |
| Bytes_sent      | 1176560426  |
```
Server Status Variables

<table>
<thead>
<tr>
<th>Variable Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connections</td>
<td>30023</td>
</tr>
<tr>
<td>Created_tmp_table</td>
<td>0</td>
</tr>
<tr>
<td>Created_tmp_files</td>
<td>3</td>
</tr>
<tr>
<td>Created_tmp_tables</td>
<td>2</td>
</tr>
<tr>
<td>Threads_created</td>
<td>217</td>
</tr>
<tr>
<td>Threads_running</td>
<td>88</td>
</tr>
<tr>
<td>Uptime</td>
<td>1389872</td>
</tr>
</tbody>
</table>

Several status variables provide statement counts. To determine the number of statements executed, use these relationships:

\[
\text{SUM(Com}_\text{xxx}) + \text{Qcache hits} = \text{Questions + statements executed within stored programs = Queries}
\]

Many status variables are reset to 0 by the `FLUSH STATUS` statement.

The following table lists all available server status variables:

### Table 5.4 Status Variable Summary

The status variables have the following meanings. For meanings of status variables specific to MySQL Cluster, see MySQL Cluster Status Variables.

- **Aborted_clients**

  The number of connections that were aborted because the client died without closing the connection properly. See Section B.5.2.11, “Communication Errors and Aborted Connections”.

- **Aborted_connects**

  The number of failed attempts to connect to the MySQL server. See Section B.5.2.11, “Communication Errors and Aborted Connections”.

- **Binlog_cache_disk_use**

  The number of transactions that used the temporary binary log cache but that exceeded the value of `binlog_cache_size` and used a temporary file to store statements from the transaction.

- **Binlog_cache_use**

  The number of transactions that used the temporary binary log cache.
Server Status Variables

- **Bytes_received**
  The number of bytes received from all clients.

- **Bytes_sent**
  The number of bytes sent to all clients.

- **Com_xxx**
  The `Com_xxx` statement counter variables indicate the number of times each `xxx` statement has been executed. There is one status variable for each type of statement. For example, `Com_delete` and `Com_update` count `DELETE` and `UPDATE` statements, respectively. `Com_delete_multi` and `Com_update_multi` are similar but apply to `DELETE` and `UPDATE` statements that use multiple-table syntax.

  If a query result is returned from query cache, the server increments the `Qcache_hits` status variable, not `Com_select`. See Section 8.10.3.4, “Query Cache Status and Maintenance”.

  The discussion at the beginning of this section indicates how to relate these statement-counting status variables to other such variables.

  All of the `Com_stmt_xxx` variables are increased even if a prepared statement argument is unknown or an error occurred during execution. In other words, their values correspond to the number of requests issued, not to the number of requests successfully completed.

  The `Com_stmt_xxx` status variables are as follows:

  - `Com_stmt_prepare`
  - `Com_stmt_execute`
  - `Com_stmt_fetch`
  - `Com_stmt_send_long_data`
  - `Com_stmt_reset`
  - `Com_stmt_close`

  Those variables stand for prepared statement commands. Their names refer to the `COM_xxx` command set used in the network layer. In other words, their values increase whenever prepared statement API calls such as `mysql_stmt_prepare()`, `mysql_stmt_execute()`, and so forth are executed. However, `Com_stmt_prepare`, `Com_stmt_execute` and `Com_stmt_close` also increase for `PREPARE`, `EXECUTE`, or `DEALLOCATE PREPARE`, respectively. Additionally, the values of the older statement counter variables `Com_prepare_sql`, `Com_execute_sql`, and `Com_dealloc_sql` increase for the `PREPARE`, `EXECUTE`, and `DEALLOCATE PREPARE` statements. `Com_stmt_fetch` stands for the total number of network round-trips issued when fetching from cursors.

  `Com_stmt_reprepare` indicates the number of times statements were automatically repreared by the server after metadata changes to tables or views referred to by the statement. This variable was added in MySQL 5.1.25. A reprepare operation increments `Com_stmt_reprepare`, and also `Com_stmt_prepare`.

- **Compression**
  Whether the client connection uses compression in the client/server protocol. Added in MySQL 5.1.2.

- **Connections**
  The number of connection attempts (successful or not) to the MySQL server.
Server Status Variables

- **Created_tmp_disk_tables**
  The number of internal on-disk temporary tables created by the server while executing statements.

  If an internal temporary table is created initially as an in-memory table but becomes too large, MySQL automatically converts it to an on-disk table. The maximum size for in-memory temporary tables is the minimum of the `tmp_table_size` and `max_heap_table_size` values. If `Created_tmp_disk_tables` is large, you may want to increase the `tmp_table_size` or `max_heap_table_size` value to lessen the likelihood that internal temporary tables in memory will be converted to on-disk tables.

  You can compare the number of internal on-disk temporary tables created to the total number of internal temporary tables created by comparing the values of the `Created_tmp_disk_tables` and `Created_tmp_tables` variables.

  See also Section 8.4.4, "Internal Temporary Table Use in MySQL".

- **Created_tmp_files**
  How many temporary files `mysqld` has created.

- **Created_tmp_tables**
  The number of internal temporary tables created by the server while executing statements.

  You can compare the number of internal on-disk temporary tables created to the total number of internal temporary tables created by comparing the values of the `Created_tmp_disk_tables` and `Created_tmp_tables` variables.

  See also Section 8.4.4, "Internal Temporary Table Use in MySQL".

  Each invocation of the `SHOW STATUS` statement uses an internal temporary table and increments the global `Created_tmp_tables` value.

- **Delayed_errors**
  The number of rows written with `INSERT DELAYED` for which some error occurred (probably `duplicate key`).

- **Delayed_insert_threads**
  The number of `INSERT DELAYED` handler threads in use.

- **Delayed_writes**
  The number of `INSERT DELAYED` rows written.

- **Flush_commands**
  The number of times the server flushes tables, whether because a user executed a `FLUSH TABLES` statement or due to internal server operation. It is also incremented by receipt of a `COM_REFRESH` packet. This is in contrast to `Com_flush`, which indicates how many `FLUSH` statements have been executed, whether `FLUSH TABLES`, `FLUSH LOGS`, and so forth.

- **Handler_commit**
  The number of internal `COMMIT` statements.

- **Handler_delete**
  The number of times that rows have been deleted from tables.

- **Handler_prepare**
A counter for the prepare phase of two-phase commit operations.

- **Handler_read_first**
  The number of times the first entry in an index was read. If this value is high, it suggests that the server is doing a lot of full index scans; for example, `SELECT col1 FROM foo`, assuming that `col1` is indexed.

- **Handler_read_key**
  The number of requests to read a row based on a key. If this value is high, it is a good indication that your tables are properly indexed for your queries.

- **Handler_read_next**
  The number of requests to read the next row in key order. This value is incremented if you are querying an index column with a range constraint or if you are doing an index scan.

- **Handler_read_prev**
  The number of requests to read the previous row in key order. This read method is mainly used to optimize `ORDER BY ... DESC`.

- **Handler_read_rnd**
  The number of requests to read a row based on a fixed position. This value is high if you are doing a lot of queries that require sorting of the result. You probably have a lot of queries that require MySQL to scan entire tables or you have joins that do not use keys properly.

- **Handler_read_rnd_next**
  The number of requests to read the next row in the data file. This value is high if you are doing a lot of table scans. Generally this suggests that your tables are not properly indexed or that your queries are not written to take advantage of the indexes you have.

- **Handler.Rollback**
  The number of requests for a storage engine to perform a rollback operation.

- **Handler_savepoint**
  The number of requests for a storage engine to place a savepoint.

- **Handler_savepoint.rollback**
  The number of requests for a storage engine to roll back to a savepoint.

- **Handler_update**
  The number of requests to update a row in a table.

- **Handler_write**
  The number of requests to insert a row in a table.

- **Innodb_buffer_pool_pages_data**
  The number of pages containing data (dirty or clean).

- **Innodb_buffer_pool_pages_dirty**
  The number of pages currently dirty.
• **Innodb_buffer_pool_pages_flushed**
  The number of buffer pool page-flush requests.

• **Innodb_buffer_pool_pages_free**
  The number of free pages.

• **Innodb_buffer_pool_pages_latched**
  The number of latched pages in InnoDB buffer pool. These are pages currently being read or written or that cannot be flushed or removed for some other reason. Calculation of this variable is expensive, so as of MySQL 5.1.28, it is available only when the UNIV_DEBUG system is defined at server build time.

• **Innodb_buffer_pool_pages_misc**
  The number of pages that are busy because they have been allocated for administrative overhead such as row locks or the adaptive hash index. This value can also be calculated as $\text{Innodb_buffer_pool_pages_total} - \text{Innodb_buffer_pool_pages_free} - \text{Innodb_buffer_pool_pages_data}$.

• **Innodb_buffer_pool_pages_total**
  The total size of the buffer pool, in pages.

• **Innodb_buffer_pool_read_ahead**
  (InnoDB Plugin only) The number of pages read into the InnoDB buffer pool by the read-ahead background thread.
  This variable was added in MySQL 5.1.41.

• **Innodb_buffer_pool_read_ahead_evicted**
  (InnoDB Plugin only) The number of pages read into the InnoDB buffer pool by the read-ahead background thread that were subsequently evicted without having been accessed by queries.
  This variable was added in MySQL 5.1.41.

• **Innodb_buffer_pool_read_ahead_rnd**
  The number of “random” read-aheads initiated by InnoDB. This happens when a query scans a large portion of a table but in random order.
  For InnoDB Plugin, this variable was removed in MySQL 5.1.41.

• **Innodb_buffer_pool_read_ahead_seq**
  The number of sequential read-aheads initiated by InnoDB. This happens when InnoDB does a sequential full table scan.
  For InnoDB Plugin, this variable was removed in MySQL 5.1.41.

• **Innodb_buffer_pool_read_requests**
  The number of logical read requests.

• **Innodb_buffer_pool_reads**
  The number of logical reads that InnoDB could not satisfy from the buffer pool, and had to read directly from the disk.

• **Innodb_buffer_pool_wait_free**
Server Status Variables

Normally, writes to the InnoDB buffer pool happen in the background. However, if it is necessary to read or create a page and no clean pages are available, it is also necessary to wait for pages to be flushed first. This counter counts instances of these waits. If the buffer pool size has been set properly, this value should be small.

- **Innodb_buffer_pool_write_requests**
  The number writes done to the InnoDB buffer pool.

- **Innodb_data_fsyncs**
  The number of fsync() operations so far.

- **Innodb_data_pending_fsyncs**
  The current number of pending fsync() operations.

- **Innodb_data_pending_reads**
  The current number of pending reads.

- **Innodb_data_pending_writes**
  The current number of pending writes.

- **Innodb_data_read**
  The amount of data read since the server was started.

- **Innodb_data_reads**
  The total number of data reads.

- **Innodb_data_writes**
  The total number of data writes.

- **Innodb_data_written**
  The amount of data written so far, in bytes.

- **Innodb_dblwr_pages_written**
  The number of pages that have been written for doublewrite operations. See Section 14.6.7.1, “InnoDB Disk I/O”.

- **Innodb_dblwr_writes**
  The number of doublewrite operations that have been performed. See Section 14.6.7.1, “InnoDB Disk I/O”.

- **Innodb_have_atomic_builtin**
  (InnoDB Plugin only) Indicates whether the server was built with atomic instructions. This variable was added in MySQL 5.1.38.

- **Innodb_log_waits**
  The number of times that the log buffer was too small and a wait was required for it to be flushed before continuing.

- **Innodb_log_write_requests**
  The number of log write requests.
Server Status Variables

- **Innodb_log_writes**
  The number of physical writes to the log file.

- **Innodb_os_log_fsyncs**
  The number of `fsync()` writes done to the log file.

- **Innodb_os_log_pending_fsyncs**
  The number of pending log file `fsync()` operations.

- **Innodb_os_log_pending_writes**
  The number of pending log file writes.

- **Innodb_os_log_written**
  The number of bytes written to the log file.

- **Innodb_page_size**
  The compiled-in InnoDB page size (default 16KB). Many values are counted in pages; the page size enables them to be easily converted to bytes.

- **Innodb_pages_created**
  The number of pages created.

- **Innodb_pages_read**
  The number of pages read.

- **Innodb_pages_written**
  The number of pages written.

- **Innodb_row_lock_current_waits**
  The number of row locks currently being waited for.

- **Innodb_row_lock_time**
  The total time spent in acquiring row locks, in milliseconds.

- **Innodb_row_lock_time_avg**
  The average time to acquire a row lock, in milliseconds.

- **Innodb_row_lock_time_max**
  The maximum time to acquire a row lock, in milliseconds.

- **Innodb_row_lock_waits**
  The number of times a row lock had to be waited for.

- **Innodb_rows_deleted**
  The number of rows deleted from InnoDB tables.

- **Innodb_rows_inserted**
  The number of rows inserted into InnoDB tables.
• **Innodb_rows_read**
  The number of rows read from InnoDB tables.

• **Innodb_rows_updated**
  The number of rows updated in InnoDB tables.

• **Key_blocks_not_flushed**
  The number of key blocks in the key cache that have changed but have not yet been flushed to disk.

• **Key_blocks_unused**
  The number of unused blocks in the key cache. You can use this value to determine how much of the key cache is in use; see the discussion of `key_buffer_size` in Section 5.1.4, “Server System Variables”.

• **Key_blocks_used**
  The number of used blocks in the key cache. This value is a high-water mark that indicates the maximum number of blocks that have ever been in use at one time.

• **Key_read_requests**
  The number of requests to read a key block from the cache.

• **Key_reads**
  The number of physical reads of a key block from disk. If `Key_reads` is large, then your `key_buffer_size` value is probably too small. The cache miss rate can be calculated as `Key_reads/Key_read_requests`.

• **Key_write_requests**
  The number of requests to write a key block to the cache.

• **Key_writes**
  The number of physical writes of a key block to disk.

• **Last_query_cost**
  The total cost of the last compiled query as computed by the query optimizer. This is useful for comparing the cost of different query plans for the same query. The default value of 0 means that no query has been compiled yet. The default value is 0. `Last_query_cost` has session scope.

  The `Last_query_cost` value can be computed accurately only for simple “flat” queries, not complex queries such as those with subqueries or `UNION`. For the latter, the value is set to 0.

• **Max_used_connections**
  The maximum number of connections that have been in use simultaneously since the server started.

• **Not_flushed_delayed_rows**
  The number of rows waiting to be written in `INSERT DELAYED` queues.

• **Open_files**
  The number of files that are open. This count includes regular files opened by the server. It does not include other types of files such as sockets or pipes. Also, the count does not include files that storage engines open using their own internal functions rather than asking the server level to do so.
Server Status Variables

- **Open Streams**
  The number of streams that are open (used mainly for logging).

- **Open Table Definitions**
  The number of cached .frm files. This variable was added in MySQL 5.1.3.

- **Open Tables**
  The number of tables that are open.

- **Opened Files**
  The number of files that have been opened with my_open() (a mysys library function). Parts of the server that open files without using this function do not increment the count. This variable was added in MySQL 5.1.21.

- **Opened Table Definitions**
  The number of .frm files that have been cached. This variable was added in MySQL 5.1.24.

- **Opened Tables**
  The number of tables that have been opened. If Opened Tables is big, your table_open_cache value is probably too small.

- **Prepared Stmt Count**
  The current number of prepared statements. (The maximum number of statements is given by the max_prepared_stmt_count system variable.) This variable was added in MySQL 5.1.14.

- **Qcache Free Blocks**
  The number of free memory blocks in the query cache.

- **Qcache Free Memory**
  The amount of free memory for the query cache.

- **Qcache Hits**
  The number of query cache hits.

  The discussion at the beginning of this section indicates how to relate this statement-counting status variable to other such variables.

- **Qcache Inserts**
  The number of queries added to the query cache.

- **Qcache Lowmem Prunes**
  The number of queries that were deleted from the query cache because of low memory.

- **Qcache Not Cached**
  The number of noncached queries (not cacheable, or not cached due to the query_cache_type setting).

- **Qcache Queries in Cache**
  The number of queries registered in the query cache.

- **Qcache Total Blocks**
Server Status Variables

The total number of blocks in the query cache.

- **Queries**
  The number of statements executed by the server. This variable includes statements executed within stored programs, unlike the **Questions** variable. It does not count `COM_PING` or `COM_STATISTICS` commands. This variable was added in MySQL 5.1.31.
  
  The discussion at the beginning of this section indicates how to relate this statement-counting status variable to other such variables.

- **Questions**
  The number of statements executed by the server. As of MySQL 5.1.31, this includes only statements sent to the server by clients and no longer includes statements executed within stored programs, unlike the **Queries** variable. This variable does not count `COM_PING`, `COM_STATISTICS`, `COM_STMT_PREPARE`, `COM_STMT_CLOSE`, or `COM_STMT_RESET` commands.
  
  The discussion at the beginning of this section indicates how to relate this statement-counting status variable to other such variables.

- **Rpl_status**
  The status of fail-safe replication (not implemented). This variable is unused and is removed in MySQL 5.6.

- **Select_full_join**
  The number of joins that perform table scans because they do not use indexes. If this value is not 0, you should carefully check the indexes of your tables.

- **Select_full_range_join**
  The number of joins that used a range search on a reference table.

- **Select_range**
  The number of joins that used ranges on the first table. This is normally not a critical issue even if the value is quite large.

- **Select_range_check**
  The number of joins without keys that check for key usage after each row. If this is not 0, you should carefully check the indexes of your tables.

- **Select_scan**
  The number of joins that did a full scan of the first table.

- **Slave_open_temp_tables**
  The number of temporary tables that the slave SQL thread currently has open. If the value is greater than zero, it is not safe to shut down the slave; see Section 16.4.1.23, “Replication and Temporary Tables”.

- **Slave_retried_transactions**
  The total number of times since startup that the replication slave SQL thread has retried transactions.

- **Slave_running**
  This is **ON** if this server is a replication slave that is connected to a replication master, and both the I/O and SQL threads are running; otherwise, it is **OFF**.
Server Status Variables

- **Slow_launch_threads**
  The number of threads that have taken more than `slow_launch_time` seconds to create.

- **Slow_queries**
  The number of queries that have taken more than `long_query_time` seconds. This counter increments regardless of whether the slow query log is enabled. For information about that log, see Section 5.4.5, “The Slow Query Log”.

- **Sort_merge_passes**
  The number of merge passes that the sort algorithm has had to do. If this value is large, you should consider increasing the value of the `sort_buffer_size` system variable.

- **Sort_range**
  The number of sorts that were done using ranges.

- **Sort_rows**
  The number of sorted rows.

- **Sort_scan**
  The number of sorts that were done by scanning the table.

- **Ssl_accept_renegotiates**
  The number of renegotiations needed to establish the connection.

- **Ssl_accepts**
  The number of accepted SSL connections.

- **Ssl_callback_cache_hits**
  The number of callback cache hits.

- **Ssl_cipher**
  The current encryption cipher (empty for unencrypted connections).

- **Ssl_cipher_list**
  The list of possible SSL ciphers (empty for non-SSL connections).

- **Ssl_client_connects**
  The number of SSL connection attempts to an SSL-enabled master.

- **Ssl_connect_renegotiates**
  The number of renegotiations needed to establish the connection to an SSL-enabled master.

- **Ssl_ctx_verify_depth**
  The SSL context verification depth (how many certificates in the chain are tested).

- **Ssl_ctx_verify_mode**
  The SSL context verification mode.

- **Ssl_default_timeout**
The default SSL timeout.

- **Ssl_finished_accepts**
  The number of successful SSL connections to the server.

- **Ssl_finished_connects**
  The number of successful slave connections to an SSL-enabled master.

- **Ssl_session_cache_hits**
  The number of SSL session cache hits.

- **Ssl_session_cache_misses**
  The number of SSL session cache misses.

- **Ssl_session_cache_mode**
  The SSL session cache mode.

- **Ssl_session_cache_overflows**
  The number of SSL session cache overflows.

- **Ssl_session_cache_size**
  The SSL session cache size.

- **Ssl_session_cache_timeouts**
  The number of SSL session cache timeouts.

- **Ssl_sessions_reused**
  How many SSL connections were reused from the cache.

- **Ssl_used_session_cache_entries**
  How many SSL session cache entries were used.

- **Ssl_verify_depth**
  The verification depth for replication SSL connections.

- **Ssl_verify_mode**
  The verification mode for replication SSL connections.

- **Ssl_version**
  The SSL protocol version of the connection; for example, TLSv1. If the connection is not encrypted, the value is empty.

- **Table_locks_immediate**
  The number of times that a request for a table lock could be granted immediately.

- **Table_locks_waited**
  The number of times that a request for a table lock could not be granted immediately and a wait was needed. If this is high and you have performance problems, you should first optimize your queries, and then either split your table or tables or use replication.
• \texttt{Tc\_log\_max\_pages\_used}

For the memory-mapped implementation of the log that is used by \texttt{mysqld} when it acts as the transaction coordinator for recovery of internal XA transactions, this variable indicates the largest number of pages used for the log since the server started. If the product of \texttt{Tc\_log\_max\_pages\_used} and \texttt{Tc\_log\_page\_size} is always significantly less than the log size, the size is larger than necessary and can be reduced. (The size is set by the \texttt{--log-tc-size} option. This variable is unused: It is unneeded for binary log-based recovery, and the memory-mapped recovery log method is not used unless the number of storage engines that are capable of two-phase commit and that support XA transactions is greater than one. (\texttt{InnoDB} is the only applicable engine.)

• \texttt{Tc\_log\_page\_size}

The page size used for the memory-mapped implementation of the XA recovery log. The default value is determined using \texttt{getpagesize()}. This variable is unused for the same reasons as described for \texttt{Tc\_log\_max\_pages\_used}.

• \texttt{Tc\_log\_page\_waits}

For the memory-mapped implementation of the recovery log, this variable increments each time the server was not able to commit a transaction and had to wait for a free page in the log. If this value is large, you might want to increase the log size (with the \texttt{--log-tc-size} option). For binary log-based recovery, this variable increments each time the binary log cannot be closed because there are two-phase commits in progress. (The close operation waits until all such transactions are finished.)

• \texttt{Threads\_cached}

The number of threads in the thread cache.

• \texttt{Threads\_connected}

The number of currently open connections.

• \texttt{Threads\_created}

The number of threads created to handle connections. If \texttt{Threads\_created} is big, you may want to increase the \texttt{thread_cache_size} value. The cache miss rate can be calculated as \texttt{Threads\_created/Connections}.

• \texttt{Threads\_running}

The number of threads that are not sleeping.

• \texttt{Uptime}

The number of seconds that the server has been up.

• \texttt{Uptime\_since\_flush\_status}

The number of seconds since the most recent \texttt{FLUSH STATUS} statement. This variable was added in 5.1.24.

\subsection{Server SQL Modes}

The MySQL server can operate in different SQL modes, and can apply these modes differently for different clients, depending on the value of the \texttt{sql_mode} system variable. DBAs can set the global SQL mode to match site server operating requirements, and each application can set its session SQL mode to its own requirements.
Server SQL Modes

Modes affect the SQL syntax MySQL supports and the data validation checks it performs. This makes it easier to use MySQL in different environments and to use MySQL together with other database servers.

- Setting the SQL Mode
- The Most Important SQL Modes
- Full List of SQL Modes
- Strict SQL Mode
- Combination SQL Modes

When working with InnoDB tables using the InnoDB Plugin, consider also the innodb_strict_mode system variable. It enables additional error checks for InnoDB tables.

Setting the SQL Mode

The default SQL mode is empty (no modes set).

To set the SQL mode at server startup, use the `--sql-mode="modes"` option on the command line, or `sql-mode="modes"` in an option file such as `my.cnf` (Unix operating systems) or `my.ini` (Windows). `modes` is a list of different modes separated by commas. To clear the SQL mode explicitly, set it to an empty string using `--sql-mode=""` on the command line, or `sql-mode=""` in an option file.

**Note**

MySQL installation programs may configure the SQL mode during the installation process. If the SQL mode differs from the default or from what you expect, check for a setting in an option file that the server reads at startup.

To change the SQL mode at runtime, set the global or session `sql_mode` system variable using a `SET` statement:

```
SET GLOBAL sql_mode = 'modes';
SET SESSION sql_mode = 'modes';
```

Setting the `GLOBAL` variable requires the `SUPER` privilege and affects the operation of all clients that connect from that time on. Setting the `SESSION` variable affects only the current client. Each client can change its session `sql_mode` value at any time.

To determine the current global or session `sql_mode` value, use the following statements:

```
SELECT @@GLOBAL.sql_mode;
SELECT @@SESSION.sql_mode;
```

**Important**

**SQL mode and user-defined partitioning.** Changing the server SQL mode after creating and inserting data into partitioned tables can cause major changes in the behavior of such tables, and could lead to loss or corruption of data. It is strongly recommended that you never change the SQL mode once you have created tables employing user-defined partitioning.

When replicating partitioned tables, differing SQL modes on master and slave can also lead to problems. For best results, you should always use the same server SQL mode on the master and on the slave.

See Section 18.5, “Restrictions and Limitations on Partitioning”, for more information.
The Most Important SQL Modes

The most important `sql_mode` values are probably these:

- **ANSI**
  This mode changes syntax and behavior to conform more closely to standard SQL. It is one of the special combination modes listed at the end of this section.

- **STRICT_TRANS_TABLES**
  If a value could not be inserted as given into a transactional table, abort the statement. For a nontransactional table, abort the statement if the value occurs in a single-row statement or the first row of a multiple-row statement. More details are given later in this section.

- **TRADITIONAL**
  Make MySQL behave like a “traditional” SQL database system. A simple description of this mode is “give an error instead of a warning” when inserting an incorrect value into a column. It is one of the special combination modes listed at the end of this section.

  **Note**
  The `INSERT` or `UPDATE` aborts as soon as the error is noticed. This may not be what you want if you are using a nontransactional storage engine, because data changes made prior to the error may not be rolled back, resulting in a “partially done” update.

When this manual refers to “strict mode,” it means a mode with either or both `STRICT_TRANS_TABLES` or `STRICT_ALL_TABLES` enabled.

Full List of SQL Modes

The following list describes all supported SQL modes:

- **ALLOW_INVALID_DATES**
  Do not perform full checking of dates. Check only that the month is in the range from 1 to 12 and the day is in the range from 1 to 31. This is very convenient for Web applications where you obtain year, month, and day in three different fields and you want to store exactly what the user inserted (without date validation). This mode applies to `DATE` and `DATETIME` columns. It does not apply to `TIMESTAMP` columns, which always require a valid date.

  The server requires that month and day values be legal, and not merely in the range 1 to 12 and 1 to 31, respectively. With strict mode disabled, invalid dates such as `'2004-04-31'` are converted to `'0000-00-00'` and a warning is generated. With strict mode enabled, invalid dates generate an error. To permit such dates, enable `ALLOW_INVALID_DATES`.

- **ANSI_QUOTES**
  Treat `"` as an identifier quote character (like the `\` quote character) and not as a string quote character. You can still use `\` to quote identifiers with this mode enabled. With `ANSI_QUOTES` enabled, you cannot use double quotation marks to quote literal strings, because it is interpreted as an identifier.

- **ERROR_FOR_DIVISION_BY_ZERO**
  The `ERROR_FOR_DIVISION_BY_ZERO` mode affects handling of division by zero, which includes `MOD(N, 0)`. For data-change operations (`INSERT`, `UPDATE`), its effect also depends on whether strict SQL mode is enabled.

  - If this mode is not enabled, division by zero inserts `NULL` and produces no warning.
Server SQL Modes

- If this mode is enabled, division by zero inserts NULL and produces a warning.

- If this mode and strict mode are enabled, division by zero produces an error, unless IGNORE is given as well. For INSERT IGNORE and UPDATE IGNORE, division by zero inserts NULL and produces a warning.

  For SELECT, division by zero returns NULL. Enabling ERROR_FOR_DIVISION_BY_ZERO causes a warning to be produced as well, regardless of whether strict mode is enabled.

- **HIGH_NOT_PRECEDENCE**

  The precedence of the NOT operator is such that expressions such as NOT a BETWEEN b AND c are parsed as NOT (a BETWEEN b AND c). In some older versions of MySQL, the expression was parsed as (NOT a) BETWEEN b AND c. The old higher-precedence behavior can be obtained by enabling the HIGH_NOT_PRECEDENCE SQL mode.

    ```
    mysql> SET sql_mode = '';
    mysql> SELECT NOT 1 BETWEEN -5 AND 5;
    -> 0
    mysql> SET sql_mode = 'HIGH_NOT_PRECEDENCE';
    mysql> SELECT NOT 1 BETWEEN -5 AND 5;
    -> 1
    ```

- **IGNORE_SPACE**

  Permit spaces between a function name and the "(" character. This causes built-in function names to be treated as reserved words. As a result, identifiers that are the same as function names must be quoted as described in Section 9.2, “Schema Object Names”. For example, because there is a COUNT() function, the use of count as a table name in the following statement causes an error:

    ```
    mysql> CREATE TABLE count (i INT);
    ERROR 1064 (42000): You have an error in your SQL syntax
    ```

  The table name should be quoted:

    ```
    mysql> CREATE TABLE `count` (i INT);
    Query OK, 0 rows affected (0.00 sec)
    ```

  The IGNORE_SPACE SQL mode applies to built-in functions, not to user-defined functions or stored functions. It is always permissible to have spaces after a UDF or stored function name, regardless of whether IGNORE_SPACE is enabled.

  For further discussion of IGNORE_SPACE, see Section 9.2.4, “Function Name Parsing and Resolution”.

- **NO_AUTO_CREATE_USER**

  Prevent the GRANT statement from automatically creating new users if it would otherwise do so, unless a nonempty password also is specified.

- **NO_AUTO_VALUE_ON_ZERO**

  NO_AUTO_VALUE_ON_ZERO affects handling of AUTO_INCREMENT columns. Normally, you generate the next sequence number for the column by inserting either NULL or 0 into it. NO_AUTO_VALUE_ON_ZERO suppresses this behavior for 0 so that only NULL generates the next sequence number.

  This mode can be useful if 0 has been stored in a table's AUTO_INCREMENT column. (Storing 0 is not a recommended practice, by the way.) For example, if you dump the table with mysql dump and then reload it, MySQL normally generates new sequence numbers when it encounters the
Server SQL Modes

0 values, resulting in a table with contents different from the one that was dumped. Enabling
NO_AUTO_VALUE_ON_ZERO before reloading the dump file solves this problem. mysqldump now
automatically includes in its output a statement that enables NO_AUTO_VALUE_ON_ZERO, to avoid
this problem.

• NO_BACKSLASH_ESCAPES

Disable the use of the backslash character ("\") as an escape character within strings. With this
mode enabled, backslash becomes an ordinary character like any other.

• NO_DIR_IN_CREATE

When creating a table, ignore all INDEX DIRECTORY and DATA DIRECTORY directives. This option
is useful on slave replication servers.

• NO_ENGINE_SUBSTITUTION

Control automatic substitution of the default storage engine when a statement such as CREATE
TABLE or ALTER TABLE specifies a storage engine that is disabled or not compiled in.

Up through MySQL 5.1.11, with NO_ENGINE_SUBSTITUTION disabled, the default engine is used
and a warning occurs if the desired engine is known but disabled or not compiled in. If the desired
engine is invalid (not a known engine name), an error occurs and the table is not created or altered.

With NO_ENGINE_SUBSTITUTION enabled, an error occurs and the table is not created or altered if
the desired engine is unavailable for any reason (whether disabled or invalid).

As of MySQL 5.1.12, storage engines can be pluggable at runtime, so the distinction between
disabled and invalid no longer applies. All unavailable engines are treated the same way:

With NO_ENGINE_SUBSTITUTION disabled, for CREATE TABLE the default engine is used and a
warning occurs if the desired engine is unavailable. For ALTER TABLE, a warning occurs and the
table is not altered.

With NO_ENGINE_SUBSTITUTION enabled, an error occurs and the table is not created or altered if
the desired engine is unavailable.

• NO_FIELD_OPTIONS

Do not print MySQL-specific column options in the output of SHOW CREATE TABLE. This mode is
used by mysqldump in portability mode.

• NO_KEY_OPTIONS

Do not print MySQL-specific index options in the output of SHOW CREATE TABLE. This mode is used
by mysqldump in portability mode.

• NO_TABLE_OPTIONS

Do not print MySQL-specific table options (such as ENGINE) in the output of SHOW CREATE TABLE.
This mode is used by mysqldump in portability mode.

• NO_UNSIGNED_SUBTRACTION

By default, subtraction between integer operands produces an UNSIGNED result if any operand is
UNSIGNED. When NO_UNSIGNED_SUBTRACTION is enabled, the subtraction result is signed, even
if any operand is unsigned. For example, compare the type of column c2 in table t1 with that of
column c2 in table t2:

mysql> SET sql_mode='';
mysql> CREATE TABLE test (c1 BIGINT UNSIGNED NOT NULL);
Server SQL Modes

```sql
mysql> CREATE TABLE t1 SELECT c1 - 1 AS c2 FROM test;
mysql> DESCRIBE t1;
+-------+---------------------+------+-----+---------+-------+
<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Null</th>
<th>Key</th>
<th>Default</th>
<th>Extra</th>
</tr>
</thead>
<tbody>
<tr>
<td>c2</td>
<td>bigint(21) unsigned</td>
<td>NO</td>
<td></td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>
+-------+---------------------+------+-----+---------+-------+
```

mysql> SET sql_mode='NO_UNSIGNED_SUBTRACTION';
```
mysql> CREATE TABLE t2 SELECT c1 - 1 AS c2 FROM test;
mysql> DESCRIBE t2;
+-------+------------+------+-----+---------+-------+
<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Null</th>
<th>Key</th>
<th>Default</th>
<th>Extra</th>
</tr>
</thead>
<tbody>
<tr>
<td>c2</td>
<td>bigint(21)</td>
<td>NO</td>
<td></td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>
+-------+------------+------+-----+---------+-------+
```

This means that BIGINT UNSIGNED is not 100% usable in all contexts. See Section 12.10, "Cast Functions and Operators".

```sql
mysql> SET sql_mode = '';
mysql> SELECT CAST(0 AS UNSIGNED) - 1;
+-------------------------+
<table>
<thead>
<tr>
<th>CAST(0 AS UNSIGNED) - 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>18446744073709551615</td>
</tr>
</tbody>
</table>
+-------------------------+
```

mysql> SET sql_mode = 'NO_UNSIGNED_SUBTRACTION';
```
mysql> SELECT CAST(0 AS UNSIGNED) - 1;
```n+-------------------------+
<table>
<thead>
<tr>
<th>CAST(0 AS UNSIGNED) - 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>-1</td>
</tr>
</tbody>
</table>
+-------------------------+
```

• **NO_ZERO_DATE**

The NO_ZERO_DATE mode affects whether the server permits '0000-00-00' as a valid date. Its effect also depends on whether strict SQL mode is enabled.

• If this mode is not enabled, '0000-00-00' is permitted and inserts produce no warning.

• If this mode is enabled, '0000-00-00' is permitted and inserts produce a warning.

• If this mode and strict mode are enabled, '0000-00-00' is not permitted and inserts produce an error, unless IGNORE is given as well. For INSERT IGNORE and UPDATE IGNORE, '0000-00-00' is permitted and inserts produce a warning.

• **NO_ZERO_IN_DATE**

The NO_ZERO_IN_DATE mode affects whether the server permits dates in which the year part is nonzero but the month or day part is 0. (This mode affects dates such as '2010-00-01' or '2010-01-00', but not '0000-00-00'. To control whether the server permits '0000-00-00', use the NO_ZERO_DATE mode.) The effect of NO_ZERO_IN_DATE also depends on whether strict SQL mode is enabled.

• If this mode is not enabled, dates with zero parts are permitted and inserts produce no warning.

• If this mode is enabled, dates with zero parts are inserted as '0000-00-00' and produce a warning.

• If this mode and strict mode are enabled, dates with zero parts are not permitted and inserts produce an error, unless IGNORE is given as well. For INSERT IGNORE and UPDATE IGNORE, dates with zero parts are inserted as '0000-00-00' and produce a warning.
Server SQL Modes

- **ONLY_FULL_GROUP_BY**

  Reject queries for which the select list or (as of MySQL 5.1.10) **HAVING** condition refer to nonaggregated columns that are not named in the **GROUP BY** clause.

  A MySQL extension to standard SQL permits references in the **HAVING** clause to aliased expressions in the select list. Enabling **ONLY_FULL_GROUP_BY** disables this extension, thus requiring the **HAVING** clause to be written using unaliased expressions.

  For additional discussion and examples, see Section 12.17.3, “MySQL Handling of GROUP BY”.

- **PAD_CHAR_TO_FULL_LENGTH**

  By default, trailing spaces are trimmed from **CHAR** column values on retrieval. If **PAD_CHAR_TO_FULL_LENGTH** is enabled, trimming does not occur and retrieved **CHAR** values are padded to their full length. This mode does not apply to **VARCHAR** columns, for which trailing spaces are retained on retrieval. This mode was added in MySQL 5.1.20.

  ```sql
  mysql> CREATE TABLE t1 (c1 CHAR(10));
  Query OK, 0 rows affected (0.37 sec)
  mysql> INSERT INTO t1 (c1) VALUES('xy');
  Query OK, 1 row affected (0.01 sec)
  mysql> SET sql_mode = '';
  Query OK, 0 rows affected (0.00 sec)
  mysql> SELECT c1, CHAR_LENGTH(c1) FROM t1;
  +------+-----------------+
  | c1   | CHAR_LENGTH(c1) |
  +------+-----------------+
  | xy   |               2 |
  +------+-----------------+
  1 row in set (0.00 sec)
  mysql> SET sql_mode = 'PAD_CHAR_TO_FULL_LENGTH';
  Query OK, 0 rows affected (0.00 sec)
  mysql> SELECT c1, CHAR_LENGTH(c1) FROM t1;
  +------------+-----------------+
  | c1         | CHAR_LENGTH(c1) |
  +------------+-----------------+
  | xy         |              10 |
  +------------+-----------------+
  1 row in set (0.00 sec)
  ```

- **PIPES_AS_CONCAT**

  Treat `||` as a string concatenation operator (same as **CONCAT()**) rather than as a synonym for **OR**.

- **REAL_AS_FLOAT**

  Treat **REAL** as a synonym for **FLOAT**. By default, MySQL treats **REAL** as a synonym for **DOUBLE**.

- **STRICT_ALL_TABLES**

  Enable strict SQL mode for all storage engines. Invalid data values are rejected. For details, see Strict SQL Mode.

- **STRICT_TRANS_TABLES**

  Enable strict SQL mode for transactional storage engines, and when possible for nontransactional storage engines. For details, see Strict SQL Mode.
Combination SQL Modes

The following special modes are provided as shorthand for combinations of mode values from the preceding list.

• **ANSI**

  Equivalent to `REAL_AS_FLOAT`, `PIPES_AS_CONCAT`, `ANSI_QUOTES`, `IGNORE_SPACE`.

  As of MySQL 5.1.18, **ANSI** mode also causes the server to return an error for queries where a set function $S$ with an outer reference $S(outer\_ref)$ cannot be aggregated in the outer query against which the outer reference has been resolved. This is such a query:

  ```sql
  SELECT * FROM t1 WHERE t1.a IN (SELECT MAX(t1.b) FROM t2 WHERE ...);
  ```

  Here, `MAX(t1.b)` cannot aggregated in the outer query because it appears in the `WHERE` clause of that query. Standard SQL requires an error in this situation. If **ANSI** mode is not enabled, the server treats $S(outer\_ref)$ in such queries the same way that it would interpret $S(const)$, as was always done prior to 5.1.18.

  See Section 1.8, "MySQL Standards Compliance".

• **DB2**

  Equivalent to `PIPES_AS_CONCAT`, `ANSI_QUOTES`, `IGNORE_SPACE`, `NO_KEY_OPTIONS`, `NO_TABLE_OPTIONS`, `NO_FIELD_OPTIONS`.

• **MAXDB**

  Equivalent to `PIPES_AS_CONCAT`, `ANSI_QUOTES`, `IGNORE_SPACE`, `NO_KEY_OPTIONS`, `NO_TABLE_OPTIONS`, `NO_FIELD_OPTIONS`, `NO_AUTO_CREATE_USER`.

• **MSSQL**

  Equivalent to `PIPES_AS_CONCAT`, `ANSI_QUOTES`, `IGNORE_SPACE`, `NO_KEY_OPTIONS`, `NO_TABLE_OPTIONS`, `NO_FIELD_OPTIONS`.

• **MYSQL323**

  Equivalent to `MYSQL323`, `HIGH_NOT_PRECEDENCE`. This means `HIGH_NOT_PRECEDENCE` plus some `SHOW CREATE TABLE` behaviors specific to **MYSQL323**:

  • `TIMESTAMP` column display does not include `DEFAULT` or `ON UPDATE` attributes that were introduced in MySQL 4.1.

  • String column display does not include character set and collation attributes that were introduced in MySQL 4.1. For `CHAR` and `VARCHAR` columns, if the collation is binary, `BINARY` is appended to the column type.

  • The `ENGINE=engine\_name` table option displays as `TYPE=engine\_name`.

  • For `MEMORY` tables, the storage engine is displayed as `HEAP`.

• **MYSQL40**

  Equivalent to `MYSQL40`, `HIGH_NOT_PRECEDENCE`. This means `HIGH_NOT_PRECEDENCE` plus some behaviors specific to **MYSQL40**. These are the same as for **MYSQL323**, except that `SHOW CREATE TABLE` does not display `HEAP` as the storage engine for `MEMORY` tables.

• **ORACLE**
Strict SQL Mode

Strict mode controls how MySQL handles invalid or missing values in data-change statements such as `INSERT` or `UPDATE`. A value can be invalid for several reasons. For example, it might have the wrong data type for the column, or it might be out of range. A value is missing when a new row to be inserted does not contain a value for a non-`NULL` column that has no explicit `DEFAULT` clause in its definition. (For a `NULL` column, `NULL` is inserted if the value is missing.)

If strict mode is not in effect, MySQL inserts adjusted values for invalid or missing values and produces warnings (see Section 13.7.5.42, "SHOW WARNINGS Syntax"). In strict mode, you can produce this behavior by using `INSERT IGNORE` or `UPDATE IGNORE`.

For statements such as `SELECT` that do not change data, invalid values generate a warning in strict mode, not an error.

Strict mode does not affect whether foreign key constraints are checked. `foreign_key_checks` can be used for that. (See Section 5.1.4, "Server System Variables").

Strict SQL mode is in effect if either `STRICT_ALL_TABLES` or `STRICT_TRANS_TABLES` is enabled, although the effects of these modes differ somewhat:

- For transactional tables, an error occurs for invalid or missing values in a data-change statement when either `STRICT_ALL_TABLES` or `STRICT_TRANS_TABLES` is enabled. The statement is aborted and rolled back.
- For nontransactional tables, the behavior is the same for either mode if the bad value occurs in the first row to be inserted or updated: The statement is aborted and the table remains unchanged. If the statement inserts or modifies multiple rows and the bad value occurs in the second or later row, the result depends on which strict mode is enabled:
  - If `STRICT_ALL_TABLES`, MySQL returns an error and ignores the rest of the rows. However, because the earlier rows have been inserted or updated, the result is a partial update. To avoid this, use single-row statements, which can be aborted without changing the table.
  - If `STRICT_TRANS_TABLES`, MySQL converts an invalid value to the closest valid value for the column and inserts the adjusted value. If a value is missing, MySQL inserts the implicit default value for the column data type. In either case, MySQL generates a warning rather than an error and continues processing the statement. Implicit defaults are described in Section 11.6, "Data Type Default Values".

Strict mode also affects handling of division by zero, zero dates, and zeros in dates, in conjunction with the `ERROR_FOR_DIVISION_BY_ZERO`, `NO_ZERO_DATE`, and `NO_ZERO_IN_DATE` modes. For details, see the descriptions of those modes.

5.1.8 Server Plugins

MySQL 5.1 and up supports a plugin API that enables creation of server components. Plugins can be loaded at server startup, or loaded and unloaded at runtime without restarting the server.
The components supported by this interface include, but are not limited to, storage engines, INFORMATION_SCHEMA tables, full-text parser plugins, partitioning support, and server extensions.

5.1.8.1 Installing and Uninstalling Plugins

Server plugins must be loaded into the server before they can be used. MySQL supports plugin loading at server startup and runtime. It is also possible to control the activation of loaded plugins at startup, and to unload them at runtime.

- Installing plugins
- Controlling plugin activation
- Uninstalling plugins

While a plugin is loaded, information about it is available at runtime from several sources, such as the INFORMATION_SCHEMA.PLUGINS table and the SHOW PLUGINS statement. See Section 5.1.8.2, “Obtaining Server Plugin Information”.

Installing Plugins

Before a server plugin can be used, it must be installed using one of the following methods. In the descriptions, plugin_name stands for a plugin name such as innodb or csv.

Built-in plugins:

A built-in plugin is known by the server automatically. Normally, the server enables the plugin at startup. Some built-in plugins permit this to be changed with the --plugin_name[=activation_state] option.

Plugins registered in the mysql.plugin system table:

The mysql.plugin table serves as a registry of plugins (other than built-in plugins, which need not be registered). The server loads each plugin listed in the table at startup. Normally, for a plugin loaded from the mysql.plugin table, the server also enables the plugin. This can be changed with the --plugin_name[=activation_state] option.

If the server is started with the --skip-grant-tables option, it does not consult the mysql.plugin table and does not load the plugins listed there.

Plugins named with the --plugin-load option:

A plugin located in a plugin library file can be loaded at server startup with the --plugin-load option. Normally, for a plugin loaded at startup, the server also enables the plugin. This can be changed with the --plugin_name[=activation_state] option.

The value of each plugin-loading option is a semicolon-separated list of name=plugin_library and plugin_library values. Each name is the name of a plugin to load, and plugin_library is the name of the library object file that contains the plugin code. If a plugin library is named without any preceding plugin name, the server loads all plugins in the library. The server looks for plugin library files in the directory named by the plugin_dir system variable.

Plugin-loading options do not register any plugin in the mysql.plugin table. For subsequent restarts, the server loads the plugin again only if --plugin-load is given again. That is, the option produces a one-time plugin-installation operation that persists for a single server invocation.

--plugin-load enables plugins to be loaded even when --skip-grant-tables is given (which causes the server to ignore the mysql.plugin table). --plugin-load also enables plugins to be loaded at startup under configurations when plugins cannot be loaded at runtime.

Plugins installed with the INSTALL PLUGIN statement:
A plugin located in a plugin library file can be loaded at runtime with the `INSTALL PLUGIN` statement. The statement also registers the plugin in the `mysql.plugin` table to cause the server to load it on subsequent restarts. For this reason, `INSTALL PLUGIN` requires the `INSERT` privilege for the `mysql.plugin` table.

The plugin library file base name depends on your platform. Common suffixes are `.so` for Unix and Unix-like systems, `.dll` for Windows.

Example: The `--plugin-load` option installs a plugin at server startup. To install a plugin named `myplugin` from a plugin library file named `somepluglib.so`, use these lines in a `my.cnf` file:

```plaintext
[mysqld]
plugin-load=myplugin=somepluglib.so
```

In this case, the plugin is not registered in `mysql.plugin`. Restarting the server without the `--plugin-load` option causes the plugin not to be loaded at startup.

Alternatively, the `INSTALL PLUGIN` statement causes the server to load the plugin code from the library file at runtime:

```plaintext
mysql> INSTALL PLUGIN myplugin SONAME 'somepluglib.so';
```

`INSTALL PLUGIN` also causes “permanent” plugin registration: The plugin is listed in the `mysql.plugin` table to ensure that the server loads it on subsequent restarts.

Many plugins can be loaded either at server startup or at runtime. However, if a plugin is designed such that it must be loaded and initialized during server startup, attempts to load it using `INSTALL PLUGIN` produce an error:

```plaintext
mysql> INSTALL PLUGIN myplugin SONAME 'somepluglib.so';
ERROR 1721 (HY000): Plugin 'myplugin' is marked as not dynamically installable. You have to stop the server to install it.
```

In this case, you must use `--plugin-load`.

If a plugin is named both using a `--plugin-load` option and (as a result of an earlier `INSTALL PLUGIN` statement) in the `mysql.plugin` table, the server starts but writes these messages to the error log:

```plaintext
[ERROR] Function 'plugin_name' already exists
[Warning] Couldn't load plugin named 'plugin_name' with soname 'plugin_object_file'.
```

### Controlling Plugin Activation

If the server knows about a plugin when it starts (for example, because the plugin is named using a `--plugin-load` option or is registered in the `mysql.plugin` table), the server loads and enables the plugin by default. It is possible to control activation state for such a plugin using a `--plugin_name[=activation_state]` startup option, where `plugin_name` is the name of the plugin to affect, such as `innodb` or `csv`. As with other options, dashes and underscores are interchangeable in option names. Also, activation state values are not case sensitive. For example, `--my_plugin=ON` and `--my-plugin=on` are equivalent.

As of MySQL 5.1.36, these options control plugin loading:

- `--plugin_name=OFF`
  - Tells the server to disable the plugin.
- `--plugin_name[=ON]`
Server Plugins

Tells the server to enable the plugin. (Specifying the option as `--plugin_name` without a value has the same effect.) If the plugin fails to initialize, the server runs with the plugin disabled.

- `--plugin_name=FORCE`

Tells the server to enable the plugin, but if plugin initialization fails, the server does not start. In other words, this option forces the server to run with the plugin enabled or not at all.

The values OFF, ON, and FORCE are not case sensitive.

Suppose that CSV, BLACKHOLE, and ARCHIVE are built-in pluggable storage engines and that you want the server to load them at startup, subject to these conditions: The server is permitted to run if CSV initialization fails, must require that BLACKHOLE initialization succeeds, and should disable ARCHIVE. To accomplish that, use these lines in an option file:

```
[mysqld]
csv=ON
blackhole=FORCE
archive=OFF
```

The `--enable-plugin_name` option format is a synonym for `--plugin_name=ON`. The `--disable-plugin_name` and `--skip-plugin_name` option formats are synonyms for `--plugin_name=OFF`.

Before MySQL 5.1.36, plugin options are boolean options (see Section 4.2.5, “Program Option Modifiers”). That is, any of these options enable the plugin:

```
--plugin_name
--plugin_name=1
--enable-plugin_name
```

And these options disable the plugin:

```
--plugin_name=0
--disable-plugin_name
--skip-plugin_name
```

If you upgrade to MySQL 5.1.36 or later from an older version and previously used options of the form `--plugin_name=0` or `--plugin_name=1`, the equivalent options are now `--plugin_name=OFF` and `--plugin_name=ON`, respectively. You also have the choice of requiring plugins to start successfully by using `--plugin_name=FORCE`.

If a plugin is disabled, either explicitly with OFF or implicitly because it was enabled with ON but failed to initialize, aspects of server operation that require the plugin will change. For example, if the plugin implements a storage engine, existing tables for the storage engine become inaccessible, and attempts to create new tables for the storage engine result in tables that use the default storage engine unless the NO_ENGINE_SUBSTITUTION SQL mode is enabled to cause an error to occur instead.

Disabling a plugin may require adjustment to other options. For example, if you start the server using `--skip-innodb` to disable InnoDB, other innodb.xxx options likely will need to be omitted from the startup command. In addition, if the server is configured to use InnoDB as the default storage engine, it will not start unless you specify another available storage engine with `--default-storage-engine`.

Uninstalling Plugins

At runtime, the UNINSTALL PLUGIN statement disables and uninstalls a plugin known to the server. The statement unloads the plugin and removes it from the mysql.plugin table, if it is registered there. For this reason, UNINSTALL PLUGIN statement requires the DELETE privilege for the mysql.plugin table. With the plugin no longer registered in the table, the server will not load the plugin automatically for subsequent restarts.
**UNINSTALL PLUGIN** can unload a plugin regardless of whether it was loaded at runtime with **INSTALL PLUGIN** or at startup with a plugin-loading option.

**UNINSTALL PLUGIN** cannot unload plugins that are built in to the server. These can be identified as those that have a library name of **NULL** in the output from **INFORMATION_SCHEMA.PLUGINS** or **SHOW PLUGINS**.

To uninstall a plugin that currently is loaded at server startup with a plugin-loading option, use this procedure.

1. Remove any options related to the plugin from the **my.cnf** file.
2. Restart the server.
3. Plugins normally are installed using either a plugin-loading option at startup or with **INSTALL PLUGIN** at runtime, but not both. However, removing options for a plugin from the **my.cnf** file may not be sufficient to uninstall it if at some point **INSTALL PLUGIN** has also been used. If the plugin still appears in the output from **INFORMATION_SCHEMA.PLUGINS** or **SHOW PLUGINS**, use **UNINSTALL PLUGIN** to remove it from the **mysql.plugin** table. Then restart the server again.

### 5.1.8.2 Obtaining Server Plugin Information

There are several ways to determine which plugins are installed in the server:

- The **INFORMATION_SCHEMA.PLUGINS** table contains a row for each loaded plugin. Any that have a **PLUGIN_LIBRARY** value of **NULL** are built in and cannot be unloaded.

```sql
mysql> SELECT * FROM information_schema.PLUGINS\G
*************************** 1. row ***************************
  PLUGIN_NAME: binlog
  PLUGIN_VERSION: 1.0
  PLUGIN_STATUS: ACTIVE
  PLUGIN_TYPE: STORAGE ENGINE
  PLUGIN_TYPE_VERSION: 50158.0
  PLUGIN_LIBRARY: NULL
  PLUGIN_LIBRARY_VERSION: NULL
  PLUGIN_AUTHOR: MySQL AB
  PLUGIN_DESCRIPTION: This is a pseudo storage engine to represent the binlog in a transaction
  PLUGIN_LICENSE: GPL
...
```

- The **SHOW PLUGINS** statement displays a row for each loaded plugin. Any that have a **Library** value of **NULL** are built in and cannot be unloaded.

```sql
mysql> SHOW PLUGINS\G
*************************** 1. row ***************************
  Name: binlog
  Status: ACTIVE
  Type: STORAGE ENGINE
  Library: NULL
  License: GPL
...
5.1.9 Server-Side Help

MySQL Server supports a `HELP` statement that returns information from the MySQL Reference manual (see Section 13.8.3, “HELP Syntax”). Several tables in the `mysql` system database contain the information needed to support this statement (see Section 5.3, “The mysql System Database”). The proper operation of this statement requires that these help tables be initialized, which is done by processing the contents of the `fill_help_tables.sql` script.

If you install MySQL using a binary or source distribution on Unix, help table content initialization occurs when you initialize the data directory (see Section 2.12.1, “Initializing the Data Directory”). For an RPM distribution on Linux or binary distribution on Windows, content initialization occurs as part of the MySQL installation process.

If you upgrade MySQL using a binary distribution, help table content is not upgraded automatically, but you can upgrade it manually. Locate the `fill_help_tables.sql` file in the `share` or `share/mysql` directory. Change location into that directory and process the file with the `mysql` client as follows:

```shell>
mysql -u root mysql < fill_help_tables.sql
```

You can also obtain the latest `fill_help_tables.sql` at any time to upgrade your help tables. Download the proper file for your version of MySQL from [http://dev.mysql.com/doc/index-other.html](http://dev.mysql.com/doc/index-other.html). After downloading and uncompressing the file, process it with `mysql` as described previously.

If you are working with Bazaar and a MySQL development source tree, you must use a downloaded copy of the `fill_help_tables.sql` file because the source tree contains only a “stub” version.

Note

For a server that participates in replication, the help table content upgrade process involves multiple servers. For details, see Section 16.4.1.30, “Replication of Server-Side Help Tables”.

5.1.10 Server Response to Signals

On Unix, signals can be sent to processes. `mysqld` responds to signals sent to it as follows:

- **SIGTERM** causes the server to shut down.
- **SIGHUP** causes the server to reload the grant tables and to flush tables, logs, the thread cache, and the host cache. These actions are like various forms of the `FLUSH` statement. The server also writes a status report to the error log that has this format:

```
Status information:
Current dir: /var/mysql/data/
Running threads: 0  Stack size: 196608
Current locks:
Key caches: default
```
5.1.11 The Server Shutdown Process

The server shutdown process takes place as follows:

1. The shutdown process is initiated.
   
   This can occur initiated several ways. For example, a user with the **SHUTDOWN** privilege can execute a `mysqladmin shutdown` command. `mysqladmin` can be used on any platform supported by MySQL. Other operating system-specific shutdown initiation methods are possible as well: The server shuts down on Unix when it receives a **SIGTERM** signal. A server running as a service on Windows shuts down when the services manager tells it to.

2. The server creates a shutdown thread if necessary.
   
   Depending on how shutdown was initiated, the server might create a thread to handle the shutdown process. If shutdown was requested by a client, a shutdown thread is created. If shutdown is the result of receiving a **SIGTERM** signal, the signal thread might handle shutdown itself, or it might create a separate thread to do so. If the server tries to create a shutdown thread and cannot (for example, if memory is exhausted), it issues a diagnostic message that appears in the error log:

   ```
   Error: Can't create thread to kill server
   ```

3. The server stops accepting new connections.
   
   To prevent new activity from being initiated during shutdown, the server stops accepting new client connections by closing the handlers for the network interfaces to which it normally listens for connections: the TCP/IP port, the Unix socket file, the Windows named pipe, and shared memory on Windows.

4. The server terminates current activity.
   
   For each thread associated with a client connection, the server breaks the connection to the client and marks the thread as killed. Threads die when they notice that they are so marked. Threads for idle connections die quickly. Threads that currently are processing statements check their
state periodically and take longer to die. For additional information about thread termination, see Section 13.7.6.4, “KILL Syntax”, in particular for the instructions about killed REPAIR TABLE or OPTIMIZE TABLE operations on MyISAM tables.

For threads that have an open transaction, the transaction is rolled back. If a thread is updating a nontransactional table, an operation such as a multiple-row UPDATE or INSERT may leave the table partially updated because the operation can terminate before completion.

If the server is a master replication server, it treats threads associated with currently connected slaves like other client threads. That is, each one is marked as killed and exits when it next checks its state.

If the server is a slave replication server, it stops the I/O and SQL threads, if they are active, before marking client threads as killed. The SQL thread is permitted to finish its current statement (to avoid causing replication problems), and then stops. In MySQL 5.1.34 and earlier, if the SQL thread was in the middle of a transaction at this point, the transaction was rolled back; in MySQL 5.1.35 and later, the server waits until the current replication event group (if any) has finished executing, or until the user issues a KILL QUERY or KILL CONNECTION statement. See also Section 13.4.2.8, “STOP SLAVE Syntax”.

If the slave is updating a nontransactional table when it is forcibly killed, the slave’s data may become inconsistent with the master.

5. The server shuts down or closes storage engines.

At this stage, the server flushes the table cache and closes all open tables.

Each storage engine performs any actions necessary for tables that it manages. For example, MyISAM flushes any pending index writes for a table. InnoDB flushes its buffer pool to disk (unless innodb_fast_shutdown is 2), writes the current LSN to the tablespace, and terminates its own internal threads.

6. The server exits.

5.2 The MySQL Data Directory

Information managed by the MySQL server is stored under a directory known as the data directory. The following list briefly describes the items typically found in the data directory, with cross references for additional information:

• Each data directory subdirectory corresponds to a database managed by the server:

  • The mysql directory corresponds to the mysql system database, which contains information required by the MySQL server as it runs. See Section 5.3, “The mysql System Database”.

  • Other subdirectories correspond to databases created by users or applications.

• Log files written by the server. See Section 5.4, “MySQL Server Logs”.

• InnoDB tablespace and log files. See Section 14.6, “The InnoDB Storage Engine”.

• The server process ID file (while the server is running).

Some items in the preceding list can be relocated elsewhere; for any given MySQL installation, check the server configuration to determine whether items have been moved. In addition, the location of the data directory itself can be discovered or configured using the datadir system variable.

5.3 The mysql System Database

The mysql database is the system database. It contains tables that store information required by the MySQL server as it runs.
Tables in the `mysql` database fall into these categories:

- Grant tables
- Object information tables
- General log and slow query log tables
- Server-side help tables
- Time zone tables
- Replication tables
- Miscellaneous tables

### Grant System Tables

These system tables contain grant information about user accounts and the privileges held by them:

- **user**: User accounts, global privileges, and other non-privilege columns.
- **db**: Database-level privileges.
- **host**: Obsolete.
- **tables_priv**: Table-level privileges.
- **columns_priv**: Column-level privileges.
- **procs_priv**: Stored procedure and function privileges.

For more information about the structure, contents, and purpose of the grant tables, see Section 6.2.2, "Grant Tables".

### Object Information System Tables

These system tables contain information about stored programs, user-defined functions, and server-side plugins:

- **event**: Information about Event Scheduler events. See Section 19.4, “Using the Event Scheduler”.
- **func**: Information about user-defined functions. See Section 22.3, “Adding New Functions to MySQL”.
- **plugin**: Information about server plugins. See Section 5.1.8.1, “Installing and Uninstalling Plugins”, and Section 22.2, “The MySQL Plugin API”.
- **proc**: Information about stored procedures and functions. See Section 19.2, “Using Stored Routines (Procedures and Functions)”.

### Log System Tables

The server uses these system tables for logging:

- **general_log**: The general query log table.
- **slow_log**: The slow query log table.

For more information, see Section 5.4, “MySQL Server Logs”.

### Server-Side Help System Tables
These system tables contain server-side help information:

- **help_category**: Information about help categories.
- **help_keyword**: Keywords associated with help topics.
- **help_relation**: Mappings between help keywords and topics.
- **help_topic**: Help topic contents.

For more information, see Section 5.1.9, “Server-Side Help”.

**Time Zone System Tables**

These system tables contain time zone information:

- **time_zone**: List of time zone IDs and whether they use leap seconds.
- **time_zone_leap_second**: When leap seconds occur.
- **time_zone_name**: Mappings between time zone IDs and names.
- **time_zone_transition, time_zone_transition_type**: Time zone descriptions.

For more information, see Section 10.6, “MySQL Server Time Zone Support”.

**Replication System Tables**

The server uses the `ndb_binlog_index` system table to store binary log information for MySQL Cluster replication. See Section 17.6.4, “MySQL Cluster Replication Schema and Tables”.

**Miscellaneous System Tables**

Other system tables do not fit the preceding categories:

- **servers**: Used by the FEDERATED storage engine. See Section 14.11.2.2, “Creating a FEDERATED Table Using CREATE SERVER”.

### 5.4 MySQL Server Logs

MySQL Server has several logs that can help you find out what activity is taking place.

<table>
<thead>
<tr>
<th>Log Type</th>
<th>Information Written to Log</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error log</td>
<td>Problems encountered starting, running, or stopping <code>mysqld</code></td>
</tr>
<tr>
<td>General query log</td>
<td>Established client connections and statements received from clients</td>
</tr>
<tr>
<td>Binary log</td>
<td>Statements that change data (also used for replication)</td>
</tr>
<tr>
<td>Relay log</td>
<td>Data changes received from a replication master server</td>
</tr>
<tr>
<td>Slow query log</td>
<td>Queries that took more than <code>long_query_time</code> seconds to execute</td>
</tr>
<tr>
<td>DDL log (metadata log)</td>
<td>Metadata operations performed by DDL statements</td>
</tr>
</tbody>
</table>

By default, no logs are enabled, except the error log on Windows. (The DDL log is always created when required, and has no user-configurable options; see Section 5.4.6, “The DDL Log”.) The following log-specific sections provide information about the server options that enable logging.

By default, the server writes files for all enabled logs in the data directory. You can force the server to close and reopen the log files (or in some cases switch to a new log file) by flushing the logs. Log flushing occurs when you issue a `FLUSH LOGS` statement; execute `mysqladmin` with a `flush-logs`
or refresh argument; or execute mysqldump with a --flush-logs or --master-data option. See Section 13.7.6.3, “FLUSH Syntax”, Section 4.5.2, “mysqladmin — Client for Administering a MySQL Server”, and Section 4.5.4, “mysqldump — A Database Backup Program”. In addition, the binary log is flushed when its size reaches the value of the max_binlog_size system variable.

You can control the general query and slow query logs during runtime. You can enable or disable logging, or change the log file name. You can tell the server to write general query and slow query entries to log tables, log files, or both. For details, see Section 5.4.1, “Selecting General Query and Slow Query Log Output Destinations”, Section 5.4.3, “The General Query Log”, and Section 5.4.5, “The Slow Query Log”.

The relay log is used only on slave replication servers, to hold data changes from the master server that must also be made on the slave. For discussion of relay log contents and configuration, see Section 16.2.2.1, “The Slave Relay Log”.

For information about log maintenance operations such as expiration of old log files, see Section 5.4.7, “Server Log Maintenance”.

For information about keeping logs secure, see Section 6.1.2.3, “Passwords and Logging”.

5.4.1 Selecting General Query and Slow Query Log Output Destinations

As of MySQL 5.1.6, MySQL Server provides flexible control over the destination of output to the general query log and the slow query log, if those logs are enabled. Possible destinations for log entries are log files or the general_log and slow_log tables in the mysql database. Either or both destinations can be selected. (Before MySQL 5.1.6, the server uses only log files as the destination for general query log and slow query log entries.)

Note

For new installations of MySQL 5.1.6 or higher, the log tables are created during the installation procedure along with the other system tables. If you upgrade MySQL from a release older than 5.1.6 to MySQL 5.1.6 or higher, you must upgrade the system tables after upgrading to make sure that the log tables exist. See Section 4.4.8, “mysql_upgrade — Check and Upgrade MySQL Tables”.

Logging to tables incurs significantly more server overhead than logging to files. If you enable the general log or slow query log and require highest performance, you should use file logging, not table logging.

Log control at server startup. The --log-output option specifies the destination for log output, if logging is enabled. This option does not in itself enable the logs. Its syntax is --log-output [=value,...]:

- If --log-output is given with a value, the value should be a comma-separated list of one or more of the words TABLE (log to tables), FILE (log to files), or NONE (do not log to tables or files). NONE, if present, takes precedence over any other specifiers.
- If --log-output is omitted or given without a value, the default is FILE. (For MySQL 5.1.6 through 5.1.20, the default logging destination is TABLE.)

The general_log system variable controls logging to the general query log for the selected log destinations. If specified at server startup, general_log takes an optional argument of 1 or 0 to enable or disable the log. To specify a file name other than the default for file logging, set the general_log_file variable. Similarly, the slow_query_log variable controls logging to the slow query log for the selected destinations and setting slow_query_log_file specifies a file name for file logging. If either log is enabled, the server opens the corresponding log file and writes startup messages to it. However, further logging of queries to the file does not occur unless the FILE log destination is selected. Prior to MySQL 5.1.29, the --log and --log-slow-queries options enable
the general query log and slow query log. Either option may be given with a file name argument to specify a log file name to override the default.

Examples:

- To write general query log entries to the log table and the log file, use `--log-output=TABLE,FILE` to select both log destinations and `--general_log` to enable the general query log.

- To write general and slow query log entries only to the log tables, use `--log-output=TABLE` to select tables as the log destination and `--general_log` and `--slow_query_log` to enable both logs.

- To write slow query log entries only to the log file, use `--log-output=FILE` to select files as the log destination and `--slow_query_log` to enable the slow query log. (In this case, because the default log destination is FILE, you could omit the `--log-output` option.)

Log control at runtime. The system variables associated with log tables and files enable runtime control over logging:

- The global `log_output` system variable indicates the current logging destination. It can be modified at runtime to change the destination.

- The global `general_log` and `slow_query_log` variables indicate whether the general query log and slow query log are enabled (ON) or disabled (OFF). You can set these variables at runtime to control whether the logs are enabled.

- The global `general_log_file` and `slow_query_log_file` variables indicate the names of the general query log and slow query log files. As of MySQL 5.1.29, you can set these variables at server startup or at runtime to change the names of the log files. Before MySQL 5.1.29, you can set these variables only at runtime, but the `--log` and `--log-slow-queries` options can be given with a file name argument at startup to change the log file names from their default values.

- To disable or enable general query logging for the current connection, set the session `sql_log_off` variable to ON or OFF.

The use of tables for log output offers the following benefits:

- Log entries have a standard format. To display the current structure of the log tables, use these statements:

  ```sql
  SHOW CREATE TABLE mysql.general_log;
  SHOW CREATE TABLE mysql.slow_log;
  ```

- Log contents are accessible through SQL statements. This enables the use of queries that select only those log entries that satisfy specific criteria. For example, to select log contents associated with a particular client (which can be useful for identifying problematic queries from that client), it is easier to do this using a log table than a log file.

- Logs are accessible remotely through any client that can connect to the server and issue queries (if the client has the appropriate log table privileges). It is not necessary to log in to the server host and directly access the file system.

The log table implementation has the following characteristics:

- In general, the primary purpose of log tables is to provide an interface for users to observe the runtime execution of the server, not to interfere with its runtime execution.

- `CREATE TABLE`, `ALTER TABLE`, and `DROP TABLE` are valid operations on a log table. For `ALTER TABLE` and `DROP TABLE`, the log table cannot be in use and must be disabled, as described later.

- By default, the log tables use the CSV storage engine that writes data in comma-separated values format. For users who have access to the `.CSV` files that contain log table data, the files are easy to import into other programs such as spreadsheets that can process CSV input.
Beginning with MySQL 5.1.12, the log tables can be altered to use the MyISAM storage engine. You cannot use `ALTER TABLE` to alter a log table that is in use. The log must be disabled first. No engines other than CSV or MyISAM are legal for the log tables.

To disable logging so that you can alter (or drop) a log table, you can use the following strategy. The example uses the general query log; the procedure for the slow query log is similar but uses the `slow_log` table and `slow_query_log` system variable.

```
SET @old_log_state = @@global.general_log;
SET GLOBAL general_log = 'OFF';
ALTER TABLE mysql.general_log ENGINE = MyISAM;
SET GLOBAL general_log = @old_log_state;
```

- **TRUNCATE TABLE** is a valid operation on a log table. It can be used to expire log entries.
- As of MySQL 5.1.13, **RENAME TABLE** is a valid operation on a log table. You can atomically rename a log table (to perform log rotation, for example) using the following strategy:

```
USE mysql;
DROP TABLE IF EXISTS general_log2;
CREATE TABLE general_log2 LIKE general_log;
RENAME TABLE general_log TO general_log_backup, general_log2 TO general_log;
```

- **LOCK TABLES** cannot be used on a log table.
- **INSERT**, **DELETE**, and **UPDATE** cannot be used on a log table. These operations are permitted only internally to the server itself.
- **FLUSH TABLES WITH READ LOCK** and the state of the `read_only` system variable have no effect on log tables. The server can always write to the log tables.
- Entries written to the log tables are not written to the binary log and thus are not replicated to slave servers.
- To flush the log tables or log files, use **FLUSH TABLES** or **FLUSH LOGS**, respectively. (From MySQL 5.1.12 to 5.1.20, **FLUSH TABLES** ignores log tables and **FLUSH LOGS** flushes both the log tables and files.)
- Partitioning of log tables is not permitted beginning with MySQL 5.1.20, and not recommended before that.
- Before MySQL 5.1.64, `mysqldump` does not dump the `general_log` or `slow_query_log` tables for dumps of the `mysql` database. As of 5.1.64, the dump includes statements to recreate those tables so that they are not missing after reloading the dump file. Log table contents are not dumped.

### 5.4.2 The Error Log

The error log contains information indicating when `mysqld` was started and stopped and also any critical errors that occur while the server is running. If `mysqld` notices a table that needs to be automatically checked or repaired, it writes a message to the error log.

On some operating systems, the error log contains a stack trace if `mysqld` exits abnormally. The trace can be used to determine where `mysqld` exited. See Section 22.4, "Debugging and Porting MySQL".

If `mysqld_safe` is used to start `mysqld` and `mysqld` exits abnormally, `mysqld_safe` notices this, restarts `mysqld`, and writes a `mysqld restarted` message to the error log.

In the following discussion, “console” means `stderr`, the standard error output; this is your terminal or console window unless the standard error output has been redirected. (For example, if invoked with the `--syslog` option, `mysqld_safe` arranges for the server’s `stderr` to be sent to `syslog`, as described later.)
On Windows, the `--log-error`, `--pid-file`, and `--console` options affect error logging:

- If no log file name is specified, the default log file is `host_name.err` in the data directory, unless the `--pid-file` option is specified. In that case, the default name is the PID file base name with a suffix of `.err` in the data directory.

- Without `--log-error`, `mysqld` writes error messages to the default log file.

- With `--log-error=[file_name]`, `mysqld` writes error messages to an error log file. `mysqld` writes to the named file if present, creating it in the data directory unless an absolute path name is given to specify a different directory. If no file is named, `mysqld` writes to the default log file.

- With `--console`, `mysqld` writes error messages to the console, unless `--log-error` is also given. If both options are present, the last one takes precedence.

In addition, on Windows, the server writes events and error messages to the Windows Event Log within the Application log. Entries marked as `Warning` and `Note` are written to the Event Log, but not informational messages such as information statements from individual storage engines. These log entries have a source of `MySQL`. You cannot disable writing information to the Windows Event Log.

On Unix and Unix-like systems, `mysqld` writes error log messages as follows:

- Without `--log-error`, `mysqld` writes error messages to the console.

- With `--log-error=[file_name]`, `mysqld` writes error messages to an error log file. The server uses the named file if present, creating it in the data directory unless an absolute path name is given to specify a different directory. If no file is named, the default name is `host_name.err` in the data directory.

At runtime, `log_error` system variable indicates the error log file name if error output is written to a file.

If you specify `--log-error` in an option file in a `[mysqld]`, `[server]`, or `[mysqld_safe]` section, `mysqld_safe` will find and use the option.

If you flush the logs using `FLUSH LOGS` or `mysqladmin flush-logs` and `mysqld` is writing the error log to a file (for example, if it was started with the `--log-error` option), the effect is version dependent:

- As of MySQL 5.1.51, the server closes andreopensthe log file. To rename the file, do so manually before flushing. Then flushing the logs reopens a new file with the original file name. For example, to rename the file and create a new one, use the following commands:

  ```
  shell> mv host_name.err host_name.err-old
  shell> mysqladmin flush-logs
  shell> mv host_name.err-old backup-directory
  ```

  On Windows, use `rename` rather than `mv`.

- Prior to MySQL 5.1.51, the server renames the current log file with the suffix `-old`, then creates a new empty log file. Be aware that a second log-flushing operation thus causes the original error log file to be lost unless you save it under a different name. On Windows, you cannot rename the error log while the server has it open before MySQL 5.1.51. To avoid a restart, flush the logs first to cause the server to rename the original file and create a new one, then save the renamed file. That also works on Unix, or you can use the commands shown earlier.

If the server is not writing to a named file, no error log renaming occurs when the logs are flushed.

If you use `mysqld_safe` to start `mysqld`, `mysqld_safe` arranges for `mysqld` to write error messages to a log file or (as of MySQL 5.1.20) to `syslog`. 
• Before 5.1.20, `mysqld_safe` behavior is to log to a file, using the default error log file if the `--log-error` option is not given to `mysqld_safe`. Otherwise, `mysqld_safe` uses the file name specified using `--log-error=file_name`.

• From 5.1.20 on, `mysqld_safe` has two additional error-logging options, `--syslog` and `--skip-syslog`.

In 5.1.21 and up, the default with no logging options is `--skip-syslog`, which is compatible with the default behavior of writing an error log file for releases prior to 5.1.20. To explicitly specify use of an error log file, specify `--log-error=file_name` to `mysqld_safe`, and `mysqld_safe` will arrange for `mysqld` to write messages to a log file. To use `syslog` instead, specify the `--syslog` option.

In 5.1.20 only, the following conditions apply: 1) The default is to use `syslog`, which is not compatible with releases prior to 5.1.20. 2) Logging to `syslog` may fail to operate correctly in some cases; if so, use `--skip-syslog` or `--log-error`.

For logging to `syslog`, messages from `mysqld_safe` and `mysqld` are written with a tag of `mysqld_safe` and `mysqld`, respectively. As of MySQL 5.1.21, to specify a suffix for the tag, use `--syslog-tag=tag`, which modifies the tags to be `mysqld_safe-tag` and `mysqld-tag`.

The `--log-warnings` option or `log_warnings` system variable can be used to control warning logging to the error log. The default value is enabled (1). Warning logging can be disabled using a value of 0. If the value is greater than 1, aborted connections are written to the error log. See Section B.5.2.11, “Communication Errors and Aborted Connections”.

5.4.3 The General Query Log

The general query log is a general record of what `mysqld` is doing. The server writes information to this log when clients connect or disconnect, and it logs each SQL statement received from clients. The general query log can be very useful when you suspect an error in a client and want to know exactly what the client sent to `mysqld`.

`mysqld` writes statements to the query log in the order that it receives them, which might differ from the order in which they are executed. This logging order is in contrast with that of the binary log, for which statements are written after they are executed but before any locks are released. In addition, the query log may contain statements that only select data while such statements are never written to the binary log.

When using statement-based binary logging on a replication master server, statements received by its slaves are written to the query log of each slave. Statements are written to the query log of the master server if a client reads events with the `mysqlbinlog` utility and passes them to the server.

However, when using row-based binary logging, updates are sent as row changes rather than SQL statements, and thus these statements are never written to the query log when `binlog_format` is `ROW`. A given update also might not be written to the query log when this variable is set to `MIXED`, depending on the statement used. See Section 16.1.2.1, “Advantages and Disadvantages of Statement-Based and Row-Based Replication”, for more information.

Control the general query log at server startup as follows:

• Before 5.1.6, the general query log destination is always a file. To enable the log, start `mysqld` with the `--log=file_name` or `-l file_name` option.

• As of MySQL 5.1.6, the destination can be a file or a table, or both. Start `mysqld` with the `--log=file_name` or `-l file_name` option to enable the general query log, and optionally use `--log-output` to specify the log destination (as described in Section 5.4.1, “Selecting General Query and Slow Query Log Output Destinations”).

• As of MySQL 5.1.12, as an alternative to `--log` or `-l`, use `--general_log={0|1}` to specify the initial general query log state. In this case, the default general query log file name is used. With
The Binary Log

no argument or an argument of 1, --general_log enables the log. With an argument of 0, this option disables the log.

- As of MySQL 5.1.29, use --general_log=[{0|1}] to enable or disable the general query log, and optionally --general_log_file=file_name to specify a log file name. The --log and -l options are deprecated.

If the general query log file is enabled but no name is specified, the default name is host_name.log and the server creates the file in the same directory where it creates the PID file. If a name is given, the server creates the file in the data directory unless an absolute path name is given to specify a different directory.

To disable or enable the general query log or change the log file name at runtime, use the global general_log and general_log_file system variables. Set general_log to 0 (or OFF) to disable the log or to 1 (or ON) to enable it. Set general_log_file to specify the name of the log file. If a log file already is open, it is closed and the new file is opened.

When the general query log is enabled, the server writes output to any destinations specified by the --log-output option or log_output system variable. If you enable the log, the server opens the log file and writes startup messages to it. However, further logging of queries to the file does not occur unless the FILE log destination is selected. If the destination is NONE, the server writes no queries even if the general log is enabled. Setting the log file name has no effect on logging if the log destination value does not contain FILE.

Server restarts and log flushing do not cause a new general query log file to be generated (although flushing closes and reopens it). On Unix, you can rename the file and create a new one by using the following commands:

shell> mv host_name.log host_name-old.log
shell> mysqladmin flush-logs
shell> mv host_name-old.log backup-directory

On Windows, you cannot rename the general query log file while the server has it open before MySQL 5.1.3. You must stop the server, rename the file, and then restart the server to create a new log file.

As of MySQL 5.1.12, you can rename the general query log file at runtime by disabling the log:

SET GLOBAL general_log = 'OFF';

With the log disabled, rename the log file externally; for example, from the command line. Then enable the log again:

SET GLOBAL general_log = 'ON';

This method works on any platform and does not require a server restart.

The session sql_log_off variable can be set to ON or OFF to disable or enable general query logging for the current connection.

The general query log should be protected because logged statements might contain passwords. See Section 6.1.2.3, “Passwords and Logging”.

5.4.4 The Binary Log

The binary log contains “events” that describe database changes such as table creation operations or changes to table data. It also contains events for statements that potentially could have made changes (for example, a DELETE which matched no rows), unless row-based logging is used. The binary log also contains information about how long each statement took that updated data. The binary log has two important purposes:
• For replication, the binary log on a master replication server provides a record of the data changes to be sent to slave servers. The master server sends the events contained in its binary log to its slaves, which execute those events to make the same data changes that were made on the master. See Section 16.2, “Replication Implementation”.

• Certain data recovery operations require use of the binary log. After a backup has been restored, the events in the binary log that were recorded after the backup was made are re-executed. These events bring databases up to date from the point of the backup. See Section 7.5, “Point-in-Time (Incremental) Recovery Using the Binary Log”.

The binary log is not used for statements such as `SELECT` or `SHOW` that do not modify data. To log all statements (for example, to identify a problem query), use the general query log. See Section 5.4.3, “The General Query Log”.

Running a server with binary logging enabled makes performance slightly slower. However, the benefits of the binary log in enabling you to set up replication and for restore operations generally outweigh this minor performance decrement.

The binary log should be protected because logged statements might contain passwords. See Section 6.1.2.3, “Passwords and Logging”.

The following discussion describes some of the server options and variables that affect the operation of binary logging. For a complete list, see Section 16.1.3.4, “Binary Log Options and Variables”.

To enable the binary log, start the server with the `--log-bin[=base_name]` option. If no `base_name` value is given, the default name is the value of the `pid-file` option (which by default is the name of host machine) followed by `-bin`. If the base name is given, the server writes the file in the data directory unless the base name is given with a leading absolute path name to specify a different directory. It is recommended that you specify a base name explicitly rather than using the default of the host name; see Section B.5.7, “Known Issues in MySQL”, for the reason.

**Note**

From MySQL 5.1.18 through 5.1.22, “mysql” was used when no `base_name` was specified. Also in these versions, a path given as part of the `--log-bin` options was treated as absolute rather than relative. The previous behaviors were restored in MySQL 5.1.23. (See Bug #28603 and Bug #28597.)

If you supply an extension in the log name (for example, `--log-bin=base_name.extension`), the extension is silently removed and ignored.

`mysqld` appends a numeric extension to the binary log base name to generate binary log file names. The number increases each time the server creates a new log file, thus creating an ordered series of files. The server creates a new file in the series each time it starts or flushes the logs. The server also creates a new binary log file automatically after the current log’s size reaches `max_binlog_size`. A binary log file may become larger than `max_binlog_size` if you are using large transactions because a transaction is written to the file in one piece, never split between files.

To keep track of which binary log files have been used, `mysqld` also creates a binary log index file that contains the names of all used binary log files. By default, this has the same base name as the binary log file, with the extension ‘.index’. You can change the name of the binary log index file with the `--log-bin-index[=file_name]` option. You should not manually edit this file while `mysqld` is running; doing so would confuse `mysqld`.

The term “binary log file” generally denotes an individual numbered file containing database events. The term “binary log” collectively denotes the set of numbered binary log files plus the index file.

A client that has the `SUPER` privilege can disable binary logging of its own statements by using a `SET sql_log_bin=0` statement. See Section 5.1.4, “Server System Variables”.

The format of the events recorded in the binary log is dependent on the binary logging format. Three format types are supported, row-based logging, statement-based logging and mixed-base logging. The
The Binary Log

The binary logging format used depends on the MySQL version. For general descriptions of the logging formats, see Section 5.4.4.1, “Binary Logging Formats”. For detailed information about the format of the binary log, see MySQL Internals: The Binary Log.

The server evaluates the --binlog-do-db and --binlog-ignore-db options in the same way as it does the --replicate-do-db and --replicate-ignore-db options. For information about how this is done, see Section 16.2.3.1, “Evaluation of Database-Level Replication and Binary Logging Options”.

If you are replicating from a MySQL Cluster to a standalone MySQL Server, you should be aware that the NDB storage engine uses default values for some binary logging options (including options specific to NDB such as --ndb-log-update-as-write) that differ from those used by other storage engines. If not corrected for, these differences can lead to divergence of the master’s and slave’s binary logs. For more information, see Replication from NDB to other storage engines. In particular, if you are using a nontransactional storage engine such as MyISAM on the slave, see Replication from NDB to a nontransactional storage engine.

A replication slave server by default does not write to its own binary log any data modifications that are received from the replication master. To log these modifications, start the slave with the --log-slave-updates option in addition to the --log-bin option (see Section 16.1.3.3, “Replication Slave Options and Variables”). This is done when a slave is also to act as a master to other slaves in chained replication.

You can delete all binary log files with the RESET MASTER statement, or a subset of them with PURGE BINARY LOGS. See Section 13.7.6.6, “RESET Syntax”, and Section 13.4.1.1, “PURGE BINARY LOGS Syntax”.

If you are using replication, you should not delete old binary log files on the master until you are sure that no slave still needs to use them. For example, if your slaves never run more than three days behind, once a day you can execute mysqladmin flush-logs on the master and then remove any logs that are more than three days old. You can remove the files manually, but it is preferable to use PURGE BINARY LOGS, which also safely updates the binary log index file for you (and which can take a date argument). See Section 13.4.1.1, “PURGE BINARY LOGS Syntax”.

You can display the contents of binary log files with the mysqlbinlog utility. This can be useful when you want to reprocess statements in the log for a recovery operation. For example, you can update a MySQL server from the binary log as follows:

```
shell> mysqlbinlog log_file | mysql -h server_name
```

mysqlbinlog also can be used to display replication slave relay log file contents because they are written using the same format as binary log files. For more information on the mysqlbinlog utility and how to use it, see Section 4.6.7, "mysqlbinlog — Utility for Processing Binary Log Files". For more information about the binary log and recovery operations, see Section 7.5, “Point-in-Time (Incremental) Recovery Using the Binary Log”.

Binary logging is done immediately after a statement or transaction completes but before any locks are released or any commit is done. This ensures that the log is logged in commit order.

Updates to nontransactional tables are stored in the binary log immediately after execution. In MySQL 5.1.22 and earlier versions of MySQL 5.1, an UPDATE statement using a stored function that modified a nontransactional table was not logged if it failed, and an INSERT ... ON DUPLICATE KEY UPDATE statement that encountered a duplicate key constraint—but did not actually change any data—was not logged. Beginning with MySQL 5.1.23, both of these statements are written to the binary log. (Bug #23333)

Within an uncommitted transaction, all updates (UPDATE, DELETE, or INSERT) that change transactional tables such as InnoDB tables are cached until a COMMIT statement is received by the server. At that point, mysqld writes the entire transaction to the binary log before the COMMIT is executed.
Modifications to nontransactional tables cannot be rolled back. If a transaction that is rolled back includes modifications to nontransactional tables, the entire transaction is logged with a `ROLLBACK` statement at the end to ensure that the modifications to those tables are replicated.

When a thread that handles the transaction starts, it allocates a buffer of `binlog_cache_size` to buffer statements. If a statement is bigger than this, the thread opens a temporary file to store the transaction. The temporary file is deleted when the thread ends.

The `Binlog_cache_use` status variable shows the number of transactions that used this buffer (and possibly a temporary file) for storing statements. The `Binlog_cache_disk_use` status variable shows how many of those transactions actually had to use a temporary file. These two variables can be used for tuning `binlog_cache_size` to a large enough value that avoids the use of temporary files.

The `max_binlog_cache_size` system variable (default 4GB, which is also the maximum) can be used to restrict the total size used to cache a multiple-statement transaction. If a transaction is larger than this many bytes, it fails and rolls back. The minimum value is 4096.

If you are using the binary log and row based logging, concurrent inserts are converted to normal inserts for `CREATE ... SELECT` or `INSERT ... SELECT` statements. This is done to ensure that you can re-create an exact copy of your tables by applying the log during a backup operation. If you are using statement-based logging, the original statement is written to the log.

The binary log format has some known limitations that can affect recovery from backups. See Section 16.4.1, “Replication Features and Issues”.

Binary logging for stored programs is done as described in Section 19.7, “Binary Logging of Stored Programs”.

Note that the binary log format differs in MySQL 5.1 from previous versions of MySQL, due to enhancements in replication. See Section 16.4.2, “Replication Compatibility Between MySQL Versions”.

Writes to the binary log file and binary log index file are handled in the same way as writes to MyISAM tables. See Section B.5.3.4, “How MySQL Handles a Full Disk”.

By default, the binary log is not synchronized to disk at each write. So if the operating system or machine (not only the MySQL server) crashes, there is a chance that the last statements of the binary log are lost. To prevent this, you can make the binary log be synchronized to disk after every `N` writes to the binary log, with the `sync_binlog` system variable. See Section 5.1.4, “Server System Variables”. 1 is the safest value for `sync_binlog`, but also the slowest. Even with `sync_binlog` set to 1, there is still the chance of an inconsistency between the table content and binary log content in case of a crash. For example, if you are using InnoDB tables and the MySQL server processes a `COMMIT` statement, it writes the whole transaction to the binary log and then commits this transaction into InnoDB. If the server crashes between those two operations, the transaction is rolled back by InnoDB at restart but still exists in the binary log. To resolve this, you should set `--innodb_support_xa` to 1. Although this option is related to the support of XA transactions in InnoDB, it also ensures that the binary log and InnoDB data files are synchronized.

For this option to provide a greater degree of safety, the MySQL server should also be configured to synchronize the binary log and the InnoDB logs to disk at every transaction. The InnoDB logs are synchronized by default, and `sync_binlog=1` can be used to synchronize the binary log. The effect of this option is that at restart after a crash, after doing a rollback of transactions, the MySQL server cuts rolled back InnoDB transactions from the binary log. This ensures that the binary log reflects the exact data of InnoDB tables, and so, that the slave remains in synchrony with the master (not receiving a statement which has been rolled back).

If the MySQL server discovers at crash recovery that the binary log is shorter than it should have been, it lacks at least one successfully committed InnoDB transaction. This should not happen if `sync_binlog=1` and the disk/file system do an actual sync when they are requested to (some do
not), so the server prints an error message The binary log file_name is shorter than its expected size. In this case, this binary log is not correct and replication should be restarted from a fresh snapshot of the master's data.

For MySQL 5.1.20 and later (and MySQL 5.0.46 and later for backward compatibility), the session values of the following system variables are written to the binary log and honored by the replication slave when parsing the binary log:

- sql_mode (except that the NO_DIR_IN_CREATE mode is not replicated; see Section 16.4.1.38, "Replication and Variables")
- foreign_key_checks
- unique_checks
- character_set_client
- collation_connection
- collation_database
- collation_server
- sql_auto_is_null

### 5.4.4.1 Binary Logging Formats

The server uses several logging formats to record information in the binary log. The exact format employed depends on the version of MySQL being used. There are three logging formats:

- Replication capabilities in MySQL originally were based on propagation of SQL statements from master to slave. This is called statement-based logging. You can cause this format to be used by starting the server with --binlog-format=STATEMENT.

- In row-based logging, the master writes events to the binary log that indicate how individual table rows are affected. You can cause the server to use row-based logging by starting it with --binlog-format=ROW.

- A third option is also available: mixed logging. With mixed logging, statement-based logging is used by default, but the logging mode switches automatically to row-based in certain cases as described below. You can cause MySQL to use mixed logging explicitly by starting mysql with the option --binlog-format=MIXED.

Support for row-based logging was added in MySQL 5.1.5. Mixed logging is available beginning with MySQL 5.1.8. In MySQL 5.1.12, MIXED become the default logging mode; in 5.1.29, the default was changed back to STATEMENT for compatibility with MySQL 5.0.

Starting with MySQL 5.1.20, the logging format can also be set or limited by the storage engine being used. This helps to eliminate issues when replicating certain statements between a master and slave that are using different storage engines.

With statement-based replication, there may be issues with replicating nondeterministic statements. In deciding whether or not a given statement is safe for statement-based replication, MySQL determines whether it can guarantee that the statement can be replicated using statement-based logging. If MySQL cannot make this guarantee, it marks the statement as potentially unreliable and issues the warning, Statement may not be safe to log in statement format.

Prior to MySQL 5.1.36, this warning read, Statement is not safe to log in statement format. (Bug #42415)

You can avoid these issues by using MySQL's row-based replication instead.
5.4.4.2 Setting The Binary Log Format

You can select the binary logging format explicitly by starting the MySQL server with `--binlog-format=type`. The supported values for `type` are:

- **STATEMENT** causes logging to be statement based.
- **ROW** causes logging to be row based.
- **MIXED** causes logging to use mixed format.

The default binary logging format depends on the version of MySQL you are using:

- For MySQL 5.1.11 and earlier, and for MySQL 5.1.29 and later, statement-based logging is used by default.
- For MySQL 5.1.12 through MySQL 5.1.28, mixed logging is used by default.

**Exception.** For all MySQL Cluster releases using version 6.1 or later of the **NDBCLUSTER** storage engine (even those releases based on MySQL 5.1.29 and later), the default binary log format is **MIXED**. See Section 17.6, "MySQL Cluster Replication".

The logging format also can be switched at runtime. To specify the format globally for all clients, set the global value of the `binlog_format` system variable:

```
mysql> SET GLOBAL binlog_format = 'STATEMENT';
```

```
mysql> SET GLOBAL binlog_format = 'ROW';
```

```
mysql> SET GLOBAL binlog_format = 'MIXED';
```

An individual client can control the logging format for its own statements by setting the session value of `binlog_format`:

```
mysql> SET SESSION binlog_format = 'STATEMENT';
```

```
mysql> SET SESSION binlog_format = 'ROW';
```

```
mysql> SET SESSION binlog_format = 'MIXED';
```

**Note**

Each MySQL Server can set its own and only its own binary logging format (true whether `binlog_format` is set with global or session scope). This means that changing the logging format on a replication master does not cause a slave to change its logging format to match. (When using **STATEMENT** mode, the `binlog_format` system variable is not replicated; when using **MIXED** or **ROW** logging mode, it is replicated but is ignored by the slave.) Changing the binary logging format on the master while replication is ongoing, or without also changing it on the slave can cause replication to fail with errors such as `Error executing row event: 'Cannot execute statement: impossible to write to binary log since statement is in row format and BINLOG_FORMAT = STATEMENT.'`

To change the global `binlog_format` value, you must have the super privilege. This is also true for the session value as of MySQL 5.1.29.

There are several reasons why a client might want to set binary logging on a per-session basis:

- A session that makes many small changes to the database might want to use row-based logging.
- A session that performs updates that match many rows in the **WHERE** clause might want to use statement-based logging because it will be more efficient to log a few statements than many rows.
- Some statements require a lot of execution time on the master, but result in just a few rows being modified. It might therefore be beneficial to replicate them using row-based logging.
There are exceptions when you cannot switch the replication format at runtime:

- From within a stored function or a trigger
- If the NDBCLUSTER storage engine is enabled
- If the session is currently in row-based replication mode and has open temporary tables

Trying to switch the format in any of these cases results in an error.

If you are using InnoDB tables and the transaction isolation level is READ COMMITTED or READ UNCOMMITTED, only row-based logging can be used. It is possible to change the logging format to STATEMENT, but doing so at runtime leads very rapidly to errors because InnoDB can no longer perform inserts.

Switching the replication format at runtime is not recommended when any temporary tables exist, because temporary tables are logged only when using statement-based replication, whereas with row-based replication they are not logged. With mixed replication, temporary tables are usually logged; exceptions happen with user-defined functions (UDFs) and with the UUID() function.

With the binary log format set to ROW, many changes are written to the binary log using the row-based format. Some changes, however, still use the statement-based format. Examples include all DDL (data definition language) statements such as CREATE TABLE, ALTER TABLE, or DROP TABLE.

The --binlog-row-event-max-size option is available for servers that are capable of row-based replication. Rows are stored into the binary log in chunks having a size in bytes not exceeding the value of this option. The value must be a multiple of 256. The default value is 1024.

Warning

When using statement-based logging for replication, it is possible for the data on the master and slave to become different if a statement is designed in such a way that the data modification is nondeterministic; that is, it is left to the will of the query optimizer. In general, this is not a good practice even outside of replication. For a detailed explanation of this issue, see Section B.5.7, “Known Issues in MySQL”.

5.4.4.3 Mixed Binary Logging Format

When running in MIXED logging format, the server automatically switches from statement-based to row-based logging under the following conditions:

- When a DML statement updates an NDBCLUSTER table.
- When a function contains UUID().
- Prior to MySQL 5.1.40, when two or more tables with AUTO_INCREMENT columns are updated. As of 5.1.40, when one or more tables with AUTO_INCREMENT columns are updated and a trigger or stored function is invoked. Unlike other unsafe statements, this does not generate a warning if binlog_format = STATEMENT.

For more information, see Section 16.4.1.1, “Replication and AUTO_INCREMENT”.
- When any INSERT DELAYED is executed.
- When the body of a view requires row-based replication, the statement creating the view also uses it. For example, this occurs when the statement creating a view uses the UUID() function.
- When a call to a UDF is involved.
- If a statement is logged by row and the session that executed the statement has any temporary tables, logging by row is used for all subsequent statements (except for those accessing temporary tables) until all temporary tables in use by that session are dropped.
This is true whether or not any temporary tables are actually logged.

Temporary tables cannot be logged using row-based format; thus, once row-based logging is used, all subsequent statements using that table are unsafe. The server approximates this condition by treating all statements executed during the session as unsafe until the session no longer holds any temporary tables.

• Beginning with MySQL 5.1.23:
  • When `FOUND_ROWS()` or `ROW_COUNT()` is used. (Bug #12092, Bug #30244)
  • When `USER()`, `CURRENT_USER()`, or `CURRENT_USER` is used. (Bug #28086)
• Beginning with MySQL 5.1.24, when a statement refers to one or more system variables. (Bug #31168)

   **Exception.** The following system variables, when used with session scope (only), do not cause the logging format to switch:

   • `auto_increment_increment`
   • `auto_increment_offset`
   • `character_set_client`
   • `character_set_connection`
   • `character_set_database`
   • `character_set_server`
   • `collation_connection`
   • `collation_database`
   • `collation_server`
   • `foreign_key_checks`
   • `identity`
   • `last_insert_id`
   • `lc_time_names`
   • `pseudo_thread_id`
   • `sql_auto_is_null`
   • `time_zone`
   • `timestamp`
   • `unique_checks`

For information about determining system variable scope, see Section 5.1.5, “Using System Variables”.

For information about how replication treats `sql_mode`, see Section 16.4.1.38, “Replication and Variables”.

• Beginning with MySQL 5.1.30, when one of the tables involved is a log table in the `mysql` database.
• Beginning with MySQL 5.1.34, when the `LOAD_FILE()` function is used. (Bug #39701)

**Note**

Starting with MySQL 5.1.20, a warning is generated if you try to execute a statement using statement-based logging that should be written using row-based logging. The warning is shown both in the client (in the output of `SHOW WARNINGS`) and through the `mysqld` error log. A warning is added to the `SHOW WARNINGS` table each time such a statement is executed. However, only the first statement that generated the warning for each client session is written to the error log to prevent flooding the log.

Starting with MySQL 5.1.20, in addition to the decisions above, individual engines can also determine the logging format used when information in a table is updated. The logging capabilities of an individual engine can be defined as follows:

- If an engine supports row-based logging, the engine is said to be **row-logging capable**.
- If an engine supports statement-based logging, the engine is said to be **statement-logging capable**.

A given storage engine can support either or both logging formats. The following table lists the logging formats supported by each storage engine.

<table>
<thead>
<tr>
<th>Storage Engine</th>
<th>Row Logging Supported</th>
<th>Statement Logging Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>ARCHIVE</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>BLACKHOLE</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>CSV</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>EXAMPLE</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>FEDERATED</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>HEAP</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>InnoDB</td>
<td>Yes</td>
<td>Yes when the transaction isolation level is <strong>REPEATABLE READ</strong> or <strong>SERIALIZABLE</strong>; No otherwise.</td>
</tr>
<tr>
<td>MyISAM</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>MERGE</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>NDBCLUSTER</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

When determining the logging mode to be used, the capabilities of all the tables affected by the event are combined. The set of affected tables is then marked according to these rules:

- A set of tables is defined as **row-logging restricted** if the tables are row-logging capable but not statement-logging capable.
- A set of tables is defined as **statement-logging restricted** if the tables are statement-logging capable but not row-logging capable.

Once the determination of the possible logging formats required by the statement is complete it is compared to the current `binlog_format` setting. The following table is used to decide how the information is recorded in the binary log or, if appropriate, whether an error is raised. In the table, a safe operation is defined as one that is deterministic.

<table>
<thead>
<tr>
<th>SLR</th>
<th>RLR</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Several rules decide whether the statement is deterministic, as shown in the following table, where **SLR** stands for “statement-logging restricted” and **RLR** stands for “row-logging restricted”. A statement
The Binary Log

is _statement-logging restricted_ if one or more of the tables it accesses is not row-logging capable. Similarly, a statement is _row-logging restricted_ if any table accessed by the statement is not statement-logging capable.

</tr>
</tbody>
</table>

When a warning is produced by the determination, a standard MySQL warning is produced (and is available using `SHOW WARNINGS`). The information is also written to the _mysql_ error log. Only one error for each error instance per client connection is logged to prevent flooding the log. The log message includes the SQL statement that was attempted.
The Slow Query Log

If a slave server was started with `--log-warnings` enabled, the slave prints messages to the error log to provide information about its status, such as the binary log and relay log coordinates where it starts its job, when it is switching to another relay log, when it reconnects after a disconnect, and so forth.

5.4.4.4 Logging Format for Changes to mysql Database Tables

The contents of the grant tables in the `mysql` database can be modified directly (for example, with `INSERT` or `DELETE`) or indirectly (for example, with `GRANT` or `CREATE USER`). As of MySQL 5.1.17, statements that affect `mysql` database tables are written to the binary log using the following rules:

- Data manipulation statements that change data in `mysql` database tables directly are logged according to the setting of the `binlog_format` system variable. This pertains to statements such as `INSERT`, `UPDATE`, `DELETE`, `REPLACE`, `DO`, `LOAD DATA INFILE`, `SELECT`, and `TRUNCATE TABLE`.

- Statements that change the `mysql` database indirectly are logged as statements regardless of the value of `binlog_format`. This pertains to statements such as `GRANT`, `REVOKE`, `SET PASSWORD`, `RENAME USER`, `CREATE` (all forms except `CREATE TABLE ... SELECT`), `ALTER` (all forms), and `DROP` (all forms).

`CREATE TABLE ... SELECT` is a combination of data definition and data manipulation. The `CREATE TABLE` part is logged using statement format and the `SELECT` part is logged according to the value of `binlog_format`.

5.4.5 The Slow Query Log

The slow query log consists of SQL statements that took more than `long_query_time` seconds to execute and (as of MySQL 5.1.21) required at least `min_examined_row_limit` rows to be examined. The default value of `long_query_time` is 10. Beginning with MySQL 5.1.21, the minimum is 0, and the value can be specified to a resolution of microseconds. For logging to a file, times are written including the microseconds part. For logging to tables, only integer times are written; the microseconds part is ignored. Prior to MySQL 5.1.21, the minimum value is 1, and the value for this variable must be an integer.

By default, administrative statements are not logged, nor are queries that do not use indexes for lookups. This behavior can be changed using `--log-slow-admin-statements` and `--log-queries-not-using-indexes`, as described later.

The time to acquire the initial locks is not counted as execution time. `mysqld` writes a statement to the slow query log after it has been executed and after all locks have been released, so log order might differ from execution order.

Control the slow query log at server startup as follows:

- Before 5.1.6, the slow query log destination is always a file. To enable the log, start `mysqld` with the `--log-slow-queries=[file_name]` option.

- As of MySQL 5.1.6, the destination can be a file or a table, or both. Start `mysqld` with the `--log-slow-queries=[file_name]` option to enable the slow query log, and optionally use `--log-output` to specify the log destination (as described in Section 5.4.1, “Selecting General Query and Slow Query Log Output Destinations”).

- As of MySQL 5.1.12, as an alternative to `--log-slow-queries`, use `--slow_query_log={0|1}` to specify the initial slow query log state. In this case, the default slow query log file name is used. With no argument or an argument of 1, `--slow_query_log` enables the log. With an argument of 0, this option disables the log.

- As of MySQL 5.1.29, use `--slow_query_log={0|1}` to enable or disable the slow query log, and optionally `--slow_query_log_file=file_name` to specify a log file name. The `--log-slow-queries` option is deprecated.
If the slow query log file is enabled but no name is specified, the default name is `host_name-slow.log` and the server creates the file in the same directory where it creates the PID file. If a name is given, the server creates the file in the data directory unless an absolute path name is given to specify a different directory.

To disable or enable the slow query log or change the log file name at runtime, use the global `slow_query_log` and `slow_query_log_file` system variables. Set `slow_query_log` to 0 (or OFF) to disable the log or to 1 (or ON) to enable it. Set `slow_query_log_file` to specify the name of the log file. If a log file already is open, it is closed and the new file is opened.

When the slow query log is enabled, the server writes output to any destinations specified by the `--log-output` option or `log_output` system variable. If you enable the log, the server opens the log file and writes startup messages to it. However, further logging of queries to the file does not occur unless the FILE log destination is selected. If the destination is NONE, the server writes no queries even if the slow query log is enabled. Setting the log file name has no effect on logging if the log destination value does not contain FILE.

The server writes less information to the slow query log if you use the `--log-short-format` option.

To include slow administrative statements in the statements written to the slow query log, use the `--log-slow-admin-statements` server option. Administrative statements include ALTER TABLE, ANALYZE TABLE, CHECK TABLE, CREATE INDEX, DROP INDEX, OPTIMIZE TABLE, and REPAIR TABLE.

To include queries that do not use indexes for row lookups in the statements written to the slow query log, use the `--log-queries-not-using-indexes` server option. See Section 5.1.3, "Server Command Options". When such queries are logged, the slow query log may grow quickly.

The server uses the controlling parameters in the following order to determine whether to write a query to the slow query log:

1. The query must either not be an administrative statement, or `--log-slow-admin-statements` must have been specified.
2. The query must have taken at least `long_query_time` seconds, or `--log-queries-not-using-indexes` must have been specified and the query used no indexes for row lookups.
3. The query must have examined at least `min_examined_row_limit` rows.

The server does not write queries handled by the query cache to the slow query log, nor queries that would not benefit from the presence of an index because the table has zero rows or one row.

Prior to MySQL 5.1.45, replication slaves did not write replicated queries to the slow query log, even if the same queries were written to the slow query log on the master. (Bug #23300) In MySQL 5.1.45 and later, this behavior can be overridden using the `--log-slow-slave-statements` option.

The slow query log should be protected because logged statements might contain passwords. See Section 6.1.2.3, "Passwords and Logging".

The slow query log can be used to find queries that take a long time to execute and are therefore candidates for optimization. However, examining a long slow query log can become a difficult task. To make this easier, you can process a slow query log file using the `mysqldumpslow` command to summarize the queries that appear in the log. See Section 4.6.8, "mysqldumpslow — Summarize Slow Query Log Files".

### 5.4.6 The DDL Log

In MySQL 5.1 and later, the DDL log, or metadata log, records metadata operations generated by data definition statements such as DROP TABLE and ALTER TABLE. MySQL uses this log to recover from crashes occurring in the middle of a metadata operation. When executing the statement DROP TABLE
Server Log Maintenance

t1, t2, we need to ensure that both t1 and t2 are dropped, and that each table drop is complete. Another example of this type of SQL statement is ALTER TABLE t3 DROP PARTITION p2, where we must make certain that the partition is completely dropped and that its definition is removed from the list of partitions for table t3.

A record of metadata operations such as those just described are written to the file ddl_log.log, in the MySQL data directory. This is a binary file; it is not intended to be human-readable, and you should not attempt to modify it in any way.

ddl_log.log is not created until it is actually needed for recording metadata statements, so it is possible for this file not to be present on a MySQL server that is functioning in a completely normal manner.

There are no user-configurable server options or variables associated with this file.

5.4.7 Server Log Maintenance

As described in Section 5.4, “MySQL Server Logs”, MySQL Server can create several different log files to help you see what activity is taking place. However, you must clean up these files regularly to ensure that the logs do not take up too much disk space.

When using MySQL with logging enabled, you may want to back up and remove old log files from time to time and tell MySQL to start logging to new files. See Section 7.2, “Database Backup Methods”.

On a Linux (Red Hat) installation, you can use the mysql-log-rotate script for this. If you installed MySQL from an RPM distribution, this script should have been installed automatically. Be careful with this script if you are using the binary log for replication. You should not remove binary logs until you are certain that their contents have been processed by all slaves.

On other systems, you must install a short script yourself that you start from cron (or its equivalent) for handling log files.

For the binary log, you can set the expire_logs_days system variable to expire binary log files automatically after a given number of days (see Section 5.1.4, “Server System Variables”). If you are using replication, you should set the variable no lower than the maximum number of days your slaves might lag behind the master. To remove binary logs on demand, use the PURGE BINARY LOGS statement (see Section 13.4.1.1, “PURGE BINARY LOGS Syntax”).

You can force MySQL to start using new log files by flushing the logs. Log flushing occurs when you issue a FLUSH LOGS statement or execute a mysqladmin flush-logs,mysqladmin refresh, mysqldump --flush-logs, or mysqldump --master-data command. See Section 13.7.6.3, "FLUSH Syntax", Section 4.5.2, "mysqladmin — Client for Administering a MySQL Server", and Section 4.5.4, "mysqldump — A Database Backup Program". In addition, the binary log is flushed when its size reaches the value of the max_binlog_size system variable.

A log-flushing operation does the following:

• If general query logging or slow query logging to a log file is enabled, the server closes and reopens the general query log file or slow query log file.

• If binary logging is enabled, the server closes the current binary log file and opens a new log file with the next sequence number.

• If the server was started with the --log-error option to cause the error log to be written to a file, the result of a log-flushing operation is version dependent:

  • As of MySQL 5.1.51, the server closes and reopens the log file.

  • Prior to MySQL 5.1.51, the server renames the current log file with the suffix -old, then creates a new empty log file.
The server creates a new binary log file when you flush the logs. However, it just closes and reopens the general and slow query log files. To cause new files to be created on Unix, rename the current log files before flushing them. At flush time, the server opens new log files with the original names. For example, if the general and slow query log files are named `mysql.log` and `mysql-slow.log`, you can use a series of commands like this:

```
shell> cd mysql-data-directory
shell> mv mysql.log mysql.old
shell> mv mysql-slow.log mysql-slow.old
shell> mysqladmin flush-logs
```

On Windows, use `rename` rather than `mv`.

At this point, you can make a backup of `mysql.old` and `mysql-slow.old` and then remove them from disk.

As of MySQL 5.1.12, you can rename the general query log or slow query log at runtime by disabling the log:

```
SET GLOBAL general_log = 'OFF';
SET GLOBAL slow_query_log = 'OFF';
```

With the logs disabled, rename the log files externally; for example, from the command line. Then enable the logs again:

```
SET GLOBAL general_log = 'ON';
SET GLOBAL slow_query_log = 'ON';
```

This method works on any platform and does not require a server restart.

For older versions of MySQL on Windows, you cannot rename certain log files while the server has them open. Before MySQL 5.1.3, this restriction applies to all log files. You must stop the server, rename the file, then restart the server to create a new log file. From 5.1.4 to 5.1.50, the restriction applies only to the error log file. To rename the error log file, a stop and restart can be avoided by flushing the logs to cause the server to rename the current log file with the suffix `-old` and create a new empty error log file. For further information, see Section 5.4.2, “The Error Log”.

### 5.5 Running Multiple MySQL Instances on One Machine

In some cases, you might want to run multiple instances of MySQL on a single machine. You might want to test a new MySQL release while leaving an existing production setup undisturbed. Or you might want to give different users access to different `mysqld` servers that they manage themselves. (For example, you might be an Internet Service Provider that wants to provide independent MySQL installations for different customers.)

It is possible to use a different MySQL server binary per instance, or use the same binary for multiple instances, or any combination of the two approaches. For example, you might run a server from MySQL 5.0 and one from MySQL 5.1, to see how different versions handle a given workload. Or you might run multiple instances of the current production version, each managing a different set of databases.

Whether or not you use distinct server binaries, each instance that you run must be configured with unique values for several operating parameters. This eliminates the potential for conflict between instances. Parameters can be set on the command line, in option files, or by setting environment variables. See Section 4.2.3, "Specifying Program Options". To see the values used by a given instance, connect to it and execute a `SHOW VARIABLES` statement.

The primary resource managed by a MySQL instance is the data directory. Each instance should use a different data directory, the location of which is specified using the `--datadir=dir_name` option. For
methods of configuring each instance with its own data directory, and warnings about the dangers of failing to do so, see Section 5.5.1, “Setting Up Multiple Data Directories”.

In addition to using different data directories, several other options must have different values for each server instance:

- **--port=port_num**

  --port controls the port number for TCP/IP connections. Alternatively, if the host has multiple network addresses, you can use **--bind-address** to cause each server to listen to a different address.

- **--socket={file_name|pipe_name}**

  --socket controls the Unix socket file path on Unix or the named pipe name on Windows. On Windows, it is necessary to specify distinct pipe names only for those servers configured to permit named-pipe connections.

- **--shared-memory-base-name=name**

  This option is used only on Windows. It designates the shared-memory name used by a Windows server to permit clients to connect using shared memory. It is necessary to specify distinct shared-memory names only for those servers configured to permit shared-memory connections.

- **--pid-file=file_name**

  This option indicates the path name of the file in which the server writes its process ID.

If you use the following log file options, their values must differ for each server:

- **--general_log_file=file_name**
- **--log-bin=[file_name]**
- **--slow_query_log_file=file_name**
- **--log-error=[file_name]**

For further discussion of log file options, see Section 5.4, “MySQL Server Logs”.

To achieve better performance, you can specify the following option differently for each server, to spread the load between several physical disks:

- **--tmpdir=dir_name**

Having different temporary directories also makes it easier to determine which MySQL server created any given temporary file.

If you have multiple MySQL installations in different locations, you can specify the base directory for each installation with the **--basedir=dir_name** option. This causes each instance to automatically use a different data directory, log files, and PID file because the default for each of those parameters is relative to the base directory. In that case, the only other options you need to specify are the **--socket** and **--port** options. Suppose that you install different versions of MySQL using tar file binary distributions. These install in different locations, so you can start the server for each installation using the command **bin/mysqld_safe** under its corresponding base directory. **mysqld_safe** determines the proper **--basedir** option to pass to **mysqld**, and you need specify only the **--socket** and **--port** options to **mysqld_safe**.

As discussed in the following sections, it is possible to start additional servers by specifying appropriate command options or by setting environment variables. However, if you need to run multiple servers on a more permanent basis, it is more convenient to use option files to specify for each server those option values that must be unique to it. The **--defaults-file** option is useful for this purpose.
5.5.1 Setting Up Multiple Data Directories

Each MySQL Instance on a machine should have its own data directory. The location is specified using the --datadir=dir_name option.

There are different methods of setting up a data directory for a new instance:

- Create a new data directory.
- Copy an existing data directory.

The following discussion provides more detail about each method.

**Warning**

Normally, you should never have two servers that update data in the same databases. This may lead to unpleasant surprises if your operating system does not support fault-free system locking. If (despite this warning) you run multiple servers using the same data directory and they have logging enabled, you must use the appropriate options to specify log file names that are unique to each server. Otherwise, the servers try to log to the same files.

Even when the preceding precautions are observed, this kind of setup works only with MyISAM and MERGE tables, and not with any of the other storage engines. Also, this warning against sharing a data directory among servers always applies in an NFS environment. Permitting multiple MySQL servers to access a common data directory over NFS is a very bad idea. The primary problem is that NFS is the speed bottleneck. It is not meant for such use. Another risk with NFS is that you must devise a way to ensure that two or more servers do not interfere with each other. Usually NFS file locking is handled by the lockd daemon, but at the moment there is no platform that performs locking 100% reliably in every situation.

**Create a New Data Directory**

With this method, the data directory will be in the same state as when you first install MySQL. It will have the default set of MySQL accounts and no user data.

On Unix, initialize the data directory. See Section 2.12, “Postinstallation Setup and Testing”.

On Windows, the data directory is included in MySQL distributions. If you obtain a distribution in Windows Zip archive format, you can unpack it into a temporary location, then copy the data directory from this location to where you are setting up the new instance.

**Copy an Existing Data Directory**

With this method, any MySQL accounts or user data present in the data directory are carried over to the new data directory.

1. Stop the existing MySQL instance using the data directory. This must be a clean shutdown so that the instance flushes any pending changes to disk.
2. Copy the data directory to the location where the new data directory should be.
3. Copy the my.cnf or my.ini option file used by the existing instance. This serves as a basis for the new instance.
4. Modify the new option file so that any pathnames referring to the original data directory refer to the new data directory. Also, modify any other options that must be unique per instance, such as the TCP/IP port number and the log files. For a list of parameters that must be unique per instance, see Section 5.5, “Running Multiple MySQL Instances on One Machine”.

643
5. Start the new instance, telling it to use the new option file.

5.5.2 Running Multiple MySQL Instances on Windows

You can run multiple servers on Windows by starting them manually from the command line, each with appropriate operating parameters, or by installing several servers as Windows services and running them that way. General instructions for running MySQL from the command line or as a service are given in Section 2.3, “Installing MySQL on Microsoft Windows”. The following sections describe how to start each server with different values for those options that must be unique per server, such as the data directory. These options are listed in Section 5.5, “Running Multiple MySQL Instances on One Machine”.

5.5.2.1 Starting Multiple MySQL Instances at the Windows Command Line

The procedure for starting a single MySQL server manually from the command line is described in Section 2.3.6.5, “Starting MySQL Server from the Windows Command Line”. To start multiple servers this way, you can specify the appropriate options on the command line or in an option file. It is more convenient to place the options in an option file, but it is necessary to make sure that each server gets its own set of options. To do this, create an option file for each server and tell the server the file name with a `--defaults-file` option when you run it.

Suppose that you want to run one instance of `mysqld` on port 3307 with a data directory of `C:\mydata1`, and another instance on port 3308 with a data directory of `C:\mydata2`. Use this procedure:

1. Make sure that each data directory exists, including its own copy of the `mysql` database that contains the grant tables.

2. Create two option files. For example, create one file named `C:\my-opts1.cnf` that looks like this:

```
[mysqld]
datadir = C:/mydata1
port = 3307
```

Create a second file named `C:\my-opts2.cnf` that looks like this:

```
[mysqld]
datadir = C:/mydata2
port = 3308
```

3. Use the `--defaults-file` option to start each server with its own option file:

```
C:\> C:\mysql\bin\mysqld --defaults-file=C:\my-opts1.cnf
C:\> C:\mysql\bin\mysqld --defaults-file=C:\my-opts2.cnf
```

Each server starts in the foreground (no new prompt appears until the server exits later), so you will need to issue those two commands in separate console windows.

To shut down the servers, connect to each using the appropriate port number:

```
C:\> C:\mysql\bin\mysqladmin --port=3307 --host=127.0.0.1 --user=root --password shutdown
C:\> C:\mysql\bin\mysqladmin --port=3308 --host=127.0.0.1 --user=root --password shutdown
```

Servers configured as just described permit clients to connect over TCP/IP. If your version of Windows supports named pipes and you also want to permit named-pipe connections, use the `mysqld-nt` (MySQL 5.1.20 and earlier) or `mysqld` (MySQL 5.1.21 and later) server and specify options that enable the named pipe and specify its name. Each server that supports named-pipe connections must use a unique pipe name. For example, the `C:\my-opts1.cnf` file might be written like this:
Running Multiple MySQL Instances on Windows

Modify `C:\my-opts2.cnf` similarly for use by the second server. Then start the servers as described previously.

A similar procedure applies for servers that you want to permit shared-memory connections. Enable such connections with the `--shared-memory` option and specify a unique shared-memory name for each server with the `--shared-memory-base-name` option.

### 5.5.2.2 Starting Multiple MySQL Instances as Windows Services

On Windows, a MySQL server can run as a Windows service. The procedures for installing, controlling, and removing a single MySQL service are described in Section 2.3.6.7, “Starting MySQL Server as a Microsoft Windows Service”.

To set up multiple MySQL services, you must make sure that each instance uses a different service name in addition to the other parameters that must be unique per instance.

For the following instructions, suppose that you want to run the `mysqld` server from two different versions of MySQL that are installed at `C:\mysql-5.0.92` and `C:\mysql-5.1.73`, respectively. (This might be the case if you are running 5.0.92 as your production server, but also want to conduct tests using 5.1.73.)

To install MySQL as a Windows service, use the `--install` or `--install-manual` option. For information about these options, see Section 2.3.6.7, “Starting MySQL Server as a Microsoft Windows Service”.

Based on the preceding information, you have several ways to set up multiple services. The following instructions describe some examples. Before trying any of them, shut down and remove any existing MySQL services.

- **Approach 1**: Specify the options for all services in one of the standard option files. To do this, use a different service name for each server. Suppose that you want to run the 5.0.92 `mysqld` using the service name of `mysqld1` and the 5.1.73 `mysqld` using the service name `mysqld2`. In this case, you can use the `[mysqld1]` group for 5.0.92 and the `[mysqld2]` group for 5.1.73. For example, you can set up `C:\my.cnf` like this:

  ```
  # options for mysqld1 service
  [mysqld1]
  basedir = C:/mysql-5.0.92
  port = 3307
  enable-named-pipe
  socket = mypipe1

  # options for mysqld2 service
  [mysqld2]
  basedir = C:/mysql-5.1.73
  port = 3308
  enable-named-pipe
  socket = mypipe2
  ```

  Install the services as follows, using the full server path names to ensure that Windows registers the correct executable program for each service:

  ```
  C:/> C:\mysql-5.0.92\bin\mysqld --install mysqld1
  C:/> C:\mysql-5.1.73\bin\mysqld --install mysqld2
  ```

  To start the services, use the services manager, or use `NET START` with the appropriate service names:
Running Multiple MySQL Instances on Unix

To stop the services, use the services manager, or use `NET STOP` with the appropriate service names:

```
C:\> NET STOP mysqld1
C:\> NET STOP mysqld2
```

- **Approach 2:** Specify options for each server in separate files and use `--defaults-file` when you install the services to tell each server what file to use. In this case, each file should list options using a `[mysqld]` group.

With this approach, to specify options for the 5.0.92 `mysqld-nt`, create a file `C:\my-opts1.cnf` that looks like this:

```
[mysqld]
basedir = C:/mysql-5.0.92
port = 3307
enable-named-pipe
socket = mypipe1
```

For the 5.1.73 `mysqld`, create a file `C:\my-opts2.cnf` that looks like this:

```
[mysqld]
basedir = C:/mysql-5.1.73
port = 3308
enable-named-pipe
socket = mypipe2
```

Install the services as follows (enter each command on a single line):

```
C:\> C:\mysql-5.0.92\bin\mysqld --install mysqld1
     --defaults-file=C:\my-opts1.cnf
C:\> C:\mysql-5.1.73\bin\mysqld --install mysqld2
     --defaults-file=C:\my-opts2.cnf
```

When you install a MySQL server as a service and use a `--defaults-file` option, the service name must precede the option.

After installing the services, start and stop them the same way as in the preceding example.

To remove multiple services, use `mysqld --remove` for each one, specifying a service name following the `--remove` option. If the service name is the default (`MySQL`), you can omit it.

### 5.5.3 Running Multiple MySQL Instances on Unix

One way is to run multiple MySQL instances on Unix is to compile different servers with different default TCP/IP ports and Unix socket files so that each one listens on different network interfaces. Compiling in different base directories for each installation also results automatically in a separate, compiled-in data directory, log file, and PID file location for each server.

Assume that an existing 5.0 server is configured for the default TCP/IP port number (3306) and Unix socket file (`/tmp/mysql.sock`). To configure a new 5.1.73 server to have different operating parameters, use a `configure` command something like this:

```
shell> .configure --with-tcp-port=port_number \ 
    --with-unix-socket-path=file_name \ 
    --prefix=/usr/local/mysql-5.1.73
```
Here, `port_number` and `file_name` must be different from the default TCP/IP port number and Unix socket file path name, and the `--prefix` value should specify an installation directory different from the one under which the existing MySQL installation is located.

If you have a MySQL server listening on a given port number, you can use the following command to find out what operating parameters it is using for several important configurable variables, including the base directory and Unix socket file name:

```
shell> mysqladmin --host=host_name --port=port_number variables
```

With the information displayed by that command, you can tell what option values *not* to use when configuring an additional server.

If you specify `localhost` as the host name, `mysqladmin` defaults to using a Unix socket file connection rather than TCP/IP. To explicitly specify the connection protocol, use the `--protocol={TCP|SOCKET|PIPE|MEMORY}` option.

You need not compile a new MySQL server just to start with a different Unix socket file and TCP/IP port number. It is also possible to use the same server binary and start each invocation of it with different parameter values at runtime. One way to do so is by using command-line options:

```
shell> mysqld_safe --socket=file_name --port=port_number
```

To start a second server, provide different `--socket` and `--port` option values, and pass a `--datadir=dir_name` option to `mysqld_safe` so that the server uses a different data directory.

Alternatively, put the options for each server in a different option file, then start each server using a `--defaults-file` option that specifies the path to the appropriate option file. For example, if the option files for two server instances are named `/usr/local/mysql/my.cnf` and `/usr/local/mysql/my.cnf2`, start the servers like this: command:

```
shell> mysqld_safe --defaults-file=/usr/local/mysql/my.cnf
shell> mysqld_safe --defaults-file=/usr/local/mysql/my.cnf2
```

Another way to achieve a similar effect is to use environment variables to set the Unix socket file name and TCP/IP port number:

```
shell> MYSQL_UNIX_PORT=/tmp/mysqld-new.sock
shell> MYSQL_TCP_PORT=3307
shell> export MYSQL_UNIX_PORT MYSQL_TCP_PORT
shell> mysql_install_db --user=mysql
shell> mysqld_safe --datadir=/path/to/datadir &
```

This is a quick way of starting a second server to use for testing. The nice thing about this method is that the environment variable settings apply to any client programs that you invoke from the same shell. Thus, connections for those clients are automatically directed to the second server.

Section 2.14, “Environment Variables”, includes a list of other environment variables you can use to affect MySQL programs.

On Unix, the `mysqld_multi` script provides another way to start multiple servers. See Section 4.3.4, “`mysqld_multi — Manage Multiple MySQL Servers`”.

### 5.5.4 Using Client Programs in a Multiple-Server Environment

To connect with a client program to a MySQL server that is listening to different network interfaces from those compiled into your client, you can use one of the following methods:

- Start the client with `--host=host_name --port=port_number` to connect using TCP/IP to a remote server, with `--host=127.0.0.1 --port=port_number` to connect using TCP/IP to a
local server, or with `--host=localhost  --socket=file_name` to connect to a local server using a Unix socket file or a Windows named pipe.

- Start the client with `--protocol=TCP` to connect using TCP/IP, `--protocol=SOCKET` to connect using a Unix socket file, `--protocol=PIPE` to connect using a named pipe, or `--protocol=MEMORY` to connect using shared memory. For TCP/IP connections, you may also need to specify `--host` and `--port` options. For the other types of connections, you may need to specify a `--socket` option to specify a Unix socket file or Windows named-pipe name, or a `--shared-memory-base-name` option to specify the shared-memory name. Shared-memory connections are supported only on Windows.

- On Unix, set the `MYSQL_UNIX_PORT` and `MYSQL_TCP_PORT` environment variables to point to the Unix socket file and TCP/IP port number before you start your clients. If you normally use a specific socket file or port number, you can place commands to set these environment variables in your `.login` file so that they apply each time you log in. See Section 2.14, “Environment Variables”.

- Specify the default Unix socket file and TCP/IP port number in the `[client]` group of an option file. For example, you can use `C:\my.cnf` on Windows, or the `.my.cnf` file in your home directory on Unix. See Section 4.2.6, “Using Option Files”.

- In a C program, you can specify the socket file or port number arguments in the `mysql_real_connect()` call. You can also have the program read option files by calling `mysql_options()`. See Section 21.8.7, “C API Function Descriptions”.

- If you are using the Perl `DBD::mysql` module, you can read options from MySQL option files. For example:

```perl
$dsn = "DBI:mysql:test;mysql_read_default_group=client;"
     "mysql_read_default_file=/usr/local/mysql/data/my.cnf";
$dbh = DBI->connect($dsn, $user, $password);
```

See Section 21.10, “MySQL Perl API”.

Other programming interfaces may provide similar capabilities for reading option files.

When thinking about security within a MySQL installation, you should consider a wide range of possible topics and how they affect the security of your MySQL server and related applications:

- General factors that affect security. These include choosing good passwords, not granting unnecessary privileges to users, ensuring application security by preventing SQL injections and data corruption, and others. See Section 6.1, “General Security Issues”.

- Security of the installation itself. The data files, log files, and the all the application files of your installation should be protected to ensure that they are not readable or writable by unauthorized parties. For more information, see Section 2.12, “Postinstallation Setup and Testing”.

- Access control and security within the database system itself, including the users and databases granted with access to the databases, views and stored programs in use within the database. For more information, see Section 6.2, “The MySQL Access Privilege System”, and Section 6.3, “MySQL User Account Management”.

- Network security of MySQL and your system. The security is related to the grants for individual users, but you may also wish to restrict MySQL so that it is available only locally on the MySQL server host, or to a limited set of other hosts.
• Ensure that you have adequate and appropriate backups of your database files, configuration and log files. Also be sure that you have a recovery solution in place and test that you are able to successfully recover the information from your backups. See Chapter 7, Backup and Recovery.

6.1 General Security Issues

This section describes general security issues to be aware of and what you can do to make your MySQL installation more secure against attack or misuse. For information specifically about the access control system that MySQL uses for setting up user accounts and checking database access, see Section 2.12, “Postinstallation Setup and Testing”.

For answers to some questions that are often asked about MySQL Server security issues, see Section A.9, “MySQL 5.1 FAQ: Security”.

6.1.1 Security Guidelines

Anyone using MySQL on a computer connected to the Internet should read this section to avoid the most common security mistakes.

In discussing security, it is necessary to consider fully protecting the entire server host (not just the MySQL server) against all types of applicable attacks: eavesdropping, altering, playback, and denial of service. We do not cover all aspects of availability and fault tolerance here.

MySQL uses security based on Access Control Lists (ACLs) for all connections, queries, and other operations that users can attempt to perform. There is also support for SSL-encrypted connections between MySQL clients and servers. Many of the concepts discussed here are not specific to MySQL at all; the same general ideas apply to almost all applications.

When running MySQL, follow these guidelines:

• Do not ever give anyone (except MySQL root accounts) access to the user table in the mysql database! This is critical.

• Learn how the MySQL access privilege system works (see Section 6.2, “The MySQL Access Privilege System”). Use the GRANT and REVOKE statements to control access to MySQL. Do not grant more privileges than necessary. Never grant privileges to all hosts.

Checklist:

• Try mysql -u root. If you are able to connect successfully to the server without being asked for a password, anyone can connect to your MySQL server as the MySQL root user with full privileges! Review the MySQL installation instructions, paying particular attention to the information about setting a root password. See Section 2.12.4, “Securing the Initial MySQL Accounts”.

• Use the SHOW GRANTS statement to check which accounts have access to what. Then use the REVOKE statement to remove those privileges that are not necessary.

• Do not store cleartext passwords in your database. If your computer becomes compromised, the intruder can take the full list of passwords and use them. Instead, use SHA1() or MD5() or some other one-way hashing function and store the hash value.

To prevent password recovery using rainbow tables, do not use these functions on a plain password; instead, choose some string to be used as a salt, and use hash(hash(password)+salt) values.

• Do not choose passwords from dictionaries. Special programs exist to break passwords. Even passwords like “xfish98” are very bad. Much better is “duaq98” which contains the same word “fish” but typed one key to the left on a standard QWERTY keyboard. Another method is to use a password that is taken from the first characters of each word in a sentence (for example, “Four score and seven years ago” results in a password of “Fsasya”). The password is easy to remember and type, but difficult to guess for someone who does not know the sentence. In this case, you can
keeping passwords secure

Additionally substitute digits for the number words to obtain the phrase “4 score and 7 years ago”, yielding the password “4sa7ya” which is even more difficult to guess.

• Invest in a firewall. This protects you from at least 50% of all types of exploits in any software. Put MySQL behind the firewall or in a demilitarized zone (DMZ).

Checklist:

• Try to scan your ports from the internet using a tool such as nmap. MySQL uses port 3306 by default. This port should not be accessible from untrusted hosts. As a simple way to check whether your MySQL port is open, try the following command from some remote machine, where server_host is the host name or IP address of the host on which your MySQL server runs:

```shell
telnet server_host 3306
```

If telnet hangs or the connection is refused, the port is blocked, which is how you want it to be. If you get a connection and some garbage characters, the port is open, and should be closed on your firewall or router, unless you really have a good reason to keep it open.

• Applications that access MySQL should not trust any data entered by users, and should be written using proper defensive programming techniques. See Section 6.1.7, “Client Programming Security Guidelines”.

• Do not transmit plain (unencrypted) data over the internet. This information is accessible to everyone who has the time and ability to intercept it and use it for their own purposes. Instead, use an encrypted protocol such as SSL or SSH. MySQL supports internal SSL connections. Another technique is to use SSH port-forwarding to create an encrypted (and compressed) tunnel for the communication.

• learn to use the tcpdump and strings utilities. In most cases, you can check whether MySQL data streams are unencrypted by issuing a command like the following:

```shell
tcpdump -l -i eth0 -w - src or dst port 3306 | strings
```

This works under Linux and should work with small modifications under other systems.

Warning

If you do not see cleartext data, this does not always mean that the information actually is encrypted. If you need high security, consult with a security expert.

6.1.2 Keeping Passwords Secure

Passwords occur in several contexts within MySQL. The following sections provide guidelines that enable end users and administrators to keep these passwords secure and avoid exposing them. There is also a discussion of how MySQL uses password hashing internally.

6.1.2.1 End-User Guidelines for Password Security

MySQL users should use the following guidelines to keep passwords secure.

When you run a client program to connect to the MySQL server, it is inadvisable to specify your password in a way that exposes it to discovery by other users. The methods you can use to specify your password when you run client programs are listed here, along with an assessment of the risks of each method. In short, the safest methods are to have the client program prompt for the password or to specify the password in a properly protected option file.

• Use a -p your_pass or --password=your_pass option on the command line. For example:
Keeping Passwords Secure

- Use the `-p` or `--password` option on the command line with no password value specified. In this case, the client program solicits the password interactively:

  ```
  shell> mysql -u francis -p db_name
  Enter password: ********
  ```

  The "*" characters indicate where you enter your password. The password is not displayed as you enter it.

- Store your password in an option file. For example, on Unix, you can list your password in the `[client]` section of the `.my.cnf` file in your home directory:

  ```
  [client]
  password=your_pass
  ```

  To keep the password safe, the file should not be accessible to anyone but yourself. To ensure this, set the file access mode to `400` or `600`. For example:

  ```
  shell> chmod 600 .my.cnf
  ```

  To name from the command line a specific option file containing the password, use the `--defaults-file=file_name` option, where `file_name` is the full path name to the file. For example:

  ```
  shell> mysql --defaults-file=/home/francis/mysql-opts
  ```

  **Section 4.2.6, “Using Option Files”,** discusses option files in more detail.

- Store your password in the `MYSQL_PWD` environment variable. See Section 2.14, “Environment Variables”.

  This method of specifying your MySQL password must be considered extremely insecure and should not be used. Some versions of `ps` include an option to display the environment of running processes. On some systems, if you set `MYSQL_PWD`, your password is exposed to any other user who runs `ps`. Even on systems without such a version of `ps`, it is unwise to assume that there are no other methods by which users can examine process environments.

  On Unix, the `mysql` client writes a record of executed statements to a history file (see Section 4.5.1.3, “mysql Logging”). By default, this file is named `.mysql_history` and is created in your home
Keeping Passwords Secure

directory. Passwords can be written as plain text in SQL statements such as `CREATE USER`, `GRANT`, and `SET PASSWORD`, so if you use these statements, they are logged in the history file. To keep this file safe, use a restrictive access mode, the same way as described earlier for the `.my.cnf` file.

If your command interpreter is configured to maintain a history, any file in which the commands are saved will contain MySQL passwords entered on the command line. For example, `bash` uses `~/.bash_history`. Any such file should have a restrictive access mode.

6.1.2.2 Administrator Guidelines for Password Security

Database administrators should use the following guidelines to keep passwords secure.

MySQL stores passwords for user accounts in the `mysql.user` table. Access to this table should never be granted to any nonadministrative accounts.

A user who has access to modify the plugin directory (the value of the `plugin_dir` system variable) or the `my.cnf` file that specifies the location of the plugin directory can replace plugins and modify the capabilities provided by plugins.

Files such as log files to which passwords might be written should be protected. See Section 6.1.2.3, “Passwords and Logging”.

6.1.2.3 Passwords and Logging

Passwords can be written as plain text in SQL statements such as `CREATE USER`, `GRANT`, `SET PASSWORD`, and statements that invoke the `PASSWORD()` function. If such statements are logged by the MySQL server as written, passwords in them become visible to anyone with access to the logs. This applies to the general query log, the slow query log, and the binary log (see Section 5.4, “MySQL Server Logs”).

To guard log files against unwarranted exposure, locate them in a directory that restricts access to the server and the database administrator. If the server logs to tables in the `mysql` database, grant access to those tables only to the database administrator.

Replication slaves store the password for the replication master in the `master.info` file. Restrict this file to be accessible only to the database administrator.

Use a restricted access mode to protect database backups that include log tables or log files containing passwords.

6.1.2.4 Password Hashing in MySQL

MySQL lists user accounts in the `user` table of the `mysql` database. Each MySQL account can be assigned a password, although the `user` table does not store the cleartext version of the password, but a hash value computed from it.

MySQL uses passwords in two phases of client/server communication:

- When a client attempts to connect to the server, there is an initial authentication step in which the client must present a password that has a hash value matching the hash value stored in the `user` table for the account the client wants to use.

- After the client connects, it can (if it has sufficient privileges) set or change the password hash for accounts listed in the `user` table. The client can do this by using the `PASSWORD()` function to generate a password hash, or by using a password-generating statement (`CREATE USER`, `GRANT`, or `SET PASSWORD`).

In other words, the server checks hash values during authentication when a client first attempts to connect. The server generates hash values if a connected client invokes the `PASSWORD()` function or uses a password-generating statement to set or change a password.
Password hashing methods in MySQL have the history described following. These changes are illustrated by changes in the result from the `PASSWORD()` function that computes password hash values and in the structure of the `user` table where passwords are stored.

**The Original (Pre-4.1) Hashing Method**

The original hashing method produced a 16-byte string. Such hashes look like this:

```sql
mysql> SELECT PASSWORD('mypass');
+--------------------+
| PASSWORD('mypass') |
| 6f8c114b58f2ce9e   |
+--------------------+
```

To store account passwords, the `Password` column of the `user` table was at this point 16 bytes long.

**The 4.1 Hashing Method**

MySQL 4.1 introduced password hashing that provided better security and reduced the risk of passwords being intercepted. There were several aspects to this change:

- Different format of password values produced by the `PASSWORD()` function
- Widening of the `Password` column
- Control over the default hashing method
- Control over the permitted hashing methods for clients attempting to connect to the server

The changes in MySQL 4.1 took place in two stages:

- MySQL 4.1.0 used a preliminary version of the 4.1 hashing method. This method was short lived and the following discussion says nothing more about it.

- In MySQL 4.1.1, the hashing method was modified to produce a longer 41-byte hash value:

```sql
mysql> SELECT PASSWORD('mypass');
+-------------------------------------------+
| PASSWORD('mypass')                        |
| *6C8989366EAF75BB670AD8EA7A7FCC1176A95CEF4 |
+-------------------------------------------+
```

The longer password hash format has better cryptographic properties, and client authentication based on long hashes is more secure than that based on the older short hashes.

To accommodate longer password hashes, the `Password` column in the `user` table was changed at this point to be 41 bytes, its current length.

A widened `Password` column can store password hashes in both the pre-4.1 and 4.1 formats. The format of any given hash value can be determined two ways:

- The length: 4.1 and pre-4.1 hashes are 41 and 16 bytes, respectively.
- Password hashes in the 4.1 format always begin with a "*" character, whereas passwords in the pre-4.1 format never do.

To permit explicit generation of pre-4.1 password hashes, two additional changes were made:

- The `OLD_PASSWORD()` function was added, which returns hash values in the 16-byte format.
- For compatibility purposes, the `old_passwords` system variable was added, to enable DBAs and applications control over the hashing method. The default `old_passwords` value of 0 causes
hashing to use the 4.1 method (41-byte hash values), but setting `old_passwords=1` causes hashing to use the pre-4.1 method. In this case, `PASSWORD()` produces 16-byte values and is equivalent to `OLD_PASSWORD()`

To permit DBAs control over how clients are permitted to connect, the `secure_auth` system variable was added. Starting the server with this variable disabled or enabled permits or prohibits clients to connect using the older pre-4.1 password hashing method. Before MySQL 5.6.5, `secure_auth` is disabled by default. As of 5.6.5, `secure_auth` is enabled by default to promote a more secure default configuration. (DBAs can disable it at their discretion, but this is not recommended.)

In addition, the `mysql` client supports a `--secure-auth` option that is analogous to `secure_auth`, but from the client side. It can be used to prevent connections to less secure accounts that use pre-4.1 password hashing. This option is disabled by default before MySQL 5.6.7, enabled thereafter.

### Compatibility Issues Related to Hashing Methods

The widening of the Password column in MySQL 4.1 from 16 bytes to 41 bytes affects installation or upgrade operations as follows:

- If you perform a new installation of MySQL, the Password column is made 41 bytes long automatically.
- Upgrades from MySQL 4.1 or later to current versions of MySQL should not give rise to any issues in regard to the Password column because both versions use the same column length and password hashing method.
- For upgrades from a pre-4.1 release to 4.1 or later, you must upgrade the system tables after upgrading. (See Section 4.4.8, "mysql_upgrade — Check and Upgrade MySQL Tables").

The 4.1 hashing method is understood only by MySQL 4.1 (and newer) servers and clients, which can result in some compatibility problems. A 4.1 or newer client can connect to a pre-4.1 server, because the client understands both the pre-4.1 and 4.1 password hashing methods. However, a pre-4.1 client that attempts to connect to a 4.1 or newer server may run into difficulties. For example, a 4.0 `mysql` client may fail with the following error message:

```shell
shell> mysql -h localhost -u root
Client does not support authentication protocol requested by server; consider upgrading MySQL client
```

This phenomenon also occurs for attempts to use the older PHP `mysql` extension after upgrading to MySQL 4.1 or newer. (See Common Problems with MySQL and PHP.)

The following discussion describes the differences between the pre-4.1 and 4.1 hashing methods, and what you should do if you upgrade your server but need to maintain backward compatibility with pre-4.1 clients. (However, permitting connections by old clients is not recommended and should be avoided if possible.) Additional information can be found in Section B.5.2.4, "Client does not support authentication protocol". This information is of particular importance to PHP programmers migrating MySQL databases from versions older than 4.1 to 4.1 or higher.

The differences between short and long password hashes are relevant both for how the server uses passwords during authentication and for how it generates password hashes for connected clients that perform password-changing operations.

The way in which the server uses password hashes during authentication is affected by the width of the Password column:

- If the column is short, only short-hash authentication is used.
- If the column is long, it can hold either short or long hashes, and the server can use either format:
Keeping Passwords Secure

• Pre-4.1 clients can connect, but because they know only about the pre-4.1 hashing method, they can authenticate only using accounts that have short hashes.

• 4.1 and later clients can authenticate using accounts that have short or long hashes.

Even for short-hash accounts, the authentication process is actually a bit more secure for 4.1 and later clients than for older clients. In terms of security, the gradient from least to most secure is:

• Pre-4.1 client authenticating with short password hash

• 4.1 or later client authenticating with short password hash

• 4.1 or later client authenticating with long password hash

The way in which the server generates password hashes for connected clients is affected by the width of the Password column and by the old_passwords system variable. A 4.1 or later server generates long hashes only if certain conditions are met: The Password column must be wide enough to hold long values and old_passwords must not be set to 1.

Those conditions apply as follows:

• The Password column must be wide enough to hold long hashes (41 bytes). If the column has not been updated and still has the pre-4.1 width of 16 bytes, the server notices that long hashes cannot fit into it and generates only short hashes when a client performs password-changing operations using the PASSWORD() function or a password-generating statement. This is the behavior that occurs if you have upgraded from a version of MySQL older than 4.1 to 4.1 or later but have not yet run the mysql_upgrade program to widen the Password column.

• If the Password column is wide, it can store either short or long password hashes. In this case, the PASSWORD() function and password-generating statements generate long hashes unless the server was started with the old_passwords system variable set to 1 to force the server to generate short password hashes instead.

The purpose of the old_passwords system variable is to permit backward compatibility with pre-4.1 clients under circumstances where the server would otherwise generate long password hashes. The option does not affect authentication (4.1 and later clients can still use accounts that have long password hashes), but it does prevent creation of a long password hash in the user table as the result of a password-changing operation. Were that permitted to occur, the account could no longer be used by pre-4.1 clients. With old_passwords disabled, the following undesirable scenario is possible:

• An old pre-4.1 client connects to an account that has a short password hash.

• The client changes its own password. With old_passwords disabled, this results in the account having a long password hash.

• The next time the old client attempts to connect to the account, it cannot, because the account has a long password hash that requires the 4.1 hashing method during authentication. (Once an account has a long password hash in the user table, only 4.1 and later clients can authenticate for it because pre-4.1 clients do not understand long hashes.)

This scenario illustrates that, if you must support older pre-4.1 clients, it is problematic to run a 4.1 or newer server without old_passwords set to 1. By running the server with old_passwords=1, password-changing operations do not generate long password hashes and thus do not cause accounts to become inaccessible to older clients. (Those clients cannot inadvertently lock themselves out by changing their password and ending up with a long password hash.)

The downside of old_passwords=1 is that any passwords created or changed use short hashes, even for 4.1 or later clients. Thus, you lose the additional security provided by long password hashes. To create an account that has a long hash (for example, for use by 4.1 clients) or to change an existing account to use a long password hash, an administrator can set the session value of old_passwords set to 0 while leaving the global value set to 1.
Keeping Passwords Secure

```sql
mysql> SET @@session.old_passwords = 0;
Query OK, 0 rows affected (0.00 sec)
```

```sql
mysql> SELECT @@session.old_passwords, @@global.old_passwords;
+-------------------------+------------------------+
<table>
<thead>
<tr>
<th>@@session.old_passwords</th>
<th>@@global.old_passwords</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
</tr>
</tbody>
</table>
+-------------------------+------------------------+
1 row in set (0.00 sec)
```

```sql
mysql> CREATE USER 'newuser'@'localhost' IDENTIFIED BY 'newpass';
Query OK, 0 rows affected (0.03 sec)
```  

```sql
mysql> SET PASSWORD FOR 'existinguser'@'localhost' = PASSWORD('existingpass');
Query OK, 0 rows affected (0.00 sec)
```

The following scenarios are possible in MySQL 4.1 or later. The factors are whether the `Password` column is short or long, and, if long, whether the server is started with `old_passwords` enabled or disabled.

**Scenario 1:** Short `Password` column in user table:

- Only short hashes can be stored in the `Password` column.
- The server uses only short hashes during client authentication.
- For connected clients, password hash-generating operations involving the `PASSWORD()` function or password-generating statements use short hashes exclusively. Any change to an account's password results in that account having a short password hash.
- The value of `old_passwords` is irrelevant because with a short `Password` column, the server generates only short password hashes anyway.

This scenario occurs when a pre-4.1 MySQL installation has been upgraded to 4.1 or later but `mysql_upgrade` has not been run to upgrade the system tables in the `mysql` database. (This is not a recommended configuration because it does not permit use of more secure 4.1 password hashing.)

**Scenario 2:** Long `Password` column; server started with `old_passwords=1`:

- Short or long hashes can be stored in the `Password` column.
- 4.1 and later clients can authenticate for accounts that have short or long hashes.
- Pre-4.1 clients can authenticate only for accounts that have short hashes.
- For connected clients, password hash-generating operations involving the `PASSWORD()` function or password-generating statements use short hashes exclusively. Any change to an account's password results in that account having a short password hash.

In this scenario, newly created accounts have short password hashes because `old_passwords=1` prevents generation of long hashes. Also, if you create an account with a long hash before setting `old_passwords` to 1, changing the account's password while `old_passwords=1` results in the account being given a short password, causing it to lose the security benefits of a longer hash.

To create a new account that has a long password hash, or to change the password of any existing account to use a long hash, first set the session value of `old_passwords` set to 0 while leaving the global value set to 1, as described previously.

In this scenario, the server has an up to date `Password` column, but is running with the default password hashing method set to generate pre-4.1 hash values. This is not a recommended configuration but may be useful during a transitional period in which pre-4.1 clients and passwords are upgraded to 4.1 or later. When that has been done, it is preferable to run the server with `old_passwords=0` and `secure_auth=1`. 

657
Scenario 3: Long Password column; server started with old_passwords=0:

- Short or long hashes can be stored in the Password column.
- 4.1 and later clients can authenticate using accounts that have short or long hashes.
- Pre-4.1 clients can authenticate only using accounts that have short hashes.
- For connected clients, password hash-generating operations involving the PASSWORD() function or password-generating statements use long hashes exclusively. A change to an account's password results in that account having a long password hash.

As indicated earlier, a danger in this scenario is that it is possible for accounts that have a short password hash to become inaccessible to pre-4.1 clients. A change to such an account's password made using the PASSWORD() function or a password-generating statement results in the account being given a long password hash. From that point on, no pre-4.1 client can connect to the server using that account. The client must upgrade to 4.1 or later.

If this is a problem, you can change a password in a special way. For example, normally you use SET PASSWORD as follows to change an account password:

```
SET PASSWORD FOR 'some_user'@'some_host' = PASSWORD('mypass');
```

To change the password but create a short hash, use the OLD_PASSWORD() function instead:

```
SET PASSWORD FOR 'some_user'@'some_host' = OLD_PASSWORD('mypass');
```

OLD_PASSWORD() is useful for situations in which you explicitly want to generate a short hash.

The disadvantages for each of the preceding scenarios may be summarized as follows:

In scenario 1, you cannot take advantage of longer hashes that provide more secure authentication.

In scenario 2, old_passwords=1 prevents accounts with short hashes from becoming inaccessible, but password-changing operations cause accounts with long hashes to revert to short hashes unless you take care to change the session value of old_passwords to 0 first.

In scenario 3, accounts with short hashes become inaccessible to pre-4.1 clients if you change their passwords without explicitly using OLD_PASSWORD().

The best way to avoid compatibility problems related to short password hashes is to not use them:

- Upgrade all client programs to MySQL 4.1 or later.
- Run the server with old_passwords=0.
- Reset the password for any account with a short password hash to use a long password hash.
- For additional security, run the server with secure_auth=1.

6.1.2.5 Implications of Password Hashing Changes in MySQL 4.1 for Application Programs

An upgrade to MySQL version 4.1 or later can cause compatibility issues for applications that use PASSWORD() to generate passwords for their own purposes. Applications really should not do this, because PASSWORD() should be used only to manage passwords for MySQL accounts. But some applications use PASSWORD() for their own purposes anyway.

If you upgrade to 4.1 or later from a pre-4.1 version of MySQL and run the server under conditions where it generates long password hashes, an application using PASSWORD() for its own passwords breaks. The recommended course of action in such cases is to modify the application to use another
Making MySQL Secure Against Attackers

function, such as `SHA1()` or `MD5()`, to produce hashed values. If that is not possible, you can use the `OLD_PASSWORD()` function, which is provided for generate short hashes in the old format. However, you should note that `OLD_PASSWORD()` may one day no longer be supported.

If the server is running with `old_passwords=1`, it generates short hashes and `OLD_PASSWORD()` is equivalent to `PASSWORD()`.

PHP programmers migrating their MySQL databases from version 4.0 or lower to version 4.1 or higher should see MySQL and PHP.

6.1.3 Making MySQL Secure Against Attackers

When you connect to a MySQL server, you should use a password. The password is not transmitted in clear text over the connection. Password handling during the client connection sequence was upgraded in MySQL 4.1.1 to be very secure. If you are still using pre-4.1.1-style passwords, the encryption algorithm is not as strong as the newer algorithm. With some effort, a clever attacker who can sniff the traffic between the client and the server can crack the password. (See Section 6.1.2.4, “Password Hashing in MySQL”, for a discussion of the different password handling methods.)

All other information is transferred as text, and can be read by anyone who is able to watch the connection. If the connection between the client and the server goes through an untrusted network, and you are concerned about this, you can use the compressed protocol to make traffic much more difficult to decipher. You can also use MySQL’s internal SSL support to make the connection even more secure. See Section 6.4, “Using Secure Connections”. Alternatively, use SSH to get an encrypted TCP/IP connection between a MySQL server and a MySQL client. You can find an Open Source SSH client at http://www.openssh.org/, and a comparison of both Open Source and Commercial SSH clients at http://en.wikipedia.org/wiki/Comparison_of_SSH_clients.

To make a MySQL system secure, you should strongly consider the following suggestions:

• Require all MySQL accounts to have a password. A client program does not necessarily know the identity of the person running it. It is common for client/server applications that the user can specify any user name to the client program. For example, anyone can use the `mysql` program to connect as any other person simply by invoking it as `mysql -u other_user db_name` if `other_user` has no password. If all accounts have a password, connecting using another user’s account becomes much more difficult.

For a discussion of methods for setting passwords, see Section 6.3.5, “Assigning Account Passwords”.

• Make sure that the only Unix user account with read or write privileges in the database directories is the account that is used for running `mysqld`.

• Never run the MySQL server as the Unix `root` user. This is extremely dangerous, because any user with the `FILE` privilege is able to cause the server to create files as `root` (for example, `~/root/.bashrc`). To prevent this, `mysqld` refuses to run as `root` unless that is specified explicitly using the `--user=root` option.

`mysqld` can (and should) be run as an ordinary, unprivileged user instead. You can create a separate Unix account named `mysql` to make everything even more secure. Use this account only for administering MySQL. To start `mysqld` as a different Unix user, add a `user` option that specifies the user name in the `[mysqld]` group of the `my.cnf` option file where you specify server options. For example:

```
[mysqld]
user=mysql
```

This causes the server to start as the designated user whether you start it manually or by using `mysqld_safe` or `mysql.server`. For more details, see Section 6.1.5, “How to Run MySQL as a Normal User”. 

Running mysqld as a Unix user other than root does not mean that you need to change the root user name in the user table. User names for MySQL accounts have nothing to do with user names for Unix accounts.

- Do not grant the FILE privilege to nonadministrative users. Any user that has this privilege can write a file anywhere in the file system with the privileges of the mysqld daemon. This includes the server's data directory containing the files that implement the privilege tables. To make FILE-privilege operations a bit safer, files generated with \texttt{SELECT \ldots INTO OUTFILE} do not overwrite existing files and are writable by everyone.

  The \texttt{FILE} privilege may also be used to read any file that is world-readable or accessible to the Unix user that the server runs as. With this privilege, you can read any file into a database table. This could be abused, for example, by using \texttt{LOAD DATA} to load /etc/passwd into a table, which then can be displayed with \texttt{SELECT}.

  To limit the location in which files can be read and written, set the \texttt{secure_file_priv} system to a specific directory. See Section 5.1.4, “Server System Variables”.

- Do not grant the PROCESS or SUPER privilege to nonadministrative users. The output of \texttt{mysqladmin processlist} and \texttt{SHOW PROCESSLIST} shows the text of any statements currently being executed, so any user who is permitted to see the server process list might be able to see statements issued by other users such as \texttt{UPDATE user SET password=PASSWORD('not_secure')}.

  \texttt{mysqld} reserves an extra connection for users who have the SUPER privilege, so that a MySQL root user can log in and check server activity even if all normal connections are in use.

  The SUPER privilege can be used to terminate client connections, change server operation by changing the value of system variables, and control replication servers.

- Do not permit the use of symlinks to tables. (This capability can be disabled with the \texttt{--skip-symbolic-links} option.) This is especially important if you run mysqld as root, because anyone that has write access to the server’s data directory then could delete any file in the system! See Section 8.12.4.2, “Using Symbolic Links for MyISAM Tables on Unix”.

- Stored programs and views should be written using the security guidelines discussed in Section 19.6, “Access Control for Stored Programs and Views”.

- If you do not trust your DNS, you should use IP addresses rather than host names in the grant tables. In any case, you should be very careful about creating grant table entries using host name values that contain wildcards.

- If you want to restrict the number of connections permitted to a single account, you can do so by setting the \texttt{max_user_connections} variable in mysqld. The \texttt{GRANT} statement also supports resource control options for limiting the extent of server use permitted to an account. See Section 13.7.1.3, “GRANT Syntax”.

- If the plugin directory is writable by the server, it may be possible for a user to write executable code to a file in the directory using \texttt{SELECT \ldots INTO DUMPFILE}. This can be prevented by making \texttt{plugin_dir} read only to the server or by setting \texttt{--secure-file-priv} to a directory where \texttt{SELECT} writes can be made safely.

6.1.4 Security-Related mysqld Options and Variables

The following table shows mysqld options and system variables that affect security. For descriptions of each of these, see Section 5.1.3, “Server Command Options”, and Section 5.1.4, “Server System Variables”.

#### 6.1.5 How to Run MySQL as a Normal User

On Windows, you can run the server as a Windows service using a normal user account.

On Unix, the MySQL server `mysqld` can be started and run by any user. However, you should avoid running the server as the Unix `root` user for security reasons. To change `mysqld` to run as a normal unprivileged Unix user `user_name`, you must do the following:

1. Stop the server if it is running (use `mysqladmin shutdown`).
2. Change the database directories and files so that `user_name` has privileges to read and write files in them (you might need to do this as the Unix `root` user):

   ```shell
   chown -R user_name /path/to/mysql/datadir
   ```

   If you do not do this, the server will not be able to access databases or tables when it runs as `user_name`. 
If directories or files within the MySQL data directory are symbolic links, `chown -R` might not follow symbolic links for you. If it does not, you will also need to follow those links and change the directories and files they point to.

3. Start the server as user `user_name`. Another alternative is to start `mysqld` as the Unix `root` user and use the `--user=user_name` option. `mysqld` starts up, then switches to run as the Unix user `user_name` before accepting any connections.

4. To start the server as the given user automatically at system startup time, specify the user name by adding a `user` option to the `[mysqld]` group of the `/etc/my.cnf` option file or the `my.cnf` option file in the server’s data directory. For example:

```
[mysqld]
user=use_name
```

If your Unix machine itself is not secured, you should assign passwords to the MySQL `root` accounts in the grant tables. Otherwise, any user with a login account on that machine can run the `mysql` client with a `--user=root` option and perform any operation. (It is a good idea to assign passwords to MySQL accounts in any case, but especially so when other login accounts exist on the server host.) See Section 2.12.4, “Securing the Initial MySQL Accounts”.

### 6.1.6 Security Issues with LOAD DATA LOCAL

The `LOAD DATA` statement can load a file that is located on the server host, or it can load a file that is located on the client host when the `LOCAL` keyword is specified.

There are two potential security issues with supporting the `LOCAL` version of `LOAD DATA` statements:

- The transfer of the file from the client host to the server host is initiated by the MySQL server. In theory, a patched server could be built that would tell the client program to transfer a file of the server’s choosing rather than the file named by the client in the `LOAD DATA` statement. Such a server could access any file on the client host to which the client user has read access.

- In a Web environment where the clients are connecting from a Web server, a user could use `LOAD DATA LOCAL` to read any files that the Web server process has read access to (assuming that a user could run any command against the SQL server). In this environment, the client with respect to the MySQL server actually is the Web server, not the remote program being run by the user who connects to the Web server.

To deal with these problems, `LOAD DATA LOCAL` works like this:

- By default, all MySQL clients and libraries in binary distributions are compiled with the `--enable-local-infile` option.

- If you build MySQL from source but do not invoke `configure` with the `--enable-local-infile` option, `LOAD DATA LOCAL` cannot be used by any client unless it is written explicitly to invoke `mysql_options (..., MYSQL_OPT_LOCAL_INFILE, 0)`; See Section 21.8.7.49, “mysql_options()”.

- You can disable all `LOAD DATA LOCAL` statements from the server side by starting `mysqld` with the `--local-infile=0` option.

- For the `mysql` command-line client, enable `LOAD DATA LOCAL` by specifying the `--local-infile=1` option, or disable it with the `--local-infile=0` option. For `mysqlimport`, local data file loading is off by default; enable it with the `--local` or `-L` option. In any case, successful use of a local load operation requires that the server permits it.

- If you use `LOAD DATA LOCAL` in Perl scripts or other programs that read the `[client]` group from option files, you can add the `local-infile=1` option to that group. However, to keep this from
causing problems for programs that do not understand `local-infile`, specify it using the `loose-
prefix:

```
[client]
loose-local-infile=1
```

- If `LOAD DATA LOCAL` is disabled, either in the server or the client, a client that attempts to issue such a statement receives the following error message:

```
ERROR 1148: The used command is not allowed with this MySQL version
```

### 6.1.7 Client Programming Security Guidelines

Applications that access MySQL should not trust any data entered by users, who can try to trick your code by entering special or escaped character sequences in Web forms, URLs, or whatever application you have built. Be sure that your application remains secure if a user enters something like `; DROP DATABASE mysql;`. This is an extreme example, but large security leaks and data loss might occur as a result of hackers using similar techniques, if you do not prepare for them.

A common mistake is to protect only string data values. Remember to check numeric data as well. If an application generates a query such as `SELECT * FROM table WHERE ID=234` when a user enters the value 234, the user can enter the value `234 OR 1=1` to cause the application to generate the query `SELECT * FROM table WHERE ID=234 OR 1=1`. As a result, the server retrieves every row in the table. This exposes every row and causes excessive server load. The simplest way to protect from this type of attack is to use single quotation marks around the numeric constants:

```
SELECT * FROM table WHERE ID='234'
```

In a numeric context, MySQL automatically converts this string to a number and strips any trailing nonnumeric characters from it.

Sometimes people think that if a database contains only publicly available data, it need not be protected. This is incorrect. Even if it is permissible to display any row in the database, you should still protect against denial of service attacks (for example, those that are based on the technique in the preceding paragraph that causes the server to waste resources). Otherwise, your server becomes unresponsive to legitimate users.

**Checklist:**

- Enable strict SQL mode to tell the server to be more restrictive of what data values it accepts. See Section 5.1.7, “Server SQL Modes”.

- Try to enter single and double quotation marks ("" and "") in all of your Web forms. If you get any kind of MySQL error, investigate the problem right away.

- Try to modify dynamic URLs by adding `%22 (""), %23 (""), and %27 (""") to them.

- Try to modify data types in dynamic URLs from numeric to character types using the characters shown in the previous examples. Your application should be safe against these and similar attacks.

- Try to enter characters, spaces, and special symbols rather than numbers in numeric fields. Your application should remove them before passing them to MySQL or else generate an error. Passing unchecked values to MySQL is very dangerous!

- Check the size of data before passing it to MySQL.

- Have your application connect to the database using a user name different from the one you use for administrative purposes. Do not give your applications any access privileges they do not need.

Many application programming interfaces provide a means of escaping special characters in data values. Properly used, this prevents application users from entering values that cause the application to generate statements that have a different effect than you intend:
• MySQL C API: Use the `mysql_real_escape_string()` API call.

• MySQL++: Use the `escape` and `quote` modifiers for query streams.

• PHP: Use either the `mysqli` or `pdo_mysql` extensions, and not the older `ext/mysql` extension. The preferred API's support the improved MySQL authentication protocol and passwords, as well as prepared statements with placeholders. See also Choosing an API.

If the older `ext/mysql` extension must be used, then for escaping use the `mysql_real_escape_string()` function and not `mysql_escape_string()` or `addslashes()` because only `mysql_real_escape_string()` is character set-aware; the other functions can be “bypassed” when using (invalid) multibyte character sets.

• Perl DBI: Use placeholders or the `quote()` method.

• Ruby DBI: Use placeholders or the `quote()` method.

• Java JDBC: Use a `PreparedStatement` object and placeholders.

Other programming interfaces might have similar capabilities.

### 6.2 The MySQL Access Privilege System

The primary function of the MySQL privilege system is to authenticate a user who connects from a given host and to associate that user with privileges on a database such as `SELECT`, `INSERT`, `UPDATE`, and `DELETE`. Additional functionality includes the ability to have anonymous users and to grant privileges for MySQL-specific functions such as `LOAD DATA INFILE` and administrative operations.

There are some things that you cannot do with the MySQL privilege system:

• You cannot explicitly specify that a given user should be denied access. That is, you cannot explicitly match a user and then refuse the connection.

• You cannot specify that a user has privileges to create or drop tables in a database but not to create or drop the database itself.

• A password applies globally to an account. You cannot associate a password with a specific object such as a database, table, or routine.

The user interface to the MySQL privilege system consists of SQL statements such as `CREATE USER`, `GRANT`, and `REVOKE`. See Section 13.7.1, “Account Management Statements”.

Internally, the server stores privilege information in the grant tables of the `mysql` database (that is, in the database named `mysql`). The MySQL server reads the contents of these tables into memory when it starts and bases access-control decisions on the in-memory copies of the grant tables.

The MySQL privilege system ensures that all users may perform only the operations permitted to them. As a user, when you connect to a MySQL server, your identity is determined by the host from which you connect and the user name you specify. When you issue requests after connecting, the system grants privileges according to your identity and what you want to do.

MySQL considers both your host name and user name in identifying you because there is no reason to assume that a given user name belongs to the same person on all hosts. For example, the user `joe` who connects from `office.example.com` need not be the same person as the user `joe` who connects from `home.example.com`. MySQL handles this by enabling you to distinguish users on different hosts that happen to have the same name: You can grant one set of privileges for connections by `joe` from `office.example.com`, and a different set of privileges for connections by `joe` from `home.example.com`. To see what privileges a given account has, use the `SHOW GRANTS` statement. For example:

```
SHOW GRANTS FOR 'joe'@'office.example.com';
SHOW GRANTS FOR 'joe'@'home.example.com';
```
MySQL access control involves two stages when you run a client program that connects to the server:

**Stage 1:** The server accepts or rejects the connection based on your identity and whether you can verify your identity by supplying the correct password.

**Stage 2:** Assuming that you can connect, the server checks each statement you issue to determine whether you have sufficient privileges to perform it. For example, if you try to select rows from a table in a database or drop a table from the database, the server verifies that you have the `SELECT` privilege for the table or the `DROP` privilege for the database.

For a more detailed description of what happens during each stage, see Section 6.2.4, “Access Control, Stage 1: Connection Verification”, and Section 6.2.5, “Access Control, Stage 2: Request Verification”.

If your privileges are changed (either by yourself or someone else) while you are connected, those changes do not necessarily take effect immediately for the next statement that you issue. For details about the conditions under which the server reloads the grant tables, see Section 6.2.6, “When Privilege Changes Take Effect”.

For general security-related advice, see Section 6.1, “General Security Issues”. For help in diagnosing privilege-related problems, see Section 6.2.7, “Troubleshooting Problems Connecting to MySQL”.

### 6.2.1 Privileges Provided by MySQL

MySQL provides privileges that apply in different contexts and at different levels of operation:

- Administrative privileges enable users to manage operation of the MySQL server. These privileges are global because they are not specific to a particular database.

- Database privileges apply to a database and to all objects within it. These privileges can be granted for specific databases, or globally so that they apply to all databases.

- Privileges for database objects such as tables, indexes, views, and stored routines can be granted for specific objects within a database, for all objects of a given type within a database (for example, all tables in a database), or globally for all objects of a given type in all databases.

Information about account privileges is stored in the `user`, `db`, `host`, `tables_priv`, `columns_priv`, and `procs_priv` tables in the `mysql` database (see Section 6.2.2, “Grant Tables”). The MySQL server reads the contents of these tables into memory when it starts and reloads them under the circumstances indicated in Section 6.2.6, “When Privilege Changes Take Effect”. Access-control decisions are based on the in-memory copies of the grant tables.

Some releases of MySQL introduce changes to the structure of the grant tables to add new privileges or features. To make sure that you can take advantage of any new capabilities, update your grant tables to have the current structure whenever you update to a new version of MySQL. See Section 4.4.8, “`mysql_upgrade` — Check and Upgrade MySQL Tables”.

The following table shows the privilege names used at the SQL level in the `GRANT` and `REVOKE` statements, along with the column name associated with each privilege in the grant tables and the context in which the privilege applies.

<table>

<tr>
<td>USAGE</td>
<td></td>
<td>server administration</td>
</tr>
</tbody>
</table>

The following list provides a general description of each privilege available in MySQL. Particular SQL statements might have more specific privilege requirements than indicated here. If so, the description for the statement in question provides the details.

- The **ALL** or **ALL PRIVILEGES** privilege specifier is shorthand. It stands for “all privileges available at a given privilege level” (except **GRANT OPTION**). For example, granting **ALL** at the global or table level grants all global privileges or all table-level privileges.

- The **ALTER** privilege enables use of **ALTER TABLE** to change the structure of tables. **ALTER TABLE** also requires the **CREATE** and **INSERT** privileges. Renaming a table requires **ALTER** and **DROP** on the old table, **CREATE**, and **INSERT** on the new table.

- The **ALTER ROUTINE** privilege is needed to alter or drop stored routines (procedures and functions).

- The **CREATE** privilege enables creation of new databases and tables.

- The **CREATE ROUTINE** privilege is needed to create stored routines (procedures and functions).

- The **CREATE TEMPORARY TABLES** privilege enables the creation of temporary tables using the **CREATE TEMPORARY TABLE** statement.

However, other operations on a temporary table, such as **INSERT**, **UPDATE**, or **SELECT**, require additional privileges for those operations for the database containing the temporary table, or for the nontemporary table of the same name.
To keep privileges for temporary and nontemporary tables separate, a common workaround for this situation is to create a database dedicated to the use of temporary tables. Then for that database, a user can be granted the `CREATE TEMPORARY TABLES` privilege, along with any other privileges required for temporary table operations done by that user.

- The `CREATE USER` privilege enables use of `CREATE USER`, `DROP USER`, `RENAME USER`, and `REVOKE ALL PRIVILEGES`.

- The `CREATE VIEW` privilege enables use of `CREATE VIEW`.

- The `DELETE` privilege enables rows to be deleted from tables in a database.

- The `DROP` privilege enables you to drop (remove) existing databases, tables, and views. Beginning with MySQL 5.1.10, the `DROP` privilege is also required to use the statement `ALTER TABLE ... DROP PARTITION` on a partitioned table. Beginning with MySQL 5.1.16, the `DROP` privilege is required for `TRUNCATE TABLE` (before that, `TRUNCATE TABLE` requires the `DELETE` privilege). If you grant the `DROP` privilege for the `mysql` database to a user, that user can drop the database in which the MySQL access privileges are stored.

- The `EVENT` privilege is required to create, alter, drop, or see events for the Event Scheduler. This privilege was added in MySQL 5.1.6.

- The `EXECUTE` privilege is required to execute stored routines (procedures and functions).

- The `FILE` privilege gives you permission to read and write files on the server host using the `LOAD DATA INFILE` and `SELECT ... INTO OUTFILE` statements and the `LOAD_FILE()` function. A user who has the `FILE` privilege can read any file on the server host that is either world-readable or readable by the MySQL server. (This implies the user can read any file in any database directory, because the server can access any of those files.) The `FILE` privilege also enables the user to create new files in any directory where the MySQL server has write access. This includes the server’s data directory containing the files that implement the privilege tables. As a security measure, the server will not overwrite existing files.

To limit the location in which files can be read and written, set the `secure_file_priv` system to a specific directory. See Section 5.1.4, “Server System Variables”.

- The `GRANT OPTION` privilege enables you to give to other users or remove from other users those privileges that you yourself possess.

- The `INDEX` privilege enables you to create or drop (remove) indexes. `INDEX` applies to existing tables. If you have the `CREATE` privilege for a table, you can include index definitions in the `CREATE TABLE` statement.

- The `INSERT` privilege enables rows to be inserted into tables in a database. `INSERT` is also required for the `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE` table-maintenance statements.

- The `LOCK TABLES` privilege enables the use of explicit `LOCK TABLES` statements to lock tables for which you have the `SELECT` privilege. This includes the use of write locks, which prevents other sessions from reading the locked table.

- The `PROCESS` privilege pertains to display of information about the threads executing within the server (that is, information about the statements being executed by sessions). The privilege enables use of `SHOW PROCESSLIST` or `mysqladmin processlist` to see threads belonging to other accounts; you can always see your own threads. The `PROCESS` privilege also enables use of `SHOW ENGINE`.

- The `REFERENCES` privilege is unused.

- The `RELOAD` privilege enables use of the `FLUSH` statement. It also enables `mysqladmin` commands that are equivalent to `FLUSH` operations: `flush-hosts`, `flush-logs`, `flush-privileges`, `flush-status`, `flush-tables`, `flush-threads`, `refresh`, and `reload.`
The **reload** command tells the server to reload the grant tables into memory. **flush-privileges** is a synonym for **reload**. The **refresh** command closes and reopens the log files and flushes all tables. The other **flush-xxx** commands perform functions similar to **refresh**, but are more specific and may be preferable in some instances. For example, if you want to flush just the log files, **flush-logs** is a better choice than **refresh**.

- The **REPLICATION CLIENT** privilege enables the use of **SHOW MASTER STATUS** and **SHOW SLAVE STATUS**. In MySQL 5.1.64 and later, it also enables the use of the **SHOW BINARY LOGS** statement.

- The **REPLICATION SLAVE** privilege should be granted to accounts that are used by slave servers to connect to the current server as their master. Without this privilege, the slave cannot request updates that have been made to databases on the master server.

- The **SELECT** privilege enables you to select rows from tables in a database. **SELECT** statements require the **SELECT** privilege only if they actually retrieve rows from a table. Some **SELECT** statements do not access tables and can be executed without permission for any database. For example, you can use **SELECT** as a simple calculator to evaluate expressions that make no reference to tables:

```
SELECT 1+1;
SELECT PI()*2;
```

- The **SHOW DATABASES** privilege enables the account to see database names by issuing the **SHOW DATABASE** statement. Accounts that do not have this privilege see only databases for which they have some privileges, and cannot use the statement at all if the server was started with the **--skip-show-database** option. Note that any global privilege is a privilege for the database.

- The **SHOW VIEW** privilege enables use of **SHOW CREATE VIEW**.

- The **SHUTDOWN** privilege enables use of the **mysqladmin shutdown** command and the **mysql_shutdown()** C API function. There is no corresponding SQL statement.

- The **SUPER** privilege enables an account to use **CHANGE MASTER TO**, **KILL** or **mysqladmin kill** to kill threads belonging to other accounts (you can always kill your own threads), **PURGE BINARY LOGS**, configuration changes using **SET GLOBAL** to modify global system variables, the **mysqladmin debug** command, enabling or disabling logging, performing updates even if the **read_only** system variable is enabled, starting and stopping replication on slave servers, specification of any account in the **DEFINER** attribute of stored programs and views, and enables you to connect (once) even if the connection limit controlled by the **max_connections** system variable is reached.

To create or alter stored functions if binary logging is enabled, you may also need the **SUPER** privilege, as described in Section 19.7, “Binary Logging of Stored Programs”.

- The **TRIGGER** privilege enables trigger operations. You must have this privilege for a table to create, drop, execute, or display triggers for that table. This privilege was added in MySQL 5.1.6. (Prior to MySQL 5.1.6, trigger operations required the **SUPER** privilege.)

- The **UPDATE** privilege enables rows to be updated in tables in a database.

- The **USAGE** privilege specifier stands for "no privileges." It is used at the global level with **GRANT** to modify account attributes such as resource limits or SSL characteristics without affecting existing account privileges.

It is a good idea to grant to an account only those privileges that it needs. You should exercise particular caution in granting the **FILE** and administrative privileges:
• The **FILE** privilege can be abused to read into a database table any files that the MySQL server can read on the server host. This includes all world-readable files and files in the server’s data directory. The table can then be accessed using `SELECT` to transfer its contents to the client host.

When a trigger is activated (by a user who has privileges to execute `INSERT`, `UPDATE`, or `DELETE` statements for the table associated with the trigger), trigger execution requires that the user who defined the trigger still have the **TRIGGER** privilege.

• The **GRANT OPTION** privilege enables users to give their privileges to other users. Two users that have different privileges and with the **GRANT OPTION** privilege are able to combine privileges.

• The **ALTER** privilege may be used to subvert the privilege system by renaming tables.

• The **SHUTDOWN** privilege can be abused to deny service to other users entirely by terminating the server.

• The **PROCESS** privilege can be used to view the plain text of currently executing statements, including statements that set or change passwords.

• The **SUPER** privilege can be used to terminate other sessions or change how the server operates.

• Privileges granted for the **mysql** database itself can be used to change passwords and other access privilege information. Passwords are stored encrypted, so a malicious user cannot simply read them to know the plain text password. However, a user with write access to the `user` table `Password` column can change an account’s password, and then connect to the MySQL server using that account.

### 6.2.2 Grant Tables

The **mysql** system database includes several grant tables that contain information about user accounts and the privileges held by them. This section describes those tables. For information about other tables in the system database, see [Section 5.3, “The mysql System Database”](#).

Normally, to manipulate the contents of grant tables, you modify them indirectly by using account-management statements such as `CREATE USER`, `GRANT`, and `REVOKE` to set up accounts and control the privileges available to each one. See [Section 13.7.1, “Account Management Statements”](#). The discussion here describes the underlying structure of the grant tables and how the server uses their contents when interacting with clients.

---

**Note**

Direct modification of grant tables using statements such as `INSERT`, `UPDATE`, or `DELETE` is discouraged and done at your own risk. The server is free to ignore rows that become malformed as a result of such modifications.

These **mysql** database tables contain grant information:

- **user**: User accounts, global privileges, and other non-privilege columns.
- **db**: Database-level privileges.
- **host**: Obsolete.
- **tables_priv**: Table-level privileges.
- **columns_priv**: Column-level privileges.
- **procs_priv**: Stored procedure and function privileges.

Each grant table contains scope columns and privilege columns:

- Scope columns determine the scope of each row in the tables; that is, the context in which the row applies. For example, a `user` table row with `Host` and `User` values of 'thomas.loc.gov' and
'bob' applies to authenticating connections made to the server from the host thomas.loc.gov by a client that specifies a user name of bob. Similarly, a db table row with Host, User, and Db column values of 'thomas.loc.gov', 'bob' and 'reports' applies when bob connects from the host thomas.loc.gov to access the reports database. The tables_priv and columns_priv tables contain scope columns indicating tables or table/column combinations to which each row applies. The procs_priv scope columns indicate the stored routine to which each row applies.

- Privilege columns indicate which privileges a table row grants; that is, which operations it permits to be performed. The server combines the information in the various grant tables to form a complete description of a user's privileges. Section 6.2.5, "Access Control, Stage 2: Request Verification", describes the rules for this.

The server uses the grant tables in the following manner:

- The user table scope columns determine whether to reject or permit incoming connections. For permitted connections, any privileges granted in the user table indicate the user's global privileges. Any privileges granted in this table apply to all databases on the server.

  **Caution**
  
  Because any global privilege is considered a privilege for all databases, any global privilege enables a user to see all database names with SHOW DATABASES or by examining the SCHEMATA table of INFORMATION_SCHEMA.

- The db table scope columns determine which users can access which databases from which hosts. The privilege columns determine the permitted operations. A privilege granted at the database level applies to the database and to all objects in the database, such as tables and stored programs.

- The host table is used in conjunction with the db table when you want a given db table row to apply to several hosts. For example, if you want a user to be able to use a database from several hosts in your network, leave the Host value empty in the user's db table row, then populate the host table with a row for each of those hosts. This mechanism is described more detail in Section 6.2.5, "Access Control, Stage 2: Request Verification".

  **Note**
  
  The host table must be modified directly with statements such as INSERT, UPDATE, and DELETE. It is not affected by statements such as GRANT and REVOKE that modify the grant tables indirectly. Most MySQL installations need not use this table at all.

- The tables_priv and columns_priv tables are similar to the db table, but are more fine-grained: They apply at the table and column levels rather than at the database level. A privilege granted at the table level applies to the table and to all its columns. A privilege granted at the column level applies only to a specific column.

- The procs_priv table applies to stored routines (procedures and functions). A privilege granted at the routine level applies only to a single procedure or function.

The server uses the user, db, and host tables in the mysql database at both the first and second stages of access control (see Section 6.2, "The MySQL Access Privilege System"). The columns in the user and db tables are shown here. The host table is similar to the db table but has a specialized use as described in Section 6.2.5, "Access Control, Stage 2: Request Verification".

**Table 6.3 user and db Table Columns**

</tbody>
</table>

The `Event_priv` and `Trigger_priv` columns were added in MySQL 5.1.6.

During the second stage of access control, the server performs request verification to ensure that each client has sufficient privileges for each request that it issues. In addition to the `user`, `db`, and `host` grant tables, the server may also consult the `tables_priv` and `columns_priv` tables for requests.
that involve tables. The latter tables provide finer privilege control at the table and column levels. They have the columns shown in the following table.

**Table 6.4 tables_priv and columns_priv Table Columns**

<table>
<thead>
<tr>
<th>Table Name</th>
<th>tables_priv</th>
<th>columns_priv</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Scope columns</strong></td>
<td>Host</td>
<td>Host</td>
</tr>
<tr>
<td></td>
<td>Db</td>
<td>Db</td>
</tr>
<tr>
<td></td>
<td>User</td>
<td>User</td>
</tr>
<tr>
<td></td>
<td>Table_name</td>
<td>Table_name</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Column_name</td>
</tr>
<tr>
<td><strong>Privilege columns</strong></td>
<td>Table_priv</td>
<td>Column_priv</td>
</tr>
<tr>
<td></td>
<td>Column_priv</td>
<td></td>
</tr>
<tr>
<td><strong>Other columns</strong></td>
<td>Timestamp</td>
<td>Timestamp</td>
</tr>
<tr>
<td></td>
<td>Grantor</td>
<td></td>
</tr>
</tbody>
</table>

The `Timestamp` and `Grantor` columns are unused.

For verification of requests that involve stored routines, the server may consult the `procs_priv` table, which has the columns shown in the following table.

**Table 6.5 procs_priv Table Columns**

<table>
<thead>
<tr>
<th>Table Name</th>
<th>procs_priv</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Scope columns</strong></td>
<td>Host</td>
</tr>
<tr>
<td></td>
<td>Db</td>
</tr>
<tr>
<td></td>
<td>User</td>
</tr>
<tr>
<td></td>
<td>Routine_name</td>
</tr>
<tr>
<td></td>
<td>Routine_type</td>
</tr>
<tr>
<td><strong>Privilege columns</strong></td>
<td>Proc_priv</td>
</tr>
<tr>
<td><strong>Other columns</strong></td>
<td>Timestamp</td>
</tr>
<tr>
<td></td>
<td>Grantor</td>
</tr>
</tbody>
</table>

The `Routine_type` column is an `ENUM` column with values of 'FUNCTION' or 'PROCEDURE' to indicate the type of routine the row refers to. This column enables privileges to be granted separately for a function and a procedure with the same name.

The `Timestamp` and `Grantor` columns are set to the current timestamp and the `CURRENT_USER` value, respectively, but are otherwise unused.

Scope columns in the grant tables contain strings. The default value for each is the empty string. The following table shows the number of characters permitted in each column.

**Table 6.6 Grant Table Scope Column Lengths**

<table>
<thead>
<tr>

<td>64</td>
</tr>
</tbody>
</table>
6.2.3 Specifying Account Names

MySQL account names consist of a user name and a host name. This enables creation of accounts for users with the same name who can connect from different hosts. This section describes how to write account names, including special values and wildcard rules.

In SQL statements such as `CREATE USER`, `GRANT`, and `SET PASSWORD`, write account names using the following rules:

**For access-checking purposes**, comparisons of `User`, `Password`, `Db`, and `Table_name` values are case sensitive. Comparisons of `Host`, `Column_name`, and `Routine_name` values are not case sensitive.

The `user`, `db`, and `host` tables list each privilege in a separate column that is declared as `ENUM('N','Y') DEFAULT 'N'`. In other words, each privilege can be disabled or enabled, with the default being disabled.

The `tables_priv`, `columns_priv`, and `procs_priv` tables declare the privilege columns as `SET` columns. Values in these columns can contain any combination of the privileges controlled by the table. Only those privileges listed in the column value are enabled.

### Table 6.7 Set-Type Privilege Column Values

<table>

<td><code>procs_priv</code></td>
<td><code>Proc_priv</code></td>
<td>'Execute', 'Alter Routine', 'Grant'</td>
</tr>
</tbody>
</table>

Only the `user` table specifies administrative privileges, such as `RELOAD` and `SHUTDOWN`. Administrative operations are operations on the server itself and are not database-specific, so there is no reason to list these privileges in the other grant tables. Consequently, the server need consult only the `user` table to determine whether a user can perform an administrative operation.

The `FILE` privilege also is specified only in the `user` table. It is not an administrative privilege as such, but a user's ability to read or write files on the server host is independent of the database being accessed.

The server reads the contents of the grant tables into memory when it starts. You can tell it to reload the tables by issuing a `FLUSH PRIVILEGES` statement or executing a `mysqladmin flush-privileges` or `mysqladmin reload` command. Changes to the grant tables take effect as indicated in Section 6.2.6, "When Privilege Changes Take Effect".

When you modify an account, it is a good idea to verify that your changes have the intended effect. To check the privileges for a given account, use the `SHOW GRANTS` statement. For example, to determine the privileges that are granted to an account with user name and host name values of `bob` and `pc84.example.com`, use this statement:

```
SHOW GRANTS FOR 'bob'@'pc84.example.com';
```
Specifying Account Names

- Syntax for account names is `user_name'@'host_name'`. An account name consisting only of a user name is equivalent to `user_name'@'%'`. For example, `me` is equivalent to `me'@'%'`.

- The user name and host name need not be quoted if they are legal as unquoted identifiers. Quotes are necessary to specify a `user_name` string containing special characters (such as `-`), or a `host_name` string containing special characters or wildcard characters (such as `.` or `%); for example, `test-user'@'%.com`.

- Quote user names and host names as identifiers or as strings, using either backticks (`), single quotation marks ('), or double quotation marks (").

- The user name and host name parts, if quoted, must be quoted separately. That is, write `me'@'localhost'`, not `me@localhost`; the latter is actually equivalent to `me@localhost'@'%'`.

- Quote user names and host names as strings, using either backticks (`), single quotation marks ('), or double quotation marks (").

- A reference to the `CURRENT_USER` or `CURRENT_USER()` function is equivalent to specifying the current client’s user name and host name literally.

MySQL stores account names in grant tables in the `mysql` system database using separate columns for the user name and host name parts:

- The `user` table contains one row for each account. The `User` and `Host` columns store the user name and host name. This table also indicates which global privileges the account has.

- Other grant tables indicate privileges an account has for databases and objects within databases. These tables have `User` and `Host` columns to store the account name. Each row in these tables associates with the account in the `user` table that has the same `User` and `Host` values.

For additional detail about grant table structure, see Section 6.2.2, “Grant Tables”.

User names and host names have certain special values or wildcard conventions, as described following.

A user name is either a nonblank value that literally matches the user name for incoming connection attempts, or a blank value (empty string) that matches any user name. An account with a blank user name is an anonymous user. To specify an anonymous user in SQL statements, use a quoted empty user name part, such as `''@'localhost'`.

The host name part of an account name can take many forms, and wildcards are permitted:

- A host value can be a host name or an IP address. The name `localhost` indicates the local host. The IP address `127.0.0.1` indicates the loopback interface.

- You can use the wildcard characters `%` and `_` in host name or IP address values. These have the same meaning as for pattern-matching operations performed with the LIKE operator. For example, a host value of `%` matches any host name, whereas a value of `%.mysql.com` matches any host in the `mysql.com` domain. `192.168.1.%` matches any host in the 192.168.1 class C network.

Because you can use IP wildcard values in host values (for example, `192.168.1.%` to match every host on a subnet), someone could try to exploit this capability by naming a host 192.168.1.somewhere.com. To foil such attempts, MySQL disallows matching on host names that start with digits and a dot. Thus, if you have a host named something like 1.2.example.com, its name never matches the host part of account names. An IP wildcard value can match only IP addresses, not host names.

- For a host value specified as an IP address, you can specify a netmask indicating how many address bits to use for the network number. The syntax is `host_ip/netmask`. For example:
```
CREATE USER 'david'@'192.58.197.0/255.255.255.0';
```

This enables `david` to connect from any client host having an IP address `client_ip` for which the following condition is true:

```
client_ip & netmask = host_ip
```

That is, for the `CREATE USER` statement just shown:

```
client_ip & 255.255.255.0 = 192.58.197.0
```

IP addresses that satisfy this condition and can connect to the MySQL server are those in the range from `192.58.197.0` to `192.58.197.255`.

A netmask typically begins with bits set to 1, followed by bits set to 0. Examples:

- `192.0.0.0/255.0.0.0`: Any host on the 192 class A network
- `192.168.0.0/255.255.0.0`: Any host on the 192.168 class B network
- `192.168.1.0/255.255.255.0`: Any host on the 192.168.1 class C network
- `192.168.1.1`: Only the host with this specific IP address

The server performs matching of host values in account names against the client host using the value returned by the system DNS resolver for the client host name or IP address. Except in the case that the account host value is specified using netmask notation, this comparison is performed as a string match, even for an account host value given as an IP address. This means that you should specify account host values in the same format used by DNS. Here are examples of problems to watch out for:

- Suppose that a host on the local network has a fully qualified name of `host1.example.com`. If DNS returns name lookups for this host as `host1.example.com`, use that name in account host values. But if DNS returns just `host1`, use `host1` instead.
- If DNS returns the IP address for a given host as `192.168.1.2`, that will match an account host value of `192.168.1.2` but not `192.168.01.2`. Similarly, it will match an account host pattern like `192.168.1.%` but not `192.168.01.%`.

To avoid problems like this, it is advisable to check the format in which your DNS returns host names and addresses, and use values in the same format in MySQL account names.

### 6.2.4 Access Control, Stage 1: Connection Verification

When you attempt to connect to a MySQL server, the server accepts or rejects the connection based on your identity and whether you can verify your identity by supplying the correct password. If not, the server denies access to you completely. Otherwise, the server accepts the connection, and then enters Stage 2 and waits for requests.

Credential checking is performed using the three `user` table scope columns (`Host`, `User`, and `Password`). The server accepts the connection only if the `Host` and `User` columns in some `user` table row match the client host name and user name and the client supplies the password specified in that row. The rules for permissible `Host` and `User` values are given in Section 6.2.3, "Specifying Account Names".

Your identity is based on two pieces of information:

- The client host from which you connect
- Your MySQL user name
If the `User` column value is nonblank, the user name in an incoming connection must match exactly. If the `User` value is blank, it matches any user name. If the `User` table row that matches an incoming connection has a blank user name, the user is considered to be an anonymous user with no name, not a user with the name that the client actually specified. This means that a blank user name is used for all further access checking for the duration of the connection (that is, during Stage 2).

The `Password` column can be blank. This is not a wildcard and does not mean that any password matches. It means that the user must connect without specifying a password.

Nonblank `Password` values in the `user` table represent encrypted passwords. MySQL does not store passwords in cleartext form for anyone to see. Rather, the password supplied by a user who is attempting to connect is encrypted (using the `PASSWORD()` function). The encrypted password then is used during the connection process when checking whether the password is correct. This is done without the encrypted password ever traveling over the connection. See Section 6.3.1, “User Names and Passwords”.

From MySQL's point of view, the encrypted password is the real password, so you should never give anyone access to it. In particular, do not give nonadministrative users read access to tables in the `mysql` database.

The following table shows how various combinations of `User` and `Host` values in the `user` table apply to incoming connections.

<table>
<thead>
<tr>
<th>User Value</th>
<th>Host Value</th>
<th>Permissible Connections</th>
</tr>
</thead>
<tbody>
<tr>
<td>'fred'</td>
<td>'thomas.loc.gov'</td>
<td>fred, connecting from thomas.loc.gov</td>
</tr>
<tr>
<td>''</td>
<td>'thomas.loc.gov'</td>
<td>Any user, connecting from thomas.loc.gov</td>
</tr>
<tr>
<td>'fred'</td>
<td>'%'</td>
<td>fred, connecting from any host</td>
</tr>
<tr>
<td>''</td>
<td>'%'</td>
<td>Any user, connecting from any host</td>
</tr>
<tr>
<td>'fred'</td>
<td>'%.loc.gov'</td>
<td>fred, connecting from any host in the loc.gov domain</td>
</tr>
<tr>
<td>'fred'</td>
<td>'x.y.%'</td>
<td>fred, connecting from x.y.net, x.y.com, x.y.edu, and so on; this is probably not useful</td>
</tr>
<tr>
<td>'fred'</td>
<td>'192.168.10.177'</td>
<td>fred, connecting from the host with IP address 192.168.10.177</td>
</tr>
<tr>
<td>'fred'</td>
<td>'192.168.10.%'</td>
<td>fred, connecting from any host in the 192.168.10 class C subnet</td>
</tr>
<tr>
<td>'fred'</td>
<td>'192.168.10.0/255.255.255.0'</td>
<td>Same as previous example</td>
</tr>
</tbody>
</table>

It is possible for the client host name and user name of an incoming connection to match more than one row in the `user` table. The preceding set of examples demonstrates this: Several of the entries shown match a connection from `thomas.loc.gov` by `fred`.

When multiple matches are possible, the server must determine which of them to use. It resolves this issue as follows:

- Whenever the server reads the `user` table into memory, it sorts the rows.
- When a client attempts to connect, the server looks through the rows in sorted order.
- The server uses the first row that matches the client host name and user name.

The server uses sorting rules that order rows with the most-specific `Host` values first. Literal host names and IP addresses are the most specific. (The specificity of a literal IP address is not affected by whether it has a netmask, so `192.168.1.13` and `192.168.1.0/255.255.255.0` are considered equally specific.) The pattern `'*'` means "any host" and is least specific. The empty string `''` also means "any host" but sorts after `'*'`. Rows with the same `Host` value are ordered with the most-specific `User` values first (a blank `User` value means "any user" and is least specific). For rows with equally-specific `Host` and `User` values, the order is indeterminate.
To see how this works, suppose that the `user` table looks like this:

<table>
<thead>
<tr>
<th>Host</th>
<th>User</th>
<th>...</th>
</tr>
</thead>
<tbody>
<tr>
<td>%</td>
<td>root</td>
<td></td>
</tr>
<tr>
<td>%</td>
<td>jeffrey</td>
<td></td>
</tr>
<tr>
<td>localhost</td>
<td>root</td>
<td></td>
</tr>
<tr>
<td>localhost</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

When the server reads the table into memory, it sorts the rows using the rules just described. The result after sorting looks like this:

<table>
<thead>
<tr>
<th>Host</th>
<th>User</th>
<th>...</th>
</tr>
</thead>
<tbody>
<tr>
<td>localhost</td>
<td>root</td>
<td></td>
</tr>
<tr>
<td>localhost</td>
<td></td>
<td></td>
</tr>
<tr>
<td>%</td>
<td>jeffrey</td>
<td></td>
</tr>
<tr>
<td>%</td>
<td>root</td>
<td></td>
</tr>
</tbody>
</table>

When a client attempts to connect, the server looks through the sorted rows and uses the first match found. For a connection from `localhost` by `jeffrey`, two of the rows from the table match: the one with `Host` and `User` values of `'localhost'` and `''`, and the one with values of `'%'` and `'jeffrey'`. The `'localhost'` row appears first in sorted order, so that is the one the server uses.

Here is another example. Suppose that the `user` table looks like this:

<table>
<thead>
<tr>
<th>Host</th>
<th>User</th>
<th>...</th>
</tr>
</thead>
<tbody>
<tr>
<td>%</td>
<td>jeffrey</td>
<td></td>
</tr>
<tr>
<td>thomas.loc.gov</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The sorted table looks like this:

<table>
<thead>
<tr>
<th>Host</th>
<th>User</th>
<th>...</th>
</tr>
</thead>
<tbody>
<tr>
<td>thomas.loc.gov</td>
<td></td>
<td></td>
</tr>
<tr>
<td>%</td>
<td>jeffrey</td>
<td></td>
</tr>
</tbody>
</table>

A connection by `jeffrey` from `thomas.loc.gov` is matched by the first row, whereas a connection by `jeffrey` from any host is matched by the second.

**Note**

It is a common misconception to think that, for a given user name, all rows that explicitly name that user are used first when the server attempts to find a match for the connection. This is not true. The preceding example illustrates this, where a connection from `thomas.loc.gov` by `jeffrey` is first matched not by the row containing `'jeffrey'` as the `User` column value, but by the row with no user name. As a result, `jeffrey` is authenticated as an anonymous user, even though he specified a user name when connecting.

If you are able to connect to the server, but your privileges are not what you expect, you probably are being authenticated as some other account. To find out what account the server used to authenticate you, use the `CURRENT_USER()` function. (See Section 12.14, “Information Functions.”) It returns a
value in \texttt{user_name@host_name} format that indicates the \texttt{User} and \texttt{Host} values from the matching \texttt{user} table row. Suppose that \texttt{jeffrey} connects and issues the following query:

```sql
mysql> SELECT CURRENT_USER();
+----------------+
| CURRENT_USER() |
+----------------+
| @localhost     |
+----------------+
```

The result shown here indicates that the matching \texttt{user} table row had a blank \texttt{User} column value. In other words, the server is treating \texttt{jeffrey} as an anonymous user.

Another way to diagnose authentication problems is to print out the \texttt{user} table and sort it by hand to see where the first match is being made.

### 6.2.5 Access Control, Stage 2: Request Verification

After you establish a connection, the server enters Stage 2 of access control. For each request that you issue through that connection, the server determines what operation you want to perform, then checks whether you have sufficient privileges to do so. This is where the privilege columns in the grant tables come into play. These privileges can come from any of the \texttt{user}, \texttt{db}, \texttt{host}, \texttt{tables_priv}, \texttt{columns_priv}, or \texttt{procs_priv} tables. (You may find it helpful to refer to Section 6.2.2, “Grant Tables”, which lists the columns present in each of the grant tables.)

The \texttt{user} table grants privileges that are assigned to you on a global basis and that apply no matter what the default database is. For example, if the \texttt{user} table grants you the \texttt{DELETE} privilege, you can delete rows from any table in any database on the server host! It is wise to grant privileges in the \texttt{user} table only to people who need them, such as database administrators. For other users, you should leave all privileges in the \texttt{user} table set to \texttt{N} and grant privileges at more specific levels only. You can grant privileges for particular databases, tables, columns, or routines.

The \texttt{db} and \texttt{host} tables grant database-specific privileges. Values in the scope columns of these tables can take the following forms:

- A blank \texttt{User} value in the \texttt{db} table matches the anonymous user. A nonblank value matches literally; there are no wildcards in user names.

- The wildcard characters \% and \_ can be used in the \texttt{Host} and \texttt{Db} columns of either table. These have the same meaning as for pattern-matching operations performed with the \texttt{LIKE} operator. If you want to use either character literally when granting privileges, you must escape it with a backslash. For example, to include the underscore character (\_) as part of a database name, specify it as \texttt{\_} in the \texttt{GRANT} statement.

- A \'\%\' \texttt{Host} value in the \texttt{db} table means “any host.” A blank \texttt{Host} value in the \texttt{db} table means “consult the \texttt{host} table for further information” (a process that is described later in this section).

- A \'\%\' or blank \texttt{Host} value in the \texttt{host} table means “any host.”

- A \'\%\' or blank \texttt{Db} value in either table means “any database.”

The server reads the \texttt{db} and \texttt{host} tables into memory and sorts them at the same time that it reads the \texttt{user} table. The server sorts the \texttt{db} table based on the \texttt{Host}, \texttt{Db}, and \texttt{User} scope columns, and sorts the \texttt{host} table based on the \texttt{Host} and \texttt{Db} scope columns. As with the \texttt{user} table, sorting puts the most-specific values first and least-specific values last, and when the server looks for matching rows, it uses the first match that it finds.

The \texttt{tables_priv}, \texttt{columns_priv}, and \texttt{procs_priv} tables grant table-specific, column-specific, and routine-specific privileges. Values in the scope columns of these tables can take the following forms:
• The wildcard characters % and _ can be used in the Host column. These have the same meaning as for pattern-matching operations performed with the LIKE operator.

• A ‘%’ or blank Host value means “any host.”

• The Db, Table_name, Column_name, and Routine_name columns cannot contain wildcards or be blank.

The server sorts the tables_priv, columns_priv, and procs_priv tables based on the Host, Db, and User columns. This is similar to db table sorting, but simpler because only the Host column can contain wildcards.

The server uses the sorted tables to verify each request that it receives. For requests that require administrative privileges such as SHUTDOWN or RELOAD, the server checks only the user table row because that is the only table that specifies administrative privileges. The server grants access if the row permits the requested operation and denies access otherwise. For example, if you want to execute mysqladmin shutdown but your user table row does not grant the SHUTDOWN privilege to you, the server denies access without even checking the db or host tables. (They contain no Shutdown_priv column, so there is no need to do so.)

For database-related requests (INSERT, UPDATE, and so on), the server first checks the user’s global privileges by looking in the user table row. If the row permits the requested operation, access is granted. If the global privileges in the user table are insufficient, the server determines the user’s database-specific privileges by checking the db and host tables:

1. The server looks in the db table for a match on the Host, Db, and User columns. The Host and User columns are matched to the connecting user’s host name and MySQL user name. The Db column is matched to the database that the user wants to access. If there is no row for the Host and User, access is denied.

2. If there is a matching db table row and its Host column is not blank, that row defines the user’s database-specific privileges.

3. If the matching db table row’s Host column is blank, it signifies that the host table enumerates which hosts should be permitted access to the database. In this case, a further lookup is done in the host table to find a match on the Host and Db columns. If no host table row matches, access is denied. If there is a match, the user’s database-specific privileges are computed as the intersection (not the union!) of the privileges in the db and host table rows; that is, the privileges that are ‘Y’ in both rows. (This way you can grant general privileges in the db table row and then selectively restrict them on a host-by-host basis using the host table rows.)

After determining the database-specific privileges granted by the db and host table rows, the server adds them to the global privileges granted by the user table. If the result permits the requested operation, access is granted. Otherwise, the server successively checks the user’s table and column privileges in the tables_priv and columns_priv tables, adds those to the user’s privileges, and permits or denies access based on the result. For stored-routine operations, the server uses the procs_priv table rather than tables_priv and columns_priv.

Expressed in boolean terms, the preceding description of how a user’s privileges are calculated may be summarized like this:

<table>
<thead>
<tr>
<th>global privileges</th>
<th>OR (database privileges AND host privileges)</th>
</tr>
</thead>
<tbody>
<tr>
<td>OR table privileges</td>
<td></td>
</tr>
<tr>
<td>OR column privileges</td>
<td></td>
</tr>
<tr>
<td>OR routine privileges</td>
<td></td>
</tr>
</tbody>
</table>

It may not be apparent why, if the global user row privileges are initially found to be insufficient for the requested operation, the server adds those privileges to the database, table, and column privileges later. The reason is that a request might require more than one type of privilege. For example, if you execute an INSERT INTO ... SELECT statement, you need both the INSERT and the SELECT
privileges. Your privileges might be such that the **user** table row grants one privilege and the **db** table row grants the other. In this case, you have the necessary privileges to perform the request, but the server cannot tell that from either table by itself; the privileges granted by the rows in both tables must be combined.

The **host** table is not affected by the **GRANT** or **REVOKE** statements, so it is unused in most MySQL installations. If you modify it directly, you can use it for some specialized purposes, such as to maintain a list of secure servers on the local network that are granted all privileges.

You can also use the **host** table to indicate hosts that are **not** secure. Suppose that you have a machine **public.your.domain** that is located in a public area that you do not consider secure. You can enable access to all hosts on your network except that machine by using **host** table rows like this:

| Host               | Db | ...          |
|--------------------+----+-------------|
| public.your.domain | %  | ... (all privileges set to 'N') |
| %.your.domain      | %  | ... (all privileges set to 'Y') |

### 6.2.6 When Privilege Changes Take Effect

When **mysqld** starts, it reads all grant table contents into memory. The in-memory tables become effective for access control at that point.

If you modify the grant tables indirectly using account-management statements such as **GRANT**, **REVOKE**, **SET PASSWORD**, or **RENAME USER**, the server notices these changes and loads the grant tables into memory again immediately.

If you modify the grant tables directly using statements such as **INSERT**, **UPDATE**, or **DELETE**, your changes have no effect on privilege checking until you either restart the server or tell it to reload the tables. If you change the grant tables directly but forget to reload them, your changes have **no effect** until you restart the server. This may leave you wondering why your changes seem to make no difference!

To tell the server to reload the grant tables, perform a flush-privileges operation. This can be done by issuing a **FLUSH PRIVILEGES** statement or by executing a **mysqladmin flush-privileges** or **mysqladmin reload** command.

A grant table reload affects privileges for each existing client connection as follows:

- Table and column privilege changes take effect with the client’s next request.
- Database privilege changes take effect the next time the client executes a **USE db_name** statement.

**Note**

Client applications may cache the database name; thus, this effect may not be visible to them without actually changing to a different database or flushing the privileges.

- Global privileges and passwords are unaffected for a connected client. These changes take effect only for subsequent connections.

If the server is started with the **--skip-grant-tables** option, it does not read the grant tables or implement any access control. Anyone can connect and do anything, **which is insecure**. To cause a server thus started to read the tables and enable access checking, flush the privileges.

### 6.2.7 Troubleshooting Problems Connecting to MySQL

If you encounter problems when you try to connect to the MySQL server, the following items describe some courses of action you can take to correct the problem.
Troubleshooting Problems Connecting to MySQL

- Make sure that the server is running. If it is not, clients cannot connect to it. For example, if an attempt to connect to the server fails with a message such as one of those following, one cause might be that the server is not running:

```shell
shell> mysql
ERROR 2003: Can't connect to MySQL server on 'host_name' (111)
shell> mysql
ERROR 2002: Can't connect to local MySQL server through socket '/tmp/mysql.sock' (111)
```

- It might be that the server is running, but you are trying to connect using a TCP/IP port, named pipe, or Unix socket file different from the one on which the server is listening. To correct this when you invoke a client program, specify a `--port` option to indicate the proper port number, or a `--socket` option to indicate the proper named pipe or Unix socket file. To find out where the socket file is, you can use this command:

```shell
shell> netstat -ln | grep mysql
```

- Make sure that the server has not been configured to ignore network connections or (if you are attempting to connect remotely) that it has not been configured to listen only locally on its network interfaces. If the server was started with `--skip-networking`, it will not accept TCP/IP connections at all. If the server was started with `--bind-address=127.0.0.1`, it will listen for TCP/IP connections only locally on the loopback interface and will not accept remote connections.

- Check to make sure that there is no firewall blocking access to MySQL. Your firewall may be configured on the basis of the application being executed, or the port number used by MySQL for communication (3306 by default). Under Linux or Unix, check your IP tables (or similar) configuration to ensure that the port has not been blocked. Under Windows, applications such as ZoneAlarm or the Windows XP personal firewall may need to be configured not to block the MySQL port.

- The grant tables must be properly set up so that the server can use them for access control. For some distribution types (such as binary distributions on Windows, or RPM distributions on Linux), the installation process initializes the MySQL data directory, including the `mysql` database containing the grant tables. For distributions that do not do this, you must initialize the data directory manually. For details, see Section 2.12, “Postinstallation Setup and Testing”.

To determine whether you need to initialize the grant tables, look for a `mysql` directory under the data directory. (The data directory normally is named `data` or `var` and is located under your MySQL installation directory.) Make sure that you have a file named `user.MYD` in the `mysql` database directory. If not, initialize the data directory. After doing so and starting the server, test the initial privileges by executing this command:

```shell
shell> mysql -u root
```

The server should let you connect without error.

- After a fresh installation, you should connect to the server and set up your users and their access permissions:

```shell
shell> mysql -u root mysql
```

The server should let you connect because the MySQL `root` user has no password initially. That is also a security risk, so setting the password for the `root` accounts is something you should do while you’re setting up your other MySQL accounts. For instructions on setting the initial passwords, see Section 2.12.4, “Securing the Initial MySQL Accounts”.

- If you have updated an existing MySQL installation to a newer version, did you run the `mysql_upgrade` script? If not, do so. The structure of the grant tables changes occasionally when new capabilities are added, so after an upgrade you should always make sure that your tables have
Troubleshooting Problems Connecting to MySQL

the current structure. For instructions, see Section 4.4.8, “mysql_upgrade — Check and Upgrade MySQL Tables”.

• If a client program receives the following error message when it tries to connect, it means that the server expects passwords in a newer format than the client is capable of generating:

        shell> mysql
        Client does not support authentication protocol requested
        by server; consider upgrading MySQL client

For information on how to deal with this, see Section 6.1.2.4, “Password Hashing in MySQL”, and Section B.5.2.4, “Client does not support authentication protocol”.

• Remember that client programs use connection parameters specified in option files or environment variables. If a client program seems to be sending incorrect default connection parameters when you have not specified them on the command line, check any applicable option files and your environment. For example, if you get Access denied when you run a client without any options, make sure that you have not specified an old password in any of your option files!

You can suppress the use of option files by a client program by invoking it with the --no-defaults option. For example:

        shell> mysqladmin --no-defaults -u root version

The option files that clients use are listed in Section 4.2.6, “Using Option Files”. Environment variables are listed in Section 2.14, “Environment Variables”.

• If you get the following error, it means that you are using an incorrect root password:

        shell> mysqladmin -u root -p
        xxxx
        Access denied for user 'root'@'localhost' (using password: YES)

If the preceding error occurs even when you have not specified a password, it means that you have an incorrect password listed in some option file. Try the --no-defaults option as described in the previous item.

For information on changing passwords, see Section 6.3.5, “Assigning Account Passwords”.

If you have lost or forgotten the root password, see Section B.5.3.2, “How to Reset the Root Password”.

• If you change a password by using SET PASSWORD, INSERT, or UPDATE, you must encrypt the password using the PASSWORD() function. If you do not use PASSWORD() for these statements, the password will not work. For example, the following statement assigns a password, but fails to encrypt it, so the user is not able to connect afterward:

        SET PASSWORD FOR 'abe'@'host_name' = 'eagle';

Instead, set the password like this:

        SET PASSWORD FOR 'abe'@'host_name' = PASSWORD('eagle');

The PASSWORD() function is unnecessary when you specify a password using the CREATE USER or GRANT statements or the mysqladmin password command. Each of those automatically uses PASSWORD() to encrypt the password. See Section 6.3.5, “Assigning Account Passwords”, and Section 13.7.1.1, “CREATE USER Syntax”.

• localhost is a synonym for your local host name, and is also the default host to which clients try to connect if you specify no host explicitly.
You can use a \texttt{--host=127.0.0.1} option to name the server host explicitly. This will make a TCP/IP connection to the local \texttt{mysqld} server. You can also use TCP/IP by specifying a \texttt{--host} option that uses the actual host name of the local host. In this case, the host name must be specified in a \texttt{user} table row on the server host, even though you are running the client program on the same host as the server.

- The \texttt{Access denied} error message tells you who you are trying to log in as, the client host from which you are trying to connect, and whether you were using a password. Normally, you should have one row in the \texttt{user} table that exactly matches the host name and user name that were given in the error message. For example, if you get an error message that contains \texttt{using password: NO}, it means that you tried to log in without a password.

- If you get an \texttt{Access denied} error when trying to connect to the database with \texttt{mysql -u user\_name}, you may have a problem with the \texttt{user} table. Check this by executing \texttt{mysql -u root mysql} and issuing this SQL statement:

\begin{verbatim}
SELECT * FROM user;
\end{verbatim}

The result should include a row with the \texttt{Host} and \texttt{User} columns matching your client's host name and your MySQL user name.

- If the following error occurs when you try to connect from a host other than the one on which the MySQL server is running, it means that there is no row in the \texttt{user} table with a \texttt{Host} value that matches the client host:

\begin{verbatim}
Host ... is not allowed to connect to this MySQL server
\end{verbatim}

You can fix this by setting up an account for the combination of client host name and user name that you are using when trying to connect.

If you do not know the IP address or host name of the machine from which you are connecting, you should put a row with \texttt{'%'} as the \texttt{Host} column value in the \texttt{user} table. After trying to connect from the client machine, use a \texttt{SELECT USER()} query to see how you really did connect. Then change the \texttt{'%'} in the \texttt{user} table row to the actual host name that shows up in the log. Otherwise, your system is left insecure because it permits connections from any host for the given user name.

On Linux, another reason that this error might occur is that you are using a binary MySQL version that is compiled with a different version of the \texttt{glibc} library than the one you are using. In this case, you should either upgrade your operating system or \texttt{glibc}, or download a source distribution of MySQL version and compile it yourself. A source RPM is normally trivial to compile and install, so this is not a big problem.

- If you specify a host name when trying to connect, but get an error message where the host name is not shown or is an IP address, it means that the MySQL server got an error when trying to resolve the IP address of the client host to a name:

\begin{verbatim}
shell> mysqladmin -u root -pxxxx -h some_hostname ver
Access denied for user 'root'@'' (using password: YES)
\end{verbatim}

If you try to connect as \texttt{root} and get the following error, it means that you do not have a row in the \texttt{user} table with a \texttt{User} column value of \texttt{'root'} and that \texttt{mysqld} cannot resolve the host name for your client:

\begin{verbatim}
Access denied for user ''@'unknown'
\end{verbatim}

These errors indicate a DNS problem. To fix it, execute \texttt{mysqladmin flush-hosts} to reset the internal DNS host cache. See Section 8.12.6.2, “DNS Lookup Optimization and the Host Cache”. 683
Some permanent solutions are:

- Determine what is wrong with your DNS server and fix it.
- Specify IP addresses rather than host names in the MySQL grant tables.
- Put an entry for the client machine name in `/etc/hosts` on Unix or `\windows\hosts` on Windows.
- Start `mysql` with the `--skip-name-resolve` option.
- Start `mysql` with the `--skip-host-cache` option.

- On Unix, if you are running the server and the client on the same machine, connect to `localhost`. For connections to `localhost`, MySQL programs attempt to connect to the local server by using a Unix socket file, unless there are connection parameters specified to ensure that the client makes a TCP/IP connection. For more information, see Section 4.2.2, "Connecting to the MySQL Server".

- On Windows, if you are running the server and the client on the same machine and the server supports named pipe connections, connect to the host name. Connections to use a named pipe rather than TCP/IP.

- If `mysql -u root` works but `mysql -h your_hostname -u root` results in `Access denied` (where `your_hostname` is the actual host name of the local host), you may not have the correct name for your host in the `user` table. A common problem here is that the `Host` value in the `user` table row specifies an unqualified host name, but your system's name resolution routines return a fully qualified domain name (or vice versa). For example, if you have a row with host 'pluto' in the `user` table, but your DNS tells MySQL that your host name is 'pluto.example.com', the row does not work. Try adding a row to the `user` table that contains the IP address of your host as the `Host` column value. (Alternatively, you could add a row to the `user` table with a `Host` value that contains a wildcard; for example, 'pluto.%'. However, use of `Host` values ending with `%` is insecure and is not recommended!)

- If `mysql -u user_name` works but `mysql -u user_name some_db` does not, you have not granted access to the given user for the database named `some_db`.

- If `mysql -u user_name` works when executed on the server host, but `mysql -h host_name -u user_name` does not work when executed on a remote client host, you have not enabled access to the server for the given user name from the remote host.

- If you cannot figure out why you get `Access denied`, remove from the `user` table all rows that have `Host` values containing wildcards (rows that contain '%', '_' characters). A very common error is to insert a new row with `Host='%'` and `User='some_user'`, thinking that this enables you to specify `localhost` to connect from the same machine. The reason that this does not work is that the default privileges include a row with `Host='localhost'` and `User=''`. Because that row has a `Host` value 'localhost' that is more specific than '%', it is used in preference to the new row when connecting from `localhost`! The correct procedure is to insert a second row with `Host='localhost'` and `User='some_user'`, or to delete the row with `Host='localhost'` and `User=''`. After deleting the row, remember to issue a `FLUSH PRIVILEGES` statement to reload the grant tables. See also Section 6.2.4, "Access Control, Stage 1: Connection Verification".

- If you are able to connect to the MySQL server, but get an `Access denied` message whenever you issue a `SELECT ... INTO OUTFILE` or `LOAD DATA INFILE` statement, your row in the `user` table does not have the `FILE` privilege enabled.

- If you change the grant tables directly (for example, by using `INSERT`, `UPDATE`, or `DELETE` statements) and your changes seem to be ignored, remember that you must execute a `FLUSH PRIVILEGES` statement or a `mysqladmin flush-privileges` command to cause the server to reload the privilege tables. Otherwise, your changes have no effect until the next time the server is
MySQL User Account Management

restarted. Remember that after you change the root password with an UPDATE statement, you will not need to specify the new password until after you flush the privileges, because the server will not know you've changed the password yet!

- If your privileges seem to have changed in the middle of a session, it may be that a MySQL administrator has changed them. Reloading the grant tables affects new client connections, but it also affects existing connections as indicated in Section 6.2.6, “When Privilege Changes Take Effect”.

- If you have access problems with a Perl, PHP, Python, or ODBC program, try to connect to the server with mysql -u user_name db_name or mysql -u user_name -pyour_pass db_name. If you are able to connect using the mysql client, the problem lies with your program, not with the access privileges. (There is no space between -p and the password; you can also use the --password=your_pass syntax to specify the password. If you use the -p or --password option with no password value, MySQL prompts you for the password.)

- For testing purposes, start the mysqld server with the --skip-grant-tables option. Then you can change the MySQL grant tables and use the mysqlaccess script to check whether your modifications have the desired effect. When you are satisfied with your changes, execute mysqladmin flush-privileges to tell the mysqld server to reload the privileges. This enables you to begin using the new grant table contents without stopping and restarting the server.

- If you get the following error, you may have a problem with the db or host table:

  Access to database denied

  If the row selected from the db table has an empty value in the Host column, make sure that there are one or more corresponding rows in the host table specifying which hosts the db table row applies to. This problem occurs infrequently because the host table is rarely used.

- If everything else fails, start the mysqld server with a debugging option (for example, --debug=d,general,query). This prints host and user information about attempted connections, as well as information about each command issued. See Section 22.4.3, “The DBUG Package”.

- If you have any other problems with the MySQL grant tables and feel you must post the problem to the mailing list, always provide a dump of the MySQL grant tables. You can dump the tables with the mysqldump mysql command. To file a bug report, see the instructions at Section 1.7, “How to Report Bugs or Problems”. In some cases, you may need to restart mysqld with --skip-grant-tables to run mysqldump.

6.3 MySQL User Account Management

This section describes how to set up accounts for clients of your MySQL server. It discusses the following topics:

- The meaning of account names and passwords as used in MySQL and how that compares to names and passwords used by your operating system
- How to set up new accounts and remove existing accounts
- How to change passwords
- Guidelines for using passwords securely

See also Section 13.7.1, “Account Management Statements”, which describes the syntax and use for all user-management SQL statements.

6.3.1 User Names and Passwords

MySQL stores accounts in the user table of the mysql system database. An account is defined in terms of a user name and the client host or hosts from which the user can connect to the server. The
User Names and Passwords

account may also have a password. For information about account representation in the `user` table, see Section 6.2.2, “Grant Tables”.

There are several distinctions between the way user names and passwords are used by MySQL and your operating system:

• User names, as used by MySQL for authentication purposes, have nothing to do with user names (login names) as used by Windows or Unix. On Unix, most MySQL clients by default try to log in using the current Unix user name as the MySQL user name, but that is for convenience only. The default can be overridden easily, because client programs permit any user name to be specified with a `-u` or `--user` option. This means that anyone can attempt to connect to the server using any user name, so you cannot make a database secure in any way unless all MySQL accounts have passwords. Anyone who specifies a user name for an account that has no password is able to connect successfully to the server.

• MySQL user names can be up to 16 characters long. Operating system user names may be of a different maximum length. For example, Unix user names typically are limited to eight characters.

Warning

The limit on MySQL user name length is hardcoded in MySQL servers and clients, and trying to circumvent it by modifying the definitions of the tables in the `mysql` database does not work.

You should never alter the structure of tables in the `mysql` database in any manner whatsoever except by means of the procedure that is described in Section 4.4.8, “`mysql_upgrade` — Check and Upgrade MySQL Tables”. Attempting to redefine MySQL’s system tables in any other fashion results in undefined (and unsupported!) behavior. The server is free to ignore rows that become malformed as a result of such modifications.

• To authenticate client connections that use MySQL built-in authentication, the server uses MySQL passwords stored in the `user` table. These passwords are distinct from passwords for logging in to your operating system. There is no necessary connection between the “external” password you use to log in to a Windows or Unix machine and the password you use to access the MySQL server on that machine.

• MySQL encrypts passwords stored in the `user` table using its own algorithm. This encryption is the same as that implemented by the `PASSWORD()` SQL function but differs from that used during the Unix login process. Unix password encryption is the same as that implemented by the `ENCRYPT()` SQL function. See the descriptions of the `PASSWORD()` and `ENCRYPT()` functions in Section 12.13, “Encryption and Compression Functions”.

From version 4.1 on, MySQL employs a stronger authentication method that has better password protection during the connection process than in earlier versions. It is secure even if TCP/IP packets are sniffed or the `mysql` database is captured. (In earlier versions, even though passwords are stored in encrypted form in the `user` table, knowledge of the encrypted password value could be used to connect to the MySQL server.) Section 6.1.2.4, “Password Hashing in MySQL”, discusses password encryption further.

• If the user name and password contain only ASCII characters, it is possible to connect to the server regardless of character set settings. To connect when the user name or password contain non-ASCII characters, the client should call the `mysql_options()` C API function with the `MYSQL_SET_CHARSET_NAME` option and appropriate character set name as arguments. This causes authentication to take place using the specified character set. Otherwise, authentication will fail unless the server default character set is the same as the encoding in the authentication defaults.

Standard MySQL client programs support a `--default-character-set` option that causes `mysql_options()` to be called as just described. For programs that use a connector that is not
Adding User Accounts

based on the C API, the connector may provide an equivalent to `mysql_options()` that can be used instead. Check the connector documentation.

The preceding notes do not apply for `ucs2`, which is not permitted as a client character set.

The MySQL installation process populates the grant tables with an initial account or accounts. The names and access privileges for these accounts are described in Section 2.12.4, “Securing the Initial MySQL Accounts”, which also discusses how to assign passwords to them. Thereafter, you normally set up, modify, and remove MySQL accounts using statements such as `CREATE USER`, `DROP USER`, `GRANT`, and `REVOKE`. See Section 13.7.1, “Account Management Statements”.

To connect to a MySQL server with a command-line client, specify user name and password options as necessary for the account that you want to use:

```shell
shell> mysql --user=monty --password db_name
```

If you prefer short options, the command looks like this:

```shell
shell> mysql -u monty -p db_name
```

If you omit the password value following the `--password` or `-p` option on the command line (as just shown), the client prompts for one. Alternatively, the password can be specified on the command line:

```shell
shell> mysql --user=monty --password=password db_name
shell> mysql -u monty -p password db_name
```

If you use the `-p` option, there must be no space between `-p` and the following password value.

Specifying a password on the command line should be considered insecure. See Section 6.1.2.1, “End-User Guidelines for Password Security”. You can use an option file to avoid giving the password on the command line. See Section 4.2.6, “Using Option Files”.

For additional information about specifying user names, passwords, and other connection parameters, see Section 4.2.2, “Connecting to the MySQL Server”.

### 6.3.2 Adding User Accounts

You can create MySQL accounts two ways:

- By using account-management statements intended for creating accounts and establishing their privileges, such as `CREATE USER` and `GRANT`. These statements cause the server to make appropriate modifications to the underlying grant tables.

- By manipulating the MySQL grant tables directly with statements such as `INSERT`, `UPDATE`, or `DELETE`.

The preferred method is to use account-management statements because they are more concise and less error-prone than manipulating the grant tables directly. All such statements are described in Section 13.7.1, “Account Management Statements”. Direct grant table manipulation is discouraged, and is not described here. The server is free to ignore rows that become malformed as a result of such modifications.

Another option for creating accounts is to use the GUI tool MySQL Workbench. Also, several third-party programs offer capabilities for MySQL account administration. `phpMyAdmin` is one such program.

The following examples show how to use the `mysql` client program to set up new accounts. These examples assume that privileges have been set up according to the defaults described in Section 2.12.4, “Securing the Initial MySQL Accounts”. This means that to make changes, you must connect to the MySQL server as the MySQL `root` user, which has the `CREATE USER` privilege.

First, use the `mysql` program to connect to the server as the MySQL `root` user:
Adding User Accounts

Shell> mysql --user=root mysql

If you have assigned a password to the root account, you must also supply a --password or -p option.

After connecting to the server as root, you can add new accounts. The following example uses CREATE USER and GRANT statements to set up four accounts:

```sql
mysql> CREATE USER 'monty'@'localhost' IDENTIFIED BY 'some_pass';
```

```sql
mysql> GRANT ALL PRIVILEGES ON *.* TO 'monty'@'localhost' WITH GRANT OPTION;
```

```sql
mysql> CREATE USER 'monty'@'%' IDENTIFIED BY 'some_pass';
```

```sql
mysql> GRANT ALL PRIVILEGES ON *.* TO 'monty'@'%' WITH GRANT OPTION;
```

```sql
mysql> CREATE USER 'admin'@'localhost' IDENTIFIED BY 'admin_pass';
```

```sql
mysql> GRANT RELOAD, PROCESS ON *.* TO 'admin'@'localhost';
```

```sql
mysql> CREATE USER 'dummy'@'localhost';
```

The accounts created by those statements have the following properties:

- Two accounts have a user name of monty and a password of some_pass. Both are superuser accounts with full privileges to do anything. The 'monty'@'localhost' account can be used only when connecting from the local host. The 'monty'@'%' account uses the '%' wildcard for the host part, so it can be used to connect from any host.

  The 'monty'@'localhost' account is necessary if there is an anonymous-user account for localhost. Without the 'monty'@'localhost' account, that anonymous-user account takes precedence when monty connects from the local host and monty is treated as an anonymous user. The reason for this is that the anonymous-user account has a more specific Host column value than the 'monty'@'%' account and thus comes earlier in the user table sort order. (User table sorting is discussed in Section 6.2.4, "Access Control, Stage 1: Connection Verification").

- The 'admin'@'localhost' account has a password of admin_pass. This account can be used only by admin to connect from the local host. It is granted the RELOAD and PROCESS administrative privileges. These privileges enable the admin user to execute the mysqladmin reload, mysqladmin refresh, and mysqladmin flush-xxx commands, as well as mysqladmin processlist. No privileges are granted for accessing any databases. You could add such privileges using GRANT statements.

- The 'dummy'@'localhost' account has no password (which is insecure and not recommended). This account can be used only to connect from the local host. No privileges are granted. It is assumed that you will grant specific privileges to the account using GRANT statements.

To see the privileges for an account, use SHOW GRANTS:

```sql
mysql> SHOW GRANTS FOR 'admin'@'localhost';
```

```sql
+-----------------------------------------------------+
| Grants for admin@localhost                          |
| GRANT RELOAD, PROCESS ON *.* TO 'admin'@'localhost' |
+-----------------------------------------------------+

The next examples create three accounts and grant them access to specific databases. Each of them has a user name of custom and password of obscure:

```sql
mysql> CREATE USER 'custom'@'localhost' IDENTIFIED BY 'obscure';
```

```sql
mysql> GRANT SELECT, INSERT, UPDATE, DELETE, CREATE, DROP ON bankaccount.* TO 'custom'@'localhost';
```

```sql
mysql> CREATE USER 'custom'@'host47.example.com' IDENTIFIED BY 'obscure';
```

```sql
mysql> GRANT SELECT, INSERT, UPDATE, DELETE, CREATE, DROP ON expenses.* TO 'custom'@'host47.example.com';
```
Removing User Accounts

The three accounts can be used as follows:

- The first account can access the `bankaccount` database, but only from the local host.
- The second account can access the `expenses` database, but only from the host `host47.example.com`.
- The third account can access the `customer` database, from any host in the `example.com` domain.

This account has access from all machines in the domain due to use of the "%" wildcard character in the host part of the account name.

6.3.3 Removing User Accounts

To remove an account, use the `DROP USER` statement, which is described in Section 13.7.1.2, "DROP USER Syntax". For example:

```
mysql> DROP USER 'jeffrey'@'localhost';
```

6.3.4 Setting Account Resource Limits

One means of restricting client use of MySQL server resources is to set the global `max_user_connections` system variable to a nonzero value. This limits the number of simultaneous connections that can be made by any given account, but places no limits on what a client can do once connected. In addition, setting `max_user_connections` does not enable management of individual accounts. Both types of control are of interest to MySQL administrators.

To address such concerns, MySQL permits limits for individual accounts on use of these server resources:

- The number of queries an account can issue per hour
- The number of updates an account can issue per hour
- The number of times an account can connect to the server per hour
- The number of simultaneous connections to the server by an account

Any statement that a client can issue counts against the query limit, unless its results are served from the query cache. Only statements that modify databases or tables count against the update limit.

An "account" in this context corresponds to a row in the `mysql.user` table. That is, a connection is assessed against the `User` and `Host` values in the `user` table row that applies to the connection. For example, an account `usera'@'%.example.com'` corresponds to a row in the `user` table that has `User` and `Host` values of `usera` and `%.example.com`, to permit `usera` to connect from any host in the `example.com` domain. In this case, the server applies resource limits in this row collectively to all connections by `usera` from any host in the `example.com` domain because all such connections use the same account.

Before MySQL 5.0.3, an "account" was assessed against the actual host from which a user connects. This older method of accounting may be selected by starting the server with the `--old-style-user-limits` option. In this case, if `usera` connects simultaneously from `host1.example.com` and `host2.example.com`, the server applies the account resource limits separately to each connection. If `usera` connects again from `host1.example.com`, the server applies the limits for that connection together with the existing connection from that host.

To establish resource limits for an account, use the `GRANT` statement (see Section 13.7.1.3, "GRANT Syntax"). Provide a `WITH` clause that names each resource to be limited. The default value for each
Setting Account Resource Limits

limit is zero (no limit). For example, to create a new account that can access the customer database, but only in a limited fashion, issue these statements:

```sql
mysql> CREATE USER 'francis'@'localhost' IDENTIFIED BY 'frank';
mysql> GRANT ALL ON customer.* TO 'francis'@'localhost'
    -> WITH MAX_QUERIES_PER_HOUR 20
    -> MAX_UPDATES_PER_HOUR 10
    -> MAX_CONNECTIONS_PER_HOUR 5
    -> MAX_USER_CONNECTIONS 2;
```

The limit types need not all be named in the WITH clause, but those named can be present in any order. The value for each per-hour limit should be an integer representing a count per hour. For MAX_USER_CONNECTIONS, the limit is an integer representing the maximum number of simultaneous connections by the account. If this limit is set to zero, the global max_user_connections system variable value determines the number of simultaneous connections. If max_user_connections is also zero, there is no limit for the account.

To modify limits for an existing account, use a GRANT USAGE statement at the global level (ON *.*).
The following statement changes the query limit for francis to 100:

```sql
mysql> GRANT USAGE ON *.* TO 'francis'@'localhost'
    -> WITH MAX_QUERIES_PER_HOUR 100;
```

The statement modifies only the limit value specified and leaves the account otherwise unchanged.

To remove a limit, set its value to zero. For example, to remove the limit on how many times per hour francis can connect, use this statement:

```sql
mysql> GRANT USAGE ON *.* TO 'francis'@'localhost'
    -> WITH MAX_CONNECTIONS_PER_HOUR 0;
```

As mentioned previously, the simultaneous-connection limit for an account is determined from the MAX_USER_CONNECTIONS limit and the max_user_connections system variable. Suppose that the global max_user_connections value is 10 and three accounts have individual resource limits specified as follows:

- GRANT ... TO 'user1'@'localhost' WITH MAX_USER_CONNECTIONS 0;
- GRANT ... TO 'user2'@'localhost' WITH MAX_USER_CONNECTIONS 5;
- GRANT ... TO 'user3'@'localhost' WITH MAX_USER_CONNECTIONS 20;

user1 has a connection limit of 10 (the global max_user_connections value) because it has a MAX_USER_CONNECTIONS limit of zero. user2 and user3 have connection limits of 5 and 20, respectively, because they have nonzero MAX_USER_CONNECTIONS limits.

The server stores resource limits for an account in the user table row corresponding to the account. The max_questions, max_updates, and max_connections columns store the per-hour limits, and the max_user_connections column stores the MAX_USER_CONNECTIONS limit. (See Section 6.2.2, “Grant Tables”.) If your user table does not have these columns, it must be upgraded; see Section 4.4.8, “mysql_upgrade — Check and Upgrade MySQL Tables”.

Resource-use counting takes place when any account has a nonzero limit placed on its use of any of the resources.

As the server runs, it counts the number of times each account uses resources. If an account reaches its limit on number of connections within the last hour, the server rejects further connections for the account until that hour is up. Similarly, if the account reaches its limit on the number of queries or updates, the server rejects further queries or updates until the hour is up. In all such cases, the server issues appropriate error messages.

Resource counting occurs per account, not per client. For example, if your account has a query limit of 50, you cannot increase your limit to 100 by making two simultaneous client connections to the server. Queries issued on both connections are counted together.
Assigning Account Passwords

The current per-hour resource-use counts can be reset globally for all accounts, or individually for a given account:

- To reset the current counts to zero for all accounts, issue a `FLUSH USER_RESOURCES` statement. The counts also can be reset by reloading the grant tables (for example, with a `FLUSH PRIVILEGES` statement or a `mysqladmin reload` command).
- The counts for an individual account can be reset to zero by setting any of its limits again. Specify a limit value equal to the value currently assigned to the account.

Per-hour counter resets do not affect the `MAX_USER_CONNECTIONS` limit.

All counts begin at zero when the server starts. Counts do not carry over through server restarts.

For the `MAX_USER_CONNECTIONS` limit, an edge case can occur if the account currently has open the maximum number of connections permitted to it: A disconnect followed quickly by a connect can result in an error (`ER_TOO_MANY_USER_CONNECTIONS` or `ER_USER_LIMIT_REACHED`) if the server has not fully processed the disconnect by the time the connect occurs. When the server finishes disconnect processing, another connection will once more be permitted.

### 6.3.5 Assigning Account Passwords

Required credentials for clients that connect to the MySQL server can include a password. This section describes how to assign passwords for MySQL accounts.

MySQL stores passwords in the `user` table in the `mysql` system database. Operations that assign or modify passwords are permitted only to users with the `CREATE USER` privilege, or, alternatively, privileges for the `mysql` database (`INSERT` privilege to create new accounts, `UPDATE` privilege to modify existing accounts). If the `read_only` system variable is enabled, use of account-modification statements such as `CREATE USER` or `SET PASSWORD` additionally requires the `SUPER` privilege.

The discussion here summarizes syntax only for the most common password-assignment statements. For complete details on other possibilities, see Section 13.7.1.1, “CREATE USER Syntax”, Section 13.7.1.3, “GRANT Syntax”, and Section 13.7.1.6, “SET PASSWORD Syntax”.

MySQL hashes passwords stored in the `mysql.user` table to obfuscate them. For most statements described here, MySQL automatically hashes the password specified. An exception is `SET PASSWORD ... = PASSWORD('auth_string')`, for which you use the `PASSWORD()` function explicitly to hash the password. There are also syntaxes for `CREATE USER`, `GRANT`, and `SET PASSWORD` that permit hashed values to be specified literally; for details, see the descriptions of those statements.

To assign a password when you create a new account, use `CREATE USER` and include an `IDENTIFIED BY` clause:

```
mysql> CREATE USER 'jeffrey'@'localhost' IDENTIFIED BY 'mypass';
```

For this `CREATE USER` syntax, MySQL automatically hashes the password before storing it in the `mysql.user` table.

To assign or change a password for an existing account, use one of the following methods:

- Use `SET PASSWORD` with the `PASSWORD()` function:

  ```
  mysql> SET PASSWORD FOR 'jeffrey'@'localhost' = PASSWORD('mypass');
  ```

  If you are not connected as an anonymous user, you can change your own password by omitting the `FOR` clause:
The `PASSWORD()` function hashes the password using the hashing method determined by the value of the `old_passwords` system variable value. If `SET PASSWORD` rejects the hashed password value returned by `PASSWORD()` as not being in the correct format, it may be necessary to change `old_passwords` to change the hashing method. For descriptions of the permitted values, see Section 5.1.4, “Server System Variables”.

• You can also use a `GRANT USAGE` statement at the global level (`ON *.*`) to assign a password to an account without affecting the account’s current privileges:

```sql
mysql> GRANT USAGE ON *.* TO 'jeffrey'@'localhost'
    -> IDENTIFIED BY 'mypass';
```

For this `GRANT` syntax, MySQL automatically hashes the password before storing it in the `mysql.user` table.

• To change an account password from the command line, use the `mysqladmin` command:

```shell
shell> mysqladmin -u user_name -h host_name password "new_password"
```

The account for which this command sets the password is the one with a `mysql.user` table row that matches `user_name` in the `User` column and the client host `from which you connect` in the `Host` column.

For password changes made using `mysqladmin`, MySQL automatically hashes the password before storing it in the `mysql.user` table.

### 6.3.6 SQL-Based MySQL Account Activity Auditing

Applications can use the following guidelines to perform SQL-based auditing that ties database activity to MySQL accounts.

MySQL accounts correspond to rows in the `mysql.user` table. When a client connects successfully, the server authenticates the client to a particular row in this table. The `User` and `Host` column values in this row uniquely identify the account and correspond to the `'user_name'@'host_name'` format in which account names are written in SQL statements.

The account used to authenticate a client determines which privileges the client has. Normally, the `CURRENT_USER()` function can be invoked to determine which account this is for the client user. Its value is constructed from the `User` and `Host` columns of the `user` table row for the account.

However, there are circumstances under which the `CURRENT_USER()` value corresponds not to the client user but to a different account. This occurs in contexts when privilege checking is not based the client’s account:

• Stored routines (procedures and functions) defined with the `SQL SECURITY DEFINER` characteristic

• Views defined with the `SQL SECURITY DEFINER` characteristic (as of MySQL 5.1.12)

• Triggers and events

In those contexts, privilege checking is done against the `DEFINER` account and `CURRENT_USER()` refers to that account, not to the account for the client who invoked the stored routine or view or who caused the trigger to activate. To determine the invoking user, you can call the `USER()` function, which returns a value indicating the actual user name provided by the client and the host from which the client connected. However, this value does not necessarily correspond directly to an account in the `user` table, because the `USER()` value never contains wildcards, whereas account values (as returned by `CURRENT_USER()`) may contain user name and host name wildcards.
For example, a blank user name matches any user, so an account of "@localhost" enables clients to connect as an anonymous user from the local host with any user name. In this case, if a client connects as user1 from the local host, USER() and CURRENT_USER() return different values:

```sql
mysql> SELECT USER(), CURRENT_USER();
+-----------------+----------------+
| USER()          | CURRENT_USER() |
+-----------------+----------------+
| user1@localhost | @localhost     |
+-----------------+----------------+
```

The host name part of an account can contain wildcards, too. If the host name contains a '%' or '_' pattern character or uses netmask notation, the account can be used for clients connecting from multiple hosts and the CURRENT_USER() value will not indicate which one. For example, the account 'user2'@'%.example.com' can be used by user2 to connect from any host in the example.com domain. If user2 connects from remote.example.com, USER() and CURRENT_USER() return different values:

```sql
mysql> SELECT USER(), CURRENT_USER();
+--------------------------+---------------------+
| USER()                   | CURRENT_USER()      |
+--------------------------+---------------------+
| user2@remote.example.com | user2@%.example.com |
+--------------------------+---------------------+
```

If an application must invoke USER() for user auditing (for example, if it does auditing from within triggers) but must also be able to associate the USER() value with an account in the user table, it is necessary to avoid accounts that contain wildcards in the User or Host column. Specifically, do not permit User to be empty (which creates an anonymous-user account), and do not permit pattern characters or netmask notation in Host values. All accounts must have a nonempty User value and literal Host value.

With respect to the previous examples, the "@localhost" and 'user2'@'%.example.com' accounts should be changed not to use wildcards:

```sql
RENAME USER ''@localhost' TO 'user1'@'localhost';
RENAME USER 'user2'@'%.example.com' TO 'user2'@'remote.example.com';
```

If user2 must be able to connect from several hosts in the example.com domain, there should be a separate account for each host.

To extract the user name or host name part from a CURRENT_USER() or USER() value, use the SUBSTRING_INDEX() function:

```sql
mysql> SELECT SUBSTRING_INDEX(CURRENT_USER(),'@',1);
+---------------------------------------+
| SUBSTRING_INDEX(CURRENT_USER(),'@',1) |
| user1                                 |
+---------------------------------------+

mysql> SELECT SUBSTRING_INDEX(CURRENT_USER(),'@',-1);
+----------------------------------------+
| SUBSTRING_INDEX(CURRENT_USER(),'@',-1) |
| localhost                              |
+----------------------------------------+
```

### 6.4 Using Secure Connections

With an unencrypted connection between the MySQL client and the server, someone with access to the network could watch all your traffic and inspect the data being sent or received between client and server.
When you must move information over a network in a secure fashion, an unencrypted connection is unacceptable. To make any kind of data unreadable, use encryption. Encryption algorithms must include security elements to resist many kinds of known attacks such as changing the order of encrypted messages or replaying data twice.

MySQL supports secure (encrypted) connections between clients and the server using the TLS (Transport Layer Security) protocol. TLS is sometimes referred to as SSL (Secure Sockets Layer).

TLS uses encryption algorithms to ensure that data received over a public network can be trusted. It has mechanisms to detect data change, loss, or replay. TLS also incorporates algorithms that provide identity verification using the X509 standard.

X509 makes it possible to identify someone on the Internet. In basic terms, there should be some entity called a “Certificate Authority” (or CA) that assigns electronic certificates to anyone who needs them. Certificates rely on asymmetric encryption algorithms that have two encryption keys (a public key and a secret key). A certificate owner can present the certificate to another party as proof of identity. A certificate consists of its owner’s public key. Any data encrypted using this public key can be decrypted only using the corresponding secret key, which is held by the owner of the certificate.

For more information about TLS, SSL, X509, encryption, or public-key cryptography, perform an Internet search for the keywords in which you are interested.

MySQL can be compiled for secure-connection support using OpenSSL or yaSSL. For a comparison of the two packages, see Section 6.4.1, “OpenSSL Versus yaSSL” For information about the encryption protocols and ciphers each package supports, see Section 6.4.3, “Secure Connection Protocols and Ciphers”.

MySQL performs encryption on a per-connection basis, and use of encryption can be optional or mandatory. This enables you to choose an encrypted or unencrypted connection according to the requirements of individual applications. For information on how to require users to use encrypted connections, see the discussion of the REQUIRE clause of the GRANT statement in Section 13.7.1.3, “GRANT Syntax”.

Encrypted connections are not used by default. For applications that require the security provided by encrypted connections, the extra computation to encrypt the data is worthwhile.

Secure connections are available through the MySQL C API using the mysql_ssl_set() and mysql_options() functions. See Section 21.8.7.67, “mysql_ssl_set()”, and Section 21.8.7.49, “mysql_options()”.

Replication uses the C API, so secure connections can be used between master and slave servers. See Section 16.3.7, “Setting Up Replication to Use Secure Connections”.

It is also possible to connect securely from within an SSH connection to the MySQL server host. For an example, see Section 6.4.7, “Connecting to MySQL Remotely from Windows with SSH”.

6.4.1 OpenSSL Versus yaSSL

MySQL can be compiled using OpenSSL or yaSSL, both of which enable secure connections based on the OpenSSL API.

OpenSSL and yaSSL offer the same basic functionality, but additional features are available in MySQL distributions compiled using OpenSSL: OpenSSL supports a wider range of encryption ciphers from which to choose for the --ssl-cipher option, and supports the --ssl-capath option. See Section 6.4.5, “Command Options for Secure Connections”.

6.4.2 Building MySQL with Support for Secure Connections

To use SSL connections between the MySQL server and client programs, your system must support either OpenSSL or yaSSL, and your version of MySQL must be built with SSL support. To make it easier to use secure connections, MySQL is bundled with yaSSL, which uses the same licensing
Building MySQL with Support for Secure Connections

model as MySQL. (OpenSSL uses an Apache-style license.) yaSSL support is available on all MySQL platforms supported by Oracle Corporation.

To get secure connections to work with MySQL and SSL, you must do the following:

1. If you are not using a binary (precompiled) version of MySQL that has been built with SSL support, and you are going to use OpenSSL rather than the bundled yaSSL library, install OpenSSL if it has not already been installed. We have tested MySQL with OpenSSL 0.9.6. To obtain OpenSSL, visit http://www.openssl.org.

Building MySQL using OpenSSL requires a shared OpenSSL library, otherwise linker errors occur. Alternatively, build MySQL using yaSSL.

2. If you are not using a binary (precompiled) version of MySQL that has been built with SSL support, configure a MySQL source distribution to use SSL. When you configure MySQL, invoke the configure script like this:

```
shell> ./configure --with-ssl
```

That command configures the distribution to use the bundled yaSSL library. To use OpenSSL instead, specify the --with-ssl option with the path to the directory where the OpenSSL header files and libraries are located:

```
shell> ./configure --with-ssl=path
```

Note

On some platforms the full determination of the You may also need to explicitly add the SSL library and header directories. You can do this by setting the LDFLAGS, CFLAGS, CPPFLAGS and CXXFLAGS with the full directories. For example:

```
shell> LDFLAGS="-L/usr/local/ssl/lib" CFLAGS="-I/usr/local/ssl/include" \ 
CPPFLAGS="-I/usr/local/ssl/include" CXXFLAGS="-I/usr/local/ssl/include" \ 
configure --with-ssl=/usr/local/ssl
```

Before MySQL 5.1.11, you must use the appropriate option to select the SSL library that you want to use.

For yaSSL:

```
shell> ./configure --with-yassl
```

For OpenSSL:

```
shell> ./configure --with-openssl
```

Then compile and install the distribution.

On Unix platforms, yaSSL retrieves true random numbers from either /dev/urandom or /dev/random. Bug#13164 lists workarounds for some very old platforms which do not support these devices.

3. To check whether a `mysqld` server supports secure connections, examine the value of the have_ssl system variable:

```
mysql> SHOW VARIABLES LIKE 'have_ssl';
+----------------+-------+
| Variable_name  | Value |
+----------------+-------+
```

695
If the value is **YES**, the server supports secure connections. If the value is **DISABLED**, the server is capable of supporting secure connections but was not started with the appropriate `--ssl-xxx` options to enable secure connections to be used; see Section 6.4.4, “Configuring MySQL to Use Secure Connections”.

### 6.4.3 Secure Connection Protocols and Ciphers

To determine which encryption protocol and cipher are in use for an encrypted connection, use the following statements to check the values of the `Ssl_version` and `Ssl_cipher` status variables:

```sql
mysql> SHOW SESSION STATUS LIKE 'Ssl_version';
+---------------+-------+
| Variable_name | Value |
+---------------+-------+
| Ssl_version   | TLSv1 |
+---------------+-------+

mysql> SHOW SESSION STATUS LIKE 'Ssl_cipher';
+---------------+--------------------+
| Variable_name | Value              |
+---------------+--------------------+
| Ssl_cipher    | DHE-RSA-AES256-SHA |
+---------------+--------------------+
```

If the connection is not encrypted, both variables have an empty value.

MySQL supports encrypted connections using the TLSv1 protocol.

To determine which ciphers a given server supports, use the following statement to check the value of the `Ssl_cipher_list` status variable:

```sql
SHOW SESSION STATUS LIKE 'Ssl_cipher_list';
```

The set of available ciphers depends on your MySQL version and whether MySQL was compiled using OpenSSL or yaSSL, and (for OpenSSL) the library version used to compile MySQL.

MySQL passes this cipher list to OpenSSL:

- AES256-GCM-SHA384
- AES256-SHA
- AES256-SHA256
- CAMELLIA256-SHA
- DES-CBC3-SHA
- DHE-DSS-AES256-GCM-SHA384
- DHE-DSS-AES256-SHA
- DHE-DSS-AES256-SHA256
- DHE-DSS-CAMELLIA256-SHA
- DHE-RSA-AES256-GCM-SHA384
- DHE-RSA-AES256-SHA
- DHE-RSA-AES256-SHA256
- DHE-RSA-CAMELLIA256-SHA
- DHE-RSA-AES256-GCM-SHA384
- DHE-RSA-AES256-SHA
- DHE-RSA-AES256-SHA256
- DHE-RSA-CAMELLIA256-SHA
- ECDH-ECDSA-AES128-GCM-SHA256
- ECDH-ECDSA-AES128-SHA
- ECDH-ECDSA-AES128-SHA256
- ECDH-ECDSA-AES256-GCM-SHA384
- ECDH-ECDSA-AES256-SHA
- ECDH-ECDSA-AES256-SHA256
- ECDH-ECDSA-AES256-SHA384
- ECDH-ECDSA-DES-CBC3-SHA
- ECDH-RSA-AES256-GCM-SHA384
- ECDH-RSA-AES256-SHA
- ECDH-RSA-AES256-SHA256
- ECDH-RSA-AES256-SHA384
- ECDH-RSA-DES-CBC3-SHA
- ECDH-RSA-DES-CBC3-SHA
- ECDHE-ECDSA-AES128-GCM-SHA256
- ECDHE-ECDSA-AES128-SHA
- ECDHE-ECDSA-AES128-SHA256
- ECDHE-ECDSA-AES256-GCM-SHA384
- ECDHE-ECDSA-AES256-SHA
- ECDHE-ECDSA-AES256-SHA256
- ECDHE-ECDSA-AES256-SHA384
- ECDHE-ECDSA-AES256-SHA
6.4.4 Configuring MySQL to Use Secure Connections

To enable secure connections, your MySQL distribution must be built with SSL support, as described in Section 6.4.2, “Building MySQL with Support for Secure Connections”. In addition, the proper options must be used to specify the appropriate certificate and key files. For a complete list of options related to establishment of secure connections, see Section 6.4.5, “Command Options for Secure Connections”.

If you need to create the required SSL files, see Section 6.4.6, “Creating SSL Certificates and Keys Using openssl”.

Server-Side Configuration for Secure Connections

To start the MySQL server so that it permits clients to connect securely, use options that identify the certificate and key files the server uses when establishing a secure connection:

- `--ssl-ca` identifies the Certificate Authority (CA) certificate.

- `--ssl-cert` identifies the server public key certificate. This can be sent to the client and authenticated against the CA certificate that it has.

- `--ssl-key` identifies the server private key.

For example, start the server with these lines in the `my.cnf` file, changing the file names as necessary:

```
[mysqld]
ssl-ca=ca.pem
ssl-cert=server-cert.pem
ssl-key=server-key.pem
```
Configuring MySQL to Use Secure Connections

Each option names a file in PEM format. If you have a MySQL source distribution, you can test your setup using the demonstration certificate and key files in its `mysql-test/std_data` directory.

Client-Side Configuration for Secure Connections

For client programs, options for secure connections are similar to those used on the server side, but `--ssl-cert` and `--ssl-key` identify the client public and private key:

- `--ssl-ca` identifies the Certificate Authority (CA) certificate. This option, if used, must specify the same certificate used by the server.
- `--ssl-cert` identifies the client public key certificate.
- `--ssl-key` identifies the client private key.

To connect securely to a MySQL server that supports secure connections, the options that a client must specify depend on the encryption requirements of the MySQL account used by the client. (See the discussion of the `REQUIRE` clause in Section 13.7.1.3, "GRANT Syntax").

Suppose that you want to connect using an account that has no special encryption requirements or was created using a `GRANT` statement that includes the `REQUIRE SSL` option. As a recommended set of secure-connection options, start the server with at least `--ssl-cert` and `--ssl-key`, and invoke the client with `--ssl-ca`. A client can connect securely like this:

```
shell> mysql --ssl-ca=ca.pem
```

To require that a client certificate also be specified, create the account using the `REQUIRE X509` option. Then the client must also specify the proper client key and certificate files or the server will reject the connection:

```
shell> mysql --ssl-ca=ca.pem \
    --ssl-cert=client-cert.pem \
    --ssl-key=client-key.pem
```

To prevent use of encryption and override other `--ssl-xxx` options, invoke the client program with `--ssl=0` or a synonym (`--skip-ssl`, `--disable-ssl`):

```
shell> mysql --ssl=0
```

A client can determine whether the current connection with the server uses encryption by checking the value of the `Ssl_cipher` status variable. If the value is empty, the connection is not encrypted. Otherwise, the connection is encrypted and the value indicates the encryption cipher. For example:

```
mysql> SHOW STATUS LIKE 'Ssl_cipher';
+---------------+--------------------+
| Variable_name | Value              |
+---------------+--------------------+
| Ssl_cipher    | DHE-RSA-AES256-SHA |
+---------------+--------------------+
```

For the `mysql` client, an alternative is to use the `STATUS` or `\s` command and check the `SSL` line:

```
mysql> \s
...
SSL: Cipher in use is DHE-RSA-AES256-SHA
...
```

Or:

```
mysql> \s
```
C API Configuration for Secure Connections

The C API enables application programs to use secure connections:

- To establish a secure connection, use the `mysql_ssl_set()` C API function to set the appropriate certificate options before calling `mysql_real_connect()`. See Section 21.8.7.67, "mysql_ssl_set()".

- To determine whether encryption is in use after the connection is established, use `mysql_get_ssl_cipher()`. A non-NULL return value indicates an encrypted connection and names the cipher used for encryption. A NULL return value indicates that encryption is not being used. See Section 21.8.7.33, "mysql_get_ssl_cipher()".

Replication uses the C API, so secure connections can be used between master and slave servers. See Section 16.3.7, “Setting Up Replication to Use Secure Connections”.

6.4.5 Command Options for Secure Connections

This section describes options that specify whether to use secure connections and the names of certificate and key files. These options can be given on the command line or in an option file. They are not available unless MySQL has been built with SSL support. See Section 6.4.2, “Building MySQL with Support for Secure Connections”. For examples of suggested use and how to check whether a connection is secure, see Section 6.4.4, “Configuring MySQL to Use Secure Connections”. (There are also `--master-ssl*` options that can be used for setting up a secure connection from a slave replication server to a master server; see Section 16.1.3, “Replication and Binary Logging Options and Variables”.)

Table 6.8 Secure-Connection Option Summary

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
<th>Introduced</th>
</tr>
</thead>
<tbody>
<tr>
<td>--skip-ssl</td>
<td>Do not use secure connection</td>
<td></td>
</tr>
<tr>
<td>--ssl</td>
<td>Enable secure connection</td>
<td></td>
</tr>
<tr>
<td>--ssl-ca</td>
<td>Path of file that contains list of trusted SSL CAs</td>
<td>5.1.11</td>
</tr>
<tr>
<td>--ssl-capath</td>
<td>Path of directory that contains trusted SSL CA certificates in PEM format</td>
<td>5.1.11</td>
</tr>
<tr>
<td>--ssl-cert</td>
<td>Path of file that contains X509 certificate in PEM format</td>
<td>5.1.11</td>

</tbody>
</table>

- `--ssl`

For the MySQL server, this option specifies that the server permits but does not require secure connections.

For MySQL client programs, this option permits but does not require the client to connect to the server using encryption. Therefore, this option is not sufficient in itself to cause a secure connection to be used. For example, if you specify this option for a client program but the server has not been configured to support secure connections, the client falls back to an unencrypted connection.

As a recommended set of options to enable secure connections, use at least `--ssl-cert` and `--ssl-key` on the server side and `--ssl-ca` on the client side. See Section 6.4.4, “Configuring MySQL to Use Secure Connections”.
--ssl may be implied by other --ssl-xxx options, as indicated in the descriptions for those options.

The --ssl option in negated form overrides other --ssl-xxx options and indicates that encryption should not be used. To do this, specify the option as --ssl=0 or a synonym (--skip-ssl, --disable-ssl). For example, you might have options specified in the [client] group of your option file to use secure connections by default when you invoke MySQL client programs. To use an unencrypted connection instead, invoke the client program with --ssl=0 on the command line to override the options in the option file.

To require use of secure connections for a MySQL account, use a GRANT statement for the account that includes at least a REQUIRE SSL clause. Connections for the account will be rejected unless MySQL supports secure connections and the server and client have been started with the proper secure-connection options.

The REQUIRE clause permits other encryption-related options, which can be used to enforce stricter requirements than REQUIRE SSL. For additional details about which command options may or must be specified by clients that connect using accounts configured using the various REQUIRE options, see the description of REQUIRE in Section 13.7.1.3, "GRANT Syntax".

- --ssl-ca=file_name

The path to a file in PEM format that contains a list of trusted SSL certificate authorities. This option implies --ssl.

As of MySQL 5.1.18, if you use encryption when establishing a client connection, to tell the client not to authenticate the server certificate, specify neither --ssl-ca nor --ssl-capath. The server still verifies the client according to any applicable requirements established for the client account, and it still uses any --ssl-ca or --ssl-capath option values specified at server startup.

- --ssl-capath=dir_name

The path to a directory that contains trusted SSL certificate authority certificates in PEM format. This option implies --ssl.

As of MySQL 5.1.18, if you use encryption when establishing a client connection, to tell the client not to authenticate the server certificate, specify neither --ssl-ca nor --ssl-capath. The server still verifies the client according to any applicable requirements established for the client account, and it still uses any --ssl-ca or --ssl-capath option values specified at server startup.

MySQL distributions compiled using OpenSSL support the --ssl-capath option (see Section 6.4.1, "OpenSSL Versus yaSSL"). Distributions compiled using yaSSL do not because yaSSL does not look in any directory and does not follow a chained certificate tree. yaSSL requires that all components of the CA certificate tree be contained within a single CA certificate tree and that each certificate in the file has a unique SubjectName value. To work around this yaSSL limitation, concatenate the individual certificate files comprising the certificate tree into a new file and specify that file as the value of the --ssl-ca option.

- --ssl-cert=file_name

The name of the SSL certificate file in PEM format to use for establishing a secure connection. This option implies --ssl.

- --ssl-cipher=cipher_list

A list of permissible ciphers to use for connection encryption. If no cipher in the list is supported, encrypted connections will not work. This option implies --ssl.

For greatest portability, cipher_list should be a list of one or more cipher names, separated by colons. This format is understood both by OpenSSL and yaSSL. Examples:
**--ssl-cipher=AES128-SHA**  
**--ssl-cipher=DHE-RSA-AES256-SHA:AES128-SHA**

OpenSSL supports a more flexible syntax for specifying ciphers, as described in the OpenSSL documentation at [http://www.openssl.org/docs/apps/ciphers.html](http://www.openssl.org/docs/apps/ciphers.html). However, yaSSL does not, so attempts to use that extended syntax fail for a MySQL distribution compiled using yaSSL.

For information about which encryption ciphers MySQL supports, see Section 6.4.3, “Secure Connection Protocols and Ciphers”.

* **--ssl-key=file_name**

  The name of the SSL key file in PEM format to use for establishing a secure connection. This option implies **--ssl**.

  If the MySQL distribution was compiled using OpenSSL and the key file is protected by a passphrase, the program prompts the user for the passphrase. The password must be given interactively; it cannot be stored in a file. If the passphrase is incorrect, the program continues as if it could not read the key. If the MySQL distribution was built using yaSSL and the key file is protected by a passphrase, an error occurs.

* **--ssl-verify-server-cert**

  This option is available only for client programs, not the server. It causes the client to check the server's Common Name value in the certificate that the server sends to the client. The client verifies that name against the host name the client uses for connecting to the server, and the connection fails if there is a mismatch. For encrypted connections, this option helps prevent man-in-the-middle attacks. Verification is disabled by default. This option was added in MySQL 5.1.11.

### 6.4.6 Creating SSL Certificates and Keys Using openssl

This section describes how to use the `openssl` command to set up SSL certificate and key files for use by MySQL servers and clients. The first example shows a simplified procedure such as you might use from the command line. The second shows a script that contains more detail. The first two examples are intended for use on Unix and both use the `openssl` command that is part of OpenSSL. The third example describes how to set up SSL files on Windows.

**Important**

Whatever method you use to generate the certificate and key files, the Common Name value used for the server and client certificates/keys must each differ from the Common Name value used for the CA certificate. Otherwise, the certificate and key files will not work for servers compiled using OpenSSL. A typical error in this case is:

```
ERROR 2026 (HY000): SSL connection error:  
error:00000001:lib(0):func(0):reason(1)
```

**Example 1: Creating SSL Files from the Command Line on Unix**

The following example shows a set of commands to create MySQL server and client certificate and key files. You will need to respond to several prompts by the `openssl` commands. To generate test files, you can press Enter to all prompts. To generate files for production use, you should provide nonempty responses.

```
# Create clean environment
shell> rm -rf newcerts
shell> mkdir newcerts && cd newcerts

# Create CA certificate
```
Creating SSL Certificates and Keys Using openssl

shell> openssl genrsa 2048 > ca-key.pem
shell> openssl req -new -x509 -nodes -days 3600 -key ca-key.pem -out ca.pem

# Create server certificate, remove passphrase, and sign it
# server-cert.pem = public key, server-key.pem = private key
shell> openssl req -newkey rsa:2048 -days 3600 -nodes -keyout server-key.pem -out server-req.pem
shell> openssl rsa -in server-key.pem -out server-key.pem
shell> openssl x509 -req -in server-req.pem -days 3600 -CA ca.pem -CAkey ca-key.pem -set_serial 01 -out server-cert.pem

# Create client certificate, remove passphrase, and sign it
# client-cert.pem = public key, client-key.pem = private key
shell> openssl req -newkey rsa:2048 -days 3600 -nodes -keyout client-key.pem -out client-req.pem
shell> openssl rsa -in client-key.pem -out client-key.pem
shell> openssl x509 -req -in client-req.pem -days 3600 -CA ca.pem -CAkey ca-key.pem -set_serial 01 -out client-cert.pem

After generating the certificates, verify them:

shell> openssl verify -CAfile ca.pem server-cert.pem client-cert.pem
server-cert.pem: OK
client-cert.pem: OK

Now you have a set of files that can be used as follows:

- **ca.pem**: Use this as the argument to **--ssl-ca** on the server and client sides. (The CA certificate, if used, must be the same on both sides.)

- **server-cert.pem, server-key.pem**: Use these as the arguments to **--ssl-cert** and **--ssl-key** on the server side.

- **client-cert.pem, client-key.pem**: Use these as the arguments to **--ssl-cert** and **--ssl-key** on the client side.

To use the files for SSL connections, see Section 6.4.4, “Configuring MySQL to Use Secure Connections”.

**Example 2: Creating SSL Files Using a Script on Unix**

Here is an example script that shows how to set up SSL certificate and key files for MySQL. After executing the script, use the files for SSL connections as described in Section 6.4.4, “Configuring MySQL to Use Secure Connections”.

```bash
DIR=`pwd`/openssl
PRIV=$DIR/private
mkdir $DIR $PRIV $DIR/newcerts
cp /usr/share/ssl/openssl.cnf $DIR
replace ./demoCA $DIR -- $DIR/openssl.cnf

# Create necessary files: $database, $serial and $new_certs_dir
directory (optional)
touch $DIR/index.txt
echo "01" > $DIR/serial

# Generation of Certificate Authority (CA)
openssl req -new -x509 -keyout $PRIV/cakey.pem -out $DIR/ca.pem -days 3600

# Sample output:
# Using configuration from /home/monty/openssl/openssl.cnf
```

ssl-ca=$DIR/ca.pem
ssl-cert=$DIR/client-cert.pem
ssl-key=$DIR/client-key.pem
[mysqld]
ssl-ca=$DIR/ca.pem
ssl-cert=$DIR/server-cert.pem
ssl-key=$DIR/server-key.pem
EOF
```

Example 3: Creating SSL Files on Windows

Download OpenSSL for Windows if it is not installed on your system. An overview of available packages can be seen here:

Choose the Win32 OpenSSL Light or Win64 OpenSSL Light package, depending on your architecture (32-bit or 64-bit). The default installation location will be C:\OpenSSL-Win32 or C:\OpenSSL-Win64, depending on which package you downloaded. The following instructions assume a default location of C:\OpenSSL-Win32. Modify this as necessary if you are using the 64-bit package.

If a message occurs during setup indicating '...critical component is missing: Microsoft Visual C++ 2008 Redistributables', cancel the setup and download one of the following packages as well, again depending on your architecture (32-bit or 64-bit):

- **Visual C++ 2008 Redistributables (x86)**, available at:

- **Visual C++ 2008 Redistributables (x64)**, available at:

After installing the additional package, restart the OpenSSL setup procedure.

During installation, leave the default C:\OpenSSL-Win32 as the install path, and also leave the default option 'Copy OpenSSL DLL files to the Windows system directory' selected.

When the installation has finished, add C:\OpenSSL-Win32\bin to the Windows System Path variable of your server:

1. On the Windows desktop, right-click the My Computer icon, and select Properties.
2. Select the Advanced tab from the System Properties menu that appears, and click the Environment Variables button.
3. Under **System Variables**, select **Path**, then click the **Edit** button. The **Edit System Variable** dialogue should appear.

4. Add `;C:\OpenSSL-Win32\bin` to the end (notice the semicolon).

5. Press OK 3 times.

6. Check that OpenSSL was correctly integrated into the Path variable by opening a new command console (Start>Run>cmd.exe) and verifying that OpenSSL is available:

    ![Command Output]

    Depending on your version of Windows, the preceding path-setting instructions might differ slightly.

After OpenSSL has been installed, use instructions similar to those from Example 1 (shown earlier in this section), with the following changes:

- Change the following Unix commands:

    ```
    # Create clean environment
    shell> rm -rf newcerts
    shell> mkdir newcerts && cd newcerts
    ```

    On Windows, use these commands instead:

    ```
    # Create clean environment
    C:\> md c:\newcerts
    C:\> cd c:\newcerts
    ```

- When a `\` character is shown at the end of a command line, this `\` character must be removed and the command lines entered all on a single line.

After generating the certificate and key files, to use them for SSL connections, see Section 6.4.4, “Configuring MySQL to Use Secure Connections”.

### 6.4.7 Connecting to MySQL Remotely from Windows with SSH

This section describes how to get a secure connection to a remote MySQL server with SSH. The information was provided by David Carlson <dcarlson@mplcomm.com>.

2. Start your Windows SSH client. Set `Host_Name = yourmysqlserver_URL_or_IP`. Set `userid=your_userid` to log in to your server. This `userid` value might not be the same as the user name of your MySQL account.

3. Set up port forwarding. Either do a remote forward (Set `local_port: 3306, remote_host: yourmysqlservername_or_ip, remote_port: 3306`) or a local forward (Set `port: 3306, host: localhost, remote_port: 3306`).

4. Save everything, otherwise you will have to redo it the next time.

5. Log in to your server with the SSH session you just created.
6. On your Windows machine, start some ODBC application (such as Access).

7. Create a new file in Windows and link to MySQL using the ODBC driver the same way you normally do, except type in localhost for the MySQL host server, not yourmysqlservername.

At this point, you should have an ODBC connection to MySQL, encrypted using SSH.
Chapter 7 Backup and Recovery

   7.6.4 MyISAM Table Optimization ...................................................... 730
   7.6.5 Setting Up a MyISAM Table Maintenance Schedule ....................... 731

It is important to back up your databases so that you can recover your data and be up and running again in case problems occur, such as system crashes, hardware failures, or users deleting data by mistake. Backups are also essential as a safeguard before upgrading a MySQL installation, and they can be used to transfer a MySQL installation to another system or to set up replication slave servers.

MySQL offers a variety of backup strategies from which you can choose the methods that best suit the requirements for your installation. This chapter discusses several backup and recovery topics with which you should be familiar:

- Types of backups: Logical versus physical, full versus incremental, and so forth.
- Methods for creating backups.
- Recovery methods, including point-in-time recovery.
- Backup scheduling, compression, and encryption.
- Table maintenance, to enable recovery of corrupt tables.

Additional Resources

Resources related to backup or to maintaining data availability include the following:

- Customers of MySQL Enterprise Edition can use the MySQL Enterprise Backup product for backups. For an overview of the MySQL Enterprise Backup product, see Section 23.2, “MySQL Enterprise Backup Overview”.
- Details for mysqldump, mysqlhotcopy, and other MySQL backup programs can be found in Chapter 4, MySQL Programs.
- The syntax of the SQL statements described here is given in Chapter 13, SQL Statement Syntax.
• For additional information about InnoDB backup procedures, see Section 14.6.10, “InnoDB Backup and Recovery”.

• Replication enables you to maintain identical data on multiple servers. This has several benefits, such as enabling client query load to be distributed over servers, availability of data even if a given server is taken offline or fails, and the ability to make backups with no impact on the master by using a slave server. See Chapter 16, Replication.

• MySQL Cluster provides a high-availability, high-redundancy version of MySQL adapted for the distributed computing environment. See Chapter 17, MySQL Cluster NDB 6.1 - 7.1. For information specifically about MySQL Cluster backup, see Section 17.5.3, “Online Backup of MySQL Cluster”.

• Distributed Replicated Block Device (DRBD) is another high-availability solution. It works by replicating a block device from a primary server to a secondary server at the block level. See Chapter 15, High Availability and Scalability

7.1 Backup and Recovery Types

This section describes the characteristics of different types of backups.

Physical (Raw) Versus Logical Backups

Physical backups consist of raw copies of the directories and files that store database contents. This type of backup is suitable for large, important databases that need to be recovered quickly when problems occur.

Logical backups save information represented as logical database structure (CREATE DATABASE, CREATE TABLE statements) and content (INSERT statements or delimited-text files). This type of backup is suitable for smaller amounts of data where you might edit the data values or table structure, or recreate the data on a different machine architecture.

Logical backup methods have these characteristics:

• The backup is done by querying the MySQL server to obtain database structure and content information.

• Backup is slower than physical methods because the server must access database information and convert it to logical format. If the output is written on the client side, the server must also send it to the backup program.

• Output is larger than for physical backup, particularly when saved in text format.

• Backup and restore granularity is available at the server level (all databases), database level (all tables in a particular database), or table level. This is true regardless of storage engine.

• The backup does not include log or configuration files, or other database-related files that are not part of databases.

• Backups stored in logical format are machine independent and highly portable.

• Logical backups are performed with the MySQL server running. The server is not taken offline.

• Logical backup tools include the mysqldump program and the SELECT ... INTO OUTFILE statement. These work for any storage engine, even MEMORY.

• To restore logical backups, SQL-format dump files can be processed using the mysql client. To load delimited-text files, use the LOAD DATA INFILE statement or the mysqlimport client.

Physical backup methods have these characteristics:

• The backup consists of exact copies of database directories and files. Typically this is a copy of all or part of the MySQL data directory. Data from MEMORY tables cannot be backed up this way because their contents are not stored on disk.
Local Versus Remote Backups

- Physical backup methods are faster than logical because they involve only file copying without conversion.

- Output is more compact than for logical backup.

- Backup and restore granularity ranges from the level of the entire data directory down to the level of individual files. This may or may not provide for table-level granularity, depending on storage engine. (Each *MyISAM* table corresponds uniquely to a set of files, but an *InnoDB* table shares file storage with other *InnoDB* tables.)

- In addition to databases, the backup can include any related files such as log or configuration files.

- Backups are portable only to other machines that have identical or similar hardware characteristics.

- Backups can be performed while the MySQL server is not running. If the server is running, it is necessary to perform appropriate locking so that the server does not change database contents during the backup.

- Physical backup tools include file system-level commands (such as *cp*, *scp*, *tar*, *rsync*), *mysqlhotcopy* for *MyISAM* tables, *ibbackup* for *InnoDB* tables, or *START BACKUP* for *NDB* tables.

- For restore, files copied at the file system level or with *mysqlhotcopy* can be copied back to their original locations with file system commands; *ibbackup* restores *InnoDB* tables, and *ndb_restore* restores *NDB* tables.

Online Versus Offline Backups

Online backups take place while the MySQL server is running so that the database information can be obtained from the server. Offline backups take place while the server is stopped. This distinction can also be described as “hot” versus “cold” backups; a “warm” backup is one where the server remains running but locked against modifying data while you access database files externally.

Online backup methods have these characteristics:

- The backup is less intrusive to other clients, which can connect to the MySQL server during the backup and may be able to access data depending on what operations they need to perform.

- Care must be taken to impose appropriate locking so that data modifications do not take place that would compromise backup integrity. The MySQL Enterprise Backup product does such locking automatically.

Offline backup methods have these characteristics:

- Clients can be affected adversely because the server is unavailable during backup. For that reason, such backups are often taken from a replication slave server that can be taken offline without harming availability.

- The backup procedure is simpler because there is no possibility of interference from client activity.

A similar distinction between online and offline applies for recovery operations, and similar characteristics apply. However, it is more likely that clients will be affected for online recovery than for online backup because recovery requires stronger locking. During backup, clients might be able to read data while it is being backed up. Recovery modifies data and does not just read it, so clients must be prevented from accessing data while it is being restored.

Local Versus Remote Backups

A local backup is performed on the same host where the MySQL server runs, whereas a remote backup is done from a different host. For some types of backups, the backup can be initiated from a remote host even if the output is written locally on the server. host.
• **mysqldump** can connect to local or remote servers. For SQL output (CREATE and INSERT statements), local or remote dumps can be done and generate output on the client. For delimited-text output (with the `--tab` option), data files are created on the server host.

• **mysqlhotcopy** performs only local backups: It connects to the server to lock it against data modifications and then copies local table files.

• **SELECT ... INTO OUTFILE** can be initiated from a local or remote client host, but the output file is created on the server host.

• Physical backup methods typically are initiated locally on the MySQL server host so that the server can be taken offline, although the destination for copied files might be remote.

### Snapshot Backups

Some file system implementations enable “snapshots” to be taken. These provide logical copies of the file system at a given point in time, without requiring a physical copy of the entire file system. (For example, the implementation may use copy-on-write techniques so that only parts of the file system modified after the snapshot time need be copied.) MySQL itself does not provide the capability for taking file system snapshots. It is available through third-party solutions such as Veritas, LVM, or ZFS.

### Full Versus Incremental Backups

A full backup includes all data managed by a MySQL server at a given point in time. An incremental backup consists of the changes made to the data during a given time span (from one point in time to another). MySQL has different ways to perform full backups, such as those described earlier in this section. Incremental backups are made possible by enabling the server’s binary log, which the server uses to record data changes.

### Full Versus Point-in-Time (Incremental) Recovery

A full recovery restores all data from a full backup. This restores the server instance to the state that it had when the backup was made. If that state is not sufficiently current, a full recovery can be followed by recovery of incremental backups made since the full backup, to bring the server to a more up-to-date state.

Incremental recovery is recovery of changes made during a given time span. This is also called point-in-time recovery because it makes a server’s state current up to a given time. Point-in-time recovery is based on the binary log and typically follows a full recovery from the backup files that restores the server to its state when the backup was made. Then the data changes written in the binary log files are applied as incremental recovery to redo data modifications and bring the server up to the desired point in time.

### Table Maintenance

Data integrity can be compromised if tables become corrupt. For InnoDB tables, this is not a typical issue. For programs to check MyISAM tables and repair them if problems are found, see Section 7.6, “MyISAM Table Maintenance and Crash Recovery”.

### Backup Scheduling, Compression, and Encryption

Backup scheduling is valuable for automating backup procedures. Compression of backup output reduces space requirements, and encryption of the output provides better security against unauthorized access of backed-up data. MySQL itself does not provide these capabilities. The MySQL Enterprise Backup product can compress InnoDB backups, and compression or encryption of backup output can be achieved using file system utilities. Other third-party solutions may be available.

### 7.2 Database Backup Methods

This section summarizes some general methods for making backups.
Making a Hot Backup with MySQL Enterprise Backup

Customers of MySQL Enterprise Edition can use the MySQL Enterprise Backup product to do physical backups of entire instances or selected databases, tables, or both. This product includes features for incremental and compressed backups. Backing up the physical database files makes restore much faster than logical techniques such as the mysqldump command. InnoDB tables are copied using a hot backup mechanism. (Ideally, the InnoDB tables should represent a substantial majority of the data.) Tables from other storage engines are copied using a warm backup mechanism. For an overview of the MySQL Enterprise Backup product, see Section 23.2, “MySQL Enterprise Backup Overview”.

Making Backups with mysqldump or mysqlhotcopy

The mysqldump program and the mysqlhotcopy script can make backups. mysqldump is more general because it can back up all kinds of tables. mysqlhotcopy works only with some storage engines. (See Section 7.4, “Using mysqldump for Backups”, and Section 4.6.9, “mysqlhotcopy — A Database Backup Program”.)

For InnoDB tables, it is possible to perform an online backup that takes no locks on tables using the --single-transaction option to mysqldump. See Section 7.3.1, “Establishing a Backup Policy”.

Making Backups by Copying Table Files

For storage engines that represent each table using its own files, tables can be backed up by copying those files. For example, MyISAM tables are stored as files, so it is easy to do a backup by copying files (*_.frm, *_.MYD, and *_.MYI files). To get a consistent backup, stop the server or lock and flush the relevant tables:

LOCK TABLES tbl_list READ;
FLUSH TABLES tbl_list;
