• Error number: 1551; Symbol: ER_EVENT SAME_NAME; SQLSTATE: HY000
  Message: Same old and new event name

• Error number: 1552; Symbol: ER_EVENT_DATA_TOO_LONG; SQLSTATE: HY000
  Message: Data for column '%s' too long

• Error number: 1553; Symbol: ER_DROP_INDEX_FK; SQLSTATE: HY000
  Message: Cannot drop index '%s': needed in a foreign key constraint

  InnoDB reports this error when you attempt to drop the last index that can enforce a particular referential constraint.

  For optimal performance with DML statements, InnoDB requires an index to exist on foreign key columns, so that UPDATE and DELETE operations on a parent table can easily check whether corresponding rows exist in the child table. MySQL creates or drops such indexes automatically when needed, as a side-effect of CREATE TABLE, CREATE INDEX, and ALTER TABLE statements.

  When you drop an index, InnoDB checks if the index is used for checking a foreign key constraint. It is still OK to drop the index if there is another index that can be used to enforce the same constraint. InnoDB prevents you from dropping the last index that can enforce a particular referential constraint.

• Error number: 1554; Symbol: ER_WARN_DEPRECATED_SYNTAX_WITH_VER; SQLSTATE: HY000
  Message: The syntax '%s' is deprecated and will be removed in MySQL %s. Please use %s instead

• Error number: 1555; Symbol: ER_CANT_WRITE_LOCK_LOG_TABLE; SQLSTATE: HY000
  Message: You can't write-lock a log table. Only read access is possible

• Error number: 1556; Symbol: ER_CANT_LOCK_LOG_TABLE; SQLSTATE: HY000
  Message: You can't use locks with log tables.

• Error number: 1557; Symbol: ER_FOREIGN_DUPLICATE_KEY_OLD_UNUSED; SQLSTATE: 23000
  Message: Upholding foreign key constraints for table '%s', entry '%s', key %d would lead to a duplicate entry

• Error number: 1558; Symbol: ER_COL_COUNT_DOESNT_MATCH_PLEASE_UPDATE; SQLSTATE: HY000
  Message: Column count of mysql.%s is wrong. Expected %d, found %d. Created with MySQL %d, now running %d. Please use mysql_upgrade to fix this error.

- **Error number: 1659; Symbol: ER_FIELD_TYPE_NOT_ALLOWED_AS_PARTITION_FIELD; SQLSTATE: HY000**
  Message: Field '%s' is of a not allowed type for this type of partitioning

- **Error number: 1660; Symbol: ER_PARTITION_FIELDS_TOO_LONG; SQLSTATE: HY000**
  Message: The total length of the partitioning fields is too large

- **Error number: 1661; Symbol: ER_BINLOG_ROWENGINE_AND_STMTENGINE; SQLSTATE: HY000**
  Message: Cannot execute statement: impossible to write to binary log since both row-incapable engines and statement-incapable engines are involved.

- **Error number: 1662; Symbol: ER BINLOG ROW MODE AND_STMT ENGINE; SQLSTATE: HY000**
  Message: Cannot execute statement: impossible to write to binary log since BINLOG FORMAT = ROW and at least one table uses a storage engine limited to statement-based logging.

- **Error number: 1663; Symbol: ER BINLOG UNSAFE AND_STMT ENGINE; SQLSTATE: HY000**
Server Error Message Reference

Message: Cannot execute statement: impossible to write to binary log since statement is unsafe, storage engine is limited to statement-based logging, and BINLOG_FORMAT = MIXED. %s

• Error number: 1664; Symbol: ER_BINLOG_ROW_INJECTION_AND_STMT_ENGINE; SQLSTATE: HY000
Message: Cannot execute statement: impossible to write to binary log since statement is in row format and at least one table uses a storage engine limited to statement-based logging.

• Error number: 1665; Symbol: ER_BINLOG_STMT_MODE_AND_ROW_ENGINE; SQLSTATE: HY000
Message: Cannot execute statement: impossible to write to binary log since BINLOG_FORMAT = STATEMENT and at least one table uses a storage engine limited to row-based logging.%s

• Error number: 1666; Symbol: ER_BINLOG_ROW_INJECTION_AND_STMT_MODE; SQLSTATE: HY000
Message: Cannot execute statement: impossible to write to binary log since statement is in row format and BINLOG_FORMAT = STATEMENT.

• Error number: 1667; Symbol: ER_BINLOG_MULTIPLE_ENGINES_AND_SELF_LOGGING_ENGINE; SQLSTATE: HY000
Message: Cannot execute statement: impossible to write to binary log since more than one engine is involved and at least one engine is self-logging.

• Error number: 1668; Symbol: ER_BINLOG_UNSAFE_LIMIT; SQLSTATE: HY000
Message: The statement is unsafe because it uses a LIMIT clause. This is unsafe because the set of rows included cannot be predicted.

• Error number: 1669; Symbol: ER_UNUSED4; SQLSTATE: HY000
Message: The statement is unsafe because it uses INSERT DELAYED. This is unsafe because the times when rows are inserted cannot be predicted.

• Error number: 1670; Symbol: ER_BINLOG_UNSAFE_SYSTEM_TABLE; SQLSTATE: HY000
Message: The statement is unsafe because it uses the general log, slow query log, or performance_schema table(s). This is unsafe because system tables may differ on slaves.

• Error number: 1671; Symbol: ER_BINLOG_UNSAFE_AUTOINC_COLUMNS; SQLSTATE: HY000
Message: Statement is unsafe because it invokes a trigger or a stored function that inserts into an AUTO_INCREMENT column. Inserted values cannot be logged correctly.

• Error number: 1672; Symbol: ER_BINLOG_UNSAFE_UDF; SQLSTATE: HY000
Message: Statement is unsafe because it uses a UDF which may not return the same value on the slave.

• Error number: 1673; Symbol: ER_BINLOG_UNSAFE_SYSTEM_VARIABLE; SQLSTATE: HY000
Message: Statement is unsafe because it uses a system variable that may have a different value on the slave.

• Error number: 1674; Symbol: ER_BINLOG_UNSAFE_SYSTEM_FUNCTION; SQLSTATE: HY000
Message: Statement is unsafe because it uses a system function that may return a different value on the slave.

• Error number: 1675; Symbol: ER_BINLOG_UNSAFE_NONTRANS_AFTER_TRANS; SQLSTATE: HY000
Message: Statement is unsafe because it accesses a non-transactional table after accessing a transactional table within the same transaction.

- Error number: 1676; Symbol: ER_MESSAGE_AND_STATEMENT; SQLSTATE: HY000
  Message: %s Statement: %s

- Error number: 1677; Symbol: ER_SLAVE_CONVERSION_FAILED; SQLSTATE: HY000
  Message: Column %d of table '%s.%s' cannot be converted from type '%s' to type '%s'

- Error number: 1678; Symbol: ER_SLAVE_CANT_CREATE_CONVERSION; SQLSTATE: HY000
  Message: Can't create conversion table for table '%s.%s'

- Error number: 1679; Symbol: ER_INSIDE_TRANSACTION_PREVENTS_SWITCH_BINLOG_FORMAT; SQLSTATE: HY000
  Message: Cannot modify @@session.binlog_format inside a transaction

- Error number: 1680; Symbol: ER_PATH_LENGTH; SQLSTATE: HY000
  Message: The path specified for %s is too long.

- Error number: 1681; Symbol: ER_WARN_DEPRECATED_SYNTAX_NO_REPLACEMENT; SQLSTATE: HY000
  Message: '%s' is deprecated and will be removed in a future release.

- Error number: 1682; Symbol: ER_WRONG_NATIVE_TABLE_STRUCTURE; SQLSTATE: HY000
  Message: Native table '%s'.%s has the wrong structure

- Error number: 1683; Symbol: ER_WRONG_PERFSCHHEMA_USAGE; SQLSTATE: HY000
  Message: Invalid performance_schema usage.

- Error number: 1684; Symbol: ER_WARN_I_S_SKIPPED_TABLE; SQLSTATE: HY000
  Message: Table '%s'.%s was skipped since its definition is being modified by concurrent DDL statement

- Error number: 1685; Symbol: ER_INSIDE_TRANSACTION_PREVENTS_SWITCH_BINLOG_DIRECT; SQLSTATE: HY000
  Message: Cannot modify @@session.binlog_direct_non_transactional_updates inside a transaction

- Error number: 1686; Symbol: ER_STORED_FUNCTION_PREVENTS_SWITCH_BINLOG_DIRECT; SQLSTATE: HY000
  Message: Cannot change the binlog direct flag inside a stored function or trigger

- Error number: 1687; Symbol: ER_SPATIAL_MUST_HAVE_GEOM_COL; SQLSTATE: 42000
  Message: A SPATIAL index may only contain a geometrical type column

- Error number: 1688; Symbol: ER_TOO_LONG_INDEX_COMMENT; SQLSTATE: HY000
  Message: Comment for index '%s' is too long (max = %lu)

- Error number: 1689; Symbol: ER_LOCK_ABORTED; SQLSTATE: HY000
  Message: Wait on a lock was aborted due to a pending exclusive lock
• Error number: 1690; Symbol: ER_DATA_OUT_OF_RANGE; SQLSTATE: 22003
  Message: %s value is out of range in '%s'

• Error number: 1691; Symbol: ER_WRONG_SPVAR_TYPE_IN_LIMIT; SQLSTATE: HY000
  Message: A variable of a non-integer based type in LIMIT clause

• Error number: 1692; Symbol: ER_BINLOG_UNSAFE_MULTIPLE_ENGINES_AND_SELF_LOGGING_ENGINE; SQLSTATE: HY000
  Message: Mixing self-logging and non-self-logging engines in a statement is unsafe.

• Error number: 1693; Symbol: ER_BINLOG_UNSAFE_MIXED_STATEMENT; SQLSTATE: HY000
  Message: Statement accesses nontransactional table as well as transactional or temporary table, and writes to any of them.

• Error number: 1694; Symbol: ER_INSIDE_TRANSACTION_PREVENTS_SWITCH_SQL_LOG_BIN; SQLSTATE: HY000
  Message: Cannot modify @@session.sql_log_bin inside a transaction

• Error number: 1695; Symbol: ER_STORED_FUNCTION_PREVENTS_SWITCH_SQL_LOG_BIN; SQLSTATE: HY000
  Message: Cannot change the sql_log_bin inside a stored function or trigger

• Error number: 1696; Symbol: ER_FAILED_READ_FROM_PAR_FILE; SQLSTATE: HY000
  Message: Failed to read from the .par file

• Error number: 1697; Symbol: ER_VALUES_IS_NOT_INT_TYPE_ERROR; SQLSTATE: HY000
  Message: VALUES value for partition '%s' must have type INT

• Error number: 1698; Symbol: ER_ACCESS_DENIED_NO_PASSWORD_ERROR; SQLSTATE: 28000
  Message: Access denied for user '%s'@'%s'

• Error number: 1699; Symbol: ER_SET_PASSWORD_AUTH_PLUGIN; SQLSTATE: HY000
  Message: SET PASSWORD has no significance for users authenticating via plugins

• Error number: 1700; Symbol: ER_GRANT_PLUGIN_USER_EXISTS; SQLSTATE: HY000
  Message: GRANT with IDENTIFIED WITH is illegal because the user %-.*s already exists

• Error number: 1701; Symbol: ER_TRUNCATE_ILLEGAL_FK; SQLSTATE: 42000
  Message: Cannot truncate a table referenced in a foreign key constraint (%s)

• Error number: 1702; Symbol: ER_PLUGIN_IS_PERMANENT; SQLSTATE: HY000
  Message: Plugin '%s' is force_plus_permanent and can not be unloaded

• Error number: 1703; Symbol: ER_SLAVE_HEARTBEAT_VALUE_OUT_OF_RANGE_MIN; SQLSTATE: HY000
  Message: The requested value for the heartbeat period is less than 1 millisecond. The value is reset to 0, meaning that heartbeating will effectively be disabled.

• Error number: 1704; Symbol: ER_SLAVE_HEARTBEAT_VALUE_OUT_OF_RANGE_MAX; SQLSTATE: HY000
Message: The requested value for the heartbeat period exceeds the value of `slave_net_timeout` seconds. A sensible value for the period should be less than the timeout.

- Error number: 1705; Symbol: ER_STMT_CACHE_FULL; SQLSTATE: HY000
  Message: Multi-row statements required more than `max_binlog_stmt_cache_size` bytes of storage; increase this mysqld variable and try again.

- Error number: 1706; Symbol: ER_MULTI_UPDATE_KEY_CONFLICT; SQLSTATE: HY000
  Message: Primary key/partition key update is not allowed since the table is updated both as '%s' and '%s'.

- Error number: 1707; Symbol: ER_TABLE_NEEDS_REBUILD; SQLSTATE: HY000
  Message: Table rebuild required. Please do "ALTER TABLE `%s` FORCE" or dump/reload to fix it!

- Error number: 1708; Symbol: WARN_OPTION_BELOW_LIMIT; SQLSTATE: HY000
  Message: The value of '%s' should be no less than the value of '%s'.

- Error number: 1709; Symbol: ER_INDEX_COLUMN_TOO_LONG; SQLSTATE: HY000
  Message: Index column size too large. The maximum column size is %lu bytes.

- Error number: 1710; Symbol: ER_ERROR_IN_TRIGGER_BODY; SQLSTATE: HY000
  Message: Trigger '%s' has an error in its body: '%s'.

- Error number: 1711; Symbol: ER_ERROR_IN_UNKNOWN_TRIGGER_BODY; SQLSTATE: HY000
  Message: Unknown trigger has an error in its body: '%s'.

- Error number: 1712; Symbol: ER_INDEX_CORRUPT; SQLSTATE: HY000
  Message: Index %s is corrupted.

- Error number: 1713; Symbol: ER_UNDO_RECORD_TOO_BIG; SQLSTATE: HY000
  Message: Undo log record is too big.

- Error number: 1714; Symbol: ER_BINLOG_UNSAFE_INSERT_IGNORE_SELECT; SQLSTATE: HY000
  Message: INSERT IGNORE... SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are ignored. This order cannot be predicted and may differ on master and the slave.

- Error number: 1715; Symbol: ER_BINLOG_UNSAFE_INSERT_SELECT_UPDATE; SQLSTATE: HY000
  Message: INSERT... SELECT... ON DUPLICATE KEY UPDATE is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are updated. This order cannot be predicted and may differ on master and the slave.

- Error number: 1716; Symbol: ER_BINLOG_UNSAFE_REPLACE_SELECT; SQLSTATE: HY000
  Message: REPLACE... SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are replaced. This order cannot be predicted and may differ on master and the slave.

- Error number: 1717; Symbol: ER_BINLOG_UNSAFE_CREATE_IGNORE_SELECT; SQLSTATE: HY000
Message: CREATE... IGNORE SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are ignored. This order cannot be predicted and may differ on master and the slave.

- Error number: 1718; Symbol: ER_BINLOG_UNSAFE_CREATE_REPLACE_SELECT; SQLSTATE: HY000

Message: CREATE... REPLACE SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are replaced. This order cannot be predicted and may differ on master and the slave.

- Error number: 1719; Symbol: ER_BINLOG_UNSAFE_UPDATE_IGNORE; SQLSTATE: HY000

Message: UPDATE IGNORE is unsafe because the order in which rows are updated determines which (if any) rows are ignored. This order cannot be predicted and may differ on master and the slave.

- Error number: 1720; Symbol: ER_PLUGIN_NO_UNINSTALL; SQLSTATE: HY000

Message: Plugin '%s' is marked as not dynamically uninstallable. You have to stop the server to uninstall it.

- Error number: 1721; Symbol: ER_PLUGIN_NO_INSTALL; SQLSTATE: HY000

Message: Plugin '%s' is marked as not dynamically installable. You have to stop the server to install it.

- Error number: 1722; Symbol: ER_BINLOG_UNSAFE_WRITE_AUTOINC_SELECT; SQLSTATE: HY000

Message: Statements writing to a table with an auto-increment column after selecting from another table are unsafe because the order in which rows are retrieved determines what (if any) rows will be written. This order cannot be predicted and may differ on master and the slave.

- Error number: 1723; Symbol: ER_BINLOG_UNSAFE_CREATE_SELECT_AUTOINC; SQLSTATE: HY000

Message: CREATE TABLE... SELECT... on a table with an auto-increment column is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are inserted. This order cannot be predicted and may differ on master and the slave.

- Error number: 1724; Symbol: ER_BINLOG_UNSAFE_INSERT_TWO_KEYS; SQLSTATE: HY000

Message: INSERT... ON DUPLICATE KEY UPDATE on a table with more than one UNIQUE KEY is unsafe

- Error number: 1725; Symbol: ER_TABLE_IN_FK_CHECK; SQLSTATE: HY000

Message: Table is being used in foreign key check.

- Error number: 1726; Symbol: ER_UNSUPPORTED_ENGINE; SQLSTATE: HY000

Message: Storage engine '%s' does not support system tables. [%s.%s]

- Error number: 1727; Symbol: ER_BINLOG_UNSAFE_AUTOINC_NOT_FIRST; SQLSTATE: HY000

Message: INSERT into autoincrement field which is not the first part in the composed primary key is unsafe.

- Error number: 1728; Symbol: ER_CANNOT_LOAD_FROM_TABLE_V2; SQLSTATE: HY000

Message: Cannot load from %s.%s. The table is probably corrupted

  Message: Unknown LOCK type '%s'
•   Error number: 1802; Symbol: ER_MTS_CHANGE_MASTER_CANT_RUN_WITH_GAPS; SQLSTATE: HY000
  Message: CHANGE MASTER cannot be executed when the slave was stopped with an error or killed in MTS mode. Consider using RESET SLAVE or START SLAVE UNTIL.
•   Error number: 1803; Symbol: ER_MTS_RECOVERY_FAILURE; SQLSTATE: HY000
  Message: Cannot recover after SLAVE errored out in parallel execution mode. Additional error messages can be found in the MySQL error log.
•   Error number: 1804; Symbol: ER_MTS_RESET_WORKERS; SQLSTATE: HY000
  Message: Cannot clean up worker info tables. Additional error messages can be found in the MySQL error log.
•   Error number: 1805; Symbol: ER_COL_COUNT_DOESNT_MATCH_CORRUPTED_V2; SQLSTATE: HY000
  Message: Column count of %s.%s is wrong. Expected %d, found %d. The table is probably corrupted
•   Error number: 1806; Symbol: ER_SLAVE_SILENT_RETRY_TRANSACTION; SQLSTATE: HY000
  Message: Slave must silently retry current transaction
•   Error number: 1807; Symbol: ER_DISCARD_FK_CHECKS_RUNNING; SQLSTATE: HY000
  Message: There is a foreign key check running on table '%s'. Cannot discard the table.
•   Error number: 1808; Symbol: ER_TABLE_SCHEMA_MISMATCH; SQLSTATE: HY000
  Message: Schema mismatch (%s)
•   Error number: 1809; Symbol: ER_TABLE_IN_SYSTEM_TABLESPACE; SQLSTATE: HY000
  Message: Table '%s' in system tablespace
•   Error number: 1810; Symbol: ER_IO_READ_ERROR; SQLSTATE: HY000
  Message: IO Read error: (%lu, %s) %s
- Error number: 1811; Symbol: ER_IO_WRITE_ERROR; SQLSTATE: HY000
  Message: IO Write error: (%lu, %s) %s

- Error number: 1812; Symbol: ER_TABLESPACE_MISSING; SQLSTATE: HY000
  Message: Tablespace is missing for table %s.

- Error number: 1813; Symbol: ER_TABLESPACE_EXISTS; SQLSTATE: HY000
  Message: Tablespace '%s' exists.

- Error number: 1814; Symbol: ER_TABLESPACE_DISCARDED; SQLSTATE: HY000
  Message: Tablespace has been discarded for table '%s'

- Error number: 1815; Symbol: ER_INTERNAL_ERROR; SQLSTATE: HY000
  Message: Internal error: %s

- Error number: 1816; Symbol: ER_INNODB_IMPORT_ERROR; SQLSTATE: HY000
  Message: ALTER TABLE %s IMPORT TABLESPACE failed with error %lu : '%s'

- Error number: 1817; Symbol: ER_INNODB_INDEX_CORRUPT; SQLSTATE: HY000
  Message: Index corrupt: %s

- Error number: 1818; Symbol: ER_INVALID_YEAR_COLUMN_LENGTH; SQLSTATE: HY000
  Message: Supports only YEAR or YEAR(4) column.

- Error number: 1819; Symbol: ER_NOT_VALID_PASSWORD; SQLSTATE: HY000
  Message: Your password does not satisfy the current policy requirements

- Error number: 1820; Symbol: ER_MUST_CHANGE_PASSWORD; SQLSTATE: HY000
  Message: You must reset your password using ALTER USER statement before executing this statement.

- Error number: 1821; Symbol: ER_FK_NO_INDEX_CHILD; SQLSTATE: HY000
  Message: Failed to add the foreign key constraint. Missing index for constraint '%s' in the foreign table '%s'

- Error number: 1822; Symbol: ER_FK_NO_INDEX_PARENT; SQLSTATE: HY000
  Message: Failed to add the foreign key constraint. Missing index for constraint '%s' in the referenced table '%s'

- Error number: 1823; Symbol: ER_FK_FAIL_ADD_SYSTEM; SQLSTATE: HY000
  Message: Failed to add the foreign key constraint '%s' to system tables

- Error number: 1824; Symbol: ER_FK_CANNOT_OPEN_PARENT; SQLSTATE: HY000
  Message: Failed to open the referenced table '%s'

- Error number: 1825; Symbol: ER_FK_INCORRECT_OPTION; SQLSTATE: HY000
  Message: Failed to add the foreign key constraint on table '%s'. Incorrect options in FOREIGN KEY constraint '%s'
• Error number: 1826; Symbol: ER_FK_DUP_NAME; SQLSTATE: HY000
  Message: Duplicate foreign key constraint name '%s'

• Error number: 1827; Symbol: ER_PASSWORD_FORMAT; SQLSTATE: HY000
  Message: The password hash doesn't have the expected format. Check if the correct password algorithm is being used with the PASSWORD() function.

• Error number: 1828; Symbol: ER_FK_COLUMN_CANNOT_DROP; SQLSTATE: HY000
  Message: Cannot drop column '%s': needed in a foreign key constraint '%s'

• Error number: 1829; Symbol: ER_FK_COLUMN_CANNOT_DROP_CHILD; SQLSTATE: HY000
  Message: Cannot drop column '%s': needed in a foreign key constraint '%s' of table '%s'

• Error number: 1830; Symbol: ER_FK_COLUMN_NOT_NULL; SQLSTATE: HY000
  Message: Column '%s' cannot be NOT NULL: needed in a foreign key constraint '%s' SET NULL

• Error number: 1831; Symbol: ER_DUP_INDEX; SQLSTATE: HY000
  Message: Duplicate index '%s' defined on the table '%s.%s'. This is deprecated and will be disallowed in a future release.

• Error number: 1832; Symbol: ER_FK_COLUMN_CANNOT_CHANGE; SQLSTATE: HY000
  Message: Cannot change column '%s': used in a foreign key constraint '%s'

• Error number: 1833; Symbol: ER_FK_COLUMN_CANNOT_CHANGE_CHILD; SQLSTATE: HY000
  Message: Cannot change column '%s': used in a foreign key constraint '%s' of table '%s'

• Error number: 1834; Symbol: ER_FK_CANNOT_DELETE_PARENT; SQLSTATE: HY000
  Message: Cannot delete rows from table which is parent in a foreign key constraint '%s' of table '%s'
  ER_FK_CANNOT_DELETE_PARENT was removed after 5.7.3.

• Error number: 1834; Symbol: ER_UNUSED5; SQLSTATE: HY000
  Message: Cannot delete rows from table which is parent in a foreign key constraint '%s' of table '%s'
  ER_UNUSED5 was added in 5.7.4.

• Error number: 1835; Symbol: ER_MALFORMED_PACKET; SQLSTATE: HY000
  Message: Malformed communication packet.

• Error number: 1836; Symbol: ER_READ_ONLY_MODE; SQLSTATE: HY000
  Message: Running in read-only mode

• Error number: 1837; Symbol: ER_GTID_NEXT_TYPE_UNDEFINED_GROUP; SQLSTATE: HY000
  Message: When @@SESSION.GTID_NEXT is set to a GTID, you must explicitly set it to a different value after a COMMIT or ROLLBACK. Please check GTID_NEXT variable manual page for detailed explanation. Current @@SESSION.GTID_NEXT is '%s'.

• Error number: 1838; Symbol: ER_VARIABLE_NOT_SETTABLE_IN_SP; SQLSTATE: HY000
  Message: The system variable '%s' cannot be set in stored procedures.
• **Error number:** 1839; **Symbol:** ER_CANT_SET_GTID_PURGED_WHEN_GTID_MODE_IS_OFF; **SQLSTATE:** HY000
  Message: @@GLOBAL.GTID_PURGED can only be set when @@GLOBAL.GTID_MODE = ON.

• **Error number:** 1840; **Symbol:** ER_CANT_SET_GTID_PURGED_WHEN_GTID_EXECUTED_IS_NOT_EMPTY; **SQLSTATE:** HY000
  Message: @@GLOBAL.GTID_PURGED can only be set when @@GLOBAL.GTID_EXECUTED is empty.

• **Error number:** 1841; **Symbol:** ER_CANT_SET_GTID_PURGED_WHEN_OWNED_GTIDS_IS_NOT_EMPTY; **SQLSTATE:** HY000
  Message: @@GLOBAL.GTID_PURGED can only be set when there are no ongoing transactions (not even in other clients).

• **Error number:** 1842; **Symbol:** ER_GTID_PURGED_WAS_CHANGED; **SQLSTATE:** HY000
  Message: @@GLOBAL.GTID_PURGED was changed from '%s' to '%s'.

• **Error number:** 1843; **Symbol:** ER_GTID_EXECUTED_WAS_CHANGED; **SQLSTATE:** HY000
  Message: @@GLOBAL.GTID_EXECUTED was changed from '%s' to '%s'.

• **Error number:** 1844; **Symbol:** ER_BINLOG_STMT_MODE_AND_NO_REPL_TABLES; **SQLSTATE:** HY000
  Message: Cannot execute statement: impossible to write to binary log since BINLOG_FORMAT = STATEMENT, and both replicated and non replicated tables are written to.

• **Error number:** 1845; **Symbol:** ER_ALTER_OPERATION_NOT_SUPPORTED; **SQLSTATE:** 0A000
  Message: %s is not supported for this operation. Try %s.

  **ER_ALTER_OPERATION_NOT_SUPPORTED** was added in 5.7.1.

• **Error number:** 1846; **Symbol:** ER_ALTER_OPERATION_NOT_SUPPORTED_REASON; **SQLSTATE:** 0A000
  Message: %s is not supported. Reason: %s. Try %s.

  **ER_ALTER_OPERATION_NOT_SUPPORTED_REASON** was added in 5.7.1.

  Message: Adding an auto-increment column requires a lock

  `ER_ALTER_OPERATION NOT_SUPPORTED_REASON_AUTOINC` was added in 5.7.1.

- **Error number:** `1855`; **Symbol:** `ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_HIDDEN_FTS`; **SQLSTATE:** `HY000`
  
  Message: Cannot replace hidden FTS_DOC_ID with a user-visible one

  `ER_ALTER_OPERATION NOT_SUPPORTED_REASON_HIDDEN_FTS` was added in 5.7.1.

- **Error number:** `1856`; **Symbol:** `ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_CHANGE_FTS`; **SQLSTATE:** `HY000`
  
  Message: Cannot drop or rename FTS_DOC_ID

  `ER_ALTER_OPERATION NOT_SUPPORTED_REASON_CHANGE_FTS` was added in 5.7.1.

- **Error number:** `1857`; **Symbol:** `ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_FTS`; **SQLSTATE:** `HY000`
  
  Message: Fulltext index creation requires a lock

  `ER_ALTER_OPERATION NOT_SUPPORTED_REASON_FTS` was added in 5.7.1.
• Error number: 1858; Symbol: ER_SQL_SLAVE_SKIP_COUNTER_NOT_SETTABLE_IN_GTID_MODE; SQLSTATE: HY000
Message: sql_slave_skip_counter can not be set when the server is running with @@GLOBAL.GTID_MODE = ON. Instead, for each transaction that you want to skip, generate an empty transaction with the same GTID as the transaction
ER_SQL_SLAVE_SKIP_COUNTER_NOT_SETTABLE_IN_GTID_MODE was added in 5.7.1.

• Error number: 1859; Symbol: ER_DUP_UNKNOWN_IN_INDEX; SQLSTATE: 23000
Message: Duplicate entry for key '%s'
ER_DUP_UNKNOWN_IN_INDEX was added in 5.7.1.

• Error number: 1860; Symbol: ER_IDENT_CAUSES_TOO_LONG_PATH; SQLSTATE: HY000
Message: Long database name and identifier for object resulted in path length exceeding %d characters. Path: '%s'.
ER_IDENT_CAUSES_TOO_LONG_PATH was added in 5.7.1.

• Error number: 1861; Symbol: ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_NOT_NULL; SQLSTATE: HY000
Message: cannot silently convert NULL values, as required in this SQL_MODE
ER_ALTER_OPERATION_NOT_SUPPORTED_REASON_NOT_NULL was added in 5.7.1.

• Error number: 1862; Symbol: ER_MUST_CHANGE_PASSWORD_LOGIN; SQLSTATE: HY000
Message: Your password has expired. To log in you must change it using a client that supports expired passwords.
ER_MUST_CHANGE_PASSWORD_LOGIN was added in 5.7.1.

• Error number: 1863; Symbol: ER_ROW_IN_WRONG_PARTITION; SQLSTATE: HY000
Message: Found a row in wrong partition %s
ER_ROW_IN_WRONG_PARTITION was added in 5.7.1.

• Error number: 1864; Symbol: ER_MTS_EVENT_BIGGER_PENDING_JOBS_SIZE_MAX; SQLSTATE: HY000
Message: Cannot schedule event %s, relay-log name %s, position %s to Worker thread because its size %lu exceeds %lu of slave_pending_jobs_size_max.
ER_MTS_EVENT_BIGGER_PENDING_JOBS_SIZE_MAX was added in 5.7.2.

• Error number: 1865; Symbol: ER_INNODB_NO_FT_USES_PARSER; SQLSTATE: HY000
Message: Cannot CREATE FULLTEXT INDEX WITH PARSER on InnoDB table
ER_INNODB_NO_FT_USES_PARSER was added in 5.7.2.

• Error number: 1866; Symbol: ER_BINLOG_LOGICAL_CORRUPTION; SQLSTATE: HY000
Message: The binary log file '%s' is logically corrupted: %s
ER_BINLOG_LOGICAL_CORRUPTION was added in 5.7.2.

• Error number: 1867; Symbol: ER_WARN_PURGE_LOG_IN_USE; SQLSTATE: HY000
Message: file %s was not purged because it was being read by %d thread(s), purged only %d out of %d files.

**ER_WARN_PURGE_LOG_IN_USE** was added in 5.7.2.

- **Error number:** 1868; Symbol: **ER_WARN_PURGE_LOG_IS_ACTIVE**; SQLSTATE: **HY000**
  
  Message: file %s was not purged because it is the active log file.

  **ER_WARN_PURGE_LOG_IS_ACTIVE** was added in 5.7.2.

- **Error number:** 1869; Symbol: **ER_AUTO_INCREMENT_CONFLICT**; SQLSTATE: **HY000**
  
  Message: Auto-increment value in UPDATE conflicts with internally generated values

  **ER_AUTO_INCREMENT_CONFLICT** was added in 5.7.2.

- **Error number:** 1870; Symbol: **WARN_ON_BLOCKHOLE_IN_RBR**; SQLSTATE: **HY000**
  
  Message: Row events are not logged for %s statements that modify BLACKHOLE tables in row format. Table(s): '%s'

  **WARN_ON_BLOCKHOLE_IN_RBR** was added in 5.7.2.

- **Error number:** 1871; Symbol: **ER_SLAVE_MI_INIT_REPOSITORY**; SQLSTATE: **HY000**
  
  Message: Slave failed to initialize master info structure from the repository

  **ER_SLAVE_MI_INIT_REPOSITORY** was added in 5.7.2.

- **Error number:** 1872; Symbol: **ER_SLAVE_RLI_INIT_REPOSITORY**; SQLSTATE: **HY000**
  
  Message: Slave failed to initialize relay log info structure from the repository

  **ER_SLAVE_RLI_INIT_REPOSITORY** was added in 5.7.2.

- **Error number:** 1873; Symbol: **ER_ACCESS_DENIED_CHANGE_USER_ERROR**; SQLSTATE: **28000**
  
  Message: Access denied trying to change to user '%s'@'%' (using password: %s). Disconnecting.

  **ER_ACCESS_DENIED_CHANGE_USER_ERROR** was added in 5.7.2.

- **Error number:** 1874; Symbol: **ER_INNODB_READ_ONLY**; SQLSTATE: **HY000**
  
  Message: InnoDB is in read only mode.

  **ER_INNODB_READ_ONLY** was added in 5.7.2.

- **Error number:** 1875; Symbol: **ER_STOP_SLAVE_SQL_THREAD_TIMEOUT**; SQLSTATE: **HY000**
  
  Message: STOP SLAVE command execution is incomplete: Slave SQL thread got the stop signal, thread is busy, SQL thread will stop once the current task is complete.

  **ER_STOP_SLAVE_SQL_THREAD_TIMEOUT** was added in 5.7.2.

- **Error number:** 1876; Symbol: **ER_STOP_SLAVE_IO_THREAD_TIMEOUT**; SQLSTATE: **HY000**
  
  Message: STOP SLAVE command execution is incomplete: Slave IO thread got the stop signal, thread is busy, IO thread will stop once the current task is complete.

  **ER_STOP_SLAVE_IO_THREAD_TIMEOUT** was added in 5.7.2.

- **Error number:** 1877; Symbol: **ER_TABLE_CORRUPT**; SQLSTATE: **HY000**
Message: Operation cannot be performed. The table '%s.%s' is missing, corrupt or contains bad data.

ER_TABLE_CORRUPT was added in 5.7.2.

• Error number: 1878; Symbol: ER_TEMP_FILE_WRITE_FAILURE; SQLSTATE: HY000
  Message: Temporary file write failure.
  ER_TEMP_FILE_WRITE_FAILURE was added in 5.7.3.

• Error number: 1879; Symbol: ER_INNODB_FT_AUX_NOT_HEX_ID; SQLSTATE: HY000
  Message: Upgrade index name failed, please use create index(alter table) algorithm copy to rebuild index.
  ER_INNODB_FT_AUX_NOT_HEX_ID was added in 5.7.4.

• Error number: 1880; Symbol: ER_OLD_TEMPORALS_UPGRADED; SQLSTATE: HY000
  Message: TIME/TIMESTAMP/DATETIME columns of old format have been upgraded to the new format.
  ER_OLD_TEMPORALS_UPGRADED was added in 5.7.4.

• Error number: 1881; Symbol: ER_INNODB_FORCED_RECOVERY; SQLSTATE: HY000
  Message: Operation not allowed when innodb_forced_recovery > 0.
  ER_INNODB_FORCED_RECOVERY was added in 5.7.4.

• Error number: 1882; Symbol: ER_AES_INVALID_IV; SQLSTATE: HY000
  Message: The initialization vector supplied to %s is too short. Must be at least %d bytes long
  ER_AES_INVALID_IV was added in 5.7.4.

• Error number: 1883; Symbol: ER_PLUGIN_CANNOT_BE_UNINSTALLED; SQLSTATE: HY000
  Message: Plugin '%s' cannot be uninstalled now. %s
  ER_PLUGIN_CANNOT_BE_UNINSTALLED was added in 5.7.5.

• Error number: 1884; Symbol: ER_GTIDUnsafe_Binlog_Splittable_Statement_And_Gtid_Group; SQLSTATE: HY000
  Message: Cannot execute statement because it needs to be written to the binary log as multiple statements, and this is not allowed when @@SESSION.GTID_NEXT == 'UUID:NUMBER'.
  ER_GTIDUnsafe_Binlog_Splittable_Statement_And_Gtid_Group was added in 5.7.5.

• Error number: 1885; Symbol: ER_SLAVE_HAS_MORE_GTIDS_THAN_MASTER; SQLSTATE: HY000
  Message: Slave has more GTIDs than the master has, using the master’s SERVER_UUID. This may indicate that the end of the binary log was truncated or that the last binary log file was lost, e.g., after a power or disk failure when sync_binlog != 1. The master may or may not have rolled back transactions that were already replicated to the slave. Suggest to replicate any transactions that master has rolled back from slave to master, and/or commit empty transactions on master to account for transactions that have been committed on master but are not included in GTID_EXECUTED.
  ER_SLAVE_HAS_MORE_GTIDS_THAN_MASTER was added in 5.7.6.

• Error number: 1886; Symbol: ER_MISSING_KEY; SQLSTATE: HY000
Message: The table '%s.%s' does not have the necessary key(s) defined on it. Please check the table definition and create index(s) accordingly.

**ER_MISSING_KEY** was added in 5.7.22.

- Error number: 1887; Symbol: warn_named_pipe_access_everyone; SQLSTATE: HY000
  
  Message: Setting named_pipe_full_access_group='%s' is insecure. Consider using a Windows group with fewer members.

  **WARN_NAMED_PIPE_ACCESS_EVERYONE** was added in 5.7.27.

- Error number: 1888; Symbol: ER_FOUND_MISSING_GTIDS; SQLSTATE: HY000
  
  Message: Cannot replicate to server with server_uuid='%s' because the present server has purged required binary logs. The connecting server needs to replicate the missing transactions from elsewhere, or be replaced by a new server created from a more recent backup. To prevent this error in the future, consider increasing the binary log expiration period on the present server. %s.

  **ER_FOUND_MISSING_GTIDS** was added in 5.7.29.

- Error number: 1906; Symbol: ER_SLAVE_IO_THREAD_MUST_STOP; SQLSTATE: HY000
  
  Message: This operation cannot be performed with a running slave io thread; run STOP SLAVE IO_THREAD first.

  **ER_SLAVE_IO_THREAD_MUST_STOP** was added in 5.7.4, removed after 5.7.5.

- Error number: 3000; Symbol: ER_FILE_CORRUPT; SQLSTATE: HY000
  
  Message: File %s is corrupted

- Error number: 3001; Symbol: ER_ERROR_ON_MASTER; SQLSTATE: HY000
  
  Message: Query partially completed on the master (error on master: %d) and was aborted. There is a chance that your master is inconsistent at this point. If you are sure that your master is ok, run this query manually on the slave and then restart the slave with SET GLOBAL SQL_SLAVE_SKIP_COUNTER=1; START SLAVE; Query:'%s'

- Error number: 3002; Symbol: ER_INCONSISTENT_ERROR; SQLSTATE: HY000
  
  Message: Query caused different errors on master and slave. Error on master: message (format)='%s' error code=%d; Error on slave:actual message='%s', error code=%d. Default database:'%s'. Query:'%s'

- Error number: 3003; Symbol: ER_STORAGE_ENGINE_NOT_LOADED; SQLSTATE: HY000
  
  Message: Storage engine for table '%s'.%s is not loaded.

- Error number: 3004; Symbol: ER_GET_STACKED_DA_WITHOUT_ACTIVE_HANDLER; SQLSTATE: 02002
  
  Message: GET STACKED DIAGNOSTICS when handler not active

- Error number: 3005; Symbol: ER_WARN_LEGACY_SYNTAX_CONVERTED; SQLSTATE: HY000
  
  Message: %s is no longer supported. The statement was converted to %s.

- Error number: 3006; Symbol: ER_BINLOG_UNSAFE_FULLTEXT_PLUGIN; SQLSTATE: HY000
  
  Message: Statement is unsafe because it uses a fulltext parser plugin which may not return the same value on the slave.
Server Error Message Reference

**ER_BINLOG_UNSAFE_FULLTEXT_PLUGIN** was added in 5.7.1.

- **Error number:** 3007; Symbol: **ER_CANNOT_DISCARD_TEMPORARY_TABLE**; SQLSTATE: **HY000**
  
  **Message:** Cannot DISCARD/IMPORT tablespace associated with temporary table

  **ER_CANNOT_DISCARD_TEMPORARY_TABLE** was added in 5.7.1.

- **Error number:** 3008; Symbol: **ER_FK_DEPTH_EXCEEDED**; SQLSTATE: **HY000**
  
  **Message:** Foreign key cascade delete/update exceeds max depth of %d.

  **ER_FK_DEPTH_EXCEEDED** was added in 5.7.2.

- **Error number:** 3009; Symbol: **ER_COL_COUNT_DOESNT_MATCH PLEASE_UPDATE_V2**; SQLSTATE: **HY000**
  
  **Message:** Column count of %s.%s is wrong. Expected %d, found %d. Created with MySQL %d, now running %d. Please use mysql_upgrade to fix this error.

  **ER_COL_COUNT_DOESNT_MATCH PLEASE_UPDATE_V2** was added in 5.7.2.

- **Error number:** 3010; Symbol: **ER_WARN_TRIGGER DOESNT HAVE CREATED**; SQLSTATE: **HY000**
  
  **Message:** Trigger %s.%s.%s does not have CREATED attribute.

  **ER_WARN_TRIGGER DOESNT HAVE CREATED** was added in 5.7.2.

- **Error number:** 3011; Symbol: **ER_REFERENCED_TRG DOES NOT EXIST**; SQLSTATE: **HY000**
  
  **Message:** Referenced trigger '%s' for the given action time and event type does not exist.

  **ER_REFERENCED_TRG DOES NOT EXIST** was added in 5.7.2.

- **Error number:** 3012; Symbol: **ER_EXPLAIN NOT SUPPORTED**; SQLSTATE: **HY000**
  
  **Message:** EXPLAIN FOR CONNECTION command is supported only for SELECT/UPDATE/INSERT/DELETE/REPLACE

  **ER_EXPLAIN NOT SUPPORTED** was added in 5.7.2.

- **Error number:** 3013; Symbol: **ER_INVALID_FIELD_SIZE**; SQLSTATE: **HY000**
  
  **Message:** Invalid size for column '%s'.

  **ER_INVALID_FIELD_SIZE** was added in 5.7.2.

- **Error number:** 3014; Symbol: **ER_MISSING_HA_CREATE_OPTION**; SQLSTATE: **HY000**
  
  **Message:** Table storage engine '%s' found required create option missing

  **ER_MISSING_HA_CREATE_OPTION** was added in 5.7.2.

- **Error number:** 3015; Symbol: **ER_ENGINE_OUT_OF_MEMORY**; SQLSTATE: **HY000**
  
  **Message:** Out of memory in storage engine '%s'.

  **ER_ENGINE_OUT_OF_MEMORY** was added in 5.7.3.
• Error number: 3016; Symbol: ER_PASSWORD_EXPIRE_ANONYMOUS_USER; SQLSTATE: HY000
Message: The password for anonymous user cannot be expired.
ER_PASSWORD_EXPIRE_ANONYMOUS_USER was added in 5.7.3.
• Error number: 3017; Symbol: ER_SLAVE_SQL_THREAD_MUST_STOP; SQLSTATE: HY000
Message: This operation cannot be performed with a running slave sql thread; run STOP SLAVE SQL_THREAD first
ER_SLAVE_SQL_THREAD_MUST_STOP was added in 5.7.3.
• Error number: 3018; Symbol: ER_NO_FT_MATERIALIZED_SUBQUERY; SQLSTATE: HY000
Message: Cannot create FULLTEXT index on materialized subquery
ER_NO_FT_MATERIALIZED_SUBQUERY was added in 5.7.4.
• Error number: 3019; Symbol: ER_INNODB_UNDO_LOG_FULL; SQLSTATE: HY000
Message: Undo Log error: %s
ER_INNODB_UNDO_LOG_FULL was added in 5.7.4.
• Error number: 3020; Symbol: ER_INVALID_ARGUMENT_FOR_LOGARITHM; SQLSTATE: 2201E
Message: Invalid argument for logarithm
ER_INVALID_ARGUMENT_FOR_LOGARITHM was added in 5.7.4.
• Error number: 3021; Symbol: ER_SLAVE_CHANNEL_IO_THREAD_MUST_STOP; SQLSTATE: HY000
Message: This operation cannot be performed with a running slave io thread; run STOP SLAVE IO_THREAD FOR CHANNEL "%s" first.
ER_SLAVE_CHANNEL_IO_THREAD_MUST_STOP was added in 5.7.6.
• Error number: 3022; Symbol: ER_WARN_OPEN_TEMP_TABLES_MUST_BE_ZERO; SQLSTATE: HY000
Message: This operation may not be safe when the slave has temporary tables. The tables will be kept open until the server restarts or until the tables are deleted by any replicated DROP statement. Suggest to wait until slave_open_temp_tables = 0.
ER_WARN_OPEN_TEMP_TABLES_MUST_BE_ZERO was added in 5.7.4.
• Error number: 3023; Symbol: ER_WARN_ONLY_MASTER_LOG_FILE_NO_POS; SQLSTATE: HY000
Message: CHANGE MASTER TO with a MASTER_LOG_FILE clause but no MASTER_LOG_POS clause may not be safe. The old position value may not be valid for the new binary log file.
ER_WARN_ONLY_MASTER_LOG_FILE_NO_POS was added in 5.7.4.
• Error number: 3024; Symbol: ER_QUERY_TIMEOUT; SQLSTATE: HY000
Message: Query execution was interrupted, maximum statement execution time exceeded
ER_QUERY_TIMEOUT was added in 5.7.4.
• Error number: 3025; Symbol: ER_NON_RO_SELECT_DISABLE_TIMER; SQLSTATE: HY000
Message: Select is not a read only statement, disabling timer
**ER_NON_RO_SELECT_DISABLE_TIMER** was added in 5.7.4.

- **Error number:** 3026; **Symbol:** ER_DUP_LIST_ENTRY; **SQLSTATE:** HY000
  
  **Message:** Duplicate entry '%s'.
  
  **ER_DUP_LIST_ENTRY** was added in 5.7.4.

- **Error number:** 3027; **Symbol:** ER_SQL_MODE_NO_EFFECT; **SQLSTATE:** HY000
  
  **Message:** '%s' mode no longer has any effect. Use STRICT_ALL_TABLES or STRICT_TRANS_TABLES instead.
  
  **ER_SQL_MODE_NO_EFFECT** was added in 5.7.4.

- **Error number:** 3028; **Symbol:** ER_AGGREGATE_ORDER_FOR_UNION; **SQLSTATE:** HY000
  
  **Message:** Expression #%u of ORDER BY contains aggregate function and applies to a UNION
  
  **ER_AGGREGATE_ORDER_FOR_UNION** was added in 5.7.5.

- **Error number:** 3029; **Symbol:** ER_AGGREGATE_ORDER_NON_AGG_QUERY; **SQLSTATE:** HY000
  
  **Message:** Expression #%u of ORDER BY contains aggregate function and applies to the result of a non-aggregated query
  
  **ER_AGGREGATE_ORDER_NON_AGG_QUERY** was added in 5.7.5.

- **Error number:** 3030; **Symbol:** ER_SLAVE_WORKER_STOPPED_PREVIOUS_THD_ERROR; **SQLSTATE:** HY000
  
  **Message:** Slave worker has stopped after at least one previous worker encountered an error when slave-preserve-commit-order was enabled. To preserve commit order, the last transaction executed by this thread has not been committed. When restarting the slave after fixing any failed threads, you should fix this worker as well.
  
  **ER_SLAVE_WORKER_STOPPED_PREVIOUS_THD_ERROR** was added in 5.7.5.

- **Error number:** 3031; **Symbol:** ER_DONT_SUPPORT_SLAVE_PRESERVE_COMMIT_ORDER; **SQLSTATE:** HY000
  
  **Message:** slave_preserve_commit_order is not supported %s.
  
  **ER_DONT_SUPPORT_SLAVE_PRESERVE_COMMIT_ORDER** was added in 5.7.5.

- **Error number:** 3032; **Symbol:** ER_SERVER_OFFLINE_MODE; **SQLSTATE:** HY000
  
  **Message:** The server is currently in offline mode
  
  **ER_SERVER_OFFLINE_MODE** was added in 5.7.5.

- **Error number:** 3033; **Symbol:** ER_GIS_DIFFERENT_SRIDS; **SQLSTATE:** HY000
  
  **Message:** Binary geometry function %s given two geometries of different srids: %u and %u, which should have been identical.

  Geometry values passed as arguments to spatial functions must have the same SRID value.
  
  **ER_GIS_DIFFERENT_SRIDS** was added in 5.7.5.

- **Error number:** 3034; **Symbol:** ER_GIS_UNSUPPORTED_ARGUMENT; **SQLSTATE:** HY000
  
  **Message:** Calling geometry function %s with unsupported types of arguments.
A spatial function was called with a combination of argument types that the function does not support.

**ER_GIS_UNSUPPORTED_ARGUMENT** was added in 5.7.5.

- Error number: 3035; Symbol: **ER_GIS_UNKNOWN_ERROR**; SQLSTATE: **HY000**
  Message: Unknown GIS error occurred in function %s.
  **ER_GIS_UNKNOWN_ERROR** was added in 5.7.5.

- Error number: 3036; Symbol: **ER_GIS_UNKNOWN_EXCEPTION**; SQLSTATE: **HY000**
  Message: Unknown exception caught in GIS function %s.
  **ER_GIS_UNKNOWN_EXCEPTION** was added in 5.7.5.

- Error number: 3037; Symbol: **ER_GIS_INVALID_DATA**; SQLSTATE: **22023**
  Message: Invalid GIS data provided to function %s.
  A spatial function was called with an argument not recognized as a valid geometry value.
  **ER_GIS_INVALID_DATA** was added in 5.7.5.

- Error number: 3038; Symbol: **ER_BOOST_GEOMETRY_EMPTY_INPUT_EXCEPTION**; SQLSTATE: **HY000**
  Message: The geometry has no data in function %s.
  **ER_BOOST_GEOMETRY_EMPTY_INPUT_EXCEPTION** was added in 5.7.5.

- Error number: 3039; Symbol: **ER_BOOST_GEOMETRY_CENTROID_EXCEPTION**; SQLSTATE: **HY000**
  Message: Unable to calculate centroid because geometry is empty in function %s.
  **ER_BOOST_GEOMETRY_CENTROID_EXCEPTION** was added in 5.7.5.

- Error number: 3040; Symbol: **ER_BOOST_GEOMETRY_OVERLAY_INVALID_INPUT_EXCEPTION**; SQLSTATE: **HY000**
  Message: Geometry overlay calculation error: geometry data is invalid in function %s.
  **ER_BOOST_GEOMETRY_OVERLAY_INVALID_INPUT_EXCEPTION** was added in 5.7.5.

- Error number: 3041; Symbol: **ER_BOOST_GEOMETRY_TURN_INFO_EXCEPTION**; SQLSTATE: **HY000**
  Message: Geometry turn info calculation error: geometry data is invalid in function %s.
  **ER_BOOST_GEOMETRY_TURN_INFO_EXCEPTION** was added in 5.7.5.

- Error number: 3042; Symbol: **ER_BOOST_GEOMETRY_SELF_INTERSECTION_POINT_EXCEPTION**; SQLSTATE: **HY000**
  Message: Analysis procedures of intersection points interrupted unexpectedly in function %s.
  **ER_BOOST_GEOMETRY_SELF_INTERSECTION_POINT_EXCEPTION** was added in 5.7.5.

- Error number: 3043; Symbol: **ER_BOOST_GEOMETRY_UNKNOWN_EXCEPTION**; SQLSTATE: **HY000**
  Message: Unknown exception thrown in function %s.
Server Error Message Reference

ER_BOOST_GEOMETRY_UNKNOWN_EXCEPTION was added in 5.7.5.

- **Error number:** 3044; **Symbol:** ER_STD_BAD_ALLOC_ERROR; **SQLSTATE:** HY000
  Message: Memory allocation error: %s in function %s.
  ER_STD_BAD_ALLOC_ERROR was added in 5.7.5.

- **Error number:** 3045; **Symbol:** ER_STD_DOMAIN_ERROR; **SQLSTATE:** HY000
  Message: Domain error: %s in function %s.
  ER_STD_DOMAIN_ERROR was added in 5.7.5.

- **Error number:** 3046; **Symbol:** ER_STD_LENGTH_ERROR; **SQLSTATE:** HY000
  Message: Length error: %s in function %s.
  ER_STD_LENGTH_ERROR was added in 5.7.5.

- **Error number:** 3047; **Symbol:** ER_STD_INVALID_ARGUMENT; **SQLSTATE:** HY000
  Message: Invalid argument error: %s in function %s.
  ER_STD_INVALID_ARGUMENT was added in 5.7.5.

- **Error number:** 3048; **Symbol:** ER_STD_OUT_OF_RANGE_ERROR; **SQLSTATE:** HY000
  Message: Out of range error: %s in function %s.
  ER_STD_OUT_OF_RANGE_ERROR was added in 5.7.5.

- **Error number:** 3049; **Symbol:** ER_STD_OVERFLOW_ERROR; **SQLSTATE:** HY000
  Message: Overflow error error: %s in function %s.
  ER_STD_OVERFLOW_ERROR was added in 5.7.5.

- **Error number:** 3050; **Symbol:** ER_STD_RANGE_ERROR; **SQLSTATE:** HY000
  Message: Range error: %s in function %s.
  ER_STD_RANGE_ERROR was added in 5.7.5.

- **Error number:** 3051; **Symbol:** ER_STD_UNDERFLOW_ERROR; **SQLSTATE:** HY000
  Message: Underflow error: %s in function %s.
  ER_STD_UNDERFLOW_ERROR was added in 5.7.5.

- **Error number:** 3052; **Symbol:** ER_STD_LOGIC_ERROR; **SQLSTATE:** HY000
  Message: Logic error: %s in function %s.
  ER_STD_LOGIC_ERROR was added in 5.7.5.

- **Error number:** 3053; **Symbol:** ER_STD_RUNTIME_ERROR; **SQLSTATE:** HY000
  Message: Runtime error: %s in function %s.
  ER_STD_RUNTIME_ERROR was added in 5.7.5.

- **Error number:** 3054; **Symbol:** ER_STD_UNKNOWN_EXCEPTION; **SQLSTATE:** HY000
Message: Unknown exception: %s in function %s.

\texttt{ER\_STD\_UNKNOWN\_EXCEPTION} was added in 5.7.5.

- Error number: 3055; Symbol: \texttt{ER\_GIS\_DATA\_WRONG\_ENDIANESS}; SQLSTATE: HY000
  Message: Geometry byte string must be little endian.
  \texttt{ER\_GIS\_DATA\_WRONG\_ENDIANESS} was added in 5.7.5.

- Error number: 3056; Symbol: \texttt{ER\_CHANGE\_MASTER\_PASSWORD\_LENGTH}; SQLSTATE: HY000
  Message: The password provided for the replication user exceeds the maximum length of 32 characters
  \texttt{ER\_CHANGE\_MASTER\_PASSWORD\_LENGTH} was added in 5.7.5.

- Error number: 3057; Symbol: \texttt{ER\_USER\_LOCK\_WRONG\_NAME}; SQLSTATE: 42000
  Message: Incorrect user-level lock name ‘%s’.
  \texttt{ER\_USER\_LOCK\_WRONG\_NAME} was added in 5.7.5.

- Error number: 3058; Symbol: \texttt{ER\_USER\_LOCK\_DEADLOCK}; SQLSTATE: HY000
  Message: Deadlock found when trying to get user-level lock; try rolling back transaction/releasing locks and restarting lock acquisition.
  This error is returned when the metadata locking subsystem detects a deadlock for an attempt to acquire a named lock with \texttt{GET\_LOCK}.
  \texttt{ER\_USER\_LOCK\_DEADLOCK} was added in 5.7.5.

- Error number: 3059; Symbol: \texttt{ER\_REPLACE\_INACCESSIBLE\_ROWS}; SQLSTATE: HY000
  Message: REPLACE cannot be executed as it requires deleting rows that are not in the view
  \texttt{ER\_REPLACE\_INACCESSIBLE\_ROWS} was added in 5.7.5.

- Error number: 3060; Symbol: \texttt{ER\_ALTER\_OPERATION\_NOT\_SUPPORTED\_REASON\_GIS}; SQLSTATE: HY000
  Message: Do not support online operation on table with GIS index
  \texttt{ER\_ALTER\_OPERATION\_NOT\_SUPPORTED\_REASON\_GIS} was added in 5.7.5.

- Error number: 3061; Symbol: \texttt{ER\_ILLEGAL\_USER\_VAR}; SQLSTATE: 42000
  Message: User variable name ‘%s’ is illegal
  \texttt{ER\_ILLEGAL\_USER\_VAR} was added in 5.7.5.

- Error number: 3062; Symbol: \texttt{ER\_GTID\_MODE\_OFF}; SQLSTATE: HY000
  Message: Cannot %s when GTID\_MODE = OFF.
  \texttt{ER\_GTID\_MODE\_OFF} was added in 5.7.5.

- Error number: 3063; Symbol: \texttt{ER\_UNSUPPORTED\_BY\_REPLICATION\_THREAD}; SQLSTATE: HY000
  Message: Cannot %s from a replication slave thread.
ER_UNSUPPORTED_BY_REPLICATION_THREAD was added in 5.7.5.

- Error number: 3064; Symbol: ER_INCORRECT_TYPE; SQLSTATE: HY000
  Message: Incorrect type for argument %s in function %s.
  ER_INCORRECT_TYPE was added in 5.7.5.

- Error number: 3065; Symbol: ER_FIELD_IN_ORDER_NOT_SELECT; SQLSTATE: HY000
  Message: Expression #%u of ORDER BY clause is not in SELECT list, references column '%s' which is not in SELECT list; this is incompatible with %s
  ER_FIELD_IN_ORDER_NOT_SELECT was added in 5.7.5.

- Error number: 3066; Symbol: ER_AGGREGATE_IN_ORDER_NOT_SELECT; SQLSTATE: HY000
  Message: Expression #%u of ORDER BY clause is not in SELECT list, contains aggregate function; this is incompatible with %s
  ER_AGGREGATE_IN_ORDER_NOT_SELECT was added in 5.7.5.

- Error number: 3067; Symbol: ER_INVALID_RPL_WILD_TABLE_FILTER_PATTERN; SQLSTATE: HY000
  Message: Supplied filter list contains a value which is not in the required format 'db_pattern.table_pattern'
  ER_INVALID_RPL_WILD_TABLE_FILTER_PATTERN was added in 5.7.5.

- Error number: 3068; Symbol: ER_NET_OK_PACKET_TOO_LARGE; SQLSTATE: 08S01
  Message: OK packet too large
  ER_NET_OK_PACKET_TOO_LARGE was added in 5.7.5.

- Error number: 3069; Symbol: ER_INVALID_JSON_DATA; SQLSTATE: HY000
  Message: Invalid JSON data provided to function %s: %s
  ER_INVALID_JSON_DATA was added in 5.7.5.

- Error number: 3070; Symbol: ER_INVALID_GEOJSON_MISSING_MEMBER; SQLSTATE: HY000
  Message: Invalid GeoJSON data provided to function %s: Missing required member '%s'
  ER_INVALID_GEOJSON_MISSING_MEMBER was added in 5.7.5.

- Error number: 3071; Symbol: ER_INVALID_GEOJSON_WRONG_TYPE; SQLSTATE: HY000
  Message: Invalid GeoJSON data provided to function %s: Member '%s' must be of type '%s'
  ER_INVALID_GEOJSON_WRONG_TYPE was added in 5.7.5.

- Error number: 3072; Symbol: ER_INVALID_GEOJSON_UNSPECIFIED; SQLSTATE: HY000
  Message: Invalid GeoJSON data provided to function %s
  ER_INVALID_GEOJSON_UNSPECIFIED was added in 5.7.5.

- Error number: 3073; Symbol: ER_DIMENSION_UNSUPPORTED; SQLSTATE: HY000
  Message: Unsupported number of coordinate dimensions in function %s: Found %u, expected %u
Server Error Message Reference

ER_DIMENSION_UNSUPPORTED was added in 5.7.5.

• Error number: 3074; Symbol: ER_SLAVE_CHANNEL_DOES_NOT_EXIST; SQLSTATE: HY000
  Message: Slave channel '%s' does not exist.
  ER_SLAVE_CHANNEL_DOES_NOT_EXIST was added in 5.7.6.

• Error number: 3075; Symbol: ER_SLAVE_MULTIPLE_CHANNELS_HOST_PORT; SQLSTATE: HY000
  Message: A slave channel '%s' already exists for the given host and port combination.
  ER_SLAVE_MULTIPLE_CHANNELS_HOST_PORT was added in 5.7.6.

• Error number: 3076; Symbol: ER_SLAVE_CHANNEL_NAME_INVALID_OR_TOO_LONG; SQLSTATE: HY000
  Message: Couldn't create channel: Channel name is either invalid or too long.
  ER_SLAVE_CHANNEL_NAME_INVALID_OR_TOO_LONG was added in 5.7.6.

• Error number: 3077; Symbol: ER_SLAVE_NEW_CHANNEL_WRONG_REPOSITORY; SQLSTATE: HY000
  Message: To have multiple channels, repository cannot be of type FILE; Please check the repository configuration and convert them to TABLE.
  ER_SLAVE_NEW_CHANNEL_WRONG_REPOSITORY was added in 5.7.6.

• Error number: 3078; Symbol: ER_SLAVE_CHANNEL_DELETE; SQLSTATE: HY000
  Message: Cannot delete slave info objects for channel '%s'.
  ER_SLAVE_CHANNEL_DELETE was added in 5.7.6.

• Error number: 3079; Symbol: ER_SLAVE_MULTIPLE_CHANNELS_CMD; SQLSTATE: HY000
  Message: Multiple channels exist on the slave. Please provide channel name as an argument.
  ER_SLAVE_MULTIPLE_CHANNELS_CMD was added in 5.7.6.

• Error number: 3080; Symbol: ER_SLAVE_MAX_CHANNELS_EXCEEDED; SQLSTATE: HY000
  Message: Maximum number of replication channels allowed exceeded.
  ER_SLAVE_MAX_CHANNELS_EXCEEDED was added in 5.7.6.

• Error number: 3081; Symbol: ER_SLAVE_CHANNEL_MUST_STOP; SQLSTATE: HY000
  Message: This operation cannot be performed with running replication threads; run STOP SLAVE FOR CHANNEL '%s' first
  ER_SLAVE_CHANNEL_MUST_STOP was added in 5.7.6.

• Error number: 3082; Symbol: ER_SLAVE_CHANNEL_NOT_RUNNING; SQLSTATE: HY000
  Message: This operation requires running replication threads; configure slave and run START SLAVE FOR CHANNEL '%s'
  ER_SLAVE_CHANNEL_NOT_RUNNING was added in 5.7.6.

• Error number: 3083; Symbol: ER_SLAVE_CHANNEL_WAS_RUNNING; SQLSTATE: HY000
Message: Replication thread(s) for channel '%s' are already runnning.

`ER_SLAVE_CHANNEL_WAS_RUNNING` was added in 5.7.6.

- Error number: 3084; Symbol: `ER_SLAVE_CHANNEL_WAS_NOT_RUNNING`; SQLSTATE: HY000

Message: Replication thread(s) for channel '%s' are already stopped.

`ER_SLAVE_CHANNEL_WAS_NOT_RUNNING` was added in 5.7.6.

- Error number: 3085; Symbol: `ER_SLAVE_CHANNEL_SQL_THREAD_MUST_STOP`; SQLSTATE: HY000

Message: This operation cannot be performed with a running slave sql thread; run STOP SLAVE SQL_THREAD FOR CHANNEL '%s' first.

`ER_SLAVE_CHANNEL_SQL_THREAD_MUST_STOP` was added in 5.7.6.

- Error number: 3086; Symbol: `ER_SLAVE_CHANNEL_SQL_SKIP_COUNTER`; SQLSTATE: HY000

Message: When sql_slave_skip_counter > 0, it is not allowed to start more than one SQL thread by using 'START SLAVE [SQL_THREAD]'. Value of sql_slave_skip_counter can only be used by one SQL thread at a time. Please use 'START SLAVE [SQL_THREAD] FOR CHANNEL' to start the SQL thread which will use the value of sql_slave_skip_counter.

`ER_SLAVE_CHANNEL_SQL_SKIP_COUNTER` was added in 5.7.6.

- Error number: 3087; Symbol: `ER_WRONG_FIELD_WITH_GROUP_V2`; SQLSTATE: HY000

Message: Expression #%u of %s is not in GROUP BY clause and contains nonaggregated column '%s' which is not functionally dependent on columns in GROUP BY clause; this is incompatible with sql_mode=only_full_group_by

`ER_WRONG_FIELD_WITH_GROUP_V2` was added in 5.7.6.

- Error number: 3088; Symbol: `ER_MIX_OF_GROUP_FUNC_AND_FIELDS_V2`; SQLSTATE: HY000

Message: In aggregated query without GROUP BY, expression #%u of %s contains nonaggregated column '%s'; this is incompatible with sql_mode=only_full_group_by

`ER_MIX_OF_GROUP_FUNC_AND_FIELDS_V2` was added in 5.7.6.

- Error number: 3089; Symbol: `ER_WARN_DEPRECATED_SYSVAR_UPDATE`; SQLSTATE: HY000

Message: Updating '%s' is deprecated. It will be made read-only in a future release.

`ER_WARN_DEPRECATED_SYSVAR_UPDATE` was added in 5.7.6.

- Error number: 3090; Symbol: `ER_WARN_DEPRECATED_SQLMODE`; SQLSTATE: HY000

Message: Changing sql mode '%s' is deprecated. It will be removed in a future release.

`ER_WARN_DEPRECATED_SQLMODE` was added in 5.7.6.

- Error number: 3091; Symbol: `ER_CANNOT_LOG_PARTIAL_DROP_DATABASE_WITH_GTID`; SQLSTATE: HY000

Message: DROP DATABASE failed; some tables may have been dropped but the database directory remains. The GTID has not been added to GTID_EXECUTED and the statement was not written
to the binary log. Fix this as follows: (1) remove all files from the database directory %s; (2) SET GTID_NEXT='%s'; (3) DROP DATABASE '%s'.

ER_CANNOT_LOG_PARTIAL_DROP_DATABASE_WITH_GTID was added in 5.7.6.

- Error number: 3092; Symbol: ER_GROUP_REPLICATION_CONFIGURATION; SQLSTATE: HY000
  Message: The server is not configured properly to be an active member of the group. Please see more details on error log.

  ER_GROUP_REPLICATION_CONFIGURATION was added in 5.7.6.

- Error number: 3093; Symbol: ER_GROUP_REPLICATION_RUNNING; SQLSTATE: HY000
  Message: The START GROUP_REPLICATION command failed since the group is already running.

  ER_GROUP_REPLICATION_RUNNING was added in 5.7.6.

- Error number: 3094; Symbol: ER_GROUP_REPLICATION_APPLIER_INIT_ERROR; SQLSTATE: HY000
  Message: The START GROUP_REPLICATION command failed as the applier module failed to start.

  ER_GROUP_REPLICATION_APPLIER_INIT_ERROR was added in 5.7.6.

- Error number: 3095; Symbol: ER_GROUP_REPLICATION_STOP_APPLIER_THREAD_TIMEOUT; SQLSTATE: HY000
  Message: The STOP GROUP_REPLICATION command execution is incomplete: The applier thread got the stop signal while it was busy. The applier thread will stop once the current task is complete.

  ER_GROUP_REPLICATION_STOP_APPLIER_THREAD_TIMEOUT was added in 5.7.6.

- Error number: 3096; Symbol: ER_GROUP_REPLICATION_COMMUNICATION_LAYER_SESSION_ERROR; SQLSTATE: HY000
  Message: The START GROUP_REPLICATION command failed as there was an error when initializing the group communication layer.

  ER_GROUP_REPLICATION_COMMUNICATION_LAYER_SESSION_ERROR was added in 5.7.6.

- Error number: 3097; Symbol: ER_GROUP_REPLICATION_COMMUNICATION_LAYER_JOIN_ERROR; SQLSTATE: HY000
  Message: The START GROUP_REPLICATION command failed as there was an error when joining the communication group.

  ER_GROUP_REPLICATION_COMMUNICATION_LAYER_JOIN_ERROR was added in 5.7.6.

- Error number: 3098; Symbol: ER_BEFORE_DML_VALIDATION_ERROR; SQLSTATE: HY000
  Message: The table does not comply with the requirements by an external plugin.

  ER_BEFORE_DML_VALIDATION_ERROR was added in 5.7.6.

- Error number: 3099; Symbol: ER_PREVENTS_VARIABLE_WITHOUT_RBR; SQLSTATE: HY000
  Message: Cannot change the value of variable %s without binary log format as ROW.

  transaction_write_set_extraction option value is set and binlog_format is not ROW.

  ER_PREVENTS_VARIABLE_WITHOUT_RBR was added in 5.7.6.

- Error number: 3100; Symbol: ER_RUN_HOOK_ERROR; SQLSTATE: HY000
Message: Error on observer while running replication hook ‘%s’.

**ER_RUN_HOOK_ERROR** was added in 5.7.6.

- Error number: 3101; Symbol: **ER_TRANSACTION_ROLLBACK_DURING_COMMIT**; SQLSTATE: HY000

Message: Plugin instructed the server to rollback the current transaction.

When using Group Replication, this means that a transaction failed the group certification process, due to one or more members detecting a potential conflict, and was thus rolled back. See Chapter 17, *Group Replication*.

**ER_TRANSACTION_ROLLBACK_DURING_COMMIT** was added in 5.7.6.

- Error number: 3102; Symbol: **ER_GENERATED_COLUMN_FUNCTION_IS_NOT_ALLOWED**; SQLSTATE: HY000

Message: Expression of generated column ‘%s’ contains a disallowed function.

**ER_GENERATED_COLUMN_FUNCTION_IS_NOT_ALLOWED** was added in 5.7.6.

- Error number: 3103; Symbol: **ER_KEY_BASED_ON_GENERATED_COLUMN**; SQLSTATE: HY000

Message: Key/Index cannot be defined on a virtual generated column.

**ER_KEY_BASED_ON_GENERATED_COLUMN** was added in 5.7.6, removed after 5.7.7.

- Error number: 3103; Symbol: **ER_UNSUPPORTED_ALTER_INPLACE_ONVIRTUAL_COLUMN**; SQLSTATE: HY000

Message: INPLACE ADD or DROP of virtual columns cannot be combined with other ALTER TABLE actions.

**ER_UNSUPPORTED_ALTER_INPLACE_ONVIRTUAL_COLUMN** was added in 5.7.8.

- Error number: 3104; Symbol: **ER_WRONG_FK_OPTION_FOR_GENERATED_COLUMN**; SQLSTATE: HY000

Message: Cannot define foreign key with ‘%s’ clause on a generated column.

**ER_WRONG_FK_OPTION_FOR_GENERATED_COLUMN** was added in 5.7.6.

- Error number: 3105; Symbol: **ER_NONDEFAULT_VALUE_FORNGENERATED_COLUMN**; SQLSTATE: HY000

Message: The value specified for generated column ‘%s’ in table ‘%s’ is not allowed.

**ER_NONDEFAULT_VALUE_FORNGENERATED_COLUMN** was added in 5.7.6.

- Error number: 3106; Symbol: **ER_UNSUPPORTED_ACTION_ONGENERATED_COLUMN**; SQLSTATE: HY000

Message: ‘%s’ is not supported for generated columns.

**ER_UNSUPPORTED_ACTION_ONGENERATED_COLUMN** was added in 5.7.6.
• Error number: 3107; Symbol: ER_GENERATED_COLUMN_NON_PRIOR; SQLSTATE: HY000
    Message: Generated column can refer only to generated columns defined prior to it.
    To address this issue, change the table definition to define each generated column later than any generated columns to which it refers.
    ER_GENERATED_COLUMN_NON_PRIOR was added in 5.7.6.

• Error number: 3108; Symbol: ER_DEPENDENT_BY_GENERATED_COLUMN; SQLSTATE: HY000
    Message: Column '%s' has a generated column dependency.
    You cannot drop or rename a generated column if another column refers to it. You must either drop those columns as well, or redefine them not to refer to the generated column.
    ER_DEPENDENT_BY_GENERATED_COLUMN was added in 5.7.6.

• Error number: 3109; Symbol: ER_GENERATED_COLUMN_REF_AUTO_INC; SQLSTATE: HY000
    Message: Generated column '%s' cannot refer to auto-increment column.
    ER_GENERATED_COLUMN_REF_AUTO_INC was added in 5.7.6.

• Error number: 3110; Symbol: ER_FEATURE_NOTAVAILABLE; SQLSTATE: HY000
    Message: The '%s' feature is not available; you need to remove '%s' or use MySQL built with '%s'
    ER_FEATURE_NOTAVAILABLE was added in 5.7.6.

• Error number: 3111; Symbol: ER_CANT_SET_GTID_MODE; SQLSTATE: HY000
    Message: SET @@GLOBAL.GTID_MODE = %s is not allowed because %s.
    ER_CANT_SET_GTID_MODE was added in 5.7.6.

• Error number: 3112; Symbol: ER_CANT_USE_AUTO_POSITION_WITH_GTID_MODE_OFF; SQLSTATE: HY000
    Message: The replication receiver thread%s cannot start in AUTO_POSITION mode: this server uses @@GLOBAL.GTID_MODE = OFF.
    ER_CANT_USE_AUTO_POSITION_WITH_GTID_MODE_OFF was added in 5.7.6.

• Error number: 3113; Symbol: ER_CANT_REPLICATE_ANONYMOUS_WITH_AUTO_POSITION; SQLSTATE: HY000
    Message: Cannot replicate anonymous transaction when AUTO_POSITION = 1, at file %s, position %lld.
    ER_CANT_REPLICATE_ANONYMOUS_WITH_AUTO_POSITION was added in 5.7.6.

• Error number: 3114; Symbol: ER_CANT_REPLICATE_ANONYMOUS_WITH_GTID_MODE_ON; SQLSTATE: HY000
    Message: Cannot replicate anonymous transaction when @@GLOBAL.GTID_MODE = ON, at file %s, position %lld.
    ER_CANT_REPLICATE_ANONYMOUS_WITH_GTID_MODE_ON was added in 5.7.6.
• Error number: **3115**; Symbol: **ER_CANT_REPLICATE_GTID_WITH_GTID_MODE_OFF**; SQLSTATE: HY000

Message: Cannot replicate GTID-transaction when @@GLOBAL.GTID_MODE = OFF, at file %s, position %lld.

*ER_CANT_REPLICATE_GTID_WITH_GTID_MODE_OFF* was added in 5.7.6.

• Error number: **3116**; Symbol:

**ER_CANT_SET_ENFORCE_GTID_CONSISTENCY_ON_WITH_ONGOING_GTID_VIOLATING_TRANSACTIONS**;
SQLSTATE: HY000

Message: Cannot set ENFORCE_GTID_CONSISTENCY = ON because there are ongoing transactions that violate GTID consistency.

*ER_CANT_SET_ENFORCE_GTID_CONSISTENCY_ON_WITH_ONGOING_GTID_VIOLATING_TRANSACTIONS* is renamed to *ER_CANT_ENFORCE_GTID_CONSISTENCY_WITH_ONGOING_GTID_VIOLATING_TX* in MySQL 8.0.

*ER_CANT_SET_ENFORCE_GTID_CONSISTENCY_ON_WITH_ONGOING_GTID_VIOLATING_TRANSACTIONS* was added in 5.7.6.

• Error number: **3117**; Symbol:

**ER_SET_ENFORCE_GTID_CONSISTENCY_WARN_WITH_ONGOING_GTID_VIOLATING_TRANSACTIONS**;
SQLSTATE: HY000

Message: There are ongoing transactions that violate GTID consistency.

*ER_SET_ENFORCE_GTID_CONSISTENCY_WARN_WITH_ONGOING_GTID_VIOLATING_TRANSACTIONS* is renamed to *ER_ENFORCE_GTID_CONSISTENCY_WARN_WITH_ONGOING_GTID_VIOLATING_TX* in MySQL 8.0.

*ER_SET_ENFORCE_GTID_CONSISTENCY_WARN_WITH_ONGOING_GTID_VIOLATING_TRANSACTIONS* was added in 5.7.6.

• Error number: **3118**; Symbol: **ER_ACCOUNT_HAS_BEEN_LOCKED**; SQLSTATE: HY000

Message: Access denied for user '%s'@'%s'. Account is locked.

The account was locked with CREATE USER ... ACCOUNT LOCK or ALTER USER ... ACCOUNT LOCK. An administrator can unlock it with ALTER USER ... ACCOUNT UNLOCK.

*ER_ACCOUNT_HAS_BEEN_LOCKED* was added in 5.7.6.

• Error number: **3119**; Symbol: **ER_WRONG_TABLESPACE_NAME**; SQLSTATE: 42000

Message: Incorrect tablespace name `%s`.

*ER_WRONG_TABLESPACE_NAME* was added in 5.7.6.

• Error number: **3120**; Symbol: **ER_TABLESPACE_IS_NOT_EMPTY**; SQLSTATE: HY000

Message: Tablespace '%s' is not empty.

*ER_TABLESPACE_IS_NOT_EMPTY* was added in 5.7.6.

• Error number: **3121**; Symbol: **ER_WRONG_FILE_NAME**; SQLSTATE: HY000

Message: Incorrect File Name '%s'.

*ER_WRONG_FILE_NAME* was added in 5.7.6.
- **Error number:** 3122; **Symbol:** ER(boost:geometry:inconsistent:turns:exception); **SQLSTATE:** HY000

  Message: Inconsistent intersection points.

  **ER(boost:geometry:inconsistent:turns:exception)** was added in 5.7.7.

- **Error number:** 3123; **Symbol:** ER(warn:optimizer:hint:syntax:exception); **SQLSTATE:** HY000

  Message: Optimizer hint syntax error

  **ER(warn:optimizer:hint:syntax:exception)** was added in 5.7.7.

- **Error number:** 3124; **Symbol:** ER(warn:bad:max:execution:time); **SQLSTATE:** HY000

  Message: Unsupported MAX_EXECUTION_TIME

  **ER(warn:bad:max:execution:time)** was added in 5.7.7.

- **Error number:** 3125; **Symbol:** ER(warn:unsupported:max:execution:time); **SQLSTATE:** HY000

  Message: MAX_EXECUTION_TIME hint is supported by top-level standalone SELECT statements only

  The **MAX_EXECUTION_TIME** optimizer hint is supported only for **SELECT** statements.

  **ER(warn:unsupported:max:execution:time)** was added in 5.7.7.

- **Error number:** 3126; **Symbol:** ER(warn:conflicting:hint); **SQLSTATE:** HY000

  Message: Hint %s is ignored as conflicting/duplicated

  **ER(warn:conflicting:hint)** was added in 5.7.7.

- **Error number:** 3127; **Symbol:** ER(warn:unknown:qb:name); **SQLSTATE:** HY000

  Message: Query block name %s is not found for %s hint

  **ER(warn:unknown:qb:name)** was added in 5.7.7.

- **Error number:** 3128; **Symbol:** ER(unresolved:hint:name); **SQLSTATE:** HY000

  Message: Unresolved name %s for %s hint

  **ER(unresolved:hint:name)** was added in 5.7.7.

- **Error number:** 3129; **Symbol:** ER(warn:deprecated:sqlmode:unset); **SQLSTATE:** HY000

  Message: Unsetting sql mode '%s' is deprecated. It will be made read-only in a future release.

  **ER(warn:deprecated:sqlmode:unset)** was added in 5.7.7, removed after 5.7.7.

- **Error number:** 3129; **Symbol:** ER(warn:on:modifying:gtid:executed:table); **SQLSTATE:** HY000

  Message: Please do not modify the %s table. This is a mysql internal system table to store GTIDs for committed transactions. Modifying it can lead to an inconsistent GTID state.

  **ER(warn:on:modifying:gtid:executed:table)** was added in 5.7.8.

- **Error number:** 3130; **Symbol:** ER(pluggable:protocol:command:not:supported); **SQLSTATE:** HY000
Message: Command not supported by pluggable protocols

ER_PLUGGABLE_PROTOCOL_COMMAND_NOT_SUPPORTED was added in 5.7.8.

• Error number: 3131; Symbol: ER_LOCKING_SERVICE_WRONG_NAME; SQLSTATE: 42000
Message: Incorrect locking service lock name '%s'.

A locking service name was specified as NULL, the empty string, or a string longer than 64 characters. Namespace and lock names must be non-NULL, nonempty, and no more than 64 characters long.

ER_LOCKING_SERVICE_WRONG_NAME was added in 5.7.8.

• Error number: 3132; Symbol: ER_LOCKING_SERVICE_DEADLOCK; SQLSTATE: HY000
Message: Deadlock found when trying to get locking service lock; try releasing locks and restarting lock acquisition.

ER_LOCKING_SERVICE_DEADLOCK was added in 5.7.8.

• Error number: 3133; Symbol: ER_LOCKING_SERVICE_TIMEOUT; SQLSTATE: HY000
Message: Service lock wait timeout exceeded.

ER_LOCKING_SERVICE_TIMEOUT was added in 5.7.8.

• Error number: 3134; Symbol: ER_GIS_MAX_POINTS_IN_GEOMETRY_OVERFLOWED; SQLSTATE: HY000
Message: Parameter %s exceeds the maximum number of points in a geometry (%lu) in function %s.

ER_GIS_MAX_POINTS_IN_GEOMETRY_OVERFLOWED was added in 5.7.8.

• Error number: 3135; Symbol: ER_SQL_MODE_MERGED; SQLSTATE: HY000
Message: ‘NO_ZERO_DATE’, ‘NO_ZERO_IN_DATE’ and ‘ERROR_FOR_DIVISION_BY_ZERO’ sql modes should be used with strict mode. They will be merged with strict mode in a future release.

ER_SQL_MODE_MERGED was added in 5.7.8.

• Error number: 3136; Symbol: ER_VTOKEN_PLUGIN_TOKEN_MISMATCH; SQLSTATE: HY000
Message: Version token mismatch for %.*s. Correct value %.*s

The client has set its version_tokens_session system variable to the list of tokens it requires the server to match, but the server token list has at least one matching token name that has a value different from what the client requires. See Section 5.5.5, “Version Tokens”.

ER_VTOKEN_PLUGIN_TOKEN_MISMATCH was added in 5.7.8.

• Error number: 3137; Symbol: ER_VTOKEN_PLUGIN_TOKEN_NOT_FOUND; SQLSTATE: HY000
Message: Version token %.*s not found.

The client has set its version_tokens_session system variable to the list of tokens it requires the server to match, but the server token list is missing at least one of those tokens. See Section 5.5.5, “Version Tokens”.

ER_VTOKEN_PLUGIN_TOKEN_NOT_FOUND was added in 5.7.8.
• Error number: 3138; Symbol: ER_CANT_SET_VARIABLE_WHEN_OWNING_GTID; SQLSTATE: HY000
Message: Variable %s cannot be changed by a client that owns a GTID. The client owns %s. Ownership is released on COMMIT or ROLLBACK.
ER_CANT_SET_VARIABLE_WHEN_OWNING_GTID was added in 5.7.8.

• Error number: 3139; Symbol: ER_SLAVE_CHANNEL_OPERATION_NOT_ALLOWED; SQLSTATE: HY000
Message: %s cannot be performed on channel '%s'.
ER_SLAVE_CHANNEL_OPERATION_NOT_ALLOWED was added in 5.7.8.

• Error number: 3140; Symbol: ER_INVALID_JSON_TEXT; SQLSTATE: 22032
Message: Invalid JSON text: "%s" at position %u in value for column '%s'.
ER_INVALID_JSON_TEXT was added in 5.7.8.

• Error number: 3141; Symbol: ER_INVALID_JSON_TEXT_IN_PARAM; SQLSTATE: 22032
Message: Invalid JSON text in argument %u to function %s: "%s" at position %u.%s
ER_INVALID_JSON_TEXT_IN_PARAM was added in 5.7.8.

• Error number: 3142; Symbol: ER_INVALID_JSON_BINARY_DATA; SQLSTATE: HY000
Message: The JSON binary value contains invalid data.
ER_INVALID_JSON_BINARY_DATA was added in 5.7.8.

• Error number: 3143; Symbol: ER_INVALID_JSON_PATH; SQLSTATE: 42000
Message: Invalid JSON path expression. The error is around character position %u.%s
ER_INVALID_JSON_PATH was added in 5.7.8.

• Error number: 3144; Symbol: ER_INVALID_JSON_CHARSET; SQLSTATE: 22032
Message: Cannot create a JSON value from a string with CHARACTER SET '%s'.
ER_INVALID_JSON_CHARSET was added in 5.7.8.

• Error number: 3145; Symbol: ER_INVALID_JSON_CHARSET_IN_FUNCTION; SQLSTATE: 22032
Message: Invalid JSON character data provided to function %s: '%s'; utf8 is required.
ER_INVALID_JSON_CHARSET_IN_FUNCTION was added in 5.7.8.

• Error number: 3146; Symbol: ER_INVALID_TYPE_FOR_JSON; SQLSTATE: 22032
Message: Invalid data type for JSON data in argument %u to function %s; a JSON string or JSON type is required.
ER_INVALID_TYPE_FOR_JSON was added in 5.7.8.

• Error number: 3147; Symbol: ER_INVALID_CAST_TO_JSON; SQLSTATE: 22032
Message: Cannot CAST value to JSON.
ER_INVALID_CAST_TO_JSON was added in 5.7.8.
• Error number: 3148; Symbol: ER_INVALID_JSON_PATH_CHARSET; SQLSTATE: 42000
   Message: A path expression must be encoded in the utf8 character set. The path expression '%s' is encoded in character set '%s'.
   ER_INVALID_JSON_PATH_CHARSET was added in 5.7.8.
• Error number: 3149; Symbol: ER_INVALID_JSON_PATH_WILDCARD; SQLSTATE: 42000
   Message: In this situation, path expressions may not contain the * and ** tokens.
   ER_INVALID_JSON_PATH_WILDCARD was added in 5.7.8.
• Error number: 3150; Symbol: ER_JSON_VALUE_TOO_BIG; SQLSTATE: 22032
   Message: The JSON value is too big to be stored in a JSON column.
   ER_JSON_VALUE_TOO_BIG was added in 5.7.8.
• Error number: 3151; Symbol: ER_JSON_KEY_TOO_BIG; SQLSTATE: 22032
   Message: The JSON object contains a key name that is too long.
   ER_JSON_KEY_TOO_BIG was added in 5.7.8.
• Error number: 3152; Symbol: ER_JSON_USED_AS_KEY; SQLSTATE: 42000
   Message: JSON column '%s' cannot be used in key specification.
   ER_JSON_USED_AS_KEY was added in 5.7.8.
• Error number: 3153; Symbol: ER_JSON_VACUOUS_PATH; SQLSTATE: 42000
   Message: The path expression '$' is not allowed in this context.
   ER_JSON_VACUOUS_PATH was added in 5.7.8.
• Error number: 3154; Symbol: ER_JSON_BAD_ONE_OR_ALL_ARG; SQLSTATE: 42000
   Message: The oneOrAll argument to %s may take these values: 'one' or 'all'.
   ER_JSON_BAD_ONE_OR_ALL_ARG was added in 5.7.8.
• Error number: 3155; Symbol: ER_NUMERIC_JSON_VALUE_OUT_OF_RANGE; SQLSTATE: 22003
   Message: Out of range JSON value for CAST to %s%s from column %s at row %ld
   ER_NUMERIC_JSON_VALUE_OUT_OF_RANGE was added in 5.7.8.
• Error number: 3156; Symbol: ER_INVALID_JSON_VALUE_FOR_CAST; SQLSTATE: 22018
   Message: Invalid JSON value for CAST to %s%s from column %s at row %ld
   ER_INVALID_JSON_VALUE_FOR_CAST was added in 5.7.8.
• Error number: 3157; Symbol: ER_JSON_DOCUMENT_TOO_DEEP; SQLSTATE: 22032
   Message: The JSON document exceeds the maximum depth.
   ER_JSON_DOCUMENT_TOO_DEEP was added in 5.7.8.
• Error number: 3158; Symbol: ER_JSON_DOCUMENT_NULL_KEY; SQLSTATE: 22032
   Message: JSON documents may not contain NULL member names.
**ER_JSON_DOCUMENT_NULL_KEY** was added in 5.7.8.

- **Error number: 3159**; **Symbol: ER_SECURE_TRANSPORT_REQUIRED**; **SQLSTATE: HY000**
  
  Message: Connections using insecure transport are prohibited while --require_secure_transport=ON.

  With the `require_secure_transport` system variable, clients can connect only using secure transports. Qualifying connections are those using SSL, a Unix socket file, or shared memory.

  **ER_SECURE_TRANSPORT_REQUIRED** was added in 5.7.8.

- **Error number: 3160**; **Symbol: ER_NO_SECURE_TRANSPORTS_CONFIGURED**; **SQLSTATE: HY000**
  
  Message: No secure transports (SSL or Shared Memory) are configured, unable to set --require_secure_transport=ON.

  The `require_secure_transport` system variable cannot be enabled if the server does not support at least one secure transport. Configure the server with the required SSL keys/certificates to enable SSL connections, or enable the `shared_memory` system variable to enable shared-memory connections.

  **ER_NO_SECURE_TRANSPORTS_CONFIGURED** was added in 5.7.8.

- **Error number: 3161**; **Symbol: ER_DISABLED_STORAGE_ENGINE**; **SQLSTATE: HY000**
  
  Message: Storage engine %s is disabled (Table creation is disallowed).

  An attempt was made to create a table or tablespace using a storage engine listed in the value of the `disabled_storage_engines` system variable, or to change an existing table or tablespace to such an engine. Choose a different storage engine.

  **ER_DISABLED_STORAGE_ENGINE** was added in 5.7.8.

- **Error number: 3162**; **Symbol: ER_USER_DOES_NOT_EXIST**; **SQLSTATE: HY000**
  
  Message: User %s does not exist.

  **ER_USER_DOES_NOT_EXIST** was added in 5.7.8.

- **Error number: 3163**; **Symbol: ER_USER_ALREADY_EXISTS**; **SQLSTATE: HY000**
  
  Message: User %s already exists.

  **ER_USER_ALREADY_EXISTS** was added in 5.7.8.

- **Error number: 3164**; **Symbol: ER_AUDIT_API_ABORT**; **SQLSTATE: HY000**
  
  Message: Aborted by Audit API (%s;%d).

  This error indicates that an audit plugin terminated execution of an event. The message typically indicates the event subclass name and a numeric status value.

  **ER_AUDIT_API_ABORT** was added in 5.7.8.

- **Error number: 3165**; **Symbol: ER_INVALID_JSON_PATH_ARRAY_CELL**; **SQLSTATE: 42000**
  
  Message: A path expression is not a path to a cell in an array.

  **ER_INVALID_JSON_PATH_ARRAY_CELL** was added in 5.7.8.

- **Error number: 3166**; **Symbol: ER_BUFPOOL_RESIZE_INPROGRESS**; **SQLSTATE: HY000**
  
  Message: Another buffer pool resize is already in progress.

  **ER_BUFPOOL_RESIZE_INPROGRESS** was added in 5.7.8.
Server Error Message Reference

**ER_BUFPOOL_RESIZE_INPROGRESS** was added in 5.7.9.

- **Error number:** 3167; **Symbol:** ER_FEATURE_DISABLED See_doc; **SQLSTATE:** HY000
  
  Message: The '%s' feature is disabled; see the documentation for '%s'

  **ER_FEATURE_DISABLED** was added in 5.7.9.

- **Error number:** 3168; **Symbol:** ER_SERVER ISNT_AVAILABLE; **SQLSTATE:** HY000
  
  Message: Server isn't available

  **ER_SERVER ISNT_AVAILABLE** was added in 5.7.9.

- **Error number:** 3169; **Symbol:** ER_SESSION WAS_KILLED; **SQLSTATE:** HY000
  
  Message: Session was killed

  **ER_SESSION WAS_KILLED** was added in 5.7.9.

- **Error number:** 3170; **Symbol:** ER_CAPACITY_EXCEEDED; **SQLSTATE:** HY000
  
  Message: Memory capacity of %llu bytes for '%s' exceeded. %s

  **ER_CAPACITY_EXCEEDED** was added in 5.7.9.

- **Error number:** 3171; **Symbol:** ER_CAPACITY_EXCEEDED_IN_RANGE_OPTIMIZER; **SQLSTATE:** HY000
  
  Message: Range optimization was not done for this query.

  **ER_CAPACITY_EXCEEDED_IN_RANGE_OPTIMIZER** was added in 5.7.9.

- **Error number:** 3172; **Symbol:** ER_TABLE_NEEDS_UPG_PART; **SQLSTATE:** HY000
  
  Message: Partitioning upgrade required. Please dump/reload to fix it or do: ALTER TABLE `%s`.`%s` UPGRADE PARTITIONING

  **ER_TABLE_NEEDS_UPG_PART** was added in 5.7.9.

- **Error number:** 3173; **Symbol:** ER_CANT_WAIT_FOR_EXECUTED_GTID_SET WHILE_OWNING_A_GTID; **SQLSTATE:** HY000
  
  Message: The client holds ownership of the GTID %s. Therefore, WAIT_FOR_EXECUTED_GTID_SET cannot wait for this GTID.

  **ER_CANT_WAIT_FOR_EXECUTED_GTID_SET WHILE_OWNING_A_GTID** was added in 5.7.9.

- **Error number:** 3174; **Symbol:** ER_CANNOT_ADD_FOREIGN_BASE_COL_VIRTUAL; **SQLSTATE:** HY000
  
  Message: Cannot add foreign key on the base column of indexed virtual column.

  **ER_CANNOT_ADD_FOREIGN_BASE_COL_VIRTUAL** was added in 5.7.10.

- **Error number:** 3175; **Symbol:** ER_CANNOT_CREATE_VIRTUAL_INDEX_CONSTRAINT; **SQLSTATE:** HY000
  
  Message: Cannot create index on virtual column whose base column has foreign constraint.

  **ER_CANNOT_CREATE_VIRTUAL_INDEX_CONSTRAINT** was added in 5.7.10.
Server Error Message Reference

- **Error number:** 3176; **Symbol:** `ER_ERROR_ON_MODIFYING_GTID_EXECUTED_TABLE`; **SQLSTATE:** HY000

  Message: Please do not modify the %s table with an XA transaction. This is an internal system table used to store GTIDs for committed transactions. Although modifying it can lead to an inconsistent GTID state, if necessary you can modify it with a non-XA transaction.

  `ER_ERROR_ON_MODIFYING_GTID_EXECUTED_TABLE` was added in 5.7.11.

- **Error number:** 3177; **Symbol:** `ER_LOCK_REFUSED_BY_ENGINE`; **SQLSTATE:** HY000

  Message: Lock acquisition refused by storage engine.

  `ER_LOCK_REFUSED_BY_ENGINE` was added in 5.7.11.

- **Error number:** 3178; **Symbol:** `ER_UNSUPPORTED_ALTER_ONLINE_ON_VIRTUAL_COLUMN`; **SQLSTATE:** HY000

  Message: ADD COLUMN col...VIRTUAL, ADD INDEX(col)

  `ER_UNSUPPORTED_ALTER_ONLINE_ON_VIRTUAL_COLUMN` was added in 5.7.11.

- **Error number:** 3179; **Symbol:** `ER_MASTER_KEY_ROTATION_NOT_SUPPORTED_BY_SE`; **SQLSTATE:** HY000

  Message: Master key rotation is not supported by storage engine.

  `ER_MASTER_KEY_ROTATION_NOT_SUPPORTED_BY_SE` was added in 5.7.11.

- **Error number:** 3180; **Symbol:** `ER_MASTER_KEY_ROTATION_ERROR_BY_SE`; **SQLSTATE:** HY000

  Message: Encryption key rotation error reported by SE: %s

  `ER_MASTER_KEY_ROTATION_ERROR_BY_SE` was added in 5.7.11.

- **Error number:** 3181; **Symbol:** `ER_MASTER_KEY_ROTATION_BINLOG_FAILED`; **SQLSTATE:** HY000

  Message: Write to binlog failed. However, master key rotation has been completed successfully.

  `ER_MASTER_KEY_ROTATION_BINLOG_FAILED` was added in 5.7.11.

- **Error number:** 3182; **Symbol:** `ER_MASTER_KEY_ROTATION_SE_UNAVAILABLE`; **SQLSTATE:** HY000

  Message: Storage engine is not available.

  `ER_MASTER_KEY_ROTATION_SE_UNAVAILABLE` was added in 5.7.11.

- **Error number:** 3183; **Symbol:** `ER_TABLESPACE_CANNOT_ENCRYPT`; **SQLSTATE:** HY000

  Message: This tablespace can't be encrypted.

  `ER_TABLESPACE_CANNOT_ENCRYPT` was added in 5.7.11.

- **Error number:** 3184; **Symbol:** `ER_INVALID_ENCRYPTION_OPTION`; **SQLSTATE:** HY000

  Message: Invalid encryption option.

  `ER_INVALID_ENCRYPTION_OPTION` was added in 5.7.11.
Server Error Message Reference

- Error number: 3185; Symbol: ER_CANNOT_FIND_KEY_IN_KEYRING; SQLSTATE: HY000
  Message: Can't find master key from keyring, please check in the server log if a keyring plugin is loaded and initialized successfully.
  
  ER_CANNOT_FIND_KEY_IN_KEYRING was added in 5.7.11.

- Error number: 3186; Symbol: ER_CAPACITY_EXCEEDED_IN_PARSER; SQLSTATE: HY000
  Message: Parser bailed out for this query.
  
  ER_CAPACITY_EXCEEDED_IN_PARSER was added in 5.7.12.

- Error number: 3187; Symbol: ER_UNSUPPORTED_ALTER_ENCRYPTION_INPLACE; SQLSTATE: HY000
  Message: Cannot alter encryption attribute by inplace algorithm.
  
  ER_UNSUPPORTED_ALTER_ENCRYPTION_INPLACE was added in 5.7.13.

- Error number: 3188; Symbol: ER_KEYRING_UDF_KEYRING_SERVICE_ERROR; SQLSTATE: HY000
  Message: Function '%s' failed because underlying keyring service returned an error. Please check if a keyring plugin is installed and that provided arguments are valid for the keyring you are using.
  
  ER_KEYRING_UDF_KEYRING_SERVICE_ERROR was added in 5.7.13.

- Error number: 3189; Symbol: ER_USER_COLUMN_OLD_LENGTH; SQLSTATE: HY000
  Message: It seems that your db schema is old. The %s column is 77 characters long and should be 93 characters long. Please run mysql_upgrade.
  
  ER_USER_COLUMN_OLD_LENGTH was added in 5.7.13.

- Error number: 3190; Symbol: ER_CANT_RESET_MASTER; SQLSTATE: HY000
  Message: RESET MASTER is not allowed because %s.
  
  ER_CANT_RESET_MASTER was added in 5.7.14.

- Error number: 3191; Symbol: ER_GROUP_REPLICATION_MAX_GROUP_SIZE; SQLSTATE: HY000
  Message: The START GROUP_REPLICATION command failed since the group already has 9 members.
  
  ER_GROUP_REPLICATION_MAX_GROUP_SIZE was added in 5.7.14.

- Error number: 3192; Symbol: ER_CANNOT_ADD_FOREIGN_BASE_COL_STORED; SQLSTATE: HY000
  Message: Cannot add foreign key on the base column of stored column.
  
  ER_CANNOT_ADD_FOREIGN_BASE_COL_STORED was added in 5.7.14.

- Error number: 3193; Symbol: ER_TABLE_REFERENCED; SQLSTATE: HY000
  Message: Cannot complete the operation because table is referenced by another connection.
  
  ER_TABLE_REFERENCED was added in 5.7.14.

- Error number: 3194; Symbol: ER_PARTITION_ENGINE_DEPRECATED_FOR_TABLE; SQLSTATE: HY000
Message: The partition engine, used by table '%s.%s', is deprecated and will be removed in a future release. Please use native partitioning instead.

**ER_PARTITION_ENGINE_DEPRECATED_FOR_TABLE** was added in 5.7.17.

- **Error number:** 3195; **Symbol:** ER_WARN_USING_GEOMFROMWKB_TO_SET_SRID_ZERO; **SQLSTATE:** 01000

  Message: %s(geometry) is deprecated and will be replaced by st_srid(geometry, 0) in a future version. Use %s(st_aswkb(geometry), 0) instead.

  **ER_WARN_USING_GEOMFROMWKB_TO_SET_SRID_ZERO** was added in 5.7.19.

- **Error number:** 3196; **Symbol:** ER_WARN_USING_GEOMFROMWKB_TO_SET_SRID; **SQLSTATE:** 01000

  Message: %s(geometry, srid) is deprecated and will be replaced by st_srid(geometry, srid) in a future version. Use %s(st_aswkb(geometry), srid) instead.

  **ER_WARN_USING_GEOMFROMWKB_TO_SET_SRID** was added in 5.7.19.

- **Error number:** 3197; **Symbol:** ER_XA_RETRY; **SQLSTATE:** HY000

  Message: The resource manager is not able to commit the transaction branch at this time. Please retry later.

  **ER_XA_RETRY** was added in 5.7.19.

- **Error number:** 3198; **Symbol:** ER_KEYRING_AWS_UDF_AWS_KMS_ERROR; **SQLSTATE:** HY000

  Message: Function %s failed due to: %s.

  **ER_KEYRING_AWS_UDF_AWS_KMS_ERROR** was added in 5.7.19.

- **Error number:** 3199; **Symbol:** ER_BINLOG_UNSAFE_XA; **SQLSTATE:** HY000

  Message: Statement is unsafe because it is being used inside a XA transaction. Concurrent XA transactions may deadlock on slaves when replicated using statements.

  **ER_BINLOG_UNSAFE_XA** was added in 5.7.20.

- **Error number:** 3200; **Symbol:** ER_UDF_ERROR; **SQLSTATE:** HY000

  Message: %s UDF failed; %s

  **ER_UDF_ERROR** was added in 5.7.21.

- **Error number:** 3201; **Symbol:** ER_KEYRING_MIGRATION_FAILURE; **SQLSTATE:** HY000

  Message: Can not perform keyring migration : %s

  **ER_KEYRING_MIGRATION_FAILURE** was added in 5.7.21.

- **Error number:** 3202; **Symbol:** ER_KEYRING_ACCESS_DENIED_ERROR; **SQLSTATE:** 42000

  Message: Access denied; you need %s privileges for this operation

  **ER_KEYRING_ACCESS_DENIED_ERROR** was added in 5.7.21.

- **Error number:** 3203; **Symbol:** ER_KEYRING_MIGRATION_STATUS; **SQLSTATE:** HY000

  Message: Keyring migration %s.
ER_KEYRING_MIGRATION_STATUS was added in 5.7.21.

- Error number: 3204; Symbol: ER_PLUGIN_FAILED_TO_OPEN_TABLES; SQLSTATE: HY000
  Message: Failed to open the %s filter tables.
  ER_PLUGIN_FAILED_TO_OPEN_TABLES was added in 5.7.22.

- Error number: 3205; Symbol: ER_PLUGIN_FAILED_TO_OPEN_TABLE; SQLSTATE: HY000
  Message: Failed to open '%s.%s' %s table.
  ER_PLUGIN_FAILED_TO_OPEN_TABLE was added in 5.7.22.

- Error number: 3206; Symbol: ER_AUDIT_LOG_NO_KEYRING_PLUGIN_INSTALLED; SQLSTATE: HY000
  Message: No keyring plugin installed.
  ER_AUDIT_LOG_NO_KEYRING_PLUGIN_INSTALLED was added in 5.7.22.

- Error number: 3207; Symbol: ER_AUDIT_LOG_ENCRYPTION_PASSWORD_HAS_NOT_BEEN_SET; SQLSTATE: HY000
  Message: Audit log encryption password has not been set; it will be generated automatically. Use audit_log_encryption_password_get to obtain the password or audit_log_encryption_password_set to set a new one.
  ER_AUDIT_LOG_ENCRYPTION_PASSWORD_HAS_NOT_BEEN_SET was added in 5.7.22.

- Error number: 3208; Symbol: ER_AUDIT_LOG_COULD_NOT_CREATE_AES_KEY; SQLSTATE: HY000
  Message: Could not create AES key. OpenSSL's EVP_BytesToKey function failed.
  ER_AUDIT_LOG_COULD_NOT_CREATE_AES_KEY was added in 5.7.22.

- Error number: 3209; Symbol: ER_AUDIT_LOG_ENCRYPTION_PASSWORD_CANNOT_BE_FETCHED; SQLSTATE: HY000
  Message: Audit log encryption password cannot be fetched from the keyring. Password used so far is used for encryption.
  ER_AUDIT_LOG_ENCRYPTION_PASSWORD_CANNOT_BE_FETCHED was added in 5.7.22.

- Error number: 3210; Symbol: ER_AUDIT_LOG_JSON_FILTERING_NOT_ENABLED; SQLSTATE: HY000
  Message: Audit Log filtering has not been installed.
  ER_AUDIT_LOG_JSON_FILTERING_NOT_ENABLED was added in 5.7.22.

- Error number: 3211; Symbol: ER_AUDIT_LOG_UF_INSUFFICIENT_PRIVILEGE; SQLSTATE: HY000
  Message: Request ignored for '%s'@'%s'. SUPER_ACL needed to perform operation
  ER_AUDIT_LOG_UF_INSUFFICIENT_PRIVILEGE was added in 5.7.22.

- Error number: 3212; Symbol: ER_AUDIT_LOG_SUPER_PRIVILEGE_REQUIRED; SQLSTATE: HY000
  Message: SUPER privilege required for '%s'@'%s' user.
ER_AUDIT_LOG_SUPER_PRIVILEGE_REQUIRED was added in 5.7.22.

• Error number: 3213; Symbol: ER_COULD_NOT_REINITIALIZE_AUDIT_LOG_FILTERS; SQLSTATE: HY000
  Message: Could not reinitialize audit log filters.

ER_COULD_NOT_REINITIALIZE_AUDIT_LOG_FILTERS was added in 5.7.22.

• Error number: 3214; Symbol: ER_AUDIT_LOG_UDF_INVALID_ARGUMENT_TYPE; SQLSTATE: HY000
  Message: Invalid argument type

ER_AUDIT_LOG_UDF_INVALID_ARGUMENT_TYPE was added in 5.7.22.

• Error number: 3215; Symbol: ER_AUDIT_LOG_UDF_INVALID_ARGUMENT_COUNT; SQLSTATE: HY000
  Message: Invalid argument count

ER_AUDIT_LOG_UDF_INVALID_ARGUMENT_COUNT was added in 5.7.22.

• Error number: 3216; Symbol: ER_AUDIT_LOG_HAS_NOT_BEEN_INSTALLED; SQLSTATE: HY000
  Message: audit_log plugin has not been installed using INSTALL PLUGIN syntax.

ER_AUDIT_LOG_HAS_NOT_BEEN_INSTALLED was added in 5.7.22.

• Error number: 3217; Symbol: ER_AUDIT_LOG_UDF_READ_INVALID_MAX_ARRAY_LENGTH_ARG_TYPE; SQLSTATE: HY000
  Message: Invalid "max_array_length" argument type.

ER_AUDIT_LOG_UDF_READ_INVALID_MAX_ARRAY_LENGTH_ARG_TYPE was added in 5.7.22.

• Error number: 3218; Symbol: ER_AUDIT_LOG_UDF_READ_INVALID_MAX_ARRAY_LENGTH_ARG_VALUE; SQLSTATE: HY000
  Message: Invalid "max_array_length" argument value.

ER_AUDIT_LOG_UDF_READ_INVALID_MAX_ARRAY_LENGTH_ARG_VALUE was added in 5.7.22.

• Error number: 3219; Symbol: ER_AUDIT_LOG_JSON_FILTER_PARSING_ERROR; SQLSTATE: HY000
  Message: %s

ER_AUDIT_LOG_JSON_FILTER_PARSING_ERROR was added in 5.7.22.

• Error number: 3220; Symbol: ER_AUDIT_LOG_JSON_FILTER_NAME_CANNOT_BE_EMPTY; SQLSTATE: HY000
  Message: Filter name cannot be empty.

ER_AUDIT_LOG_JSON_FILTER_NAME_CANNOT_BE_EMPTY was added in 5.7.22.

• Error number: 3221; Symbol: ER_AUDIT_LOG_JSON_USER_NAME_CANNOT_BE_EMPTY; SQLSTATE: HY000
  Message: User cannot be empty.

ER_AUDIT_LOG_JSON_USER_NAME_CANNOT_BE_EMPTY was added in 5.7.22.
Server Error Message Reference

- **Error number:** 3222; Symbol: **ER_AUDIT_LOG_JSON_FILTER_DOES_NOT_EXISTS**; SQLSTATE: **HY000**
  
  Message: Specified filter has not been found.

  **ER_AUDIT_LOG_JSON_FILTER_DOES_NOT_EXISTS** was added in 5.7.22.

- **Error number:** 3223; Symbol: **ER_AUDIT_LOG_USER_FIRST_CHARACTER_MUST_BE_ALPHANUMERIC**; SQLSTATE: **HY000**
  
  Message: First character of the user name must be alphanumeric.

  **ER_AUDIT_LOG_USER_FIRST_CHARACTER_MUST_BE_ALPHANUMERIC** was added in 5.7.22.

- **Error number:** 3224; Symbol: **ER_AUDIT_LOG_USER_NAME_INVALID_CHARACTER**; SQLSTATE: **HY000**
  
  Message: Invalid character in the user name.

  **ER_AUDIT_LOG_USER_NAME_INVALID_CHARACTER** was added in 5.7.22.

- **Error number:** 3225; Symbol: **ER_AUDIT_LOG_HOST_NAME_INVALID_CHARACTER**; SQLSTATE: **HY000**
  
  Message: Invalid character in the host name.

  **ER_AUDIT_LOG_HOST_NAME_INVALID_CHARACTER** was added in 5.7.22.

- **Error number:** 3226; Symbol: **WARN_DEPRECATED_MAXDB_SQL_MODE_FOR_TIMESTAMP**; SQLSTATE: **HY000**
  
  Message: With the MAXDB SQL mode enabled, TIMESTAMP is identical with DATETIME. The MAXDB SQL mode is deprecated and will be removed in a future release. Please disable the MAXDB SQL mode and use DATETIME instead.

  **WARN_DEPRECATED_MAXDB_SQL_MODE_FOR_TIMESTAMP** was added in 5.7.22.

- **Error number:** 3227; Symbol: **ER_XA_REPLICATION_FILTERS**; SQLSTATE: **HY000**
  
  Message: The use of replication filters with XA transactions is not supported, and can lead to an undefined state in the replication slave.

  **ER_XA_REPLICATION_FILTERS** was added in 5.7.23.

- **Error number:** 3228; Symbol: **ER_CANT_OPEN_ERROR_LOG**; SQLSTATE: **HY000**
  
  Message: Could not open file '%s' for error logging

  **ER_CANT_OPEN_ERROR_LOG** was added in 5.7.24.

- **Error number:** 3229; Symbol: **ER_GROUPING_ON_TIMESTAMP_IN_DST**; SQLSTATE: **HY000**
  
  Message: Grouping on temporal is non-deterministic for timezones having DST. Please consider switching to UTC for this query.

  **ER_GROUPING_ON_TIMESTAMP_IN_DST** was added in 5.7.27.

- **Error number:** 3230; Symbol: **ER_CANT_START_SERVER_NAMEDPIPE**; SQLSTATE: **HY000**
  
  Message: Can't start server : Named Pipe "%s" already in use.

  **ER_CANT_START_SERVER_NAMED_PIPE** was added in 5.7.27.
B.3.2 Client Error Message Reference

Client error messages originate from within the MySQL client library. Here is an example client error message, as displayed by the `mysql` client:

```
shell> mysql -h no-such-host
ERROR 2005 (HY000): Unknown MySQL server host 'no-such-host' (0)
```

Each client error message includes an error code, SQLSTATE value, and message string, as described in Section B.1, "Error Message Sources and Components". These components are available as described in Section B.2, "Error Information Interfaces". For client errors, the SQLSTATE value is always 'HY000' (general error), so it is not meaningful for distinguishing one client error from another.

The client library also makes available to host client programs any errors that originate on the server side and are received from the client by the server. For a list of server-side errors, see Section B.3.1, "Server Error Message Reference".

In addition to the errors in the following list, the client library can also produce error messages that have error codes in the range from 1 to 999. See Section B.3.3, "Global Error Message Reference"

- Error number: 2000; Symbol: CR_UNKNOWN_ERROR;
  Message: Unknown MySQL error

- Error number: 2001; Symbol: CR_SOCKET_CREATE_ERROR;
  Message: Can't create UNIX socket (%d)

- Error number: 2002; Symbol: CR_CONNECTION_ERROR;
  Message: Can't connect to local MySQL server through socket '%s' (%d)

- Error number: 2003; Symbol: CR_CONN_HOST_ERROR;
  Message: Can't connect to MySQL server on '%s' (%d)

- Error number: 2004; Symbol: CR_IPSOCK_ERROR;
  Message: Can't create TCP/IP socket (%d)

- Error number: 2005; Symbol: CR_UNKNOWN_HOST;
  Message: Unknown MySQL server host '%s' (%d)

- Error number: 2006; Symbol: CR_SERVER_GONE_ERROR;
  Message: MySQL server has gone away

- Error number: 2007; Symbol: CR_VERSION_ERROR;
  Message: Protocol mismatch; server version = %d, client version = %d

- Error number: 2008; Symbol: CR_OUT_OF_MEMORY;
  Message: MySQL client ran out of memory

- Error number: 2009; Symbol: CR_WRONG_HOST_INFO;
  Message: Wrong host info

- Error number: 2010; Symbol: CR_LOCALHOST_CONNECTION;
  Message: Localhost via UNIX socket
• Error number: 2011; Symbol: CR_TCP_CONNECTION;
  Message: %s via TCP/IP

• Error number: 2012; Symbol: CR_SERVER_HANDSHAKE_ERR;
  Message: Error in server handshake

• Error number: 2013; Symbol: CR_SERVER_LOST;
  Message: Lost connection to MySQL server during query

• Error number: 2014; Symbol: CR_COMMANDS_OUT_OF_SYNC;
  Message: Commands out of sync; you can't run this command now

  Commands were executed in an improper order. This error occurs when a function is called that is not appropriate for the current state of the connection. For example, if mysql_stmt_fetch() is not called enough times to read an entire result set (that is, enough times to return MYSQL_NO_DATA), this error may occur for the following C API call.

• Error number: 2015; Symbol: CR_NAMEDPIPE_CONNECTION;
  Message: Named pipe: %s

• Error number: 2016; Symbol: CR_NAMEDPIPEWAIT_ERROR;
  Message: Can't wait for named pipe to host: %s pipe: %s (%lu)

• Error number: 2017; Symbol: CR_NAMEDPIPEOPEN_ERROR;
  Message: Can't open named pipe to host: %s pipe: %s (%lu)

• Error number: 2018; Symbol: CR_NAMEDPIPESETSTATE_ERROR;
  Message: Can't set state of named pipe to host: %s pipe: %s (%lu)

• Error number: 2019; Symbol: CR_CANT_READ_CHARSET;
  Message: Can't initialize character set %s (path: %s)

Message: Attempt to read a row while there is no result set associated with the statement
B.3.3 Global Error Message Reference

This section lists global error messages that are shared in the sense that they can be produced by the MySQL server or by MySQL client programs. These errors have error codes in the range from 1 to 999.

Each global error message includes an error code, SQLSTATE value, and message string, as described in Section B.1, “Error Message Sources and Components”. These components are available as described in Section B.2, “Error Information Interfaces”. For global errors, the SQLSTATE value is always 'HY000' (general error), so it is not meaningful for distinguishing one client error from another.

• Error number: 1; Symbol: EE_CANTCREATEFILE;
  Message: Can't create/write to file '%s' (Errcode: %d - %s)

• Error number: 2; Symbol: EE_READ;
  Message: Error reading file '%s' (Errcode: %d - %s)
Global Error Message Reference

- Error number: 3; Symbol: EE_WRITE;
  Message: Error writing file '%%s' (Errcode: %d - %s)

- Error number: 4; Symbol: EE_BADCLOSE;
  Message: Error on close of '%%s' (Errcode: %d - %s)

- Error number: 5; Symbol: EE_OUTOFMEMORY;
  Message: Out of memory (Needed %u bytes)

- Error number: 6; Symbol: EE_DELETE;
  Message: Error on delete of '%%s' (Errcode: %d - %s)

- Error number: 7; Symbol: EE_LINK;
  Message: Error on rename of '%%s' to '%%s' (Errcode: %d - %s)

- Error number: 9; Symbol: EE_EOFERR;
  Message: Unexpected EOF found when reading file '%%s' (Errcode: %d - %s)

- Error number: 10; Symbol: EE_CANTLOCK;
  Message: Can't lock file (Errcode: %d - %s)

- Error number: 11; Symbol: EE_CANTUNLOCK;
  Message: Can't unlock file (Errcode: %d - %s)

- Error number: 12; Symbol: EE_DIR;
  Message: Can't read dir of '%%s' (Errcode: %d - %s)

- Error number: 13; Symbol: EE_STAT;
  Message: Can't get stat of '%%s' (Errcode: %d - %s)

- Error number: 14; Symbol: EE_CANT_CHSIZE;
  Message: Can't change size of file (Errcode: %d - %s)

- Error number: 15; Symbol: EE_CANT_OPEN_STREAM;
  Message: Can't open stream from handle (Errcode: %d - %s)

- Error number: 16; Symbol: EE_GETWD;
  Message: Can't get working directory (Errcode: %d - %s)

- Error number: 17; Symbol: EE_SETWD;
  Message: Can't change dir to '%%s' (Errcode: %d - %s)

- Error number: 18; Symbol: EE_LINK_WARNING;
  Message: Warning: '%%s' had %d links

- Error number: 19; Symbol: EE_OPEN_WARNING;
  Message: Warning: %d files and %d streams is left open

- Error number: 20; Symbol: EE_DISK_FULL;
B.4 Problems and Common Errors

This section lists some common problems and error messages that you may encounter. It describes how to determine the causes of the problems and what to do to solve them.
B.4.1 How to Determine What Is Causing a Problem

When you run into a problem, the first thing you should do is to find out which program or piece of equipment is causing it:

- If you have one of the following symptoms, then it is probably a hardware problems (such as memory, motherboard, CPU, or hard disk) or kernel problem:
  - The keyboard does not work. This can normally be checked by pressing the Caps Lock key. If the Caps Lock light does not change, you have to replace your keyboard. (Before doing this, you should try to restart your computer and check all cables to the keyboard.)
  - The mouse pointer does not move.
  - The machine does not answer to a remote machine's pings.
  - Other programs that are not related to MySQL do not behave correctly.
  - Your system restarted unexpectedly. (A faulty user-level program should never be able to take down your system.)

In this case, you should start by checking all your cables and run some diagnostic tool to check your hardware! You should also check whether there are any patches, updates, or service packs for your operating system that could likely solve your problem. Check also that all your libraries (such as glibc) are up to date.

It is always good to use a machine with ECC memory to discover memory problems early.

- If your keyboard is locked up, you may be able to recover by logging in to your machine from another machine and executing **kbd_mode -a**.
- Please examine your system log file (**/var/log/messages** or similar) for reasons for your problem. If you think the problem is in MySQL, you should also examine MySQL's log files. See Section 5.4, "MySQL Server Logs".
- If you do not think you have hardware problems, you should try to find out which program is causing problems. Try using **top, ps, Task Manager, or some similar program**, to check which program is taking all CPU or is locking the machine.
- Use **top, df**, or a similar program to check whether you are out of memory, disk space, file descriptors, or some other critical resource.
- If the problem is some runaway process, you can always try to kill it. If it does not want to die, there is probably a bug in the operating system.

If you have examined all other possibilities and concluded that the MySQL server or a MySQL client is causing the problem, it is time to create a bug report, see Section 1.7, "How to Report Bugs or Problems". In the bug report, try to give a complete description of how the system is behaving and what you think is happening. Also state why you think that MySQL is causing the problem. Take into consideration all the situations described in this chapter. State any problems exactly how they appear when you examine your system. Use the "copy and paste" method for any output and error messages from programs and log files.

Try to describe in detail which program is not working and all symptoms you see. We have in the past received many bug reports that state only "the system does not work." This provides us with no information about what could be the problem.

If a program fails, it is always useful to know the following information:

- Has the program in question made a segmentation fault (did it dump core)?
Common Errors When Using MySQL Programs

- Is the program taking up all available CPU time? Check with `top`. Let the program run for a while, it may simply be evaluating something computationally intensive.

- If the `mysqld` server is causing problems, can you get any response from it with `mysqladmin -u root ping` or `mysqladmin -u root processlist`?

- What does a client program say when you try to connect to the MySQL server? (Try with `mysql`, for example.) Does the client jam? Do you get any output from the program?

When sending a bug report, you should follow the outline described in Section 1.7, “How to Report Bugs or Problems”.

B.4.2 Common Errors When Using MySQL Programs

This section lists some errors that users frequently encounter when running MySQL programs. Although the problems show up when you try to run client programs, the solutions to many of the problems involves changing the configuration of the MySQL server.

B.4.2.1 Access denied

An `Access denied` error can have many causes. Often the problem is related to the MySQL accounts that the server permits client programs to use when connecting. See Section 6.2, “Access Control and Account Management”, and Section 6.2.17, “Troubleshooting Problems Connecting to MySQL”.

B.4.2.2 Can't connect to [local] MySQL server

A MySQL client on Unix can connect to the `mysqld` server in two different ways: By using a Unix socket file to connect through a file in the file system (default `/tmp/mysql.sock`), or by using TCP/IP, which connects through a port number. A Unix socket file connection is faster than TCP/IP, but can be used only when connecting to a server on the same computer. A Unix socket file is used if you do not specify a host name or if you specify the special host name `localhost`.

If the MySQL server is running on Windows, you can connect using TCP/IP. If the server is started with the `named_pipe` system variable enabled, you can also connect with named pipes if you run the client on the host where the server is running. The name of the named pipe is `MySQL` by default. If you do not give a host name when connecting to `mysqld`, a MySQL client first tries to connect to the named pipe. If that does not work, it connects to the TCP/IP port. You can force the use of named pipes on Windows by using `. ` as the host name.

The error (2002) `Can't connect to ...` normally means that there is no MySQL server running on the system or that you are using an incorrect Unix socket file name or TCP/IP port number when trying to connect to the server. You should also check that the TCP/IP port you are using has not been blocked by a firewall or port blocking service.

The error (2003) `Can't connect to MySQL server on 'server' (10061)` indicates that the network connection has been refused. You should check that there is a MySQL server running, that it has network connections enabled, and that the network port you specified is the one configured on the server.

Start by checking whether there is a process named `mysqld` running on your server host. (Use `ps xa | grep mysqld` on Unix or the Task Manager on Windows.) If there is no such process, you should start the server. See Section 2.10.2, “Starting the Server”.

If a `mysqld` process is running, you can check it by trying the following commands. The port number or Unix socket file name might be different in your setup. `host_ip` represents the IP address of the machine where the server is running.

```
shell> mysqladmin version
shell> mysqladmin variables
shell> mysqladmin -h `hostname` version variables
```
Common Errors When Using MySQL Programs

Note the use of backticks rather than forward quotation marks with the `hostname` command; these cause the output of `hostname` (that is, the current host name) to be substituted into the `mysqldadmin` command. If you have no `hostname` command or are running on Windows, you can manually type the host name of your machine (without backticks) following the `-h` option. You can also try `-h 127.0.0.1` to connect with TCP/IP to the local host.

Make sure that the server has not been configured to ignore network connections or (if you are attempting to connect remotely) that it has not been configured to listen only locally on its network interfaces. If the server was started with the `skip_networking` system variable enabled, it will not accept TCP/IP connections at all. If the server was started with the `bind_address` system variable set to `127.0.0.1`, it will listen for TCP/IP connections only locally on the loopback interface and will not accept remote connections.

Check to make sure that there is no firewall blocking access to MySQL. Your firewall may be configured on the basis of the application being executed, or the port number used by MySQL for communication (3306 by default). Under Linux or Unix, check your IP tables (or similar) configuration to ensure that the port has not been blocked. Under Windows, applications such as ZoneAlarm or Windows Firewall may need to be configured not to block the MySQL port.

Here are some reasons the `Can't connect to local MySQL server` error might occur:

1. `mysqld` is not running on the local host. Check your operating system's process list to ensure the `mysqld` process is present.

2. You're running a MySQL server on Windows with many TCP/IP connections to it. If you're experiencing that quite often your clients get that error, you can find a workaround here: Connection to MySQL Server Failing on Windows.

3. Someone has removed the Unix socket file that `mysqld` uses (`/tmp/mysql.sock` by default). For example, you might have a `cron` job that removes old files from the `/tmp` directory. You can always run `mysqldadmin version` to check whether the Unix socket file that `mysqldadmin` is trying to use really exists. The fix in this case is to change the `cron` job to not remove `mysql.sock` or to place the socket file somewhere else. See Section B.4.3.6, “How to Protect or Change the MySQL Unix Socket File”.

4. You have started the `mysqld` server with the `--socket=/path/to/socket` option, but forgotten to tell client programs the new name of the socket file. If you change the socket path name for the server, you must also notify the MySQL clients. You can do this by providing the same `--socket` option when you run client programs. You also need to ensure that clients have permission to access the `mysql.sock` file. To find out where the socket file is, you can do:

   ```shell
   netstat -ln | grep mysql
   ```

   See Section B.4.3.6, “How to Protect or Change the MySQL Unix Socket File”.

5. You are using Linux and one server thread has died (dumped core). In this case, you must kill the other `mysqld` threads (for example, with `kill`) before you can restart the MySQL server. See Section B.4.3.3, “What to Do If MySQL Keeps Crashing”.

6. The server or client program might not have the proper access privileges for the directory that holds the Unix socket file or the socket file itself. In this case, you must either change the access privileges for the directory or socket file so that the server and clients can access them, or restart `mysqld` with an `--socket` option that specifies a socket file name in a directory where the server can create it and where client programs can access it.

If you get the error message `Can't connect to MySQL server on some_host`, you can try the following things to find out what the problem is:
Common Errors When Using MySQL Programs

- Check whether the server is running on that host by executing `telnet some_host 3306` and pressing the Enter key a couple of times. (3306 is the default MySQL port number. Change the value if your server is listening to a different port.) If there is a MySQL server running and listening to the port, you should get a response that includes the server’s version number. If you get an error such as `telnet: Unable to connect to remote host: Connection refused`, then there is no server running on the given port.

- If the server is running on the local host, try using `mysqladmin -h localhost variables` to connect using the Unix socket file. Verify the TCP/IP port number that the server is configured to listen to (it is the value of the `port` variable.)

- If you are running under Linux and Security-Enhanced Linux (SELinux) is enabled, see Set SELinux context for MySQL Server.

Set SELinux context for MySQL Server

The MySQL server reads from and writes to many files, and if the SELinux context is not set correctly on these files then the mysqld process may block access to MySQL files. In some cases, this may stop mysqld from logging errors.

Required Tools

The `semanage` binary is used in this guide to manage context; on Enterprise Linux it’s part of the `policycoreutils-python` package:

```
shell> yum install policycoreutils-python
```

Note

RHEL 6 with Python 2.6: to use semanage with early versions of RHEL 6 with python 2.6, you may need to install a backport of the `OrderedDict` python collection module using python-pip from the EPEL repository.

List Current MySQL Context

List them using the following:

```
shell> semanage fcontext -l | grep -i mysql
```

Set MySQL Data Directory Context

The default data directory location is `/var/lib/mysql/`; and the SELinux context used is `mysqld_db_t`.

If you edit the configuration file to use a different location for the data directory, or for any of the files normally in the data directory (such as the binary logs) you may need to set the context for the new location. For example:

```
shell> semanage fcontext -a -t mysqld_db_t "/path/to/my/custom/datadir(/.*)?"  
shell> restorecon -Rv /path/to/my/custom/datadir

shell> semanage fcontext -a -t mysqld_db_t "/path/to/my/custom/logdir(/.*)?"  
shell> restorecon -Rv /path/to/my/custom/logdir
```

Set MySQL Error Log File Context

The default location for RedHat RPMs is `/var/log/mysqld.log`; and the SELinux context used is `mysqld_log_t`.

If you edit the configuration file to use a different location then you may need to set the context for the new location. For example:

```
shell> semanage fcontext -a -t mysqld_log_t "/path/to/my/custom/error.log"
```
Set PID File Context

The default location for the PID file is `/var/run/mysqld/mysqld.pid`; and the SELinux context used is `mysqld_var_run_t`.

If you edit the configuration file to use a different location then you may need to set the context for the new location. For example:

```
shell> semanage fcontext -a -t mysqld_var_run_t "*/path/to/my/custom/pidfile/directory/.*?"
shell> restorecon -Rv /path/to/my/custom/pidfile/directory
```

Set unix-domain Socket Context

The default location for the unix-domain socket is `/var/lib/mysql/mysql.sock`; and the SELinux context used is `mysqld_var_run_t`.

If you edit the configuration file to use a different location then you may need to set the context for the new location. For example:

```
shell> semanage fcontext -a -t mysqld_var_run_t "*/path/to/my/custom/mysql\\.sock"*
shell> restorecon -Rv /path/to/my/custom/mysql.sock
```

Set TCP Port Context

The default TCP port is `3306`; and the SELinux context used is `mysqld_port_t`.

If you edit the configuration file to use a different TCP port, or you enable Group Replication which uses an additional port (typically port 13306), you may need to set the context for the new port. For example:

```
shell> semanage port -a -t mysqld_port_t -p tcp 13306
shell> restorecon
```

Set `secure_file_priv` Directory Context

For MySQL versions since 5.5.53, 5.6.34, 5.7.16, and 8.0.11.

Installing the MySQL server RPM creates a `/var/lib/mysql-files/` directory, but does not set the SELinux context on this directory. This directory is intended to be used for operations such as `SELECT ... INTO OUTFILE`.

If you enabled the use of this directory by setting `secure_file_priv`, you may need to set the context like so:

```
shell> semanage fcontext -a -t mysqld_db_t "*/var/lib/mysql-files/(.*)?"
shell> restorecon -Rv /var/lib/mysql-files
```

Edit this path if you used a different location. For security purposes, this directory should never be within the data directory.

For more information about this variable, see the `secure_file_priv` documentation.

**Connection to MySQL Server Failing on Windows**

When you're running a MySQL server on Windows with many TCP/IP connections to it, and you're experiencing that quite often your clients get a `Can't connect to MySQL server` error, the reason might be that Windows does not allow for enough ephemeral (short-lived) ports to serve those connections.

The purpose of `TIME_WAIT` is to keep a connection accepting packets even after the connection has been closed. This is because Internet routing can cause a packet to take a slow route to its destination...
and it may arrive after both sides have agreed to close. If the port is in use for a new connection, that packet from the old connection could break the protocol or compromise personal information from the original connection. The **TIME_WAIT** delay prevents this by ensuring that the port cannot be reused until after some time has been permitted for those delayed packets to arrive.

It is safe to reduce **TIME_WAIT** greatly on LAN connections because there is little chance of packets arriving at very long delays, as they could through the Internet with its comparatively large distances and latencies.

Windows permits ephemeral (short-lived) TCP ports to the user. After any port is closed it will remain in a **TIME_WAIT** status for 120 seconds. The port will not be available again until this time expires. The default range of port numbers depends on the version of Windows, with a more limited number of ports in older versions:

- Windows through Server 2003: Ports in range 1025–5000

With a small stack of available TCP ports (5000) and a high number of TCP ports being open and closed over a short period of time along with the **TIME_WAIT** status you have a good chance for running out of ports. There are two ways to address this problem:

- Reduce the number of TCP ports consumed quickly by investigating connection pooling or persistent connections where possible
- Tune some settings in the Windows registry (see below)

---

**Important**

The following procedure involves modifying the Windows registry. Before you modify the registry, make sure to back it up and make sure that you understand how to restore it if a problem occurs. For information about how to back up, restore, and edit the registry, view the following article in the Microsoft Knowledge Base: [http://support.microsoft.com/kb/256986/EN-US/](http://support.microsoft.com/kb/256986/EN-US/).

1. Start Registry Editor (**Regedt32.exe**).
2. Locate the following key in the registry:
   ```plaintext
   HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters
   ```
3. On the **Edit** menu, click **Add Value**, and then add the following registry value:
   ```plaintext
   Value Name: MaxUserPort
   Data Type: REG_DWORD
   Value: 65534
   ```
   This sets the number of ephemeral ports available to any user. The valid range is between 5000 and 65534 (decimal). The default value is 0x1388 (5000 decimal).
4. On the **Edit** menu, click **Add Value**, and then add the following registry value:
   ```plaintext
   Value Name: TcpTimedWaitDelay
   Data Type: REG_DWORD
   Value: 30
   ```
   This sets the number of seconds to hold a TCP port connection in **TIME_WAIT** state before closing. The valid range is between 30 and 300 decimal, although you may wish to check with Microsoft for the latest permitted values. The default value is 0x78 (120 decimal).
5. Quit Registry Editor.
6. Reboot the machine.
Common Errors When Using MySQL Programs

Note: Undoing the above should be as simple as deleting the registry entries you've created.

B.4.2.3 Lost connection to MySQL server

There are three likely causes for this error message.

Usually it indicates network connectivity trouble and you should check the condition of your network if this error occurs frequently. If the error message includes "during query," this is probably the case you are experiencing.

Sometimes the “during query” form happens when millions of rows are being sent as part of one or more queries. If you know that this is happening, you should try increasing net_read_timeout from its default of 30 seconds to 60 seconds or longer, sufficient for the data transfer to complete.

More rarely, it can happen when the client is attempting the initial connection to the server. In this case, if your connect_timeout value is set to only a few seconds, you may be able to resolve the problem by increasing it to ten seconds, perhaps more if you have a very long distance or slow connection.

You can determine whether you are experiencing this more uncommon cause by using SHOW GLOBAL STATUS LIKE 'Aborted_connects'. It will increase by one for each initial connection attempt that the server aborts. You may see “reading authorization packet" as part of the error message; if so, that also suggests that this is the solution that you need.

If the cause is none of those just described, you may be experiencing a problem with BLOB values that are larger than max_allowed_packet, which can cause this error with some clients. Sometime you may see an ER_NET_PACKET_TOO_LARGE error, and that confirms that you need to increase max_allowed_packet.

B.4.2.4 Password Fails When Entered Interactively

MySQL client programs prompt for a password when invoked with a --password or -p option that has no following password value:

```
shell> mysql -u user_name -p
Enter password:
```

On some systems, you may find that your password works when specified in an option file or on the command line, but not when you enter it interactively at the Enter password: prompt. This occurs when the library provided by the system to read passwords limits password values to a small number of characters (typically eight). That is a problem with the system library, not with MySQL. To work around it, change your MySQL password to a value that is eight or fewer characters long, or put your password in an option file.

B.4.2.5 Host 'host_name' is blocked

If the following error occurs, it means that mysqld has received many connection requests from the given host that were interrupted in the middle:

```
Host 'host_name' is blocked because of many connection errors.
Unblock with 'mysqladmin flush-hosts'
```

The value of the max_connect_errors system variable determines how many successive interrupted connection requests are permitted. After max_connect_errors failed requests without a successful connection, mysqld assumes that something is wrong (for example, that someone is trying to break in), and blocks the host from further connections until you flush the host cache by executing a FLUSH HOSTS statement, a TRUNCATE TABLE statement that truncates the Performance Schema host_cache table, or a mysqladmin flush-hosts command.

To adjust the permitted number of successive connection errors, set max_connect_errors at server startup. For example, put these lines in the server my.cnf file:

```
[mysqld]
max_connect_errors=10000
```
The value can also be set at runtime:

```sql
SET GLOBAL max_connect_errors=10000;
```

If you get the `Host 'host_name' is blocked` error message for a given host, you should first verify that there is nothing wrong with TCP/IP connections from that host. If you are having network problems, it does no good to increase the value of `max_connect_errors`.

For more information about how the host cache works, see Section 8.12.5.2, “DNS Lookup Optimization and the Host Cache”.

**B.4.2.6 Too many connections**

If clients encounter `Too many connections` errors when attempting to connect to the `mysqld` server, all available connections are in use by other clients.

The permitted number of connections is controlled by the `max_connections` system variable. The default value is 151 to improve performance when MySQL is used with the Apache Web server. To support more connections, set `max_connections` to a larger value.

`mysqld` actually permits `max_connections + 1` client connections. The extra connection is reserved for use by accounts that have the `SUPER` privilege. By granting the privilege to administrators and not to normal users (who should not need it), an administrator who also has the `PROCESS` privilege can connect to the server and use `SHOW PROCESSLIST` to diagnose problems even if the maximum number of unprivileged clients are connected. See Section 13.7.5.29, “SHOW PROCESSLIST Statement”.

For more information about how the server handles client connections, see Section 8.12.5.1, “How MySQL Handles Client Connections”.

**B.4.2.7 Out of memory**

If you issue a query using the `mysql` client program and receive an error like the following one, it means that `mysql` does not have enough memory to store the entire query result:

```
mysql: Out of memory at line 42, 'malloc.c'
mysql: needed 8136 byte (8k), memory in use: 12481367 bytes (12189k)
ERROR 2008: MySQL client ran out of memory
```

To remedy the problem, first check whether your query is correct. Is it reasonable that it should return so many rows? If not, correct the query and try again. Otherwise, you can invoke `mysql` with the `--quick` option. This causes it to use the `mysql_use_result()` C API function to retrieve the result set, which places less of a load on the client (but more on the server).

**B.4.2.8 MySQL server has gone away**

This section also covers the related `Lost connection to server during query` error.

The most common reason for the `MySQL server has gone away` error is that the server timed out and closed the connection. In this case, you normally get one of the following error codes (which one you get is operating system-dependent).

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CR_SERVER_GONE_ERROR</td>
<td>The client couldn't send a question to the server.</td>
</tr>
<tr>
<td>CR_SERVER_LOST</td>
<td>The client didn't get an error when writing to the server, but it didn't get a full answer (or any answer) to the question.</td>
</tr>
</tbody>
</table>

By default, the server closes the connection after eight hours if nothing has happened. You can change the time limit by setting the `wait_timeout` variable when you start `mysqld`. See Section 5.1.7, “Server System Variables”.

4403
If you have a script, you just have to issue the query again for the client to do an automatic reconnection. This assumes that you have automatic reconnection in the client enabled (which is the default for the mysql command-line client).

Some other common reasons for the MySQL server has gone away error are:

- You (or the db administrator) has killed the running thread with a KILL statement or a mysqladmin kill command.
- You tried to run a query after closing the connection to the server. This indicates a logic error in the application that should be corrected.
- A client application running on a different host does not have the necessary privileges to connect to the MySQL server from that host.
- You got a timeout from the TCP/IP connection on the client side. This may happen if you have been using the commands: mysql_options(..., MYSQL_OPT_READ_TIMEOUT,...) or mysql_options(..., MYSQL_OPT_WRITE_TIMEOUT,...). In this case increasing the timeout may help solve the problem.
- You have encountered a timeout on the server side and the automatic reconnection in the client is disabled (the reconnect flag in the MYSQL structure is equal to 0).
- You are using a Windows client and the server had dropped the connection (probably because wait_timeout expired) before the command was issued.

The problem on Windows is that in some cases MySQL does not get an error from the OS when writing to the TCP/IP connection to the server, but instead gets the error when trying to read the answer from the connection.

The solution to this is to either do a mysql_ping() on the connection if there has been a long time since the last query (this is what Connector/ODBC does) or set wait_timeout on the mysqld server so high that it in practice never times out.

- You can also get these errors if you send a query to the server that is incorrect or too large. If mysqld receives a packet that is too large or out of order, it assumes that something has gone wrong with the client and closes the connection. If you need big queries (for example, if you are working with big BLOB columns), you can increase the query limit by setting the server’s max_allowed_packet variable, which has a default value of 4MB. You may also need to increase the maximum packet size on the client end. More information on setting the packet size is given in Section B.4.2.9, “Packet Too Large”.

An INSERT or REPLACE statement that inserts a great many rows can also cause these sorts of errors. Either one of these statements sends a single request to the server irrespective of the number of rows to be inserted; thus, you can often avoid the error by reducing the number of rows sent per INSERT or REPLACE.

- It is also possible to see this error if host name lookups fail (for example, if the DNS server on which your server or network relies goes down). This is because MySQL is dependent on the host system for name resolution, but has no way of knowing whether it is working—from MySQL’s point of view the problem is indistinguishable from any other network timeout.

You may also see the MySQL server has gone away error if MySQL is started with the skip_networking system variable enabled.

Another networking issue that can cause this error occurs if the MySQL port (default 3306) is blocked by your firewall, thus preventing any connections at all to the MySQL server.

- You can also encounter this error with applications that fork child processes, all of which try to use the same connection to the MySQL server. This can be avoided by using a separate connection for each child process.
Common Errors When Using MySQL Programs

- You have encountered a bug where the server died while executing the query.

You can check whether the MySQL server died and restarted by executing `mysqladmin version` and examining the server's uptime. If the client connection was broken because `mysqld` crashed and restarted, you should concentrate on finding the reason for the crash. Start by checking whether issuing the query again kills the server again. See Section B.4.3.3, “What to Do If MySQL Keeps Crashing”.

You can obtain more information about lost connections by starting `mysqld` with the `log_error_verbosity` system variable set to 3. This logs some of the disconnection messages in the `hostname.err` file. See Section 5.4.2, “The Error Log”.

If you want to create a bug report regarding this problem, be sure that you include the following information:

- Indicate whether the MySQL server died. You can find information about this in the server error log. See Section B.4.3.3, “What to Do If MySQL Keeps Crashing”.

- If a specific query kills `mysqld` and the tables involved were checked with `CHECK TABLE` before you ran the query, can you provide a reproducible test case? See Section 28.5, “Debugging and Porting MySQL”.

- What is the value of the `wait_timeout` system variable in the MySQL server? (`mysqladmin variables` gives you the value of this variable.)

- Have you tried to run `mysqld` with the general query log enabled to determine whether the problem query appears in the log? (See Section 5.4.3, “The General Query Log”.)

See also Section B.4.2.10, “Communication Errors and Aborted Connections”, and Section 1.7, “How to Report Bugs or Problems”.

### B.4.2.9 Packet Too Large

A communication packet is a single SQL statement sent to the MySQL server, a single row that is sent to the client, or a binary log event sent from a master replication server to a slave.

The largest possible packet that can be transmitted to or from a MySQL 5.7 server or client is 1GB.

When a MySQL client or the `mysqld` server receives a packet bigger than `max_allowed_packet` bytes, it issues an `ER_NET_PACKET_TOO_LARGE` error and closes the connection. With some clients, you may also get a `Lost connection to MySQL server during query` error if the communication packet is too large.

Both the client and the server have their own `max_allowed_packet` variable, so if you want to handle big packets, you must increase this variable both in the client and in the server.

If you are using the `mysql` client program, its default `max_allowed_packet` variable is 16MB. To set a larger value, start `mysql` like this:

```
shell> mysql --max_allowed_packet=32M
```

That sets the packet size to 32MB.

The server's default `max_allowed_packet` value is 4MB. You can increase this if the server needs to handle big queries (for example, if you are working with big BLOB columns). For example, to set the variable to 16MB, start the server like this:

```
shell> mysqld --max_allowed_packet=16M
```

You can also use an option file to set `max_allowed_packet`. For example, to set the size for the server to 16MB, add the following lines in an option file:

```ini
[mysqld]
max_allowed_packet = 16M
```
It is safe to increase the value of this variable because the extra memory is allocated only when needed. For example, `mysqld` allocates more memory only when you issue a long query or when `mysqld` must return a large result row. The small default value of the variable is a precaution to catch incorrect packets between the client and server and also to ensure that you do not run out of memory by using large packets accidentally.

You can also get strange problems with large packets if you are using large BLOB values but have not given `mysqld` access to enough memory to handle the query. If you suspect this is the case, try adding `ulimit -d 256000` to the beginning of the `mysqld_safe` script and restarting `mysqld`.

### B.4.2.10 Communication Errors and Aborted Connections

If connection problems occur such as communication errors or aborted connections, use these sources of information to diagnose problems:

- The error log. See Section 5.4.2, “The Error Log”.
- The general query log. See Section 5.4.3, “The General Query Log”.
- The `Aborted_`xxx and `Connection_errors_`xxx status variables. See Section 5.1.9, “Server Status Variables”.
- The host cache, which is accessible using the Performance Schema `host_cache` table. See Section 8.12.5.2, “DNS Lookup Optimization and the Host Cache”, and Section 25.12.16.1, “The `host_cache` Table”.

If the `log_error_verbosity` system variable is set to 3, you might find messages like this in your error log:

```
[Note] Aborted connection 854 to db: 'employees' user: 'josh'
```

If a client is unable even to connect, the server increments the `Aborted_connects` status variable. Unsuccessful connection attempts can occur for the following reasons:

- A client attempts to access a database but has no privileges for it.
- A client uses an incorrect password.
- A connection packet does not contain the right information.
- It takes more than `connect_timeout` seconds to obtain a connect packet. See Section 5.1.7, “Server System Variables”.

If these kinds of things happen, it might indicate that someone is trying to break into your server! If the general query log is enabled, messages for these types of problems are logged to it.

If a client successfully connects but later disconnects improperly or is terminated, the server increments the `Aborted_clients` status variable, and logs an `Aborted connection` message to the error log. The cause can be any of the following:

- The client program did not call `mysql_close()` before exiting.
- The client had been sleeping more than `wait_timeout` or `interactive_timeout` seconds without issuing any requests to the server. See Section 5.1.7, “Server System Variables”.
- The client program ended abruptly in the middle of a data transfer.

Other reasons for problems with aborted connections or aborted clients:

- The `max_allowed_packet` variable value is too small or queries require more memory than you have allocated for `mysqld`. See Section B.4.2.9, “Packet Too Large”.

---

**max_allowed_packet=16M**

max_allowed_packet=16M
• Use of Ethernet protocol with Linux, both half and full duplex. Some Linux Ethernet drivers have this bug. You should test for this bug by transferring a huge file using FTP between the client and server machines. If a transfer goes in burst-pause-burst-pause mode, you are experiencing a Linux duplex syndrome. Switch the duplex mode for both your network card and hub/switch to either full duplex or to half duplex and test the results to determine the best setting.

• A problem with the thread library that causes interrupts on reads.

• Badly configured TCP/IP.

• Faulty Ethernets, hubs, switches, cables, and so forth. This can be diagnosed properly only by replacing hardware.

See also Section B.4.2.8, “MySQL server has gone away”.

B.4.2.11 The table is full

If a table-full error occurs, it may be that the disk is full or that the table has reached its maximum size. The effective maximum table size for MySQL databases is usually determined by operating system constraints on file sizes, not by MySQL internal limits. See Section 8.4.6, “Limits on Table Size”.

B.4.2.12 Can't create/write to file

If you get an error of the following type for some queries, it means that MySQL cannot create a temporary file for the result set in the temporary directory:

```
Can't create/write to file '\sqla3fe_0.ism'.
```

The preceding error is a typical message for Windows; the Unix message is similar.

One fix is to start `mysqld` with the `--tmpdir` option or to add the option to the `[mysqld]` section of your option file. For example, to specify a directory of `C:\temp`, use these lines:

```
[mysqld]
tmpdir=C:/temp
```

The `C:\temp` directory must exist and have sufficient space for the MySQL server to write to. See Section 4.2.2.2, “Using Option Files”.

Another cause of this error can be permissions issues. Make sure that the MySQL server can write to the `tmpdir` directory.

Check also the error code that you get with `perror`. One reason the server cannot write to a table is that the file system is full:

```
shell> perror 28
OS error code 28: No space left on device
```

If you get an error of the following type during startup, it indicates that the file system or directory used for storing data files is write protected. Provided that the write error is to a test file, the error is not serious and can be safely ignored.

```
Can't create test file /usr/local/mysql/data/master.lower-test
```

B.4.2.13 Commands out of sync

If you get `Commands out of sync; you can't run this command now` in your client code, you are calling client functions in the wrong order.

This can happen, for example, if you are using `mysql_use_result()` and try to execute a new query before you have called `mysql_free_result()`. It can also happen if you try to execute two queries that return data without calling `mysql_use_result()` or `mysql_store_result()` in between.
B.4.2.14 Ignoring user

If you get the following error, it means that when mysqld was started or when it reloaded the grant tables, it found an account in the user table that had an invalid password.

```
Found wrong password for user 'some_user'@'some_host'; ignoring user
```

As a result, the account is simply ignored by the permission system.

The following list indicates possible causes of and fixes for this problem:

- You may be running a new version of mysqld with an old user table. Check whether the Password column of that table is shorter than 16 characters. If so, correct this condition by running `mysql_upgrade`.

- The account has an old password (eight characters long). Update the account in the user table to have a new password.

- You have specified a password in the user table without using the `PASSWORD()` function. Use `mysql` to update the account in the user table with a new password, making sure to use the `PASSWORD()` function:

```
mysql> UPDATE user SET Password=PASSWORD('new_password')
-> WHERE User='some_user' AND Host='some_host';
```

B.4.2.15 Table 'tbl_name' doesn't exist

If you get either of the following errors, it usually means that no table exists in the default database with the given name:

```
Table 'tbl_name' doesn't exist
Can't find file: 'tbl_name' (errno: 2)
```

In some cases, it may be that the table does exist but that you are referring to it incorrectly:

- Because MySQL uses directories and files to store databases and tables, database and table names are case-sensitive if they are located on a file system that has case-sensitive file names.

- Even for file systems that are not case-sensitive, such as on Windows, all references to a given table within a query must use the same lettercase.

You can check which tables are in the default database with `SHOW TABLES`. See Section 13.7.5, “SHOW Statements”.

B.4.2.16 Can't initialize character set

You might see an error like this if you have character set problems:

```
MySQL Connection Failed: Can't initialize character set charset_name
```

This error can have any of the following causes:

- The character set is a multibyte character set and you have no support for the character set in the client. In this case, you need to recompile the client by running `CMake` with the `DDEFAULT_CHARSET=charset_name` or `DWITH_EXTRA_CHARSETS=charset_name` option. See Section 2.9.7, “MySQL Source-Configuration Options”.

  All standard MySQL binaries are compiled with `DWITH_EXTRA_CHARSETS=complex`, which enables support for all multibyte character sets. See Section 2.9.7, “MySQL Source-Configuration Options”.

- The character set is a simple character set that is not compiled into mysqld, and the character set definition files are not in the place where the client expects to find them.
In this case, you need to use one of the following methods to solve the problem:

- Recompile the client with support for the character set. See Section 2.9.7, “MySQL Source-Configuration Options”.

- Specify to the client the directory where the character set definition files are located. For many clients, you can do this with the `--character-sets-dir` option.

- Copy the character definition files to the path where the client expects them to be.

### B.4.2.17 File Not Found and Similar Errors

If you get `ERROR 'file_name' not found (errno: 23)`, `Can't open file: file_name (errno: 24)`, or any other error with `errno 23` or `errno 24` from MySQL, it means that you have not allocated enough file descriptors for the MySQL server. You can use the `perror` utility to get a description of what the error number means:

```
shell> perror 23
OS error code 23: File table overflow
shell> perror 24
OS error code 24: Too many open files
shell> perror 11
OS error code 11: Resource temporarily unavailable
```

The problem here is that `mysqld` is trying to keep open too many files simultaneously. You can either tell `mysqld` not to open so many files at once or increase the number of file descriptors available to `mysqld`.

To tell `mysqld` to keep open fewer files at a time, you can make the table cache smaller by reducing the value of the `table_open_cache` system variable (the default value is 64). This may not entirely prevent running out of file descriptors because in some circumstances the server may attempt to extend the cache size temporarily, as described in Section 8.4.3.1, “How MySQL Opens and Closes Tables”. Reducing the value of `max_connections` also reduces the number of open files (the default value is 100).

To change the number of file descriptors available to `mysqld`, you can use the `--open-files-limit` option to `mysqld_safe` or set the `open_files_limit` system variable. See Section 5.1.7, “Server System Variables”. The easiest way to set these values is to add an option to your option file. See Section 4.2.2.2, “Using Option Files”. If you have an old version of `mysqld` that does not support setting the open files limit, you can edit the `mysqld_safe` script. There is a commented-out line `ulimit -n 256` in the script. You can remove the `#` character to uncomment this line, and change the number 256 to set the number of file descriptors to be made available to `mysqld`.

`--open-files-limit` and `ulimit` can increase the number of file descriptors, but only up to the limit imposed by the operating system. There is also a “hard” limit that can be overridden only if you start `mysqld_safe` or `mysqld` as `root` (just remember that you also need to start the server with the `--user` option in this case so that it does not continue to run as `root` after it starts up). If you need to increase the operating system limit on the number of file descriptors available to each process, consult the documentation for your system.

**Note**

If you run the `tcsh` shell, `ulimit` does not work! `tcsh` also reports incorrect values when you ask for the current limits. In this case, you should start `mysqld_safe` using `sh`.

### B.4.2.18 Table-Corruption Issues

If you have started `mysqld` with the `myisam_recover_options` system variable set, MySQL automatically checks and tries to repair MyISAM tables if they are marked as 'not closed properly' or...
Administration-Related Issues

'B.4.3 Administration-Related Issues

'B.4.3.1 Problems with File Permissions

If you have problems with file permissions, the UMASK or UMASK_DIR environment variable might be set incorrectly when mysqld starts. For example, mysqld might issue the following error message when you create a table:

```
ERROR: Can't find file: 'path/with/filename.frm' (Errcode: 13)
```

The default UMASK and UMASK_DIR values are 0640 and 0750, respectively. mysqld assumes that the value for UMASK or UMASK_DIR is in octal if it starts with a zero. For example, setting UMASK=0600 is equivalent to UMASK=384 because 0600 octal is 384 decimal.

Assuming that you start mysqld using mysqld_safe, change the default UMASK value as follows:

```
UMASK=384  # = 600 in octal
export UMASK
mysqld_safe &
```

Note

An exception applies for the error log file if you start mysqld using mysqld_safe, which does not respect UMASK. mysqld_safe may create the error log file if it does not exist prior to starting mysqld, and mysqld_safe uses a umask set to a strict value of 0137. If this is unsuitable, create the error file manually with the desired access mode prior to executing mysqld_safe.

By default, mysqld creates database directories with an access permission value of 0750. To modify this behavior, set the UMASK_DIR variable. If you set its value, new directories are created with the combined UMASK and UMASK_DIR values. For example, to give group access to all new directories, start mysqld_safe as follows:

```
UMASK_DIR=504  # = 770 in octal
export UMASK_DIR
mysqld_safe &
```

For additional details, see Section 4.9, “Environment Variables”.

'B.4.3.2 How to Reset the Root Password

If you have never assigned a root password for MySQL, the server does not require a password at all for connecting as root. However, this is insecure. For instructions on assigning a password, see Section 2.10.4, “Securing the Initial MySQL Account”.

If you know the root password and want to change it, see Section 13.7.1.1, “ALTER USER Statement”, and Section 13.7.1.7, “SET PASSWORD Statement”.
If you assigned a root password previously but have forgotten it, you can assign a new password. The following sections provide instructions for Windows and Unix and Unix-like systems, as well as generic instructions that apply to any system.

**Resetting the Root Password: Windows Systems**

On Windows, use the following procedure to reset the password for the MySQL 'root'@'localhost' account. To change the password for a root account with a different host name part, modify the instructions to use that host name.

1. Log on to your system as Administrator.

2. Stop the MySQL server if it is running. For a server that is running as a Windows service, go to the **Start** menu, select **Control Panel**, then **Administrative Tools**, then **Services**. Find the MySQL service in the list and stop it.

   If your server is not running as a service, you may need to use the Task Manager to force it to stop.

3. Create a text file containing the password-assignment statement on a single line. Replace the password with the password that you want to use.

   ```
   ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass';
   ```

4. Save the file. This example assumes that you name the file `C:\mysql-init.txt`.

5. Open a console window to get to the command prompt: From the **Start** menu, select **Run**, then enter `cmd` as the command to be run.

6. Start the MySQL server with the `init_file` system variable set to name the file (notice that the backslash in the option value is doubled):

   ```
   C:\> cd "C:\Program Files\MySQL\MySQL Server 5.7\bin"
   C:\> mysqld --init-file=C:\mysql-init.txt
   ```

   If you installed MySQL to a different location, adjust the `cd` command accordingly.

   The server executes the contents of the file named by the `init_file` system variable at startup, changing the 'root'@'localhost' account password.

   To have server output to appear in the console window rather than in a log file, add the `--console` option to the `mysqld` command.

   If you installed MySQL using the MySQL Installation Wizard, you may need to specify a `--defaults-file` option. For example:

   ```
   C:\> mysqld
   --defaults-file="C:\\ProgramData\\MySQL\\MySQL Server 5.7\\my.ini"
   --init-file=C:\\mysql-init.txt
   ```

   The appropriate `--defaults-file` setting can be found using the Services Manager: From the **Start** menu, select **Control Panel**, then **Administrative Tools**, then **Services**. Find the MySQL service in the list, right-click it, and choose the **Properties** option. The **Path to executable** field contains the `--defaults-file` setting.

7. After the server has started successfully, delete `C:\mysql-init.txt`.

You should now be able to connect to the MySQL server as root using the new password. Stop the MySQL server and restart it normally. If you run the server as a service, start it from the Windows Services window. If you start the server manually, use whatever command you normally use.

If the `ALTER USER` statement fails to reset the password, try repeating the procedure using the following statements to modify the `user` table directly:

```
Resetting the Root Password: Unix and Unix-Like Systems

On Unix, use the following procedure to reset the password for the MySQL 'root'@'localhost' account. To change the password for a root account with a different host name part, modify the instructions to use that host name.

The instructions assume that you will start the MySQL server from the Unix login account that you normally use for running it. For example, if you run the server using the mysql login account, you should log in as mysql before using the instructions. Alternatively, you can log in as root, but in this case you must start mysqld with the --user=mysql option. If you start the server as root without using --user=mysql, the server may create root-owned files in the data directory, such as log files, and these may cause permission-related problems for future server startups. If that happens, you will need to either change the ownership of the files to mysql or remove them.

1. Log on to your system as the Unix user that the MySQL server runs as (for example, mysql).

2. Stop the MySQL server if it is running. Locate the .pid file that contains the server's process ID. The exact location and name of this file depend on your distribution, host name, and configuration. Common locations are /var/lib/mysql/, /var/run/mysqld/, and /usr/local/mysql/data/. Generally, the file name has an extension of .pid and begins with either mysqld or your system's host name.

Stop the MySQL server by sending a normal kill (not kill -9) to the mysqld process. Use the actual path name of the .pid file in the following command:

shell> kill `cat /mysql-data-directory/host_name.pid`

Use backticks (not forward quotation marks) with the cat command. These cause the output of cat to be substituted into the kill command.

3. Create a text file containing the password-assignment statement on a single line. Replace the password with the password that you want to use.

ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass';

4. Save the file. This example assumes that you name the file /home/me/mysql-init. The file contains the password, so do not save it where it can be read by other users. If you are not logged in as mysql (the user the server runs as), make sure that the file has permissions that permit mysql to read it.

5. Start the MySQL server with the init_file system variable set to name the file:

shell> mysqld --init-file=/home/me/mysql-init &

The server executes the contents of the file named by the init_file system variable at startup, changing the 'root'@'localhost' account password.

Other options may be necessary as well, depending on how you normally start your server. For example, --defaults-file may be needed before the init_file argument.

6. After the server has started successfully, delete /home/me/mysql-init.

You should now be able to connect to the MySQL server as root using the new password. Stop the server and restart it normally.

If the ALTER USER statement fails to reset the password, try repeating the procedure using the following statements to modify the user table directly:

UPDATE mysql.user
Resetting the Root Password: Generic Instructions

The preceding sections provide password-resetting instructions specifically for Windows and Unix and Unix-like systems. Alternatively, on any platform, you can reset the password using the `mysql` client (but this approach is less secure):

1. Stop the MySQL server if necessary, then restart it with the `--skip-grant-tables` option. This enables anyone to connect without a password and with all privileges, and disables account-management statements such as `ALTER USER` and `SET PASSWORD`. Because this is insecure, you might want to use `--skip-grant-tables` in conjunction with enabling the `skip_networking` system variable to prevent remote clients from connecting.

2. Connect to the MySQL server using the `mysql` client; no password is necessary because the server was started with `--skip-grant-tables`:

   ```
   shell> mysql
   ```

3. In the `mysql` client, tell the server to reload the grant tables so that account-management statements work:

   ```
   mysql> FLUSH PRIVILEGES;
   ```

   Then change the `root@localhost` account password. Replace the password with the password that you want to use. To change the password for a `root` account with a different host name part, modify the instructions to use that host name.

   ```
   mysql> ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass';
   ```

You should now be able to connect to the MySQL server as `root` using the new password. Stop the server and restart it normally (without the `--skip-grant-tables` option and without enabling the `skip_networking` system variable).

If the `ALTER USER` statement fails to reset the password, try repeating the procedure using the following statements to modify the `user` table directly:

```
UPDATE mysql.user SET authentication_string = PASSWORD('MyNewPass')
WHERE User = 'root' AND Host = 'localhost';
FLUSH PRIVILEGES;
```
**Administration-Related Issues**

`mysqld` crashes, because the operating system ensures that the unflushed data is written to disk. You can force MySQL to flush everything to disk after every SQL statement by starting `mysqld` with the `--flush` option.

The preceding means that normally you should not get corrupted tables unless one of the following happens:

- The MySQL server or the server host was killed in the middle of an update.
- You have found a bug in `mysqld` that caused it to die in the middle of an update.
- Some external program is manipulating data files or index files at the same time as `mysqld` without locking the table properly.
- You are running many `mysqld` servers using the same data directory on a system that does not support good file system locks (normally handled by the `lockd` lock manager), or you are running multiple servers with external locking disabled.
- You have a crashed data file or index file that contains very corrupt data that confused `mysqld`.
- You have found a bug in the data storage code. This isn't likely, but it is at least possible. In this case, you can try to change the storage engine to another engine by using `ALTER TABLE` on a repaired copy of the table.

Because it is very difficult to know why something is crashing, first try to check whether things that work for others crash for you. Try the following things:

- Stop the `mysqld` server with `mysqldadmin shutdown`, run `myisamchk --silent --force */*.MYI` from the data directory to check all MyISAM tables, and restart `mysqld`. This ensures that you are running from a clean state. See Chapter 5, *MySQL Server Administration*.

- Start `mysqld` with the general query log enabled (see Section 5.4.3, “The General Query Log”). Then try to determine from the information written to the log whether some specific query kills the server. About 95% of all bugs are related to a particular query. Normally, this is one of the last queries in the log file just before the server restarts. See Section 5.4.3, “The General Query Log”. If you can repeatedly kill MySQL with a specific query, even when you have checked all tables just before issuing it, then you have isolated the bug and should submit a bug report for it. See Section 1.7, “How to Report Bugs or Problems”.

- Try to make a test case that we can use to repeat the problem. See Section 28.5, “Debugging and Porting MySQL”.

- Try the `fork_big.pl` script. (It is located in the `tests` directory of source distributions.)

- Configuring MySQL for debugging makes it much easier to gather information about possible errors if something goes wrong. Reconfigure MySQL with the `--WITH_DEBUG=1` option to `CMake` and then recompile. See Section 28.5, “Debugging and Porting MySQL”.

- Make sure that you have applied the latest patches for your operating system.

- Use the `--skip-external-locking` option to `mysqld`. On some systems, the `lockd` lock manager does not work properly; the `--skip-external-locking` option tells `mysqld` not to use external locking. (This means that you cannot run two `mysqld` servers on the same data directory and that you must be careful if you use `myisamchk`. Nevertheless, it may be instructive to try the option as a test.)

- If `mysqld` appears to be running but not responding, try `mysqldadmin -u root processlist`. Sometimes `mysqld` is not hung even though it seems unresponsive. The problem may be that all connections are in use, or there may be some internal lock problem. `mysqldadmin -u root processlist` usually is able to make a connection even in these cases, and can provide useful information about the current number of connections and their status.
• Run the command `mysqladmin -i 5 status` or `mysqladmin -i 5 -r status` in a separate window to produce statistics while running other queries.

• Try the following:
  1. Start `mysqld` from `gdb` (or another debugger). See Section 28.5, “Debugging and Porting MySQL”.
  2. Run your test scripts.
  3. Print the backtrace and the local variables at the three lowest levels. In `gdb`, you can do this with the following commands when `mysqld` has crashed inside `gdb`:

```
backtrace
info local
up
info local
up
info local
```

With `gdb`, you can also examine which threads exist with `info threads` and switch to a specific thread with `thread N`, where `N` is the thread ID.

• Try to simulate your application with a Perl script to force MySQL to crash or misbehave.

• Send a normal bug report. See Section 1.7, “How to Report Bugs or Problems”. Be even more detailed than usual. Because MySQL works for many people, the crash might result from something that exists only on your computer (for example, an error that is related to your particular system libraries).

• If you have a problem with tables containing dynamic-length rows and you are using only `VARCHAR` columns (not `BLOB` or `TEXT` columns), you can try to change all `VARCHAR` to `CHAR` with `ALTER TABLE`. This forces MySQL to use fixed-size rows. Fixed-size rows take a little extra space, but are much more tolerant to corruption.

The current dynamic row code has been in use for several years with very few problems, but dynamic-length rows are by nature more prone to errors, so it may be a good idea to try this strategy to see whether it helps.

• Consider the possibility of hardware faults when diagnosing problems. Defective hardware can be the cause of data corruption. Pay particular attention to your memory and disk subsystems when troubleshooting hardware.

### B.4.3.4 How MySQL Handles a Full Disk

This section describes how MySQL responds to disk-full errors (such as “no space left on device”), and to quota-exceeded errors (such as “write failed” or “user block limit reached”).

This section is relevant for writes to MyISAM tables. It also applies for writes to binary log files and binary log index file, except that references to “row” and “record” should be understood to mean “event.”

When a disk-full condition occurs, MySQL does the following:

• It checks once every minute to see whether there is enough space to write the current row. If there is enough space, it continues as if nothing had happened.

• Every 10 minutes it writes an entry to the log file, warning about the disk-full condition.

To alleviate the problem, take the following actions:

• To continue, you only have to free enough disk space to insert all records.
• Alternatively, to abort the thread, use `mysqladmin kill`. The thread is aborted the next time it checks the disk (in one minute).

• Other threads might be waiting for the table that caused the disk-full condition. If you have several "locked" threads, killing the one thread that is waiting on the disk-full condition enables the other threads to continue.

Exceptions to the preceding behavior are when you use `REPAIR TABLE` or `OPTIMIZE TABLE` or when the indexes are created in a batch after `LOAD DATA` or after an `ALTER TABLE` statement. All of these statements may create large temporary files that, if left to themselves, would cause big problems for the rest of the system. If the disk becomes full while MySQL is doing any of these operations, it removes the big temporary files and mark the table as crashed. The exception is that for `ALTER TABLE`, the old table is left unchanged.

### B.4.3.5 Where MySQL Stores Temporary Files

On Unix, MySQL uses the value of the `TMPDIR` environment variable as the path name of the directory in which to store temporary files. If `TMPDIR` is not set, MySQL uses the system default, which is usually `/tmp`, `/var/tmp`, or `/usr/tmp`.

On Windows, MySQL checks in order the values of the `TMPDIR`, `TEMP`, and `TMP` environment variables. For the first one found to be set, MySQL uses it and does not check those remaining. If none of `TMPDIR`, `TEMP`, or `TMP` are set, MySQL uses the Windows system default, which is usually `C:\windows\temp\`.

If the file system containing your temporary file directory is too small, you can use the `mysqld --tmpdir` option to specify a directory in a file system where you have enough space.

The `--tmpdir` option can be set to a list of several paths that are used in round-robin fashion. Paths should be separated by colon characters (:) on Unix and semicolon characters (;) on Windows.

**Note**

To spread the load effectively, these paths should be located on different physical disks, not different partitions of the same disk.

If the MySQL server is acting as a replication slave, you can set the `slave_load_tmpdir` system variable to specify a separate directory for holding temporary files when replicating `LOAD DATA` statements. This directory should be in a disk-based file system (not a memory-based file system) so that the temporary files used to replicate LOAD DATA can survive machine restarts. The directory also should not be one that is cleared by the operating system during the system startup process. However, replication can now continue after a restart if the temporary files have been removed.

MySQL arranges that temporary files are removed if `mysqld` is terminated. On platforms that support it (such as Unix), this is done by unlinking the file after opening it. The disadvantage of this is that the name does not appear in directory listings and you do not see a big temporary file that fills up the file system in which the temporary file directory is located. (In such cases, `lsof +L1` may be helpful in identifying large files associated with `mysqld`.)

When sorting (`ORDER BY` or `GROUP BY`), MySQL normally uses one or two temporary files. The maximum disk space required is determined by the following expression:

\[
\text{(length of what is sorted + sizeof(row pointer))} \\
\times \text{ number of matched rows} \\
\times 2
\]

The row pointer size is usually four bytes, but may grow in the future for really big tables.

For some statements, MySQL creates temporary SQL tables that are not hidden and have names that begin with `#sql`.

Some `SELECT` queries creates temporary SQL tables to hold intermediate results.
DDL operations that rebuild the table and are not performed online using the \texttt{ALGORITHM=INPLACE} technique create a temporary copy of the original table in the same directory as the original table.

Online DDL operations may use temporary log files for recording concurrent DML, temporary sort files when creating an index, and temporary intermediate tables files when rebuilding the table. For more information, see Section 14.13.3, “Online DDL Space Requirements”.

\texttt{InnoDB} non-compressed, user-created temporary tables and on-disk internal temporary tables are created in a temporary tablespace file named \texttt{ibtmp1} in the MySQL data directory. For more information, see Section 14.6.3.5, “The Temporary Tablespace”.

See also Section 14.16.7, “\texttt{InnoDB INFORMATION_SCHEMA Temporary Table Info Table}”. Orphan Temporary Tables.

\section*{B.4.3.6 How to Protect or Change the MySQL Unix Socket File}

The default location for the Unix socket file that the server uses for communication with local clients is \texttt{/tmp/mysql.sock}. (For some distribution formats, the directory might be different, such as \texttt{/var/lib/mysql} for RPMs.)

On some versions of Unix, anyone can delete files in the \texttt{/tmp} directory or other similar directories used for temporary files. If the socket file is located in such a directory on your system, this might cause problems.

On most versions of Unix, you can protect your \texttt{/tmp} directory so that files can be deleted only by their owners or the superuser (\texttt{root}). To do this, set the \texttt{sticky} bit on the \texttt{/tmp} directory by logging in as \texttt{root} and using the following command:

\begin{verbatim}
shell> chmod +t /tmp
\end{verbatim}

You can check whether the \texttt{sticky} bit is set by executing \texttt{ls -ld /tmp}. If the last permission character is \texttt{t}, the bit is set.

Another approach is to change the place where the server creates the Unix socket file. If you do this, you should also let client programs know the new location of the file. You can specify the file location in several ways:

- Specify the path in a global or local option file. For example, put the following lines in \texttt{/etc/my.cnf}:

\begin{verbatim}
[mysqld]
socket=/path/to/socket

[client]
socket=/path/to/socket
\end{verbatim}

See Section 4.2.2.2, “Using Option Files”.

- Specify a \texttt{--socket} option on the command line to \texttt{mysql_safe} and when you run client programs.

- Set the \texttt{MYSQL_UNIX_PORT} environment variable to the path of the Unix socket file.

- Recompile MySQL from source to use a different default Unix socket file location. Define the path to the file with the \texttt{MYSQL_UNIX_ADDR} option when you run \texttt{CMake}. See Section 2.9.7, “MySQL Source-Configuration Options”.

You can test whether the new socket location works by attempting to connect to the server with this command:

\begin{verbatim}
shell> mysqladmin --socket=/path/to/socket version
\end{verbatim}

\section*{B.4.3.7 Time Zone Problems}
If you have a problem with `SELECT NOW()` returning values in UTC and not your local time, you have to tell the server your current time zone. The same applies if `UNIX_TIMESTAMP()` returns the wrong value. This should be done for the environment in which the server runs (for example, in `mysqld_safe` or `mysql.server`). See Section 4.9, “Environment Variables”.

You can set the time zone for the server with the `--timezone=timezone_name` option to `mysqld_safe`. You can also set it by setting the `TZ` environment variable before you start `mysqld`.

The permissible values for `--timezone` or `TZ` are system dependent. Consult your operating system documentation to see what values are acceptable.

**B.4.4 Query-Related Issues**

**B.4.4.1 Case Sensitivity in String Searches**

For nonbinary strings (`CHAR, VARCHAR, TEXT`), string searches use the collation of the comparison operands. For binary strings (`BINARY, VARBINARY, BLOB`), comparisons use the numeric values of the bytes in the operands; this means that for alphabetic characters, comparisons will be case-sensitive.

A comparison between a nonbinary string and binary string is treated as a comparison of binary strings.

Simple comparison operations (`>=, >, =, <, <=`, sorting, and grouping) are based on each character’s “sort value.” Characters with the same sort value are treated as the same character. For example, if é and é have the same sort value in a given collation, they compare as equal.

The default character set and collation are `latin1` and `latin1_swedish_ci`, so nonbinary string comparisons are case-insensitive by default. This means that if you search with `col_name LIKE 'a %'`, you get all column values that start with A or a. To make this search case-sensitive, make sure that one of the operands has a case-sensitive or binary collation. For example, if you are comparing a column and a string that both have the `latin1` character set, you can use the `COLLATE` operator to cause either operand to have the `latin1_general_cs` or `latin1_bin` collation:

```
col_name COLLATE latin1_general_cs LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_general_cs
col_name COLLATE latin1_bin LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_bin
```

If you want a column always to be treated in case-sensitive fashion, declare it with a case-sensitive or binary collation. See Section 13.1.18, “CREATE TABLE Statement”.

To cause a case-sensitive comparison of nonbinary strings to be case-insensitive, use `COLLATE` to name a case-insensitive collation. The strings in the following example normally are case-sensitive, but `COLLATE` changes the comparison to be case-insensitive:

```
mysql> SET @s1 = 'MySQL' COLLATE latin1_bin;
-> @s2 = 'mysql' COLLATE latin1_bin;
mysql> SELECT @s1 = @s2;
+-----------+
| @s1 = @s2 |
+-----------+
|         0  |
mysql> SELECT @s1 COLLATE latin1_swedish_ci = @s2;
+-------------------------------------+
| @s1 COLLATE latin1_swedish_ci = @s2 |
+-------------------------------------+
|                                   1  |
```

A binary string is case-sensitive in comparisons. To compare the string as case-insensitive, convert it to a nonbinary string and use `COLLATE` to name a case-insensitive collation:

```
mysql> SET @s = BINARY 'MySQL';
mysql> SELECT @s = 'mysql';
```
To determine whether a value will compare as a nonbinary or binary string, use the `COLLATION()` function. This example shows that `VERSION()` returns a string that has a case-insensitive collation, so comparisons are case-insensitive:

```sql
mysql> SELECT COLLATION(VERSION());
+----------------------+
| COLLATION(VERSION()) |
| utf8_general_ci      |
+----------------------+
```

For binary strings, the collation value is `binary`, so comparisons will be case-sensitive. One context in which you will see `binary` is for compression functions, which return binary strings as a general rule:

```sql
mysql> SELECT COLLATION(COMPRESS('x'));
+--------------------------+
| COLLATION(COMPRESS('x')) |
| binary                   |
+--------------------------+
```

To check the sort value of a string, the `WEIGHT_STRING()` may be helpful. See Section 12.7, “String Functions and Operators”.

### B.4.4.2 Problems Using DATE Columns

The format of a `DATE` value is `'YYYY-MM-DD'`. According to standard SQL, no other format is permitted. You should use this format in `UPDATE` expressions and in the `WHERE` clause of `SELECT` statements. For example:

```sql
SELECT * FROM t1 WHERE date >= '2003-05-05';
```

As a convenience, MySQL automatically converts a date to a number if the date is used in numeric context and vice versa. MySQL also permits a “relaxed” string format when updating and in a `WHERE` clause that compares a date to a `DATE`, `DATETIME`, or `TIMESTAMP` column. “Relaxed” format means that any punctuation character may be used as the separator between parts. For example, `'2004-08-15'` and `'2004#08#15'` are equivalent. MySQL can also convert a string containing no separators (such as `'20040815'`), provided it makes sense as a date.

When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` to a constant string with the `<`, `<=`, `=`, `>=`, `>`, or `BETWEEN` operators, MySQL normally converts the string to an internal long integer for faster comparison (and also for a bit more “relaxed” string checking). However, this conversion is subject to the following exceptions:

- When you compare two columns
- When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` column to an expression
- When you use any comparison method other than those just listed, such as `IN` or `STRCMP()`.

For those exceptions, the comparison is done by converting the objects to strings and performing a string comparison.
To be on the safe side, assume that strings are compared as strings and use the appropriate string functions if you want to compare a temporal value to a string.

The special “zero” date '0000-00-00' can be stored and retrieved as '0000-00-00'. When a '0000-00-00' date is used through Connector/ODBC, it is automatically converted to NULL because ODBC cannot handle that kind of date.

Because MySQL performs the conversions just described, the following statements work (assume that idate is a DATE column):

```sql
INSERT INTO t1 (idate) VALUES (19970505);
INSERT INTO t1 (idate) VALUES ('19970505');
INSERT INTO t1 (idate) VALUES ('97-05-05');
INSERT INTO t1 (idate) VALUES ('1997.05.05');
INSERT INTO t1 (idate) VALUES ('1997 05 05');
INSERT INTO t1 (idate) VALUES ('0000-00-00');
SELECT idate FROM t1 WHERE idate >= '1997-05-05';
SELECT idate FROM t1 WHERE idate >= 19970505;
SELECT MOD(idate,100) FROM t1 WHERE idate >= 19970505;
SELECT idate FROM t1 WHERE idate >= '19970505';
```

However, the following statement does not work:

```sql
SELECT idate FROM t1 WHERE STRCMP(idate,'20030505')=0;
```

STRCMP() is a string function, so it converts idate to a string in 'YYYY-MM-DD' format and performs a string comparison. It does not convert '20030505' to the date '2003-05-05' and perform a date comparison.

If you enable the ALLOW_INVALID_DATES SQL mode, MySQL permits you to store dates that are given only limited checking: MySQL requires only that the day is in the range from 1 to 31 and the month is in the range from 1 to 12. This makes MySQL very convenient for Web applications where you obtain year, month, and day in three different fields and you want to store exactly what the user inserted (without date validation).

MySQL permits you to store dates where the day or month and day are zero. This is convenient if you want to store a birthdate in a DATE column and you know only part of the date. To disallow zero month or day parts in dates, enable the NO_ZERO_IN_DATE mode.

MySQL permits you to store a “zero” value of '0000-00-00' as a “dummy date.” This is in some cases more convenient than using NULL values. If a date to be stored in a DATE column cannot be converted to any reasonable value, MySQL stores '0000-00-00'. To disallow '0000-00-00', enable the NO_ZERO_DATE mode.

To have MySQL check all dates and accept only legal dates (unless overridden by IGNORE), set the sql_mode system variable to "NO_ZERO_IN_DATE,NO_ZERO_DATE".

### B.4.4.3 Problems with NULL Values

The concept of the NULL value is a common source of confusion for newcomers to SQL, who often think that NULL is the same thing as an empty string ''. This is not the case. For example, the following statements are completely different:

```sql
mysql> INSERT INTO my_table (phone) VALUES (NULL);
mysql> INSERT INTO my_table (phone) VALUES ('');
```

Both statements insert a value into the phone column, but the first inserts a NULL value and the second inserts an empty string. The meaning of the first can be regarded as “phone number is not known” and the meaning of the second can be regarded as “the person is known to have no phone, and thus no phone number.”

To help with NULL handling, you can use the IS NULL and IS NOT NULL operators and the IFNULL() function.
In SQL, the NULL value is never true in comparison to any other value, even NULL. An expression that contains NULL always produces a NULL value unless otherwise indicated in the documentation for the operators and functions involved in the expression. All columns in the following example return NULL:

```sql
mysql> SELECT NULL, 1+NULL, CONCAT('Invisible',NULL);
```

To search for column values that are NULL, you cannot use an `expr = NULL` test. The following statement returns no rows, because `expr = NULL` is never true for any expression:

```sql
mysql> SELECT * FROM my_table WHERE phone = NULL;
```

To look for NULL values, you must use the `IS NULL` test. The following statements show how to find the NULL phone number and the empty phone number:

```sql
mysql> SELECT * FROM my_table WHERE phone IS NULL;
mysql> SELECT * FROM my_table WHERE phone = '';
```

See Section 3.3.4.6, “Working with NULL Values”, for additional information and examples.

You can add an index on a column that can have NULL values if you are using the MyISAM, InnoDB, or MEMORY storage engine. Otherwise, you must declare an indexed column NOT NULL, and you cannot insert NULL into the column.

When reading data with LOAD DATA, empty or missing columns are updated with ''. To load a NULL value into a column, use `\N` in the data file. The literal word NULL may also be used under some circumstances. See Section 13.2.6, “LOAD DATA Statement”.

When using DISTINCT, GROUP BY, or ORDER BY, all NULL values are regarded as equal.

When using ORDER BY, NULL values are presented first, or last if you specify DESC to sort in descending order.

Aggregate (summary) functions such as COUNT(), MIN(), and SUM() ignore NULL values. The exception to this is COUNT(*), which counts rows and not individual column values. For example, the following statement produces two counts. The first is a count of the number of rows in the table, and the second is a count of the number of non-NULL values in the age column:

```sql
mysql> SELECT COUNT(*), COUNT(age) FROM person;
```

For some data types, MySQL handles NULL values specially. If you insert NULL into a TIMESTAMP column, the current date and time is inserted. If you insert NULL into an integer or floating-point column that has the AUTO_INCREMENT attribute, the next number in the sequence is inserted.

### B.4.4.4 Problems with Column Aliases

An alias can be used in a query select list to give a column a different name. You can use the alias in GROUP BY, ORDER BY, or HAVING clauses to refer to the column:

```sql
SELECT SQRT(a*b) AS root FROM tbl_name
GROUP BY root HAVING root > 0;
SELECT id, COUNT(*) AS cnt FROM tbl_name
GROUP BY id HAVING cnt > 0;
SELECT id AS 'Customer identity' FROM tbl_name;
```

Standard SQL disallows references to column aliases in a WHERE clause. This restriction is imposed because when the WHERE clause is evaluated, the column value may not yet have been determined. For example, the following query is illegal:

```sql
SELECT id, COUNT(*) AS cnt FROM tbl_name
WHERE cnt > 0 GROUP BY id;
```

The WHERE clause determines which rows should be included in the GROUP BY clause, but it refers to the alias of a column value that is not known until after the rows have been selected, and grouped by the GROUP BY.
In the select list of a query, a quoted column alias can be specified using identifier or string quoting characters:

```sql
SELECT 1 AS 'one', 2 AS 'two';
```

Elsewhere in the statement, quoted references to the alias must use identifier quoting or the reference is treated as a string literal. For example, this statement groups by the values in column `id`, referenced using the alias `a`:

```sql
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name
GROUP BY 'a';
```

But this statement groups by the literal string `'a'` and will not work as expected:

```sql
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name
GROUP BY 'a';
```

### B.4.4.5 Rollback Failure for Nontransactional Tables

If you receive the following message when trying to perform a `ROLLBACK`, it means that one or more of the tables you used in the transaction do not support transactions:

```
Warning: Some non-transactional changed tables couldn't be rolled back
```

These nontransactional tables are not affected by the `ROLLBACK` statement.

If you were not deliberately mixing transactional and nontransactional tables within the transaction, the most likely cause for this message is that a table you thought was transactional actually is not. This can happen if you try to create a table using a transactional storage engine that is not supported by your `mysqld` server (or that was disabled with a startup option). If `mysqld` does not support a storage engine, it instead creates the table as a `MyISAM` table, which is nontransactional.

You can check the storage engine for a table by using either of these statements:

```sql
SHOW TABLE STATUS LIKE 'tbl_name';
SHOW CREATE TABLE tbl_name;
```

See Section 13.7.5.36, “SHOW TABLE STATUS Statement”, and Section 13.7.5.10, “SHOW CREATE TABLE Statement”.

To check which storage engines your `mysqld` server supports, use this statement:

```sql
SHOW ENGINES;
```

See Section 13.7.5.16, “SHOW ENGINES Statement” for full details.

### B.4.4.6 Deleting Rows from Related Tables

If the total length of the `DELETE` statement for `related_table` is more than 1MB (the default value of the `max_allowed_packet` system variable), you should split it into smaller parts and execute multiple `DELETE` statements. You probably get the fastest `DELETE` by specifying only 100 to 1,000 `related_column` values per statement if the `related_column` is indexed. If the `related_column` isn’t indexed, the speed is independent of the number of arguments in the `IN` clause.

### B.4.4.7 Solving Problems with No Matching Rows

If you have a complicated query that uses many tables but that returns no rows, you should use the following procedure to find out what is wrong:

1. Test the query with `EXPLAIN` to check whether you can find something that is obviously wrong. See Section 13.8.2, “EXPLAIN Statement”. 

4422
2. Select only those columns that are used in the WHERE clause.

3. Remove one table at a time from the query until it returns some rows. If the tables are large, it is a good idea to use LIMIT 10 with the query.

4. Issue a SELECT for the column that should have matched a row against the table that was last removed from the query.

5. If you are comparing FLOAT or DOUBLE columns with numbers that have decimals, you cannot use equality (=) comparisons. This problem is common in most computer languages because not all floating-point values can be stored with exact precision. In some cases, changing the FLOAT to a DOUBLE fixes this. See Section B.4.4.8, "Problems with Floating-Point Values".

6. If you still cannot figure out what is wrong, create a minimal test that can be run with mysql test < query.sql that shows your problems. You can create a test file by dumping the tables with mysqldump --quick db_name tbl_name_1 ... tbl_name_n > query.sql. Open the file in an editor, remove some insert lines (if there are more than needed to demonstrate the problem), and add your SELECT statement at the end of the file. Verify that the test file demonstrates the problem by executing these commands:

shell> mysqladmin create test2
shell> mysql test2 < query.sql

Attach the test file to a bug report, which you can file using the instructions in Section 1.7, "How to Report Bugs or Problems".

B.4.4.8 Problems with Floating-Point Values

Floating-point numbers sometimes cause confusion because they are approximate and not stored as exact values. A floating-point value as written in an SQL statement may not be the same as the value represented internally. Attempts to treat floating-point values as exact in comparisons may lead to problems. They are also subject to platform or implementation dependencies. The FLOAT and DOUBLE data types are subject to these issues. For DECIMAL columns, MySQL performs operations with a precision of 65 decimal digits, which should solve most common inaccuracy problems.

The following example uses DOUBLE to demonstrate how calculations that are done using floating-point operations are subject to floating-point error.

```sql
mysql> CREATE TABLE t1 (i INT, d1 DOUBLE, d2 DOUBLE);
mysql> INSERT INTO t1 VALUES (1, 101.40, 21.40), (1, -80.00, 0.00),
   -> (2, 0.00, 0.00), (2, -13.20, 0.00), (2, 59.60, 46.40),
   -> (4, 60.00, 15.40), (4, -10.60, 0.00), (4, -34.00, 0.00),
   -> (5, 33.00, 0.00), (5, -29.60, 0.00), (5, 0.00, 7.20),
   -> (6, 0.00, 0.00), (6, -51.40, 0.00);
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b
   -> FROM t1 GROUP BY i HAVING a <> b;
```

<table>
<thead>
<tr>
<th>i</th>
<th>a</th>
<th>b</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>21.4</td>
<td>21.4</td>
</tr>
<tr>
<td>2</td>
<td>76.8</td>
<td>76.8</td>

<td>-51.4</td>
<td>0</td>
</tr>
</tbody>
</table>

The result is correct. Although the first five records look like they should not satisfy the comparison (the values of a and b do not appear to be different), they may do so because the difference between the numbers shows up around the tenth decimal or so, depending on factors such as computer...
Optimizer-Related Issues

architecture or the compiler version or optimization level. For example, different CPUs may evaluate floating-point numbers differently.

If columns \( d_1 \) and \( d_2 \) had been defined as \texttt{DECIMAL} rather than \texttt{DOUBLE}, the result of the \texttt{SELECT} query would have contained only one row—the last one shown above.

The correct way to do floating-point number comparison is to first decide on an acceptable tolerance for differences between the numbers and then do the comparison against the tolerance value. For example, if we agree that floating-point numbers should be regarded the same if they are same within a precision of one in ten thousand (0.0001), the comparison should be written to find differences larger than the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
    -> GROUP BY i HAVING ABS(a - b) > 0.0001;
```

<table>
<thead>
<tr>
<th>i</th>
<th>a</th>
<th>b</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>-51.4</td>
<td>0</td>
</tr>
</tbody>
</table>

1 row in set (0.00 sec)

Conversely, to get rows where the numbers are the same, the test should find differences within the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
    -> GROUP BY i HAVING ABS(a - b) <= 0.0001;
```

<table>
<thead>
<tr>
<th>i</th>
<th>a</th>
<th>b</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>21.4</td>
<td>21.4</td>
</tr>
<tr>
<td>2</td>
<td>76.8</td>
<td>76.8</td>
</tr>
<tr>
<td>3</td>
<td>7.4</td>
<td>7.4</td>
</tr>
<tr>
<td>4</td>
<td>15.4</td>
<td>15.4</td>
</tr>
<tr>
<td>5</td>
<td>7.2</td>
<td>7.2</td>
</tr>
</tbody>
</table>

5 rows in set (0.03 sec)

Floating-point values are subject to platform or implementation dependencies. Suppose that you execute the following statements:

```
CREATE TABLE t1(c1 FLOAT(53,0), c2 FLOAT(53,0));
INSERT INTO t1 VALUES('1e+52','-1e+52');
SELECT * FROM t1;
```

On some platforms, the \texttt{SELECT} statement returns \texttt{inf} and \texttt{-inf}. On others, it returns \texttt{0} and \texttt{-0}.

An implication of the preceding issues is that if you attempt to create a replication slave by dumping table contents with \texttt{mysqldump} on the master and reloading the dump file into the slave, tables containing floating-point columns might differ between the two hosts.

**B.4.5 Optimizer-Related Issues**

MySQL uses a cost-based optimizer to determine the best way to resolve a query. In many cases, MySQL can calculate the best possible query plan, but sometimes MySQL does not have enough information about the data at hand and has to make “educated” guesses about the data.

For the cases when MySQL does not do the “right” thing, tools that you have available to help MySQL are:

- Use the \texttt{EXPLAIN} statement to get information about how MySQL processes a query. To use it, just add the keyword \texttt{EXPLAIN} to the front of your \texttt{SELECT} statement:

  ```
  mysql> EXPLAIN SELECT * FROM t1, t2 WHERE t1.i = t2.i;
  ```

\texttt{EXPLAIN} is discussed in more detail in \textit{Section 13.8.2, “EXPLAIN Statement”}. 

4424
• Use **ANALYZE TABLE** `tbl_name` to update the key distributions for the scanned table. See Section 13.7.2.1, “ANALYZE TABLE Statement”.

• Use **FORCE INDEX** for the scanned table to tell MySQL that table scans are very expensive compared to using the given index:

```sql
SELECT * FROM t1, t2 FORCE INDEX (index_for_column)
WHERE t1.col_name=t2.col_name;
```

**USE INDEX** and **IGNORE INDEX** may also be useful. See Section 8.9.4, “Index Hints”.

• Global and table-level **STRAIGHT_JOIN**. See Section 13.2.9, “SELECT Statement”.

• You can tune global or thread-specific system variables. For example, start `mysqld` with the `--max-seeks-for-key=1000` option or use `SET max_seeks_for_key=1000` to tell the optimizer to assume that no key scan causes more than 1,000 key seeks. See Section 5.1.7, “Server System Variables”.

B.4.6 Table Definition-Related Issues

B.4.6.1 Problems with ALTER TABLE

If you get a duplicate-key error when using **ALTER TABLE** to change the character set or collation of a character column, the cause is either that the new column collation maps two keys to the same value or that the table is corrupted. In the latter case, you should run **REPAIR TABLE** on the table. **REPAIR TABLE** works for **MyISAM**, **ARCHIVE**, and **CSV** tables.

If **ALTER TABLE** dies with the following error, the problem may be that MySQL crashed during an earlier **ALTER TABLE** operation and there is an old table named **A-xxx** or **B-xxx** lying around:

```sql
Error on rename of './database/name.frm'
to './database/B-xxx.frm' (Errcode: 17)
```

In this case, go to the MySQL data directory and delete all files that have names starting with **A-** or **B-**. (You may want to move them elsewhere instead of deleting them.)

**ALTER TABLE** works in the following way:

• Create a new table named **A-xxx** with the requested structural changes.

• Copy all rows from the original table to **A-xxx**.

• Rename the original table to **B-xxx**.

• Rename **A-xxx** to your original table name.

• Delete **B-xxx**.

If something goes wrong with the renaming operation, MySQL tries to undo the changes. If something goes seriously wrong (although this shouldn't happen), MySQL may leave the old table as **B-xxx**. A simple rename of the table files at the system level should get your data back.

If you use **ALTER TABLE** on a transactional table or if you are using Windows, **ALTER TABLE** unlocks the table if you had done a **LOCK TABLE** on it. This is done because **InnoDB** and these operating systems cannot drop a table that is in use.

B.4.6.2 TEMPORARY Table Problems

Temporary tables created with **CREATE TEMPORARY TABLE** have the following limitations:

• **TEMPORARY** tables are supported only by the **InnoDB**, **MEMORY**, **MyISAM**, and **MERGE** storage engines.
• Temporary tables are not supported for NDB Cluster.

• The `SHOW TABLES` statement does not list `TEMPORARY` tables.

• To rename `TEMPORARY` tables, `RENAME TABLE` does not work. Use `ALTER TABLE` instead:

```
ALTER TABLE old_name RENAME new_name;
```

• You cannot refer to a `TEMPORARY` table more than once in the same query. For example, the following does not work:

```
SELECT * FROM temp_table JOIN temp_table AS t2;
```

The statement produces this error:

```
ERROR 1137: Can't reopen table: 'temp_table'
```

• The `Can't reopen table` error also occurs if you refer to a temporary table multiple times in a stored function under different aliases, even if the references occur in different statements within the function. It may occur for temporary tables created outside stored functions and referred to across multiple calling and callee functions.

• If a `TEMPORARY` is created with the same name as an existing non-`TEMPORARY` table, the non-`TEMPORARY` table is hidden until the `TEMPORARY` table is dropped, even if the tables use different storage engines.

• There are known issues in using temporary tables with replication. See Section 16.4.1.29, “Replication and Temporary Tables”, for more information.

### B.4.7 Known Issues in MySQL

This section lists known issues in recent versions of MySQL.

For information about platform-specific issues, see the installation and porting instructions in Section 2.1, “General Installation Guidance”, and Section 28.5, “Debugging and Porting MySQL”.

The following problems are known:

• Subquery optimization for `IN` is not as effective as for `=`.

• Even if you use `lower_case_table_names=2` (which enables MySQL to remember the case used for databases and table names), MySQL does not remember the case used for database names for the function `DATABASE()` or within the various logs (on case-insensitive systems).

• Dropping a `FOREIGN KEY` constraint does not work in replication because the constraint may have another name on the slave.

• `REPLACE` (and `LOAD DATA` with the `REPLACE` option) does not trigger `ON DELETE CASCADE`.

• `DISTINCT` with `ORDER BY` does not work inside `GROUP_CONCAT()` if you do not use all and only those columns that are in the `DISTINCT` list.

• When inserting a big integer value (between $2^{63}$ and $2^{64} - 1$) into a decimal or string column, it is inserted as a negative value because the number is evaluated in signed integer context.

• With statement-based binary logging, the master writes the executed queries to the binary log. This is a very fast, compact, and efficient logging method that works perfectly in most cases. However, it is possible for the data on the master and slave to become different if a query is designed in such a way that the data modification is nondeterministic (generally not a recommended practice, even outside of replication).

For example:
• **CREATE TABLE ... SELECT** or **INSERT ... SELECT** statements that insert zero or **NULL** values into an **AUTO_INCREMENT** column.

• **DELETE** if you are deleting rows from a table that has foreign keys with **ON DELETE CASCADE** properties.

• **REPLACE ... SELECT, INSERT IGNORE ... SELECT** if you have duplicate key values in the inserted data.

**If and only if the preceding queries have no **ORDER BY** clause guaranteeing a deterministic order.**

For example, for **INSERT ... SELECT** with no **ORDER BY**, the **SELECT** may return rows in a different order (which results in a row having different ranks, hence getting a different number in the **AUTO_INCREMENT** column), depending on the choices made by the optimizers on the master and slave.

A query is optimized differently on the master and slave only if:

• The table is stored using a different storage engine on the master than on the slave. (It is possible to use different storage engines on the master and slave. For example, you can use **InnoDB** on the master, but **MyISAM** on the slave if the slave has less available disk space.)

• MySQL buffer sizes (**key_buffer_size**, and so on) are different on the master and slave.

• The master and slave run different MySQL versions, and the optimizer code differs between these versions.

This problem may also affect database restoration using **mysqlbinlog|mysql**.

The easiest way to avoid this problem is to add an **ORDER BY** clause to the aforementioned nondeterministic queries to ensure that the rows are always stored or modified in the same order. Using row-based or mixed logging format also avoids the problem.

• Log file names are based on the server host name if you do not specify a file name with the startup option. To retain the same log file names if you change your host name to something else, you must explicitly use options such as **--log-bin=old_host_name-bin**. See Section 5.1.6, “Server Command Options”. Alternatively, rename the old files to reflect your host name change. If these are binary logs, you must edit the binary log index file and fix the binary log file names there as well. (The same is true for the relay logs on a slave server.)

• **mysqlbinlog** does not delete temporary files left after a **LOAD DATA** statement. See Section 4.6.7, “mysqlbinlog — Utility for Processing Binary Log Files”.

• **RENAME** does not work with **TEMPORARY** tables or tables used in a **MERGE** table.

• When using **SET CHARACTER SET**, you cannot use translated characters in database, table, and column names.

• You cannot use _ or % with **ESCAPE** in LIKE ... ESCAPE.

• The server uses only the first **max_sort_length** bytes when comparing data values. This means that values cannot reliably be used in **GROUP BY, ORDER BY, or DISTINCT** if they differ only after the first **max_sort_length** bytes. To work around this, increase the variable value. The default value of **max_sort_length** is 1024 and can be changed at server startup time or at runtime.

• Numeric calculations are done with **BIGINT** or **DOUBLE** (both are normally 64 bits long). Which precision you get depends on the function. The general rule is that bit functions are performed with **BIGINT** precision, **IF() and ELT()** with **BIGINT or DOUBLE** precision, and the rest with **DOUBLE** precision. You should try to avoid using unsigned long long values if they resolve to be larger than 63 bits (9223372036854775807) for anything other than bit fields.
Known Issues in MySQL

- You can have up to 255 `ENUM` and `SET` columns in one table.

- In `MIN()`, `MAX()`, and other aggregate functions, MySQL currently compares `ENUM` and `SET` columns by their string value rather than by the string’s relative position in the set.

- In an `UPDATE` statement, columns are updated from left to right. If you refer to an updated column, you get the updated value instead of the original value. For example, the following statement increments `KEY` by 2, **not 1**:

  ```sql
  mysql> UPDATE tbl_name SET KEY=KEY+1,KEY=KEY+1;
  ```

- You can refer to multiple temporary tables in the same query, but you cannot refer to any given temporary table more than once. For example, the following does not work:

  ```sql
  mysql> SELECT * FROM temp_table, temp_table AS t2;
  ERROR 1137: Can't reopen table: 'temp_table'
  ```

- The optimizer may handle `DISTINCT` differently when you are using “hidden” columns in a join than when you are not. In a join, hidden columns are counted as part of the result (even if they are not shown), whereas in normal queries, hidden columns do not participate in the `DISTINCT` comparison. An example of this is:

  ```sql
  SELECT DISTINCT mp3id FROM band_downloads
  WHERE userid = 9 ORDER BY id DESC;
  ```

  and

  ```sql
  SELECT DISTINCT band_downloads.mp3id
  FROM band_downloads,band_mp3
  WHERE band_downloads.userid = 9
  AND band_mp3.id = band_downloads.mp3id
  ORDER BY band_downloads.id DESC;
  ```

  In the second case, you may get two identical rows in the result set (because the values in the hidden `id` column may differ).

  Note that this happens only for queries that do not have the `ORDER BY` columns in the result.

- If you execute a `PROCEDURE` on a query that returns an empty set, in some cases the `PROCEDURE` does not transform the columns.

- Creation of a table of type `MERGE` does not check whether the underlying tables are compatible types.

- If you use `ALTER TABLE` to add a `UNIQUE` index to a table used in a `MERGE` table and then add a normal index on the `MERGE` table, the key order is different for the tables if there was an old, non-`UNIQUE` key in the table. This is because `ALTER TABLE` puts `UNIQUE` indexes before normal indexes to be able to detect duplicate keys as early as possible.

MySQL Glossary

These terms are commonly used in information about the MySQL database server. This glossary originated as a reference for terminology about the InnoDB storage engine, and the majority of definitions are InnoDB-related.

A

.ARM file
Metadata for ARCHIVE tables. Contrast with .ARZ file. Files with this extension are always included in backups produced by the mysqlbackup command of the MySQL Enterprise Backup product.
See Also .ARZ file, MySQL Enterprise Backup, mysqlbackup command.

.ARZ file
Data for ARCHIVE tables. Contrast with .ARM file. Files with this extension are always included in backups produced by the mysqlbackup command of the MySQL Enterprise Backup product.
See Also .ARM file, MySQL Enterprise Backup, mysqlbackup command.

ACID
An acronym standing for atomicity, consistency, isolation, and durability. These properties are all desirable in a database system, and are all closely tied to the notion of a transaction. The transactional features of InnoDB adhere to the ACID principles.

Transactions are atomic units of work that can be committed or rolled back. When a transaction makes multiple changes to the database, either all the changes succeed when the transaction is committed, or all the changes are undone when the transaction is rolled back.

The database remains in a consistent state at all times — after each commit or rollback, and while transactions are in progress. If related data is being updated across multiple tables, queries see either all old values or all new values, not a mix of old and new values.

Transactions are protected (isolated) from each other while they are in progress; they cannot interfere with each other or see each other's uncommitted data. This isolation is achieved through the locking mechanism. Experienced users can adjust the isolation level, trading off less protection in favor of increased performance and concurrency, when they can be sure that the transactions really do not interfere with each other.

The results of transactions are durable: once a commit operation succeeds, the changes made by that transaction are safe from power failures, system crashes, race conditions, or other potential dangers that many non-database applications are vulnerable to. Durability typically involves writing to disk storage, with a certain amount of redundancy to protect against power failures or software crashes during write operations. (In InnoDB, the doublewrite buffer assists with durability.)
See Also atomic, commit, concurrency, doublewrite buffer, isolation level, locking, rollback, transaction.

adaptive flushing
An algorithm for InnoDB tables that smoothes out the I/O overhead introduced by checkpoints. Instead of flushing all modified pages from the buffer pool to the data files at once, MySQL periodically flushes small sets of modified pages. The adaptive flushing algorithm extends this process by estimating the optimal rate to perform these periodic flushes, based on the rate of flushing and how fast redo information is generated.
See Also buffer pool, checkpoint, data files, flush, InnoDB, page, redo log.

adaptive hash index
An optimization for InnoDB tables that can speed up lookups using = and IN operators, by constructing a hash index in memory. MySQL monitors index searches for InnoDB tables, and if queries could benefit from a hash index, it builds one automatically for index pages that are frequently accessed.
In a sense, the adaptive hash index configures MySQL at runtime to take advantage of ample main memory, coming closer to the architecture of main-memory databases. This feature is controlled by the innodb_adaptive_hash_index configuration option. Because this feature benefits some workloads and not others, and the memory used for the hash index is reserved in the buffer pool, typically you should benchmark with this feature both enabled and disabled.
The hash index is always built based on an existing B-tree index on the table. MySQL can build a hash index on a prefix of any length of the key defined for the B-tree, depending on the pattern of searches against the index. A hash index can be partial; the whole B-tree index does not need to be cached in the buffer pool.

In MySQL 5.6 and higher, another way to take advantage of fast single-value lookups with InnoDB tables is to use the InnoDB memcached plugin. See Section 14.21, "InnoDB memcached Plugin" for details. See Also B-tree, buffer pool, hash index, memcached, page, secondary index.

AIO
Acronym for asynchronous I/O. You might see this acronym in InnoDB messages or keywords. See Also asynchronous I/O.

Antelope
The code name for the original InnoDB file format. It supports the REDUNDANT and COMPACT row formats, but not the newer DYNAMIC and COMPRESSED row formats available in the Barracuda file format. See Also Barracuda, compact row format, compressed row format, dynamic row format, file format, innodb_file_format, redundant row format.

application programming interface (API)
A set of functions or procedures. An API provides a stable set of names and types for functions, procedures, parameters, and return values.

apply
When a backup produced by the MySQL Enterprise Backup product does not include the most recent changes that occurred while the backup was underway, the process of updating the backup files to include those changes is known as the apply step. It is specified by the apply-log option of the mysqlbackup command.

Before the changes are applied, we refer to the files as a raw backup. After the changes are applied, we refer to the files as a prepared backup. The changes are recorded in the ibbackup_logfile file; once the apply step is finished, this file is no longer necessary. See Also hot backup, ibbackup_logfile, MySQL Enterprise Backup, prepared backup, raw backup.

asynchronous I/O
A type of I/O operation that allows other processing to proceed before the I/O is completed. Also known as nonblocking I/O and abbreviated as AIO. InnoDB uses this type of I/O for certain operations that can run in parallel without affecting the reliability of the database, such as reading pages into the buffer pool that have not actually been requested, but might be needed soon.

Historically, InnoDB used asynchronous I/O on Windows systems only. Starting with the InnoDB Plugin 1.1 and MySQL 5.5, InnoDB uses asynchronous I/O on Linux systems. This change introduces a dependency on libaio. Asynchronous I/O on Linux systems is configured using the innodb_use_native_aio option, which is enabled by default. On other Unix-like systems, InnoDB uses synchronous I/O only. See Also buffer pool, nonblocking I/O.

atomic
In the SQL context, transactions are units of work that either succeed entirely (when committed) or have no effect at all (when rolled back). The indivisible ("atomic") property of transactions is the "A" in the acronym ACID.
See Also ACID, commit, rollback, transaction.

atomic DDL
An atomic DDL statement is one that combines the data dictionary updates, storage engine operations, and binary log writes associated with a DDL operation into a single, atomic transaction. The transaction is either fully committed or rolled back, even if the server halts during the operation. Atomic DDL support was added in MySQL 8.0. For more information, see Atomic Data Definition Statement Support. See Also binary log, data dictionary, DDL, storage engine.

atomic instruction
Special instructions provided by the CPU, to ensure that critical low-level operations cannot be interrupted.
auto-increment
A property of a table column (specified by the AUTO_INCREMENT keyword) that automatically adds an ascending sequence of values in the column.

It saves work for the developer, not to have to produce new unique values when inserting new rows. It provides useful information for the query optimizer, because the column is known to be not null and with unique values. The values from such a column can be used as lookup keys in various contexts, and because they are auto-generated there is no reason to ever change them; for this reason, primary key columns are often specified as auto-incrementing.

Auto-increment columns can be problematic with statement-based replication, because replaying the statements on a slave might not produce the same set of column values as on the master, due to timing issues. When you have an auto-incrementing primary key, you can use statement-based replication only with the setting innodb_autoinc_lock_mode=1. If you have innodb_autoinc_lock_mode=2, which allows higher concurrency for insert operations, use row-based replication rather than statement-based replication. The setting innodb_autoinc_lock_mode=0 should not be used except for compatibility purposes.

Consecutive lock mode (innodb_autoinc_lock_mode=1) is the default setting prior to MySQL 8.0.3. As of MySQL 8.0.3, interleaved lock mode (innodb_autoinc_lock_mode=2) is the default, which reflects the change from statement-based to row-based replication as the default replication type.

See Also auto-increment locking, innodb_autoinc_lock_mode, primary key, row-based replication, statement-based replication.

auto-increment locking
The convenience of an auto-increment primary key involves some tradeoff with concurrency. In the simplest case, if one transaction is inserting values into the table, any other transactions must wait to do their own inserts into that table, so that rows inserted by the first transaction receive consecutive primary key values. InnoDB includes optimizations and the innodb_autoinc_lock_mode option so that you can configure and optimal balance between predictable sequences of auto-increment values and maximum concurrency for insert operations.

See Also auto-increment, concurrency, innodb_autoinc_lock_mode.

autocommit
A setting that causes a commit operation after each SQL statement. This mode is not recommended for working with InnoDB tables with transactions that span several statements. It can help performance for read-only transactions on InnoDB tables, where it minimizes overhead from locking and generation of undo data, especially in MySQL 5.6.4 and up. It is also appropriate for working with MyISAM tables, where transactions are not applicable.

See Also commit, locking, read-only transaction, SQL, transaction, undo.

availability
The ability to cope with, and if necessary recover from, failures on the host, including failures of MySQL, the operating system, or the hardware and maintenance activity that may otherwise cause downtime. Often paired with scalability as critical aspects of a large-scale deployment.

See Also scalability.

B

B-tree
A tree data structure that is popular for use in database indexes. The structure is kept sorted at all times, enabling fast lookup for exact matches (equals operator) and ranges (for example, greater than, less than, and BETWEEN operators). This type of index is available for most storage engines, such as InnoDB and MyISAM.

Because B-tree nodes can have many children, a B-tree is not the same as a binary tree, which is limited to 2 children per node.
Contrast with hash index, which is only available in the MEMORY storage engine. The MEMORY storage engine can also use B-tree indexes, and you should choose B-tree indexes for MEMORY tables if some queries use range operators.

The use of the term B-tree is intended as a reference to the general class of index design. B-tree structures used by MySQL storage engines may be regarded as variants due to sophistications not present in a classic B-tree design. For related information, refer to the InnoDB Page Structure Fil Header section of the MySQL Internals Manual.

See Also hash index.

backticks

Identifiers within MySQL SQL statements must be quoted using the backtick character (`) if they contain special characters or reserved words. For example, to refer to a table named FOO#BAR or a column named SELECT, you would specify the identifiers as `FOO#BAR` and `SELECT`. Since the backticks provide an extra level of safety, they are used extensively in program-generated SQL statements, where the identifier names might not be known in advance.

Many other database systems use double quotation marks (" ) around such special names. For portability, you can enable ANSI_QUOTES mode in MySQL and use double quotation marks instead of backticks to qualify identifier names.

See Also SQL.

backup

The process of copying some or all table data and metadata from a MySQL instance, for safekeeping. Can also refer to the set of copied files. This is a crucial task for DBAs. The reverse of this process is the restore operation.

With MySQL, physical backups are performed by the MySQL Enterprise Backup product, and logical backups are performed by the mysqldump command. These techniques have different characteristics in terms of size and representation of the backup data, and speed (especially speed of the restore operation).

Backups are further classified as hot, warm, or cold depending on how much they interfere with normal database operation. (Hot backups have the least interference, cold backups the most.)

See Also cold backup, hot backup, logical backup, MySQL Enterprise Backup, mysqldump, physical backup, warm backup.

Barracuda

The code name for an InnoDB file format that supports the COMPRESSED row format that enables InnoDB table compression, and the DYNAMIC row format that improves the storage layout for long variable-length columns.

The MySQL Enterprise Backup product version 3.5 and above supports backing up tablespaces that use the Barracuda file format.

See Also Antelope, compact row format, compressed row format, dynamic row format, file format, file-per-table, general tablespace, innodb_file_format, MySQL Enterprise Backup, row format, system tablespace.

base column

A non-generated table column upon which a stored generated column or virtual generated column is based. In other words, a base column is a non-generated table column that is part of a generated column definition.

See Also generated column, stored generated column, virtual generated column.

beta

An early stage in the life of a software product, when it is available only for evaluation, typically without a definite release number or a number less than 1. InnoDB does not use the beta designation, preferring an early adopter phase that can extend over several point releases, leading to a GA release.

See Also early adopter, GA.

binary log

A file containing a record of all statements that attempt to change table data. These statements can be replayed to bring slave servers up to date in a replication scenario, or to bring a database up to date after
restoring table data from a backup. The binary logging feature can be turned on and off, although Oracle recommends always enabling it if you use replication or perform backups.

You can examine the contents of the binary log, or replay those statements during replication or recovery, by using the `mysqlbinlog` command. For full information about the binary log, see Section 5.4.4, “The Binary Log”. For MySQL configuration options related to the binary log, see Section 16.1.6.4, “Binary Logging Options and Variables”.

For the MySQL Enterprise Backup product, the file name of the binary log and the current position within the file are important details. To record this information for the master server when taking a backup in a replication context, you can specify the `--slave-info` option.

Prior to MySQL 5.0, a similar capability was available, known as the update log. In MySQL 5.0 and higher, the binary log replaces the update log.

See Also `binlog`, MySQL Enterprise Backup, replication.

**binlog**

An informal name for the binary log file. For example, you might see this abbreviation used in e-mail messages or forum discussions.

See Also binary log.

blind query expansion

A special mode of full-text search enabled by the `WITH QUERY EXPANSION` clause. It performs the search twice, where the search phrase for the second search is the original search phrase concatenated with the few most highly relevant documents from the first search. This technique is mainly applicable for short search phrases, perhaps only a single word. It can uncover relevant matches where the precise search term does not occur in the document.

See Also full-text search.

bottleneck

A portion of a system that is constrained in size or capacity, that has the effect of limiting overall throughput. For example, a memory area might be smaller than necessary; access to a single required resource might prevent multiple CPU cores from running simultaneously; or waiting for disk I/O to complete might prevent the CPU from running at full capacity. Removing bottlenecks tends to improve concurrency. For example, the ability to have multiple InnoDB buffer pool instances reduces contention when multiple sessions read from and write to the buffer pool simultaneously.

See Also buffer pool, concurrency.

bounce

A shutdown operation immediately followed by a restart. Ideally with a relatively short warmup period so that performance and throughput quickly return to a high level.

See Also shutdown.

buddy allocator

A mechanism for managing different-sized pages in the InnoDB buffer pool.

See Also buffer pool, page, page size.

buffer

A memory or disk area used for temporary storage. Data is buffered in memory so that it can be written to disk efficiently, with a few large I/O operations rather than many small ones. Data is buffered on disk for greater reliability, so that it can be recovered even when a crash or other failure occurs at the worst possible time. The main types of buffers used by InnoDB are the buffer pool, the doublewrite buffer, and the change buffer.

See Also buffer pool, change buffer, crash, doublewrite buffer.

buffer pool

The memory area that holds cached InnoDB data for both tables and indexes. For efficiency of high-volume read operations, the buffer pool is divided into pages that can potentially hold multiple rows. For efficiency of cache management, the buffer pool is implemented as a linked list of pages; data that is rarely used is aged out of the cache, using a variation of the LRU algorithm. On systems with large memory, you can improve concurrency by dividing the buffer pool into multiple buffer pool instances.
Several InnoDB status variables, INFORMATION_SCHEMA tables, and performance_schema tables help to monitor the internal workings of the buffer pool. Starting in MySQL 5.6, you can avoid a lengthy warmup period after restarting the server, particularly for instances with large buffer pools, by saving the buffer pool state at server shutdown and restoring the buffer pool to the same state at server startup. See Section 14.8.3.6, “Saving and Restoring the Buffer Pool State”.

See Also buffer pool instance, LRU, page, warm up.

buffer pool instance
Any of the multiple regions into which the buffer pool can be divided, controlled by the innodb_buffer_pool_instances configuration option. The total memory size specified by innodb_buffer_pool_size is divided among all buffer pool instances. Typically, having multiple buffer pool instances is appropriate for systems that allocate multiple gigabytes to the InnoDB buffer pool, with each instance being one gigabyte or larger. On systems loading or looking up large amounts of data in the buffer pool from many concurrent sessions, having multiple buffer pool instances reduces contention for exclusive access to data structures that manage the buffer pool.

See Also buffer pool.

built-in
The built-in InnoDB storage engine within MySQL is the original form of distribution for the storage engine. Contrast with the InnoDB Plugin. Starting with MySQL 5.5, the InnoDB Plugin is merged back into the MySQL code base as the built-in InnoDB storage engine (known as InnoDB 1.1).

This distinction is important mainly in MySQL 5.1, where a feature or bug fix might apply to the InnoDB Plugin but not the built-in InnoDB, or vice versa.

See Also InnoDB.

business rules
The relationships and sequences of actions that form the basis of business software, used to run a commercial company. Sometimes these rules are dictated by law, other times by company policy. Careful planning ensures that the relationships encoded and enforced by the database, and the actions performed through application logic, accurately reflect the real policies of the company and can handle real-life situations.

For example, an employee leaving a company might trigger a sequence of actions from the human resources department. The human resources database might also need the flexibility to represent data about a person who has been hired, but not yet started work. Closing an account at an online service might result in data being removed from a database, or the data might be moved or flagged so that it could be recovered if the account is re-opened. A company might establish policies regarding salary maximums, minimums, and adjustments, in addition to basic sanity checks such as the salary not being a negative number. A retail database might not allow a purchase with the same serial number to be returned more than once, or might not allow credit card purchases above a certain value, while a database used to detect fraud might allow these kinds of things.

See Also relational.

C
.cfg file
A metadata file used with the InnoDB transportable tablespace feature. It is produced by the command FLUSH TABLES ... FOR EXPORT, puts one or more tables in a consistent state that can be copied to another server. The .cfg file is copied along with the corresponding .ibd file, and used to adjust the internal values of the .ibd file, such as the space ID, during the ALTER TABLE ... IMPORT TABLESPACE step.

See Also .ibd file, space ID, transportable tablespace.

cache
The general term for any memory area that stores copies of data for frequent or high-speed retrieval. In InnoDB, the primary kind of cache structure is the buffer pool.

See Also buffer, buffer pool.

cardinality
The number of different values in a table column. When queries refer to columns that have an associated index, the cardinality of each column influences which access method is most efficient. For example, for a
column with a **unique constraint**, the number of different values is equal to the number of rows in the table. If a table has a million rows but only 10 different values for a particular column, each value occurs (on average) 100,000 times. A query such as `SELECT c1 FROM t1 WHERE c1 = 50;` thus might return 1 row or a huge number of rows, and the database server might process the query differently depending on the cardinality of `c1`.

If the values in a column have a very uneven distribution, the cardinality might not be a good way to determine the best query plan. For example, `SELECT c1 FROM t1 WHERE c1 = x;` might return 1 row when `x=50` and a million rows when `x=30`. In such a case, you might need to use **index hints** to pass along advice about which lookup method is more efficient for a particular query.

Cardinality can also apply to the number of distinct values present in multiple columns, as in a **composite index**.

See Also **column**, **composite index**, **index**, **index hint**, **persistent statistics**, **random dive**, **selectivity**, **unique constraint**.

**change buffer**

A special data structure that records changes to **pages in secondary indexes**. These values could result from SQL **INSERT**, **UPDATE**, or **DELETE** statements (DML). The set of features involving the change buffer is known collectively as **change buffering**, consisting of **insert buffering**, **delete buffering**, and **purge buffering**.

Changes are only recorded in the change buffer when the relevant page from the secondary index is not in the **buffer pool**. When the relevant index page is brought into the buffer pool while associated changes are still in the change buffer, the changes for that page are applied in the buffer pool (**merged**) using the data from the change buffer. Periodically, the **purge** operation that runs during times when the system is mostly idle, or during a slow shutdown, writes the new index pages to disk. The purge operation can write the disk blocks for a series of index values more efficiently than if each value were written to disk immediately.

Physically, the change buffer is part of the **system tablespace**, so that the index changes remain buffered across database restarts. The changes are only applied (**merged**) when the pages are brought into the buffer pool due to some other read operation.

The kinds and amount of data stored in the change buffer are governed by the **innodb_change_buffering** and **innodb_change_buffer_max_size** configuration options. To see information about the current data in the change buffer, issue the **SHOW ENGINE INNODB STATUS** command.

Formerly known as the **insert buffer**.

**change buffering**

The general term for the features involving the **change buffer**, consisting of **insert buffering**, **delete buffering**, and **purge buffering**. Index changes resulting from SQL statements, which could normally involve random I/O operations, are held back and performed periodically by a background **thread**. This sequence of operations can write the disk blocks for a series of index values more efficiently than if each value were written to disk immediately. Controlled by the **innodb_change_buffering** and **innodb_change_buffer_max_size** configuration options.

See Also **change buffer**, **delete buffering**, **insert buffering**, **purge buffering**.

**checkpoint**

As changes are made to data pages that are cached in the **buffer pool**, those changes are written to the **data files** sometime later, a process known as **flushing**. The checkpoint is a record of the latest changes (represented by an **LSN value**) that have been successfully written to the data files.

See Also **buffer pool**, **data files**, **flush**, **fuzzy checkpointing**, **LSN**.

**checksum**

In **InnoDB**, a validation mechanism to detect corruption when a **page** in a **tablespace** is read from disk into the **InnoDB buffer pool**. This feature is controlled by the **innodb_checksums**
configuration option in MySQL 5.5. innodb_checksums is deprecated in MySQL 5.6.3, replaced by innodb_checksum_algorithm.

The innochecksum command helps diagnose corruption problems by testing the checksum values for a specified tablespace file while the MySQL server is shut down.

MySQL also uses checksums for replication purposes. For details, see the configuration options binlog_checksum, master_verify_checksum, and slave_sql_verify_checksum. See Also buffer pool, page, tablespace.

child table

In a foreign key relationship, a child table is one whose rows refer (or point) to rows in another table with an identical value for a specific column. This is the table that contains the FOREIGN KEY ... REFERENCES clause and optionally ON UPDATE and ON DELETE clauses. The corresponding row in the parent table must exist before the row can be created in the child table. The values in the child table can prevent delete or update operations on the parent table, or can cause automatic deletion or updates in the child table, based on the ON CASCADE option used when creating the foreign key. See Also foreign key, parent table.

clean page

A page in the InnoDB buffer pool where all changes made in memory have also been written (flushed) to the data files. The opposite of a dirty page. See Also buffer pool, data files, dirty page, flush, page.

clean shutdown

A shutdown that completes without errors and applies all changes to InnoDB tables before finishing, as opposed to a crash or a fast shutdown. Synonym for slow shutdown. See Also crash, fast shutdown, shutdown, slow shutdown.

cold backup

A backup taken while the database is shut down. For busy applications and websites, this might not be practical, and you might prefer a warm backup or a hot backup. See Also backup, hot backup, warm backup.

column

A data item within a row, whose storage and semantics are defined by a data type. Each table and index is largely defined by the set of columns it contains.

Each column has a cardinality value. A column can be the primary key for its table, or part of the primary key. A column can be subject to a unique constraint, a NOT NULL constraint, or both. Values in different columns, even across different tables, can be linked by a foreign key relationship.

In discussions of MySQL internal operations, sometimes field is used as a synonym. See Also cardinality, foreign key, index, NOT NULL constraint, primary key, row, table, unique constraint.
An **index** on a single column.
See Also composite index, index.

When an **index** is created with a length specification, such as `CREATE INDEX idx ON t1 (c1(N))`, only the first N characters of the column value are stored in the index. Keeping the index prefix small makes the index compact, and the memory and disk I/O savings help performance. (Although making the index prefix too small can hinder query optimization by making rows with different values appear to the query optimizer to be duplicates.)

For columns containing binary values or long text strings, where sorting is not a major consideration and storing the entire value in the index would waste space, the index automatically uses the first N (typically 768) characters of the value to do lookups and sorts.
See Also index.

**commit**
A **SQL** statement that ends a **transaction**, making permanent any changes made by the transaction. It is the opposite of **rollback**, which undoes any changes made in the transaction.

**InnoDB** uses an optimistic mechanism for commits, so that changes can be written to the data files before the commit actually occurs. This technique makes the commit itself faster, with the tradeoff that more work is required in case of a rollback.

By default, MySQL uses the **autocommit** setting, which automatically issues a commit following each SQL statement.
See Also autocommit, optimistic, rollback, SQL, transaction.

The default **InnoDB row format** for InnoDB tables from MySQL 5.0.3 to MySQL 5.7.8. As of MySQL 5.7.9, the default row format is defined by the `innodb_default_row_format` configuration option, which has a default setting of **DYNAMIC**. The **COMPACT** row format provides a more compact representation for nulls and variable-length columns than the prior default (**REDUNDANT** row format).

For additional information about **InnoDB COMPACT row format**, see Section 14.11, “InnoDB Row Formats”. See Also Antelope, dynamic row format, file format, redundant row format, row format.

**compressed row format**
A row format that enables data and index **compression** for **InnoDB** tables. It was introduced in the InnoDB Plugin, available as part of the Barracuda file format. Large fields are stored away from the page that holds the rest of the row data, as in **dynamic row format**. Both index pages and large fields are compressed,
yielding memory and disk savings. Depending on the structure of the data, the decrease in memory and disk usage might or might not outweigh the performance overhead of uncompressing the data as it is used. See Section 14.9, “InnoDB Table and Page Compression” for usage details.

For additional information about InnoDB COMPRESSED row format, see DYNAMIC Row Format. See Also Barracuda, compression, dynamic row format, row format.

compressed table
A table for which the data is stored in compressed form. For InnoDB, it is a table created with ROW_FORMAT=COMPRESSED. See Section 14.9, “InnoDB Table and Page Compression” for more information. See Also compressed row format, compression.

compression
A feature with wide-ranging benefits from using less disk space, performing less I/O, and using less memory for caching.

InnoDB supports both table-level and page-level compression. InnoDB page compression is also referred to as transparent page compression. For more information about InnoDB compression, see Section 14.9, “InnoDB Table and Page Compression”.

Another type of compression is the compressed backup feature of the MySQL Enterprise Backup product. See Also Barracuda, buffer pool, compressed backup, compressed row format, DML, transparent page compression.

compression failure
Not actually an error, rather an expensive operation that can occur when using compression in combination with DML operations. It occurs when: updates to a compressed page overflow the area on the page reserved for recording modifications; the page is compressed again, with all changes applied to the table data; the re-compressed data does not fit on the original page, requiring MySQL to split the data into two new pages and compress each one separately. To check the frequency of this condition, query the INFORMATION_SCHEMA.INNODB_CMP table and check how much the value of the COMPRESS_OPS column exceeds the value of the COMPRESS_OPS_OK column. Ideally, compression failures do not occur often; when they do, you can adjust the innodb_compression_level, innodb_compression_failure_threshold_pct, and innodb_compression_pad_pct_max configuration options. See Also compression, DML, page.

concatenated index
See composite index.

concurrency
The ability of multiple operations (in database terminology, transactions) to run simultaneously, without interfering with each other. Concurrency is also involved with performance, because ideally the protection for multiple simultaneous transactions works with a minimum of performance overhead, using efficient mechanisms for locking. See Also ACID, locking, transaction.

configuration file
The file that holds the option values used by MySQL at startup. Traditionally, on Linux and Unix this file is named my.cnf, and on Windows it is named my.ini. You can set a number of options related to InnoDB under the [mysqld] section of the file.

See Section 4.2.2.2, “Using Option Files” for information about where MySQL searches for configuration files.

When you use the MySQL Enterprise Backup product, you typically use two configuration files: one that specifies where the data comes from and how it is structured (which could be the original configuration file for your server), and a stripped-down one containing only a small set of options that specify where the backup data goes and how it is structured. The configuration files used with the MySQL Enterprise Backup product must contain certain options that are typically left out of regular configuration files, so you might need to add options to your existing configuration file for use with MySQL Enterprise Backup. See Also my.cnf, MySQL Enterprise Backup, option, option file.
consistent read
A read operation that uses snapshot information to present query results based on a point in time, regardless of changes performed by other transactions running at the same time. If queried data has been changed by another transaction, the original data is reconstructed based on the contents of the undo log. This technique avoids some of the locking issues that can reduce concurrency by forcing transactions to wait for other transactions to finish.

With REPEATABLE READ isolation level, the snapshot is based on the time when the first read operation is performed. With READ COMMITTED isolation level, the snapshot is reset to the time of each consistent read operation.

Consistent read is the default mode in which InnoDB processes SELECT statements in READ COMMITTED and REPEATABLE READ isolation levels. Because a consistent read does not set any locks on the tables it accesses, other sessions are free to modify those tables while a consistent read is being performed on the table.

For technical details about the applicable isolation levels, see Section 14.7.2.3, “Consistent Nonlocking Reads”.
See Also concurrency, isolation level, locking, READ COMMITTED, REPEATABLE READ, snapshot, transaction, undo log.

constraint
An automatic test that can block database changes to prevent data from becoming inconsistent. (In computer science terms, a kind of assertion related to an invariant condition.) Constraints are a crucial component of the ACID philosophy, to maintain data consistency. Constraints supported by MySQL include FOREIGN KEY constraints and unique constraints.
See Also ACID, foreign key, unique constraint.

counter
A value that is incremented by a particular kind of InnoDB operation. Useful for measuring how busy a server is, troubleshooting the sources of performance issues, and testing whether changes (for example, to configuration settings or indexes used by queries) have the desired low-level effects. Different kinds of counters are available through Performance Schema tables and INFORMATION_SCHEMA tables, particularly INFORMATION_SCHEMA.INNODB_METRICS.
See Also INFORMATION_SCHEMA, metrics counter, Performance Schema.

covering index
An index that includes all the columns retrieved by a query. Instead of using the index values as pointers to find the full table rows, the query returns values from the index structure, saving disk I/O. InnoDB can apply this optimization technique to more indexes than MyISAM can, because InnoDB secondary indexes also include the primary key columns. InnoDB cannot apply this technique for queries against tables modified by a transaction, until that transaction ends.

Any column index or composite index could act as a covering index, given the right query. Design your indexes and queries to take advantage of this optimization technique wherever possible.
See Also column index, composite index, index, primary key, secondary index.

cPU-bound
A type of workload where the primary bottleneck is CPU operations in memory. Typically involves read-intensive operations where the results can all be cached in the buffer pool.
See Also bottleneck, buffer pool, workload.

Crash
MySQL uses the term “crash” to refer generally to any unexpected shutdown operation where the server cannot do its normal cleanup. For example, a crash could happen due to a hardware fault on the database server machine or storage device; a power failure; a potential data mismatch that causes the MySQL server to halt; a fast shutdown initiated by the DBA; or many other reasons. The robust, automatic crash recovery for InnoDB tables ensures that data is made consistent when the server is restarted, without any extra work for the DBA.
See Also crash recovery, fast shutdown, InnoDB, shutdown.
crash recovery
The cleanup activities that occur when MySQL is started again after a crash. For InnoDB tables, changes from incomplete transactions are replayed using data from the redo log. Changes that were committed before the crash, but not yet written into the data files, are reconstructed from the doublewrite buffer. When the database is shut down normally, this type of activity is performed during shutdown by the purge operation.

During normal operation, committed data can be stored in the change buffer for a period of time before being written to the data files. There is always a tradeoff between keeping the data files up-to-date, which introduces performance overhead during normal operation, and buffering the data, which can make shutdown and crash recovery take longer.
See Also change buffer, commit, crash, data files, doublewrite buffer, InnoDB, purge, redo log.

CRUD
Acronym for “create, read, update, delete”, a common sequence of operations in database applications. Often denotes a class of applications with relatively simple database usage (basic DDL, DML and query statements in SQL) that can be implemented quickly in any language.
See Also DDL, DML, query, SQL.

cursor
An internal data structure that is used to represent the result set of a query, or other operation that performs a search using an SQL WHERE clause. It works like an iterator in other high-level languages, producing each value from the result set as requested.

Although SQL usually handles the processing of cursors for you, you might delve into the inner workings when dealing with performance-critical code.
See Also query.

D
data definition language
See DDL.

data dictionary
Metadata that keeps track of InnoDB-related objects such as tables, indexes, and table columns. This metadata is physically located in the InnoDB system tablespace. For historical reasons, it overlaps to some degree with information stored in the .frm files.

Because the MySQL Enterprise Backup product always backs up the system tablespace, all backups include the contents of the data dictionary.
See Also column, file-per-table, .frm file, index, MySQL Enterprise Backup, system tablespace, table.

data directory
The directory under which each MySQL instance keeps the data files for InnoDB and the directories representing individual databases. Controlled by the datadir configuration option.
See Also data files, instance.

data files
The files that physically contain table and index data.

The InnoDB system tablespace, which holds the InnoDB data dictionary and is capable of holding data for multiple InnoDB tables, is represented by one or more .ibdata data files.

File-per-table tablespaces, which hold data for a single InnoDB table, are represented by a .ibd data file.

General tablespaces (introduced in MySQL 5.7.6), which can hold data for multiple InnoDB tables, are also represented by a .ibd data file.
See Also data dictionary, file-per-table, general tablespace, .ibd file, ibdata file, index, system tablespace, table, tablespace.

data manipulation language
See DML.
data warehouse
A database system or application that primarily runs large queries. The read-only or read-mostly data might be organized in denormalized form for query efficiency. Can benefit from the optimizations for read-only transactions in MySQL 5.6 and higher. Contrast with OLTP.
See Also denormalized, OLTP, query, read-only transaction.

database
Within the MySQL data directory, each database is represented by a separate directory. The InnoDB system tablespace, which can hold table data from multiple databases within a MySQL instance, is kept in data files that reside outside of individual database directories. When file-per-table mode is enabled, the .ibd files representing individual InnoDB tables are stored inside the database directories unless created elsewhere using the DATA DIRECTORY clause. General tablespaces, introduced in MySQL 5.7.6, also hold table data in .ibd files. Unlike file-per-table .ibd files, general tablespace .ibd files can hold table data from multiple databases within a MySQL instance, and can be assigned to directories relative to or independent of the MySQL data directory.

For long-time MySQL users, a database is a familiar notion. Users coming from an Oracle Database background will find that the MySQL meaning of a database is closer to what Oracle Database calls a schema.
See Also data files, file-per-table, .ibd file, instance, schema, system tablespace.

DCL
Data control language, a set of SQL statements for managing privileges. In MySQL, consists of the GRANT and REVOKE statements. Contrast with DDL and DML.
See Also DDL, DML, SQL.

DDL
Data definition language, a set of SQL statements for manipulating the database itself rather than individual table rows. Includes all forms of the CREATE, ALTER, and DROP statements. Also includes the TRUNCATE statement, because it works differently than a DELETE FROM table_name statement, even though the ultimate effect is similar.

DDL statements automatically commit the current transaction; they cannot be rolled back.

The InnoDB online DDL feature enhances performance for CREATE INDEX, DROP INDEX, and many types of ALTER TABLE operations. See Section 14.13, “InnoDB and Online DDL” for more information. Also, the InnoDB file-per-table setting can affect the behavior of DROP TABLE and TRUNCATE TABLE operations.

Contrast with DML and DCL.
See Also commit, DCL, DML, file-per-table, rollback, SQL, transaction.

deadlock
A situation where different transactions are unable to proceed, because each holds a lock that the other needs. Because both transactions are waiting for a resource to become available, neither will ever release the locks it holds.

A deadlock can occur when the transactions lock rows in multiple tables (through statements such as UPDATE or SELECT ... FOR UPDATE), but in the opposite order. A deadlock can also occur when such statements lock ranges of index records and gaps, with each transaction acquiring some locks but not others due to a timing issue.

For background information on how deadlocks are automatically detected and handled, see Section 14.7.5.2, “Deadlock Detection and Rollback”. For tips on avoiding and recovering from deadlock conditions, see Section 14.7.5.3, “How to Minimize and Handle Deadlocks”.
See Also gap, lock, transaction.

deadlock detection
A mechanism that automatically detects when a deadlock occurs, and automatically rolls back one of the transactions involved (the victim). Deadlock detection can be disabled using the innodb_deadlock_detect configuration option.
See Also deadlock, rollback, transaction, victim.
When InnoDB processes a `DELETE` statement, the rows are immediately marked for deletion and no longer are returned by queries. The storage is reclaimed sometime later, during the periodic garbage collection known as the `purge` operation. For removing large quantities of data, related operations with their own performance characteristics are `TRUNCATE` and `DROP`.

See Also `drop`, `purge`, `truncate`.

delete buffering

The technique of storing changes to secondary index pages, resulting from `DELETE` operations, in the `change buffer` rather than writing the changes immediately, so that the physical writes can be performed to minimize random I/O. (Because delete operations are a two-step process, this operation buffers the write that normally marks an index record for deletion.) It is one of the types of `change buffering`; the others are `insert buffering` and `purge buffering`.

See Also `change buffer`, `change buffering`, `insert buffer`, `insert buffering`, `purge buffering`.

denormalized

A data storage strategy that duplicates data across different tables, rather than linking the tables with `foreign keys` and `join` queries. Typically used in `data warehouse` applications, where the data is not updated after loading. In such applications, query performance is more important than making it simple to maintain consistent data during updates. Contrast with `normalized`.

See Also `data warehouse`, `foreign key`, `join`, `normalized`.

descending index

A type of `index` available with some database systems, where index storage is optimized to process `ORDER BY` `column DESC` clauses. Currently, although MySQL allows the `DESC` keyword in the `CREATE TABLE` statement, it does not use any special storage layout for the resulting index.

See Also `index`.

dirty page

A page in the InnoDB `buffer pool` that has been updated in memory, where the changes are not yet written (flushed) to the `data files`. The opposite of a `clean page`.

See Also `buffer pool`, `clean page`, `data files`, `flush`, `page`.

dirty read

An operation that retrieves unreliable data, data that was updated by another transaction but not yet committed. It is only possible with the `isolation level` known as `read uncommitted`.

This kind of operation does not adhere to the `ACID` principle of database design. It is considered very risky, because the data could be rolled back, or updated further before being committed; then, the transaction doing the dirty read would be using data that was never confirmed as accurate.

Its opposite is `consistent read`, where InnoDB ensures that a transaction does not read information updated by another transaction, even if the other transaction commits in the meantime.

See Also `ACID`, `commit`, `consistent read`, `isolation level`, `READ UNCOMMITTED`, `rollback`.

disk-based

A kind of database that primarily organizes data on disk storage (hard drives or equivalent). Data is brought back and forth between disk and memory to be operated upon. It is the opposite of an `in-memory database`.

Although InnoDB is disk-based, it also contains features such as the `buffer pool`, multiple buffer pool instances, and the `adaptive hash index` that allow certain kinds of workloads to work primarily from memory.

See Also `adaptive hash index`, `buffer pool`, `in-memory database`.

disk-bound

A type of `workload` where the primary bottleneck is disk I/O. (Also known as I/O-bound.) Typically involves frequent writes to disk, or random reads of more data than can fit into the `buffer pool`.

See Also `bottleneck`, `buffer pool`, `workload`.

DML

Data manipulation language, a set of `SQL` statements for performing `INSERT`, `UPDATE`, and `DELETE` operations. The `SELECT` statement is sometimes considered as a DML statement, because the `SELECT ... FOR UPDATE` form is subject to the same considerations for `locking` as `INSERT`, `UPDATE`, and `DELETE`. 

5132
DML statements for an InnoDB table operate in the context of a transaction, so their effects can be committed or rolled back as a single unit.

Contrast with DDL and DCL.
See Also commit, DCL, DDL, locking, rollback, SQL, transaction.

document id
In the InnoDB full-text search feature, a special column in the table containing the FULLTEXT index, to uniquely identify the document associated with each ilist value. Its name is FTS_DOC_ID (uppercase required). The column itself must be of BIGINT UNSIGNED NOT NULL type, with a unique index named FTS_DOC_ID_INDEX. Preferably, you define this column when creating the table. If InnoDB must add the column to the table while creating a FULLTEXT index, the indexing operation is considerably more expensive.

See Also full-text search, FULLTEXT index, ilist.

doublewrite buffer
InnoDB uses a file flush technique called doublewrite. Before writing pages to the data files, InnoDB first writes them to a storage area called the doublewrite buffer. Only after the write and the flush to the doublewrite buffer have completed, does InnoDB write the pages to their proper positions in the data file. If there is an operating system, storage subsystem, or mysqld process crash in the middle of a page write, InnoDB can later find a good copy of the page from the doublewrite buffer during crash recovery.

Although data is always written twice, the doublewrite buffer does not require twice as much I/O overhead or twice as many I/O operations. Data is written to the buffer itself as a large sequential chunk, with a single fsync() call to the operating system.

To turn off the doublewrite buffer, specify the option innodb_doublewrite=0.
See Also crash recovery, data files, page, purge.

drop
A kind of DDL operation that removes a schema object, through a statement such as DROP TABLE or DROP INDEX. It maps internally to an ALTER TABLE statement. From an InnoDB perspective, the performance considerations of such operations involve the time that the data dictionary is locked to ensure that interrelated objects are all updated, and the time to update memory structures such as the buffer pool.
For a table, the drop operation has somewhat different characteristics than a truncate operation (TRUNCATE TABLE statement).
See Also buffer pool, data dictionary, DDL, table, truncate.

dynamic row format
A row format introduced in the InnoDB Plugin, available as part of the Barracuda file format. Because long variable-length column values are stored outside of the page that holds the row data, it is very efficient for rows that include large objects. Since the large fields are typically not accessed to evaluate query conditions, they are not brought into the buffer pool as often, resulting in fewer I/O operations and better utilization of cache memory.

As of MySQL 5.7.9, the default row format is defined by innodb_default_row_format, which has a default value of DYNAMIC.

For additional information about InnoDB DYNAMIC row format, see DYNAMIC Row Format.
See Also Barracuda, buffer pool, file format, row format.

e
early adopter
A stage similar to beta, when a software product is typically evaluated for performance, functionality, and compatibility in a non-mission-critical setting.
See Also beta.

error log
A type of log showing information about MySQL startup and critical runtime errors and crash information. For details, see Section 5.4.2, “The Error Log”.

5133
See Also crash, log.

eviction
The process of removing an item from a cache or other temporary storage area, such as the InnoDB buffer pool. Often, but not always, uses the LRU algorithm to determine which item to remove. When a dirty page is evicted, its contents are flushed to disk, and any dirty neighbor pages might be flushed also. See Also buffer pool, dirty page, flush, LRU, neighbor page.

exclusive lock
A kind of lock that prevents any other transaction from locking the same row. Depending on the transaction isolation level, this kind of lock might block other transactions from writing to the same row, or might also block other transactions from reading the same row. The default InnoDB isolation level, REPEATABLE READ, enables higher concurrency by allowing transactions to read rows that have exclusive locks, a technique known as consistent read. See Also concurrency, consistent read, isolation level, lock, REPEATABLE READ, shared lock, transaction.

extent
A group of pages within a tablespace. For the default page size of 16KB, an extent contains 64 pages. In MySQL 5.6, the page size for an InnoDB instance can be 4KB, 8KB, or 16KB, controlled by the innodb_page_size configuration option. For 4KB, 8KB, and 16KB page sizes, the extent size is always 1MB (or 1048576 bytes).

Support for 32KB and 64KB InnoDB page sizes was added in MySQL 5.7.6. For a 32KB page size, the extent size is 2MB. For a 64KB page size, the extent size is 4MB.

InnoDB features such as segments, read-ahead requests and the doublewrite buffer use I/O operations that read, write, allocate, or free data one extent at a time. See Also doublewrite buffer, page, page size, read-ahead, segment, tablespace.

F

.frn file
A file containing the metadata, such as the table definition, of a MySQL table.

For backups, you must always keep the full set of .frm files along with the backup data to be able to restore tables that are altered or dropped after the backup.

Although each InnoDB table has a .frm file, InnoDB maintains its own table metadata in the system tablespace; the .frm files are not needed for InnoDB to operate on InnoDB tables.

.frn files are backed up by the MySQL Enterprise Backup product. These files must not be modified by an ALTER TABLE operation while the backup is taking place, which is why backups that include non-InnoDB tables perform a FLUSH TABLES WITH READ LOCK operation to freeze such activity while backing up .frm files. Restoring a backup can result in .frm files being created, changed, or removed to match the state of the database at the time of the backup.

See Also data dictionary, MySQL Enterprise Backup, system tablespace.

Fast Index Creation
A capability first introduced in the InnoDB Plugin, now part of MySQL in 5.5 and higher, that speeds up creation of InnoDB secondary indexes by avoiding the need to completely rewrite the associated table. The speedup applies to dropping secondary indexes also.

Because index maintenance can add performance overhead to many data transfer operations, consider doing operations such as ALTER TABLE ... ENGINE=INNODB or INSERT INTO ... SELECT * FROM ... without any secondary indexes in place, and creating the indexes afterward.

In MySQL 5.6, this feature becomes more general. You can read and write to tables while an index is being created, and many more kinds of ALTER TABLE operations can be performed without copying the table, without blocking DML operations, or both. Thus in MySQL 5.6 and higher, this set of features is referred to as online DDL rather than Fast Index Creation.
For related information, see Section 14.13, “InnoDB and Online DDL”.
See Also DML, index, online DDL, secondary index.

fast shutdown

The default shutdown procedure for InnoDB, based on the configuration setting
innodb_fast_shutdown=1. To save time, certain flush operations are skipped. This type of shutdown
is safe during normal usage, because the flush operations are performed during the next startup, using the
same mechanism as in crash recovery. In cases where the database is being shut down for an upgrade or
downgrade, do a slow shutdown instead to ensure that all relevant changes are applied to the data files
during the shutdown.
See Also crash recovery, data files, flush, shutdown, slow shutdown.

file format

The file format for InnoDB tables, enabled using the innodb_file_format configuration option. Supported
file formats are Antelope and Barracuda. Antelope is the original InnoDB file format and supports the
REUNDANT and COMPACT row formats. Barracuda is the newer InnoDB file format and supports the
COMPRESSED and DYNAMIC row formats.
See Also Antelope, Barracuda, file-per-table, .ibd file, ibdata file, row format.

file-per-table

A general name for the setting controlled by the innodb_file_per_table option, which is an
important configuration option that affects aspects of InnoDB file storage, availability of features, and I/O
characteristics. As of MySQL 5.6.7, innodb_file_per_table is enabled by default.

With the innodb_file_per_table option enabled, you can create a table in its own .ibd file rather than
in the shared ibdata files of the system tablespace. When table data is stored in an individual .ibd file,
you have more flexibility to choose row formats required for features such as data compression. The
TRUNCATE TABLE operation is also faster, and reclaimed space can be used by the operating system rather
than remaining reserved for InnoDB.

The MySQL Enterprise Backup product is more flexible for tables that are in their own files. For example,
tables can be excluded from a backup, but only if they are in separate files. Thus, this setting is suitable for
tables that are backed up less frequently or on a different schedule.
See Also compressed row format, compression, file format, .ibd file, ibdata file, innodb_file_per_table, MySQL
Enterprise Backup, row format, system tablespace.

fill factor

In an InnoDB index, the proportion of a page that is taken up by index data before the page is split. The
unused space when index data is first divided between pages allows for rows to be updated with longer
string values without requiring expensive index maintenance operations. If the fill factor is too low, the index
consumes more space than needed, causing extra I/O overhead when reading the index. If the fill factor
is too high, any update that increases the length of column values can cause extra I/O overhead for index
maintenance. See Section 14.6.2.2, “The Physical Structure of an InnoDB Index” for more information.
See Also index, page.

fixed row format

This row format is used by the MyISAM storage engine, not by InnoDB. If you create an InnoDB table with
the option ROW_FORMAT=FIXED in MySQL 5.7.6 or earlier, InnoDB uses the compact row format instead,
although the FIXED value might still show up in output such as SHOW TABLE STATUS reports. As of MySQL
5.7.7, InnoDB returns an error if ROW_FORMAT=FIXED is specified.
See Also compact row format, row format.

flush

To write changes to the database files, that had been buffered in a memory area or a temporary disk storage
area. The InnoDB storage structures that are periodically flushed include the redo log, the undo log, and the
buffer pool.

Flushing can happen because a memory area becomes full and the system needs to free some space,
because a commit operation means the changes from a transaction can be finalized, or because a slow
shutdown operation means that all outstanding work should be finalized. When it is not critical to flush all
the buffered data at once, **InnoDB** can use a technique called **fuzzy checkpointing** to flush small batches of pages to spread out the I/O overhead.

See Also buffer pool, commit, fuzzy checkpointing, redo log, slow shutdown, undo log.

**flush list**

An internal **InnoDB** data structure that tracks **dirty pages** in the buffer pool: that is, **pages** that have been changed and need to be written back out to disk. This data structure is updated frequently by **InnoDB** internal **mini-transactions**, and so is protected by its own **mutex** to allow concurrent access to the buffer pool.

See Also buffer pool, dirty page, LRU, mini-transaction, mutex, page, page cleaner.

**foreign key**

A type of pointer relationship, between rows in separate **InnoDB** tables. The foreign key relationship is defined on one column in both the **parent table** and the **child table**.

In addition to enabling fast lookup of related information, foreign keys help to enforce **referential integrity**, by preventing any of these pointers from becoming invalid as data is inserted, updated, and deleted. This enforcement mechanism is a type of **constraint**. A row that points to another table cannot be inserted if the associated foreign key value does not exist in the other table. If a row is deleted or its foreign key value changed, and rows in another table point to that foreign key value, the foreign key can be set up to prevent the deletion, cause the corresponding column values in the other table to become **null**, or automatically delete the corresponding rows in the other table.

One of the stages in designing a **normalized** database is to identify data that is duplicated, separate that data into a new table, and set up a foreign key relationship so that the multiple tables can be queried like a single table, using a **join** operation.

See Also child table, FOREIGN KEY constraint, join, normalized, NULL, parent table, referential integrity, relational.

**FOREIGN KEY constraint**

The type of **constraint** that maintains database consistency through a **foreign key** relationship. Like other kinds of constraints, it can prevent data from being inserted or updated if data would become inconsistent; in this case, the inconsistency being prevented is between data in multiple tables. Alternatively, when a **DML** operation is performed, **FOREIGN KEY** constraints can cause data in child rows to be deleted, changed to different values, or set to **null**, based on the **ON CASCADE** option specified when creating the foreign key.

See Also child table, constraint, DML, foreign key, NULL.

**FTS**

In most contexts, an acronym for **full-text search**. Sometimes in performance discussions, an acronym for **full table scan**.

See Also full table scan, full-text search.

**full backup**

A **backup** that includes all the **tables** in each MySQL **database**, and all the databases in a MySQL **instance**. Contrast with partial backup.

See Also backup, database, instance, partial backup, table.

**full table scan**

An operation that requires reading the entire contents of a table, rather than just selected portions using an **index**. Typically performed either with small lookup tables, or in data warehousing situations with large tables where all available data is aggregated and analyzed. How frequently these operations occur, and the sizes of the tables relative to available memory, have implications for the algorithms used in query optimization and managing the buffer pool.

The purpose of indexes is to allow lookups for specific values or ranges of values within a large table, thus avoiding full table scans when practical.

See Also buffer pool, index.

**full-text search**

The MySQL feature for finding words, phrases, Boolean combinations of words, and so on within table data, in a faster, more convenient, and more flexible way than using the SQL **LIKE** operator or writing your own application-level search algorithm. It uses the SQL function **MATCH()** and **FULLTEXT indexes**.
See Also **FULLTEXT index**.

**FULLTEXT index**
The special kind of index that holds the search index in the MySQL full-text search mechanism. Represents the words from values of a column, omitting any that are specified as stopwords. Originally, only available for MyISAM tables. Starting in MySQL 5.6.4, it is also available for InnoDB tables.

See Also full-text search, index, InnoDB, search index, stopword.

**fuzzy checkpointing**
A technique that flushes small batches of dirty pages from the buffer pool, rather than flushing all dirty pages at once which would disrupt database processing.

See Also buffer pool, dirty page, flush.

**G**

**GA**
“Generally available”, the stage when a software product leaves beta and is available for sale, official support, and production use.

See Also beta.

**gap**
A place in an InnoDB index data structure where new values could be inserted. When you lock a set of rows with a statement such as SELECT ... FOR UPDATE, InnoDB can create locks that apply to the gaps as well as the actual values in the index. For example, if you select all values greater than 10 for update, a gap lock prevents another transaction from inserting a new value that is greater than 10. The supremum record and infimum record represent the gaps containing all values greater than or less than all the current index values.

See Also concurrency, gap lock, index, infimum record, isolation level, supremum record.

**gap lock**
A lock on a gap between index records, or a lock on the gap before the first or after the last index record. For example, SELECT c1 FROM t WHERE c1 BETWEEN 10 and 20 FOR UPDATE; prevents other transactions from inserting a value of 15 into the column t.c1, whether or not there was already any such value in the column, because the gaps between all existing values in the range are locked. Contrast with record lock and next-key lock.

Gap locks are part of the tradeoff between performance and concurrency, and are used in some transaction isolation levels and not others.

See Also gap, infimum record, lock, next-key lock, record lock, supremum record.

**general log**
See general query log.

**general query log**
A type of log used for diagnosis and troubleshooting of SQL statements processed by the MySQL server. Can be stored in a file or in a database table. You must enable this feature through the general_log configuration option to use it. You can disable it for a specific connection through the sql_log_off configuration option.

Records a broader range of queries than the slow query log. Unlike the binary log, which is used for replication, the general query log contains SELECT statements and does not maintain strict ordering. For more information, see Section 5.4.3, “The General Query Log”.

See Also binary log, log, slow query log.

**general tablespace**
A shared InnoDB tablespace created using CREATE TABLESPACE syntax. General tablespaces can be created outside of the MySQL data directory, are capable of holding multiple tables, and support tables of all row formats. General tablespaces were introduced in MySQL 5.7.6.
Tables are added to a general tablescape using `CREATE TABLE tbl_name ... TABLESPACE [=] tablespace_name` or `ALTER TABLE tbl_name TABLESPACE [=] tablespace_name` syntax.

Contrast with `system tablespace` and `file-per-table` tablespace.

For more information, see Section 14.6.3.3, "General Tablespaces". See Also `file-per-table`, `system tablespace`, `table`, `tablespace`.

generated column
A column whose values are computed from an expression included in the column definition. A generated column can be `virtual` or `stored`.
See Also `base column`, `stored generated column`, `virtual generated column`.

generated stored column
See `stored generated column`.

generated virtual column
See `virtual generated column`.

global transaction
A type of transaction involved in XA operations. It consists of several actions that are transactional in themselves, but that all must either complete successfully as a group, or all be rolled back as a group. In essence, this extends ACID properties "up a level" so that multiple ACID transactions can be executed in concert as components of a global operation that also has ACID properties.
See Also `ACID`, `transaction`, `XA`.

group commit
An InnoDB optimization that performs some low-level I/O operations (log write) once for a set of commit operations, rather than flushing and syncing separately for each commit.
See Also `binary log`, `commit`.

H

hash index
A type of index intended for queries that use equality operators, rather than range operators such as greater-than or `BETWEEN`. It is available for MEMORY tables. Although hash indexes are the default for MEMORY tables for historic reasons, that storage engine also supports `B-tree` indexes, which are often a better choice for general-purpose queries.

MySQL includes a variant of this index type, the adaptive hash index, that is constructed automatically for InnoDB tables if needed based on runtime conditions.
See Also `adaptive hash index`, `B-tree`, `index`, `InnoDB`.

HDD
Acronym for "hard disk drive". Refers to storage media using spinning platters, usually when comparing and contrasting with SSD. Its performance characteristics can influence the throughput of a disk-based workload.
See Also `disk-based`, `SSD`.

heartbeat
A periodic message that is sent to indicate that a system is functioning properly. In a replication context, if the master stops sending such messages, one of the slaves can take its place. Similar techniques can be used between the servers in a cluster environment, to confirm that all of them are operating properly.
See Also `master server`, `replication`.

high-water mark
A value representing an upper limit, either a hard limit that should not be exceeded at runtime, or a record of the maximum value that was actually reached. Contrast with low-water mark.
See Also `low-water mark`.

5138
history list
A list of transactions with delete-marked records scheduled to be processed by the InnoDB purge operation. Recorded in the undo log. The length of the history list is reported by the command SHOW ENGINE INNODB STATUS. If the history list grows longer than the value of the innodb_max_purge_lag configuration option, each DML operation is delayed slightly to allow the purge operation to finish flushing the deleted records.

Also known as purge lag.
See Also DML, flush, purge, purge lag, rollback segment, transaction, undo log.

hole punching
Releasing empty blocks from a page. The InnoDB transparent page compression feature relies on hole punching support. For more information, see Section 14.9.2, “InnoDB Page Compression”.
See Also sparse file, transparent page compression.

hot
A condition where a row, table, or internal data structure is accessed so frequently, requiring some form of locking or mutual exclusion, that it results in a performance or scalability issue.

Although “hot” typically indicates an undesirable condition, a hot backup is the preferred type of backup.
See Also hot backup.

hot backup
A backup taken while the database is running and applications are reading and writing to it. The backup involves more than simply copying data files: it must include any data that was inserted or updated while the backup was in process; it must exclude any data that was deleted while the backup was in process; and it must ignore any changes that were not committed.

The Oracle product that performs hot backups, of InnoDB tables especially but also tables from MyISAM and other storage engines, is known as MySQL Enterprise Backup.

The hot backup process consists of two stages. The initial copying of the data files produces a raw backup. The apply step incorporates any changes to the database that happened while the backup was running. Applying the changes produces a prepared backup; these files are ready to be restored whenever necessary.
See Also apply, MySQL Enterprise Backup, prepared backup, raw backup.

.ibd file
The data file for file-per-table tablespaces and general tablespaces. File-per-table tablespace .ibd files contain a single table and associated index data. General tablespace .ibd files may contain table and index data for multiple tables. General tablespaces were introduced in MySQL 5.7.6.

The .ibd file extension does not apply to the system tablespace, which consists of one or more ibdata files.

If a file-per-table tablespace or general tablespace is created with the DATA DIRECTORY = clause, the .ibd file is located at the specified path, outside the normal data directory, and is pointed to by a .isl file.

When a .ibd file is included in a compressed backup by the MySQL Enterprise Backup product, the compressed equivalent is a .ibz file.
See Also database, file-per-table, general tablespace, ibdata file, .ibz file, innodb_file_per_table, .isl file, MySQL Enterprise Backup, system tablespace.

.ibz file
When the MySQL Enterprise Backup product performs a compressed backup, it transforms each tablespace file that is created using the file-per-table setting from a .ibd extension to a .ibz extension.

The compression applied during backup is distinct from the compressed row format that keeps table data compressed during normal operation. A compressed backup operation skips the compression step for a
A set of files managed by InnoDB within a MySQL database: the system tablespace, file-per-table tablespace files, and redo log files. Depending on MySQL version and InnoDB configuration, may also include general tablespace, temporary tablespace, and undo tablespace files. This term is sometimes used in detailed discussions of InnoDB file structures and formats to refer to the set of files managed by InnoDB within a MySQL database.

See Also database, file-per-table, general tablespace, redo log, system tablespace, temporary tablespace, undo tablespace.

ibtmp file

The InnoDB temporary tablespace data file for non-compressed InnoDB temporary tables and related objects. The configuration file option, innodb_temp_data_file_path, allows users to define a relative path for the temporary tablespace data file. If innodb_temp_data_file_path is not specified, the default behavior is to create a single auto-extending 12MB data file named ibtmp1 in the data directory, alongside ibdata1.

See Also data files, temporary table, temporary tablespace.

ib_logfile

A set of files, typically named ib_logfile0 and ib_logfile1, that form the redo log. Also sometimes referred to as the log group. These files record statements that attempt to change data in InnoDB tables. These statements are replayed automatically to correct data written by incomplete transactions, on startup following a crash.
This data cannot be used for manual recovery; for that type of operation, use the **binary log**.
See Also binary log, log group, redo log.

**ilist**
Within an **InnoDB FULLTEXT index**, the data structure consisting of a document ID and positional information for a token (that is, a particular word).
See Also FULLTEXT index.

**implicit row lock**
A row lock that **InnoDB** acquires to ensure consistency, without you specifically requesting it.
See Also row lock.

**in-memory database**
A type of database system that maintains data in memory, to avoid overhead due to disk I/O and translation between disk blocks and memory areas. Some in-memory databases sacrifice durability (the “D” in the **ACID** design philosophy) and are vulnerable to hardware, power, and other types of failures, making them more suitable for read-only operations. Other in-memory databases do use durability mechanisms such as logging changes to disk or using non-volatile memory.

MySQL features that address the same kinds of memory-intensive processing include the **InnoDB buffer pool**, adaptive hash index, and read-only transaction optimization, the **MEMORY** storage engine, the **MyISAM** key cache, and the MySQL query cache.
See Also ACID, adaptive hash index, buffer pool, disk-based, read-only transaction.

**incremental backup**
A type of **hot backup**, performed by the **MySQL Enterprise Backup** product, that only saves data changed since some point in time. Having a full backup and a succession of incremental backups lets you reconstruct backup data over a long period, without the storage overhead of keeping several full backups on hand. You can restore the full backup and then apply each of the incremental backups in succession, or you can keep the full backup up-to-date by applying each incremental backup to it, then perform a single restore operation.

The granularity of changed data is at the **page** level. A page might actually cover more than one row. Each changed page is included in the backup.
See Also hot backup, MySQL Enterprise Backup, page.

**index**
A data structure that provides a fast lookup capability for **rows** of a **table**, typically by forming a tree structure (**B-tree**) representing all the values of a particular **column** or set of columns.

**InnoDB** tables always have a **clustered index** representing the **primary key**. They can also have one or more **secondary indexes** defined on one or more columns. Depending on their structure, secondary indexes can be classified as **partial**, **column**, or **composite** indexes.

Indexes are a crucial aspect of **query** performance. Database architects design tables, queries, and indexes to allow fast lookups for data needed by applications. The ideal database design uses a **covering index** where practical; the query results are computed entirely from the index, without reading the actual table data. Each foreign key constraint also requires an index, to efficiently check whether values exist in both the parent and child tables.

Although a B-tree index is the most common, a different kind of data structure is used for **hash indexes**, as in the **MEMORY** storage engine and the **InnoDB adaptive hash index**. R-tree indexes are used for spatial indexing of multi-dimensional information.
See Also adaptive hash index, B-tree, child table, clustered index, column index, composite index, covering index, foreign key, hash index, parent table, partial index, primary key, query, R-tree, row, secondary index, table.

**index cache**
A memory area that holds the token data for **InnoDB full-text search**. It buffers the data to minimize disk I/O when data is inserted or updated in columns that are part of a **FULLTEXT index**. The token data is written
to disk when the index cache becomes full. Each InnoDB FULLTEXT index has its own separate index cache, whose size is controlled by the configuration option innodb_ft_cache_size.
See Also full-text search, FULLTEXT index.

index condition pushdown
Index condition pushdown (ICP) is an optimization that pushes part of a WHERE condition down to the storage engine if parts of the condition can be evaluated using fields from the index. ICP can reduce the number of times the storage engine must access the base table and the number of times the MySQL server must access the storage engine. For more information, see Section 8.2.1.5, “Index Condition Pushdown Optimization”.
See Also index, storage engine.

index hint
Extended SQL syntax for overriding the indexes recommended by the optimizer. For example, the FORCE INDEX, USE INDEX, and IGNORE INDEX clauses. Typically used when indexed columns have unevenly distributed values, resulting in inaccurate cardinality estimates.
See Also cardinality, index.

index prefix
In an index that applies to multiple columns (known as a composite index), the initial or leading columns of the index. A query that references the first 1, 2, 3, and so on columns of a composite index can use the index, even if the query does not reference all the columns in the index.
See Also composite index, index.

index statistics
See statistics.

infimum record
A pseudo-record in an index, representing the gap below the smallest value in that index. If a transaction has a statement such as SELECT ... FROM ... WHERE col < 10 FOR UPDATE;, and the smallest value in the column is 5, it is a lock on the infimum record that prevents other transactions from inserting even smaller values such as 0, -10, and so on.
See Also gap, index, pseudo-record, supremum record.

INFORMATION_SCHEMA
The name of the database that provides a query interface to the MySQL data dictionary. (This name is defined by the ANSI SQL standard.) To examine information (metadata) about the database, you can query tables such as INFORMATION_SCHEMA.TABLES and INFORMATION_SCHEMA.COLUMNS, rather than using SHOW commands that produce unstructured output.

The INFORMATION_SCHEMA database also contains tables specific to InnoDB that provide a query interface to the InnoDB data dictionary. You use these tables not to see how the database is structured, but to get real-time information about the workings of InnoDB tables to help with performance monitoring, tuning, and troubleshooting.
See Also data dictionary, database, InnoDB.

InnoDB
A MySQL component that combines high performance with transactional capability for reliability, robustness, and concurrent access. It embodies the ACID design philosophy. Represented as a storage engine; it handles tables created or altered with the ENGINE=INNODB clause. See Chapter 14, The InnoDB Storage Engine for architectural details and administration procedures, and Section 8.5, “Optimizing for InnoDB Tables” for performance advice.

In MySQL 5.5 and higher, InnoDB is the default storage engine for new tables and the ENGINE=INNODB clause is not required.

InnoDB tables are ideally suited for hot backups. See Section 29.2, “MySQL Enterprise Backup Overview” for information about the MySQL Enterprise Backup product for backing up MySQL servers without interrupting normal processing.
See Also ACID, hot backup, MySQL Enterprise Backup, storage engine, transaction.
innodb_autoinc_lock_mode

The `innodb_autoinc_lock_mode` option controls the algorithm used for auto-increment locking.
When you have an auto-incrementing primary key, you can use statement-based replication only with the setting `innodb_autoinc_lock_mode=1`. This setting is known as consecutive lock mode, because multi-row inserts within a transaction receive consecutive auto-increment values. If you have `innodb_autoinc_lock_mode=2`, which allows higher concurrency for insert operations, use row-based replication rather than statement-based replication. This setting is known as interleaved lock mode, because multiple multi-row insert statements running at the same time can receive auto-increment values that are interleaved. The setting `innodb_autoinc_lock_mode=0` should not be used except for compatibility purposes.

Consecutive lock mode (`innodb_autoinc_lock_mode=1`) is the default setting prior to MySQL 8.0.3. As of MySQL 8.0.3, interleaved lock mode (`innodb_autoinc_lock_mode=2`) is the default, which reflects the change from statement-based to row-based replication as the default replication type.

See Also: auto-increment, auto-increment locking, mixed-mode insert, primary key.

innodb_file_format

The `innodb_file_format` option defines the file format to use for new InnoDB file-per-table tablespaces. Currently, you can specify the Antelope and Barracuda file formats.

See Also: Antelope, Barracuda, file format, file-per-table, general tablespace, innodb_file_per_table, system tablespace, tablespace.

innodb_file_per_table

An important configuration option that affects many aspects of InnoDB file storage, availability of features, and I/O characteristics. In MySQL 5.6.7 and higher, it is enabled by default. The `innodb_file_per_table` option turns on file-per-table mode. With this mode enabled, a newly created InnoDB table and associated indexes can be stored in a file-per-table .ibd file, outside the system tablespace.

This option affects the performance and storage considerations for a number of SQL statements, such as `DROP TABLE` and `TRUNCATE TABLE`.

Enabling the `innodb_file_per_table` option allows you to take advantage of features such as table compression and named-table backups in MySQL Enterprise Backup.

For more information, see `innodb_file_per_table`, and Section 14.6.3.2, “File-Per-Table Tablespaces”.

See Also: compression, file-per-table, .ibd file, MySQL Enterprise Backup, system tablespace.

innodb_lock_wait_timeout

The `innodb_lock_wait_timeout` option sets the balance between waiting for shared resources to become available, or giving up and handling the error, retrying, or doing alternative processing in your application. Rolls back any InnoDB transaction that waits more than a specified time to acquire a lock. Especially useful if deadlocks are caused by updates to multiple tables controlled by different storage engines; such deadlocks are not detected automatically.

See Also: deadlock, deadlock detection, lock, wait.

innodb_strict_mode

The `innodb_strict_mode` option controls whether InnoDB operates in strict mode, where conditions that are normally treated as warnings, cause errors instead (and the underlying statements fail).

See Also: strict mode.

insert

One of the primary DML operations in SQL. The performance of inserts is a key factor in data warehouse systems that load millions of rows into tables, and OLTP systems where many concurrent connections might insert rows into the same table, in arbitrary order. If insert performance is important to you, you should learn about InnoDB features such as the insert buffer used in change buffering, and auto-increment columns.

See Also: auto-increment, change buffering, data warehouse, DML, InnoDB, insert buffer, OLTP, SQL.

insert buffer

The former name of the change buffer. In MySQL 5.5, support was added for buffering changes to secondary index pages for DELETE and UPDATE operations. Previously, only changes resulting from INSERT operations were buffered. The preferred term is now change buffer.
See Also change buffer, change buffering.

**insert buffering**

The technique of storing changes to secondary index pages, resulting from `INSERT` operations, in the change buffer rather than writing the changes immediately, so that the physical writes can be performed to minimize random I/O. It is one of the types of change buffering; the others are delete buffering and purge buffering.

Insert buffering is not used if the secondary index is unique, because the uniqueness of new values cannot be verified before the new entries are written out. Other kinds of change buffering do work for unique indexes. See Also change buffer, change buffering, delete buffering, insert buffer, purge buffering, unique index.

**insert intention lock**

A type of gap lock that is set by `INSERT` operations prior to row insertion. This type of lock signals the intent to insert in such a way that multiple transactions inserting into the same index gap need not wait for each other if they are not inserting at the same position within the gap. For more information, see Section 14.7.1, “InnoDB Locking”.

See Also gap lock, lock, next-key lock.

**instance**

A single mysqld daemon managing a data directory representing one or more databases with a set of tables. It is common in development, testing, and some replication scenarios to have multiple instances on the same server machine, each managing its own data directory and listening on its own port or socket. With one instance running a disk-bound workload, the server might still have extra CPU and memory capacity to run additional instances.

See Also data directory, database, disk-bound, mysqld, replication, server, table.

**instrumentation**

Modifications at the source code level to collect performance data for tuning and debugging. In MySQL, data collected by instrumentation is exposed through an SQL interface using the INFORMATION_SCHEMA and PERFORMANCE_SCHEMA databases.

See Also INFORMATION_SCHEMA, Performance Schema.

**intention exclusive lock**

See intention lock.

**intention lock**

A kind of lock that applies to the table, used to indicate the kind of lock the transaction intends to acquire on rows in the table. Different transactions can acquire different kinds of intention locks on the same table, but the first transaction to acquire an intention exclusive (IX) lock on a table prevents other transactions from acquiring any S or X locks on the table. Conversely, the first transaction to acquire an intention shared (IS) lock on a table prevents other transactions from acquiring any X locks on the table. The two-phase process allows the lock requests to be resolved in order, without blocking locks and corresponding operations that are compatible. For more information about this locking mechanism, see Section 14.7.1, “InnoDB Locking”.

See Also lock, lock mode, locking, transaction.

**intention shared lock**

See intention lock.

**intrinsic temporary table**

An optimized internal InnoDB temporary table used by the optimizer.

See Also optimizer.

**inverted index**

A data structure optimized for document retrieval systems, used in the implementation of InnoDB full-text search. The InnoDB FULLTEXT index, implemented as an inverted index, records the position of each word within a document, rather than the location of a table row. A single column value (a document stored as a text string) is represented by many entries in the inverted index.

See Also full-text search, FULLTEXT index, ilist.
IOPS
Acronym for I/O operations per second. A common measurement for busy systems, particularly OLTP applications. If this value is near the maximum that the storage devices can handle, the application can become disk-bound, limiting scalability.
See Also disk-bound, OLTP, scalability.

isolation level
One of the foundations of database processing. Isolation is the I in the acronym ACID; the isolation level is the setting that fine-tunes the balance between performance and reliability, consistency, and reproducibility of results when multiple transactions are making changes and performing queries at the same time.

From highest amount of consistency and protection to the least, the isolation levels supported by InnoDB are: SERIALIZABLE, REPEATABLE READ, READ COMMITTED, and READ UNCOMMITTED.

With InnoDB tables, many users can keep the default isolation level (REPEATABLE READ) for all operations. Expert users might choose the READ COMMITTED level as they push the boundaries of scalability with OLTP processing, or during data warehousing operations where minor inconsistencies do not affect the aggregate results of large amounts of data. The levels on the edges (SERIALIZABLE and READ UNCOMMITTED) change the processing behavior to such an extent that they are rarely used.
See Also ACID, OLTP, READ COMMITTED, READ UNCOMMITTED, REPEATABLE READ, SERIALIZABLE, transaction.

J
join
A query that retrieves data from more than one table, by referencing columns in the tables that hold identical values. Ideally, these columns are part of an InnoDB foreign key relationship, which ensures referential integrity and that the join columns are indexed. Often used to save space and improve query performance by replacing repeated strings with numeric IDs, in a normalized data design.
See Also foreign key, index, normalized, query, referential integrity.

K
KEY_BLOCK_SIZE
An option to specify the size of data pages within an InnoDB table that uses compressed row format. The default is 8 kilobytes. Lower values risk hitting internal limits that depend on the combination of row size and compression percentage.

For MyISAM tables, KEY_BLOCK_SIZE optionally specifies the size in bytes to use for index key blocks. The value is treated as a hint; a different size could be used if necessary. A KEY_BLOCK_SIZE value specified for an individual index definition overrides a table-level KEY_BLOCK_SIZE value.
See Also compressed row format.

L
latch
A lightweight structure used by InnoDB to implement a lock for its own internal memory structures, typically held for a brief time measured in milliseconds or microseconds. A general term that includes both mutexes (for exclusive access) and rw-locks (for shared access). Certain latches are the focus of InnoDB performance tuning. Statistics about latch use and contention are available through the Performance Schema interface.
See Also lock, locking, mutex, Performance Schema, rw-lock.

list
The InnoDB buffer pool is represented as a list of memory pages. The list is reordered as new pages are accessed and enter the buffer pool, as pages within the buffer pool are accessed again and are considered newer, and as pages that are not accessed for a long time are evicted from the buffer pool. The buffer pool is divided into sublists, and the replacement policy is a variation of the familiar LRU technique.
lock
The high-level notion of an object that controls access to a resource, such as a table, row, or internal data structure, as part of a locking strategy. For intensive performance tuning, you might delve into the actual structures that implement locks, such as mutexes and latches.
See Also latch, lock mode, locking, mutex.

deadlock escalation
An operation used in some database systems that converts many row locks into a single table lock, saving memory space but reducing concurrent access to the table. InnoDB uses a space-efficient representation for row locks, so that lock escalation is not needed.
See Also locking, row lock, table lock.

lock mode
A shared (S) lock allows a transaction to read a row. Multiple transactions can acquire an S lock on that same row at the same time.

An exclusive (X) lock allows a transaction to update or delete a row. No other transaction can acquire any kind of lock on that same row at the same time.

Intention locks apply to the table, and are used to indicate what kind of lock the transaction intends to acquire on rows in the table. Different transactions can acquire different kinds of intention locks on the same table, but the first transaction to acquire an intention exclusive (IX) lock on a table prevents other transactions from acquiring any S or X locks on the table. Conversely, the first transaction to acquire an intention shared (IS) lock on a table prevents other transactions from acquiring any X locks on the table. The two-phase process allows the lock requests to be resolved in order, without blocking locks and corresponding operations that are compatible.
See Also intention lock, lock, locking, transaction.

locking
The system of protecting a transaction from seeing or changing data that is being queried or changed by other transactions. The locking strategy must balance reliability and consistency of database operations (the principles of the ACID philosophy) against the performance needed for good concurrency. Fine-tuning the locking strategy often involves choosing an isolation level and ensuring all your database operations are safe and reliable for that isolation level.
See Also ACID, concurrency, isolation level, locking, transaction.

locking read
A SELECT statement that also performs a locking operation on an InnoDB table. Either SELECT ... FOR UPDATE or SELECT ... LOCK IN SHARE MODE. It has the potential to produce a deadlock, depending on the isolation level of the transaction. The opposite of a non-locking read. Not allowed for global tables in a read-only transaction.

SELECT ... FOR SHARE replaces SELECT ... LOCK IN SHARE MODE in MySQL 8.0.1, but LOCK IN SHARE MODE remains available for backward compatibility.
See Section 14.7.2.4, “Locking Reads”.
See Also deadlock, isolation level, locking, non-locking read, read-only transaction.

log
In the InnoDB context, “log” or “log files” typically refers to the redo log represented by the ib_logfileN files. Another type of InnoDB log is the undo log, which is a storage area that holds copies of data modified by active transactions.

Other kinds of logs that are important in MySQL are the error log (for diagnosing startup and runtime problems), binary log (for working with replication and performing point-in-time restores), the general query log (for diagnosing application problems), and the slow query log (for diagnosing performance problems).
See Also binary log, error log, general query log, ib_logfile, redo log, slow query log, undo log.
log buffer
   The memory area that holds data to be written to the log files that make up the redo log. It is controlled by the innodb_log_buffer_size configuration option.
See Also log file, redo log.

log file
   One of the ib_logfile files that make up the redo log. Data is written to these files from the log buffer memory area.
See Also ib_logfile, log buffer, redo log.

log group
   The set of files that make up the redo log, typically named ib_logfile0 and ib_logfile1. (For that reason, sometimes referred to collectively as ib_logfile.)
See Also ib_logfile, redo log.

logical
   A type of operation that involves high-level, abstract aspects such as tables, queries, indexes, and other SQL concepts. Typically, logical aspects are important to make database administration and application development convenient and usable. Contrast with physical.
See Also logical backup, physical.

logical backup
   A backup that reproduces table structure and data, without copying the actual data files. For example, the mysqldump command produces a logical backup, because its output contains statements such as CREATE TABLE and INSERT that can re-create the data. Contrast with physical backup. A logical backup offers flexibility (for example, you could edit table definitions or insert statements before restoring), but can take substantially longer to restore than a physical backup.
See Also backup, mysqldump, physical backup, restore.

loose_
   A prefix added to InnoDB configuration options after server startup, so any new configuration options not recognized by the current level of MySQL do not cause a startup failure. MySQL processes configuration options that start with this prefix, but gives a warning rather than a failure if the part after the prefix is not a recognized option.
See Also startup.

low-water mark
   A value representing a lower limit, typically a threshold value at which some corrective action begins or becomes more aggressive. Contrast with high-water mark.
See Also high-water mark.

LRU
   An acronym for “least recently used”, a common method for managing storage areas. The items that have not been used recently are evicted when space is needed to cache newer items. InnoDB uses the LRU mechanism by default to manage the pages within the buffer pool, but makes exceptions in cases where a page might be read only a single time, such as during a full table scan. This variation of the LRU algorithm is called the midpoint insertion strategy. For more information, see Section 14.5.1, “Buffer Pool”.
See Also buffer pool, eviction, full table scan, midpoint insertion strategy, page.

LSN
   Acronym for “log sequence number”. This arbitrary, ever-increasing value represents a point in time corresponding to operations recorded in the redo log. (This point in time is regardless of transaction boundaries; it can fall in the middle of one or more transactions.) It is used internally by InnoDB during crash recovery and for managing the buffer pool.

   Prior to MySQL 5.6.3, the LSN was a 4-byte unsigned integer. The LSN became an 8-byte unsigned integer in MySQL 5.6.3 when the redo log file size limit increased from 4GB to 512GB, as additional bytes were required to store extra size information. Applications built on MySQL 5.6.3 or later that use LSN values should use 64-bit rather than 32-bit variables to store and compare LSN values.
In the MySQL Enterprise Backup product, you can specify an LSN to represent the point in time from which to take an incremental backup. The relevant LSN is displayed by the output of the `mysqlbackup` command. Once you have the LSN corresponding to the time of a full backup, you can specify that value to take a subsequent incremental backup, whose output contains another LSN for the next incremental backup. See Also buffer pool, crash recovery, incremental backup, MySQL Enterprise Backup, redo log, transaction.

**M**

.MRG file
A file containing references to other tables, used by the MERGE storage engine. Files with this extension are always included in backups produced by the `mysqlbackup` command of the MySQL Enterprise Backup product. See Also MySQL Enterprise Backup, `mysqlbackup` command.

.MYD file
A file that MySQL uses to store data for a MyISAM table. See Also .MYI file, MySQL Enterprise Backup, `mysqlbackup` command.

.MYI file
A file that MySQL uses to store indexes for a MyISAM table. See Also .MYD file, MySQL Enterprise Backup, `mysqlbackup` command.

master server
Frequently shortened to “master”. A database server machine in a replication scenario that processes the initial insert, update, and delete requests for data. These changes are propagated to, and repeated on, other servers known as slave servers. See Also replication, slave server.

master thread
An InnoDB thread that performs various tasks in the background. Most of these tasks are I/O related, such as writing changes from the change buffer to the appropriate secondary indexes.

To improve concurrency, sometimes actions are moved from the master thread to separate background threads. For example, in MySQL 5.6 and higher, dirty pages are flushed from the buffer pool by the page cleaner thread rather than the master thread. See Also buffer pool, change buffer, concurrency, dirty page, flush, page cleaner, thread.

MDL
Acronym for “metadata lock”. See Also metadata lock.

memcached
A popular component of many MySQL and NoSQL software stacks, allowing fast reads and writes for single values and caching the results entirely in memory. Traditionally, applications required extra logic to write the same data to a MySQL database for permanent storage, or to read data from a MySQL database when it was not cached yet in memory. Now, applications can use the simple `memcached` protocol, supported by client libraries for many languages, to communicate directly with MySQL servers using InnoDB or NDB tables. These NoSQL interfaces to MySQL tables allow applications to achieve higher read and write performance than by issuing SQL statements directly, and can simplify application logic and deployment configurations for systems that already incorporate memcached for in-memory caching.

The `memcached` interface to InnoDB tables is available in MySQL 5.6 and higher; see Section 14.21, “InnoDB memcached Plugin” for details. The `memcached` interface to NDB tables is available in NDB Cluster 7.2 and later; see http://dev.mysql.com/doc/ndbapi/en/ndbmemcache.html for details. See Also InnoDB, NoSQL.

merge
To apply changes to data cached in memory, such as when a page is brought into the buffer pool, and any applicable changes recorded in the change buffer are incorporated into the page in the buffer pool. The updated data is eventually written to the tablespace by the flush mechanism.
metadata lock
A type of lock that prevents DDL operations on a table that is being used at the same time by another transaction. For details, see Section 8.11.4, “Metadata Locking”.

Enhancements to online operations, particularly in MySQL 5.6 and higher, are focused on reducing the amount of metadata locking. The objective is for DDL operations that do not change the table structure (such as CREATE INDEX and DROP INDEX for InnoDB tables) to proceed while the table is being queried, updated, and so on by other transactions.
See Also DDL, lock, online, transaction.

metrics counter
A feature implemented by the INNODB_METRICS table in the INFORMATION_SCHEMA, in MySQL 5.6 and higher. You can query counts and totals for low-level InnoDB operations, and use the results for performance tuning in combination with data from the Performance Schema.
See Also counter, INFORMATION_SCHEMA, Performance Schema.

midpoint insertion strategy
The technique of initially bringing pages into the InnoDB buffer pool not at the “newest” end of the list, but instead somewhere in the middle. The exact location of this point can vary, based on the setting of the innodb_old_blocks_pct option. The intent is that pages that are only read once, such as during a full table scan, can be aged out of the buffer pool sooner than with a strict LRU algorithm. For more information, see Section 14.5.1, “Buffer Pool”.
See Also buffer pool, full table scan, LRU, page.

mini-transaction
An internal phase of InnoDB processing, when making changes at the physical level to internal data structures during DML operations. A mini-transaction (mtr) has no notion of rollback; multiple mini-transactions can occur within a single transaction. Mini-transactions write information to the redo log that is used during crash recovery. A mini-transaction can also happen outside the context of a regular transaction, for example during purge processing by background threads.
See Also commit, crash recovery, DML, physical, purge, redo log, rollback, transaction.

mixed-mode insert
An INSERT statement where auto-increment values are specified for some but not all of the new rows. For example, a multi-value INSERT could specify a value for the auto-increment column in some cases and NULL in other cases. InnoDB generates auto-increment values for the rows where the column value was specified as NULL. Another example is an INSERT ... ON DUPLICATE KEY UPDATE statement, where auto-increment values might be generated but not used, for any duplicate rows that are processed as UPDATE rather than INSERT statements.

Can cause consistency issues between master and slave servers in a replication configuration. Can require adjusting the value of the innodb_autoinc_lock_mode configuration option.
See Also auto-increment, innodb_autoinc_lock_mode, master server, replication, slave server.

mutex
Informal abbreviation for “mutex variable”. (Mutex itself is short for “mutual exclusion”.) The low-level object that InnoDB uses to represent and enforce exclusive-access locks to internal in-memory data structures. Once the lock is acquired, any other process, thread, and so on is prevented from acquiring the same lock. Contrast with rw-locks, which InnoDB uses to represent and enforce shared-access locks to internal in-memory data structures. Mutexes and rw-locks are known collectively as latches.
See Also latch, lock, Performance Schema, Pthreads, rw-lock.

MVCC
Acronym for “multiversion concurrency control”. This technique lets InnoDB transactions with certain isolation levels perform consistent read operations; that is, to query rows that are being updated by other transactions, and see the values from before those updates occurred. This is a powerful technique to increase concurrency, by allowing queries to proceed without waiting due to locks held by the other transactions.

This technique is not universal in the database world. Some other database products, and some other MySQL storage engines, do not support it.
See Also ACID, concurrency, consistent read, isolation level, lock, transaction.

my.cnf
The name, on Unix or Linux systems, of the MySQL option file.
See Also my.ini, option file.

my.ini
The name, on Windows systems, of the MySQL option file.
See Also my.cnf, option file.

mysql
The mysql program is the command-line interpreter for the MySQL database. It processes SQL statements, and also MySQL-specific commands such as SHOW TABLES, by passing requests to the mysqld daemon.
See Also mysqld, SQL.

MySQL Enterprise Backup
A licensed product that performs hot backups of MySQL databases. It offers the most efficiency and flexibility when backing up InnoDB tables, but can also back up MyISAM and other kinds of tables.
See Also hot backup, InnoDB.

mysqlbackup command
A command-line tool of the MySQL Enterprise Backup product. It performs a hot backup operation for InnoDB tables, and a warm backup for MyISAM and other kinds of tables. See Section 29.2, “MySQL Enterprise Backup Overview” for more information about this command.
See Also hot backup, MySQL Enterprise Backup, warm backup.

mysqld
The mysqld program is the database engine for the MySQL database. It runs as a Unix daemon or Windows service, constantly waiting for requests and performing maintenance work in the background.
See Also mysql.

mysqldump
A command that performs a logical backup of some combination of databases, tables, and table data. The results are SQL statements that reproduce the original schema objects, data, or both. For substantial amounts of data, a physical backup solution such as MySQL Enterprise Backup is faster, particularly for the restore operation.
See Also logical backup, MySQL Enterprise Backup, physical backup, restore.

natural key
An indexed column, typically a primary key, where the values have some real-world significance. Usually advised against because:

- If the value should ever change, there is potentially a lot of index maintenance to re-sort the clustered index and update the copies of the primary key value that are repeated in each secondary index.
- Even seemingly stable values can change in unpredictable ways that are difficult to represent correctly in the database. For example, one country can change into two or several, making the original country code obsolete. Or, rules about unique values might have exceptions. For example, even if taxpayer IDs
are intended to be unique to a single person, a database might have to handle records that violate that
rule, such as in cases of identity theft. Taxpayer IDs and other sensitive ID numbers also make poor
primary keys, because they may need to be secured, encrypted, and otherwise treated differently than other
columns.

Thus, it is typically better to use arbitrary numeric values to form a synthetic key, for example using an auto-
increment column.
See Also auto-increment, clustered index, primary key, secondary index, synthetic key.

neighbor page
Any page in the same extent as a particular page. When a page is selected to be flushed, any neighbor
pages that are dirty are typically flushed as well, as an I/O optimization for traditional hard disks. In MySQL
5.6 and up, this behavior can be controlled by the configuration variable innodb_flush_neighbors; you
might turn that setting off for SSD drives, which do not have the same overhead for writing smaller batches of
data at random locations.
See Also dirty page, extent, flush, page.

next-key lock
A combination of a record lock on the index record and a gap lock on the gap before the index record.
See Also gap lock, locking, record lock.

non-locking read
A query that does not use the SELECT ... FOR UPDATE or SELECT ... LOCK IN SHARE MODE
clauses. The only kind of query allowed for global tables in a read-only transaction. The opposite of a
locking read. See Section 14.7.2.3, “Consistent Nonlocking Reads”.

SELECT ... FOR SHARE replaces SELECT ... LOCK IN SHARE MODE in MySQL 8.0.1, but LOCK IN
SHARE MODE remains available for backward compatibility.
See Also locking read, query, read-only transaction.

non-repeatable read
The situation when a query retrieves data, and a later query within the same transaction retrieves what
should be the same data, but the queries return different results (changed by another transaction committing
in the meantime).

This kind of operation goes against the ACID principle of database design. Within a transaction, data should
be consistent, with predictable and stable relationships.

Among different isolation levels, non-repeatable reads are prevented by the serializable read and
repeatable read levels, and allowed by the consistent read, and read uncommitted levels.
See Also ACID, consistent read, isolation level, READ UNCOMMITTED, REPEATABLE READ,
SERIALIZABLE, transaction.

nonblocking I/O
An industry term that means the same as asynchronous I/O.
See Also asynchronous I/O.

normalized
A database design strategy where data is split into multiple tables, and duplicate values condensed into
single rows represented by an ID, to avoid storing, querying, and updating redundant or lengthy values. It is
typically used in OLTP applications.

For example, an address might be given a unique ID, so that a census database could represent the
relationship lives at this address by associating that ID with each member of a family, rather than storing
multiple copies of a complex value such as 123 Main Street, Anytown, USA.

For another example, although a simple address book application might store each phone number in the
same table as a person's name and address, a phone company database might give each phone number a
special ID, and store the numbers and IDs in a separate table. This normalized representation could simplify
large-scale updates when area codes split apart.
Normalization is not always recommended. Data that is primarily queried, and only updated by deleting entirely and reloading, is often kept in fewer, larger tables with redundant copies of duplicate values. This data representation is referred to as denormalized, and is frequently found in data warehousing applications. See Also denormalized, foreign key, OLTP, relational.

NoSQL
A broad term for a set of data access technologies that do not use the SQL language as their primary mechanism for reading and writing data. Some NoSQL technologies act as key-value stores, only accepting single-value reads and writes; some relax the restrictions of the ACID methodology; still others do not require a pre-planned schema. MySQL users can combine NoSQL-style processing for speed and simplicity with SQL operations for flexibility and convenience, by using the memcached API to directly access some kinds of MySQL tables. The memcached interface to InnoDB tables is available in MySQL 5.6 and higher; see Section 14.21, “InnoDB memcached Plugin” for details. The memcached interface to NDB tables is available in NDB Cluster 7.2 and later; see ndbmemcache—Memcache API for NDB Cluster. See Also ACID, InnoDB, memcached, schema, SQL.

NOT NULL constraint
A type of constraint that specifies that a column cannot contain any NULL values. It helps to preserve referential integrity, as the database server can identify data with erroneous missing values. It also helps in the arithmetic involved in query optimization, allowing the optimizer to predict the number of entries in an index on that column. See Also column, constraint, NULL, primary key, referential integrity.

NULL
A special value in SQL, indicating the absence of data. Any arithmetic operation or equality test involving a NULL value, in turn produces a NULL result. (Thus it is similar to the IEEE floating-point concept of NaN, “not a number.”) Any aggregate calculation such as AVG() ignores rows with NULL values, when determining how many rows to divide by. The only test that works with NULL values uses the SQL idioms IS NULL or IS NOT NULL.

NULL values play a part in index operations, because for performance a database must minimize the overhead of keeping track of missing data values. Typically, NULL values are not stored in an index, because a query that tests an indexed column using a standard comparison operator could never match a row with a NULL value for that column. For the same reason, unique indexes do not prevent NULL values; those values simply are not represented in the index. Declaring a NOT NULL constraint on a column provides reassurance that there are no rows left out of the index, allowing for better query optimization (accurate counting of rows and estimation of whether to use the index).

Because the primary key must be able to uniquely identify every row in the table, a single-column primary key cannot contain any NULL values, and a multi-column primary key cannot contain any rows with NULL values in all columns.

Although the Oracle database allows a NULL value to be concatenated with a string, InnoDB treats the result of such an operation as NULL. See Also index, primary key, SQL.

.OPT file
A file containing database configuration information. Files with this extension are included in backups produced by the mysqlbackup command of the MySQL Enterprise Backup product. See Also MySQL Enterprise Backup, mysqlbackup command.
OLTP
Acronym for “Online Transaction Processing”. A database system, or a database application, that runs a workload with many transactions, with frequent writes as well as reads, typically affecting small amounts of data at a time. For example, an airline reservation system or an application that processes bank deposits. The data might be organized in normalized form for a balance between DML (insert/update/delete) efficiency and query efficiency. Contrast with data warehouse.

With its row-level locking and transactional capability, InnoDB is the ideal storage engine for MySQL tables used in OLTP applications.

See Also data warehouse, DML, InnoDB, query, row lock, transaction.

online
A type of operation that involves no downtime, blocking, or restricted operation for the database. Typically applied to DDL. Operations that shorten the periods of restricted operation, such as fast index creation, have evolved into a wider set of online DDL operations in MySQL 5.6.

In the context of backups, a hot backup is an online operation and a warm backup is partially an online operation.

See Also DDL, Fast Index Creation, hot backup, online DDL, warm backup.

online DDL
A feature that improves the performance, concurrency, and availability of InnoDB tables during DDL (primarily ALTER TABLE) operations. See Section 14.13, “InnoDB and Online DDL” for details.

The details vary according to the type of operation. In some cases, the table can be modified concurrently while the ALTER TABLE is in progress. The operation might be able to be performed without a table copy, or using a specially optimized type of table copy. DML log space usage for in-place operations is controlled by the innodb_online_alter_log_max_size configuration option.

This feature is an enhancement of the Fast Index Creation feature in MySQL 5.5.

See Also DDL, Fast Index Creation, online.

optimistic
A methodology that guides low-level implementation decisions for a relational database system. The requirements of performance and concurrency in a relational database mean that operations must be started or dispatched quickly. The requirements of consistency and referential integrity mean that any operation could fail: a transaction might be rolled back, a DML operation could violate a constraint, a request for a lock could cause a deadlock, a network error could cause a timeout. An optimistic strategy is one that assumes most requests or attempts will succeed, so that relatively little work is done to prepare for the failure case. When this assumption is true, the database does little unnecessary work; when requests do fail, extra work must be done to clean up and undo changes.

InnoDB uses optimistic strategies for operations such as locking and commits. For example, data changed by a transaction can be written to the data files before the commit occurs, making the commit itself very fast, but requiring more work to undo the changes if the transaction is rolled back.

The opposite of an optimistic strategy is a pessimistic one, where a system is optimized to deal with operations that are unreliable and frequently unsuccessful. This methodology is rare in a database system, because so much care goes into choosing reliable hardware, networks, and algorithms.

See Also commit, concurrency, DML, locking, pessimistic, referential integrity.

optimizer
The MySQL component that determines the best indexes and join order to use for a query, based on characteristics and data distribution of the relevant tables.

See Also index, join, query, table.

option
A configuration parameter for MySQL, either stored in the option file or passed on the command line.

For the options that apply to InnoDB tables, each option name starts with the prefix innodb_.

See Also InnoDB, option, option file.
option file
The file that holds the configuration options for the MySQL instance. Traditionally, on Linux and Unix this file is named `my.cnf`, and on Windows it is named `my.ini`.
See Also configuration file, my.cnf, my.ini, option.

overflow page
Separately allocated disk pages that hold variable-length columns (such as BLOB and VARCHAR) that are too long to fit on a B-tree page. The associated columns are known as off-page columns.
See Also B-tree, off-page column, page.

P.par file
A file containing partition definitions. Files with this extension are included in backups produced by the `mysqlbackup` command of the MySQL Enterprise Backup product.

With the introduction of native partitioning support for InnoDB tables in MySQL 5.7.6, .par files are no longer created for partitioned InnoDB tables. Partitioned MyISAM tables continue to use .par files in MySQL 5.7. In MySQL 8.0, partitioning support is only provided by the InnoDB storage engine. As such, .par files are no longer used as of MySQL 8.0.
See Also MySQL Enterprise Backup, mysqlbackup command.

page
A unit representing how much data InnoDB transfers at any one time between disk (the data files) and memory (the buffer pool). A page can contain one or more rows, depending on how much data is in each row. If a row does not fit entirely into a single page, InnoDB sets up additional pointer-style data structures so that the information about the row can be stored in one page.

One way to fit more data in each page is to use compressed row format. For tables that use BLOBs or large text fields, compact row format allows those large columns to be stored separately from the rest of the row, reducing I/O overhead and memory usage for queries that do not reference those columns.

When InnoDB reads or writes sets of pages as a batch to increase I/O throughput, it reads or writes an extent at a time.

All the InnoDB disk data structures within a MySQL instance share the same page size.
See Also buffer pool, compact row format, compressed row format, data files, extent, page size, row.

page cleaner
An InnoDB background thread that flushes dirty pages from the buffer pool. Prior to MySQL 5.6, this activity was performed by the master thread. The number of page cleaner threads is controlled by the `innodb_page_cleaners` configuration option, introduced in MySQL 5.7.4.
See Also buffer pool, dirty page, flush, master thread, thread.

page size
For releases up to and including MySQL 5.5, the size of each InnoDB page is fixed at 16 kilobytes. This value represents a balance: large enough to hold the data for most rows, yet small enough to minimize the performance overhead of transferring unneeded data to memory. Other values are not tested or supported.

Starting in MySQL 5.6, the page size for an InnoDB instance can be either 4KB, 8KB, or 16KB, controlled by the `innodb_page_size` configuration option. As of MySQL 5.7.6, InnoDB also supports 32KB and 64KB page sizes. For 32KB and 64KB page sizes, `ROW_FORMAT=COMPRESSED` is not supported and the maximum record size is 16KB.

Page size is set when creating the MySQL instance, and it remains constant afterward. The same page size applies to all InnoDB tablespaces, including the system tablespace, file-per-table tablespaces, and general tablespaces.

Smaller page sizes can help performance with storage devices that use small block sizes, particularly for SSD devices in disk-bound workloads, such as for OLTP applications. As individual rows are updated, less data is copied into memory, written to disk, reorganized, locked, and so on.
parent table
The table in a foreign key relationship that holds the initial column values pointed to from the child table. The consequences of deleting, or updating rows in the parent table depend on the ON UPDATE and ON DELETE clauses in the foreign key definition. Rows with corresponding values in the child table could be automatically deleted or updated in turn, or those columns could be set to NULL, or the operation could be prevented.
See Also child table, foreign key.

partial backup
A backup that contains some of the tables in a MySQL database, or some of the databases in a MySQL instance. Contrast with full backup.
See Also backup, full backup, table.

partial index
An index that represents only part of a column value, typically the first N characters (the prefix) of a long VARCHAR value.
See Also index, index prefix.

Performance Schema
The performance_schema schema, in MySQL 5.5 and up, presents a set of tables that you can query to get detailed information about the performance characteristics of many internal parts of the MySQL server.
See Also INFORMATION_SCHEMA, latch, mutex, rw-lock.

persistent statistics
A feature that stores index statistics for InnoDB tables on disk, providing better plan stability for queries. For more information, see Section 14.8.11.1, “Configuring Persistent Optimizer Statistics Parameters”.
See Also index, optimizer, plan stability, query, table.

pessimistic
A methodology that sacrifices performance or concurrency in favor of safety. It is appropriate if a high proportion of requests or attempts might fail, or if the consequences of a failed request are severe. InnoDB uses what is known as a pessimistic locking strategy, to minimize the chance of deadlocks. At the application level, you might avoid deadlocks by using a pessimistic strategy of acquiring all locks needed by a transaction at the very beginning.

Many built-in database mechanisms use the opposite optimistic methodology.
See Also deadlock, locking, optimistic.

phantom
A row that appears in the result set of a query, but not in the result set of an earlier query. For example, if a query is run twice within a transaction, and in the meantime, another transaction commits after inserting a new row or updating a row so that it matches the WHERE clause of the query.

This occurrence is known as a phantom read. It is harder to guard against than a non-repeatable read, because locking all the rows from the first query result set does not prevent the changes that cause the phantom to appear.

Among different isolation levels, phantom reads are prevented by the serializable read level, and allowed by the repeatable read, consistent read, and read uncommitted levels.
See Also consistent read, isolation level, non-repeatable read, READ UNCOMMITTED, REPEATABLE READ, SERIALIZABLE, transaction.

physical
A type of operation that involves hardware-related aspects such as disk blocks, memory pages, files, bits, disk reads, and so on. Typically, physical aspects are important during expert-level performance tuning and problem diagnosis. Contrast with logical.
See Also logical, physical backup.

physical backup
A backup that copies the actual data files. For example, the mysqlbackup command of the MySQL Enterprise Backup product produces a physical backup, because its output contains data files that can be used directly by the mysqld server, resulting in a faster restore operation. Contrast with logical backup. See Also backup, logical backup, MySQL Enterprise Backup, restore.

PITR
Acronym for point-in-time recovery. See Also point-in-time recovery.

plan stability
A property of a query execution plan, where the optimizer makes the same choices each time for a given query, so that performance is consistent and predictable. See Also query, query execution plan.

point-in-time recovery
The process of restoring a backup to recreate the state of the database at a specific date and time. Commonly abbreviated “PITR”. Because it is unlikely that the specified time corresponds exactly to the time of a backup, this technique usually requires a combination of a physical backup and a logical backup. For example, with the MySQL Enterprise Backup product, you restore the last backup that you took before the specified point in time, then replay changes from the binary log between the time of the backup and the PITR time. See Also backup, binary log, logical backup, MySQL Enterprise Backup, physical backup.

prefix
See index prefix.

prepared backup
A set of backup files, produced by the MySQL Enterprise Backup product, after all the stages of applying binary logs and incremental backups are finished. The resulting files are ready to be restored. Prior to the apply steps, the files are known as a raw backup. See Also binary log, hot backup, incremental backup, MySQL Enterprise Backup, raw backup, restore.

primary key
A set of columns—and by implication, the index based on this set of columns—that can uniquely identify every row in a table. As such, it must be a unique index that does not contain any NULL values. InnoDB requires that every table has such an index (also called the clustered index or cluster index), and organizes the table storage based on the column values of the primary key.

When choosing primary key values, consider using arbitrary values (a synthetic key) rather than relying on values derived from some other source (a natural key). See Also clustered index, index, natural key, synthetic key.

process
An instance of an executing program. The operating system switches between multiple running processes, allowing for a certain degree of concurrency. On most operating systems, processes can contain multiple threads of execution that share resources. Context-switching between threads is faster than the equivalent switching between processes. See Also concurrency, thread.

pseudo-record
An artificial record in an index, used for locking key values or ranges that do not currently exist. See Also infimum record, locking, supremum record.

Pthreads
The POSIX threads standard, which defines an API for threading and locking operations on Unix and Linux systems. On Unix and Linux systems, InnoDB uses this implementation for mutexes. See Also mutex.
purge
A type of garbage collection performed by one or more separate background threads (controlled by `innodb_purge_threads`) that runs on a periodic schedule. Purge parses and processes undo log pages from the history list for the purpose of removing clustered and secondary index records that were marked for deletion (by previous DELETE statements) and are no longer required for MVCC or rollback. Purge frees undo log pages from the history list after processing them.
See Also history list, MVCC, rollback, undo log.

purge buffering
The technique of storing changes to secondary index pages, resulting from DELETE operations, in the change buffer rather than writing the changes immediately, so that the physical writes can be performed to minimize random I/O. (Because delete operations are a two-step process, this operation buffers the write that normally purges an index record that was previously marked for deletion.) It is one of the types of change buffering; the others are insert buffering and delete buffering.
See Also change buffer, change buffering, delete buffering, insert buffer, insert buffering.

purge lag
Another name for the InnoDB history list. Related to the `innodb_max_purge_lag` configuration option.
See Also history list, purge.

purge thread
A thread within the InnoDB process that is dedicated to performing the periodic purge operation. In MySQL 5.6 and higher, multiple purge threads are enabled by the `innodb_purge_threads` configuration option.
See Also purge, thread.

Q

query
In SQL, an operation that reads information from one or more tables. Depending on the organization of data and the parameters of the query, the lookup might be optimized by consulting an index. If multiple tables are involved, the query is known as a join.

For historical reasons, sometimes discussions of internal processing for statements use “query” in a broader sense, including other types of MySQL statements such as DDL and DML statements.
See Also DDL, DML, index, join, SQL, table.

query execution plan
The set of decisions made by the optimizer about how to perform a query most efficiently, including which index or indexes to use, and the order in which to join tables. Plan stability involves the same choices being made consistently for a given query.
See Also index, join, plan stability, query.

query log
See general query log.

quiesce
To reduce the amount of database activity, often in preparation for an operation such as an ALTER TABLE, a backup, or a shutdown. Might or might not involve doing as much flushing as possible, so that InnoDB does not continue doing background I/O.

In MySQL 5.6 and higher, the syntax `FLUSH TABLES ... FOR EXPORT` writes some data to disk for InnoDB tables that make it simpler to back up those tables by copying the data files.
See Also backup, flush, InnoDB, shutdown.

R

R-tree
A tree data structure used for spatial indexing of multi-dimensional data such as geographical coordinates, rectangles or polygons.
See Also B-tree.
RAID

Acronym for “Redundant Array of Inexpensive Drives”. Spreading I/O operations across multiple drives enables greater concurrency at the hardware level, and improves the efficiency of low-level write operations that otherwise would be performed in sequence.

See Also concurrency.

random dive

A technique for quickly estimating the number of different values in a column (the column's cardinality). InnoDB samples pages at random from the index and uses that data to estimate the number of different values.

See Also cardinality.

raw backup

The initial set of backup files produced by the MySQL Enterprise Backup product, before the changes reflected in the binary log and any incremental backups are applied. At this stage, the files are not ready to restore. After these changes are applied, the files are known as a prepared backup.

See Also binary log, hot backup, ibbackup_logfile, incremental backup, MySQL Enterprise Backup, prepared backup, restore.

READ COMMITTED

An isolation level that uses a locking strategy that relaxes some of the protection between transactions, in the interest of performance. Transactions cannot see uncommitted data from other transactions, but they can see data that is committed by another transaction after the current transaction started. Thus, a transaction never sees any bad data, but the data that it does see may depend to some extent on the timing of other transactions.

When a transaction with this isolation level performs UPDATE ... WHERE or DELETE ... WHERE operations, other transactions might have to wait. The transaction can perform SELECT ... FOR UPDATE, and LOCK IN SHARE MODE operations without making other transactions wait.

SELECT ... FOR SHARE replaces SELECT ... LOCK IN SHARE MODE in MySQL 8.0.1, but LOCK IN SHARE MODE remains available for backward compatibility.

See Also ACID, isolation level, locking, REPEATABLE READ, SERIALIZABLE, transaction.

read phenomena

Phenomena such as dirty reads, non-repeatable reads, and phantom reads which can occur when a transaction reads data that another transaction has modified.

See Also dirty read, non-repeatable read, phantom.

READ UNCOMMITTED

The isolation level that provides the least amount of protection between transactions. Queries employ a locking strategy that allows them to proceed in situations where they would normally wait for another transaction. However, this extra performance comes at the cost of less reliable results, including data that has been changed by other transactions and not committed yet (known as dirty read). Use this isolation level with great caution, and be aware that the results might not be consistent or reproducible, depending on what other transactions are doing at the same time. Typically, transactions with this isolation level only do queries, not insert, update, or delete operations.

See Also ACID, dirty read, isolation level, locking, transaction.

read view

An internal snapshot used by the MVCC mechanism of InnoDB. Certain transactions, depending on their isolation level, see the data values as they were at the time the transaction (or in some cases, the statement) started. Isolation levels that use a read view are REPEATABLE READ, READ COMMITTED, and READ UNCOMMITTED.

See Also isolation level, MVCC, READ COMMITTED, READ UNCOMMITTED, REPEATABLE READ, transaction.

read-ahead

A type of I/O request that prefetches a group of pages (an entire extent) into the buffer pool asynchronously, in anticipation that these pages will be needed soon. The linear read-ahead technique
prefetches all the pages of one extent based on access patterns for pages in the preceding extent. The random read-ahead technique prefetches all the pages for an extent once a certain number of pages from the same extent are in the buffer pool. Random read-ahead is not part of MySQL 5.5, but is re-introduced in MySQL 5.6 under the control of the `innodb_random_read_ahead` configuration option.

See Also `buffer pool`, `extent`, `page`.

**read-only transaction**

A type of transaction that can be optimized for InnoDB tables by eliminating some of the bookkeeping involved with creating a read view for each transaction. Can only perform non-locking read queries. It can be started explicitly with the syntax `START TRANSACTION READ ONLY`, or automatically under certain conditions. See Section 8.5.3, "Optimizing InnoDB Read-Only Transactions" for details.

See Also `non-locking read`, `read view`, `transaction`.

**record lock**

A lock on an index record. For example, `SELECT c1 FROM t WHERE c1 = 10 FOR UPDATE;` prevents any other transaction from inserting, updating, or deleting rows where the value of `t.c1` is 10. Contrast with gap lock and next-key lock.

See Also `gap lock`, `lock`, `next-key lock`.

**redo**

The data, in units of records, recorded in the redo log when DML statements make changes to InnoDB tables. It is used during crash recovery to correct data written by incomplete transactions. The ever-increasing LSN value represents the cumulative amount of redo data that has passed through the redo log.

See Also `crash recovery`, `DML`, `LSN`, `redo log`, `transaction`.

**redo log**

A disk-based data structure used during crash recovery, to correct data written by incomplete transactions. During normal operation, it encodes requests to change InnoDB table data, which result from SQL statements or low-level API calls through NoSQL interfaces. Modifications that did not finish updating the data files before an unexpected shutdown are replayed automatically.

The redo log is physically represented as a set of files, typically named `ib_logfile0` and `ib_logfile1`. The data in the redo log is encoded in terms of records affected; this data is collectively referred to as redo. The passage of data through the redo logs is represented by the ever-increasing LSN value. The original 4GB limit on maximum size for the redo log is raised to 512GB in MySQL 5.6.3.

The disk layout of the redo log is influenced by the configuration options `innodb_log_file_size`, `innodb_log_group_home_dir`, and (rarely) `innodb_log_files_in_group`. The performance of redo log operations is also affected by the log buffer, which is controlled by the `innodb_log_buffer_size` configuration option.

See Also `crash recovery`, `data files`, `ib_logfile`, `log buffer`, `LSN`, `redo`, `shutdown`, `transaction`.

**redo log archiving**

An InnoDB feature that, when enabled, sequentially writes redo log records to an archive file to avoid potential loss of data than can occur when a backup utility fails to keep pace with redo log generation while a backup operation is in progress. For more information, see Redo Log Archiving.

See Also `redo log`.

**redundant row format**

The oldest InnoDB row format. Prior to MySQL 5.0.3, it was the only row format available in InnoDB. From MySQL 5.0.3 to MySQL 5.7.8, the default row format is COMPACT. As of MySQL 5.7.9, the default row format is defined by the `innodb_default_row_format` configuration option, which has a default setting of DYNAMIC. You can still specify the REDUNDANT row format for compatibility with older InnoDB tables.

For more information, see Section 14.11, "InnoDB Row Formats".

See Also `compact row format`, `dynamic row format`, `row format`.

**referential integrity**

The technique of maintaining data always in a consistent format, part of the ACID philosophy. In particular, data in different tables is kept consistent through the use of foreign key constraints, which can prevent changes from happening or automatically propagate those changes to all related tables. Related mechanisms
include the **unique constraint**, which prevents duplicate values from being inserted by mistake, and the **NOT NULL constraint**, which prevents blank values from being inserted by mistake.

See Also [ACID](#), [FOREIGN KEY constraint](#), [NOT NULL constraint](#), [unique constraint](#).

**relational**

An important aspect of modern database systems. The database server encodes and enforces relationships such as one-to-one, one-to-many, many-to-one, and uniqueness. For example, a person might have zero, one, or many phone numbers in an address database; a single phone number might be associated with several family members. In a financial database, a person might be required to have exactly one taxpayer ID, and any taxpayer ID could only be associated with one person.

The database server can use these relationships to prevent bad data from being inserted, and to find efficient ways to look up information. For example, if a value is declared to be unique, the server can stop searching as soon as the first match is found, and it can reject attempts to insert a second copy of the same value.

At the database level, these relationships are expressed through SQL features such as **columns** within a table, unique and **NOT NULL constraints**, **foreign keys**, and different kinds of join operations. Complex relationships typically involve data split between more than one table. Often, the data is **normalized**, so that duplicate values in one-to-many relationships are stored only once.

In a mathematical context, the relations within a database are derived from set theory. For example, the **OR** and **AND** operators of a **WHERE** clause represent the notions of union and intersection.

See Also [ACID](#), [column](#), [constraint](#), [foreign key](#), [normalized](#).

**relevance**

In the **full-text search** feature, a number signifying the similarity between the search string and the data in the **FULLTEXT index**. For example, when you search for a single word, that word is typically more relevant for a row where it occurs several times in the text than a row where it appears only once.

See Also [full-text search](#), [FULLTEXT index](#).

**REPEATABLE READ**

The default **isolation level** for **InnoDB**. It prevents any rows that are queried from being changed by other transactions, thus blocking **non-repeatable reads** but not **phantom reads**. It uses a moderately strict locking strategy so that all queries within a transaction see data from the same snapshot, that is, the data as it was at the time the transaction started.

When a transaction with this isolation level performs **UPDATE ... WHERE**,** DELETE ... WHERE**, **SELECT ... FOR UPDATE**, and **LOCK IN SHARE MODE** operations, other transactions might have to wait.

**SELECT ... FOR SHARE** replaces **SELECT ... LOCK IN SHARE MODE** in MySQL 8.0.1, but **LOCK IN SHARE MODE** remains available for backward compatibility.

See Also [ACID](#), [consistent read](#), [isolation level](#), [locking](#), [phantom](#), [transaction](#).

**repertoire**

Repertoire is a term applied to character sets. A character set repertoire is the collection of characters in the set. See Section 10.2.1, “Character Set Repertoire”.

**replication**

The practice of sending changes from a **master database**, to one or more **slave databases**, so that all databases have the same data. This technique has a wide range of uses, such as load-balancing for better scalability, disaster recovery, and testing software upgrades and configuration changes. The changes can be sent between the database by methods called **row-based replication** and **statement-based replication**.

See Also [master server](#), [row-based replication](#), [slave server](#), [statement-based replication](#).

**restore**

The process of putting a set of backup files from the **MySQL Enterprise Backup** product in place for use by MySQL. This operation can be performed to fix a corrupted database, to return to some earlier point in time, or (in a **replication** context) to set up a new **slave database**. In the **MySQL Enterprise Backup** product, this operation is performed by the **copy-back** option of the **mysqlbackup** command.

See Also [hot backup](#), [MySQL Enterprise Backup](#), [mysqlbackup command](#), [prepared backup](#), [replication](#), [slave server](#).
rollback

A SQL statement that ends a transaction, undoing any changes made by the transaction. It is the opposite of commit, which makes permanent any changes made in the transaction.

By default, MySQL uses the autocommit setting, which automatically issues a commit following each SQL statement. You must change this setting before you can use the rollback technique.

See Also ACID, autocommit, commit, SQL, transaction.

rollback segment

The storage area containing the undo logs. Rollback segments have traditionally resided in the system tablespace. As of MySQL 5.6, rollback segments can reside in undo tablespaces. As of MySQL 5.7, rollback segments are also allocated to the global temporary tablespace.

See Also system tablespace, undo log, undo tablespace.

row

The logical data structure defined by a set of columns. A set of rows makes up a table. Within InnoDB data files, each page can contain one or more rows.

Although InnoDB uses the term row format for consistency with MySQL syntax, the row format is a property of each table and applies to all rows in that table.

See Also column, data files, page, row format, table.

row format

The disk storage format for rows of an InnoDB table. As InnoDB gains new capabilities such as compression, new row formats are introduced to support the resulting improvements in storage efficiency and performance.

The row format of an InnoDB table is specified by the ROW_FORMAT option or by the innodb_default_row_format configuration option (introduced in MySQL 5.7.9). Row formats include REDUNDANT, COMPACT, COMPRESSED, and DYNAMIC. To view the row format of an InnoDB table, issue the SHOW TABLE STATUS statement or query InnoDB table metadata in the INFORMATION_SCHEMA.

See Also compact row format, compressed row format, compression, dynamic row format, redundant row format, row, table.

row lock

A lock that prevents a row from being accessed in an incompatible way by another transaction. Other rows in the same table can be freely written to by other transactions. This is the type of locking done by DML operations on InnoDB tables.

Contrast with table locks used by MyISAM, or during DDL operations on InnoDB tables that cannot be done with online DDL; those locks block concurrent access to the table.

See Also DDL, DML, InnoDB, lock, locking, online DDL, table lock, transaction.

row-based replication

A form of replication where events are propagated from the master server specifying how to change individual rows on the slave server. It is safe to use for all settings of the innodb_autoinc_lock_mode option.

See Also auto-increment locking, innodb_autoinc_lock_mode, master server, replication, slave server, statement-based replication.

row-level locking

The locking mechanism used for InnoDB tables, relying on row locks rather than table locks. Multiple transactions can modify the same table concurrently. Only if two transactions try to modify the same row does one of the transactions wait for the other to complete (and release its row locks).

See Also InnoDB, locking, row lock, table lock, transaction.

rw-lock

The low-level object that InnoDB uses to represent and enforce shared-access locks to internal in-memory data structures following certain rules. Contrast with mutexes, which InnoDB uses to represent and enforce
exclusive access to internal in-memory data structures. Mutexes and rw-locks are known collectively as latches.

rw-lock types include s-locks (shared locks), x-locks (exclusive locks), and sx-locks (shared-exclusive locks).

- An s-lock provides read access to a common resource.
- An x-lock provides write access to a common resource while not permitting inconsistent reads by other threads.
- An sx-lock provides write access to a common resource while permitting inconsistent reads by other threads. sx-locks were introduced in MySQL 5.7 to optimize concurrency and improve scalability for read-write workloads.

The following matrix summarizes rw-lock type compatibility.

<table>
<thead>
<tr>
<th></th>
<th>S</th>
<th>SX</th>
<th>X</th>
</tr>
</thead>
<tbody>
<tr>
<td>S</td>

<td>Conflict</td>
<td>Conflict</td>
</tr>
</tbody>
</table>

See Also latch, lock, mutex, Performance Schema.

**S**

savepoint

Savepoints help to implement nested transactions. They can be used to provide scope to operations on tables that are part of a larger transaction. For example, scheduling a trip in a reservation system might involve booking several different flights; if a desired flight is unavailable, you might roll back the changes involved in booking that one leg, without rolling back the earlier flights that were successfully booked.

See Also rollback, transaction.

scalability

The ability to add more work and issue more simultaneous requests to a system, without a sudden drop in performance due to exceeding the limits of system capacity. Software architecture, hardware configuration, application coding, and type of workload all play a part in scalability. When the system reaches its maximum capacity, popular techniques for increasing scalability are scale up (increasing the capacity of existing hardware or software) and scale out (adding new servers and more instances of MySQL). Often paired with availability as critical aspects of a large-scale deployment.

See Also availability, scale out, scale up.

scale out

A technique for increasing scalability by adding new servers and more instances of MySQL. For example, setting up replication, NDB Cluster, connection pooling, or other features that spread work across a group of servers. Contrast with scale up.

See Also scalability, scale up.

scale up

A technique for increasing scalability by increasing the capacity of existing hardware or software. For example, increasing the memory on a server and adjusting memory-related parameters such as innodb_buffer_pool_size and innodb_buffer_pool_instances. Contrast with scale out.

See Also scalability, scale out.

schema

Conceptually, a schema is a set of interrelated database objects, such as tables, table columns, data types of the columns, indexes, foreign keys, and so on. These objects are connected through SQL syntax, because
the columns make up the tables, the foreign keys refer to tables and columns, and so on. Ideally, they are also connected logically, working together as part of a unified application or flexible framework. For example, the `INFORMATION_SCHEMA` and `performance_schema` databases use “schema” in their names to emphasize the close relationships between the tables and columns they contain.

In MySQL, physically, a `schema` is synonymous with a `database`. You can substitute the keyword `SCHEMA` instead of `DATABASE` in MySQL SQL syntax, for example using `CREATE SCHEMA` instead of `CREATE DATABASE`.

Some other database products draw a distinction. For example, in the Oracle Database product, a `schema` represents only a part of a database: the tables and other objects owned by a single user.

See Also `database`, `INFORMATION_SCHEMA`, `Performance Schema`.

**search index**

In MySQL, `full-text search` queries use a special kind of index, the `FULLTEXT` index. In MySQL 5.6.4 and up, `InnoDB` and `MyISAM` tables both support `FULLTEXT` indexes; formerly, these indexes were only available for `MyISAM` tables.

See Also `full-text search`, `FULLTEXT index`.

**secondary index**

A type of `InnoDB index` that represents a subset of table columns. An `InnoDB` table can have zero, one, or many secondary indexes. (Contrast with the `clustered index`, which is required for each `InnoDB` table, and stores the data for all the table columns.)

A secondary index can be used to satisfy queries that only require values from the indexed columns. For more complex queries, it can be used to identify the relevant rows in the table, which are then retrieved through lookups using the clustered index.

Creating and dropping secondary indexes has traditionally involved significant overhead from copying all the data in the `InnoDB` table. The `fast index creation` feature makes both `CREATE INDEX` and `DROP INDEX` statements much faster for `InnoDB` secondary indexes.

See Also `clustered index`, `Fast Index Creation`, `index`.

**segment**

A division within an `InnoDB` `tablespace`. If a `tablespace` is analogous to a directory, the segments are analogous to files within that directory. A segment can grow. New segments can be created.

For example, within a `file-per-table` `tablespace`, table data is in one segment and each associated index is in its own segment. The `system tablespace` contains many different segments, because it can hold many tables and their associated indexes. Prior to MySQL 8.0, the `system tablespace` also includes one or more `rollback segments` used for `undo logs`.

Segments grow and shrink as data is inserted and deleted. When a segment needs more room, it is extended by one `extent` (1 megabyte) at a time. Similarly, a segment releases one extent's worth of space when all the data in that extent is no longer needed.

See Also `extent`, `file-per-table`, `rollback segment`, `system tablespace`, `tablespace`, `undo log`.

**selectivity**

A property of data distribution, the number of distinct values in a column (its `cardinality`) divided by the number of records in the table. High selectivity means that the column values are relatively unique, and can be retrieved efficiently through an index. If you (or the query optimizer) can predict that a test in a `WHERE` clause only matches a small number (or proportion) of rows in a table, the overall `query` tends to be efficient if it evaluates that test first, using an index.

See Also `cardinality`, `query`.

**semi-consistent read**

A type of read operation used for `UPDATE` statements, that is a combination of `READ COMMITTED` and `consistent read`. When an `UPDATE` statement examines a row that is already locked, `InnoDB` returns the latest committed version to MySQL so that MySQL can determine whether the row matches the `WHERE` condition of the `UPDATE`. If the row matches (must be updated), MySQL reads
the row again, and this time InnoDB either locks it or waits for a lock on it. This type of read operation can only happen when the transaction has the READ COMMITTED isolation level, or when the innodb_locks_unsafe_for_binlog option is enabled. innodb_locks_unsafe_for_binlog was removed in MySQL 8.0.

See Also consistent read, isolation level, READ COMMITTED.

SERIALIZABLE

The isolation level that uses the most conservative locking strategy, to prevent any other transactions from inserting or changing data that was read by this transaction, until it is finished. This way, the same query can be run over and over within a transaction, and be certain to retrieve the same set of results each time. Any attempt to change data that was committed by another transaction since the start of the current transaction, cause the current transaction to wait.

This is the default isolation level specified by the SQL standard. In practice, this degree of strictness is rarely needed, so the default isolation level for InnoDB is the next most strict, REPEATABLE READ. See Also ACID, consistent read, isolation level, locking, REPEATABLE READ, transaction.

server

A type of program that runs continuously, waiting to receive and act upon requests from another program (the client). Because often an entire computer is dedicated to running one or more server programs (such as a database server, a web server, an application server, or some combination of these), the term server can also refer to the computer that runs the server software.

See Also client, mysqld.

shared lock

A kind of lock that allows other transactions to read the locked object, and to also acquire other shared locks on it, but not to write to it. The opposite of exclusive lock.

See Also exclusive lock, lock, transaction.

shared tablespace

Another way of referring to the system tablespace or a general tablespace. General tablespaces were introduced in MySQL 5.7. More than one table can reside in a shared tablespace. Only a single table can reside in a file-per-table tablespace.

See Also general tablespace, system tablespace.

sharp checkpoint

The process of flushing to disk all dirty buffer pool pages whose redo entries are contained in certain portion of the redo log. Occurs before InnoDB reuses a portion of a log file; the log files are used in a circular fashion. Typically occurs with write-intensive workloads.

See Also dirty page, flush, redo log, workload.

shutdown

The process of stopping the MySQL server. By default, this process cleans up operations for InnoDB tables, so InnoDB can be slow to shut down, but fast to start up later. If you skip the cleanup operations, it is fast to shut down but the cleanup must be performed during the next restart.

The shutdown mode for InnoDB is controlled by the innodb_fast_shutdown option.

See Also fast shutdown, InnoDB, slow shutdown, startup.

slave server

Frequently shortened to “slave”. A database server machine in a replication scenario that receives changes from another server (the master) and applies those same changes. Thus it maintains the same contents as the master, although it might lag somewhat behind.

In MySQL, slave servers are commonly used in disaster recovery, to take the place of a master servers that fails. They are also commonly used for testing software upgrades and new settings, to ensure that database configuration changes do not cause problems with performance or reliability.

Slave servers typically have high workloads, because they process all the DML (write) operations relayed from the master, as well as user queries. To ensure that slave servers can apply changes from the master
fast enough, they frequently have fast I/O devices and sufficient CPU and memory to run multiple database instances on the same slave server. For example, the master server might use hard drive storage while the slave servers use SSDs.

See Also DML, master server, replication, server, SSD.

slow query log
A type of log used for performance tuning of SQL statements processed by the MySQL server. The log information is stored in a file. You must enable this feature to use it. You control which categories of "slow" SQL statements are logged. For more information, see Section 5.4.5, "The Slow Query Log".

See Also general query log, log.

slow shutdown
A type of shutdown that does additional InnoDB flushing operations before completing. Also known as a clean shutdown. Specified by the configuration parameter innodb_fast_shutdown=0 or the command SET GLOBAL innodb_fast_shutdown=0; Although the shutdown itself can take longer, that time will be saved on the subsequent startup.

See Also clean shutdown, fast shutdown, shutdown.

snapshot
A representation of data at a particular time, which remains the same even as changes are committed by other transactions. Used by certain isolation levels to allow consistent reads.

See Also commit, consistent read, isolation level, transaction.

sort buffer
The buffer used for sorting data during creation of an InnoDB index. Sort buffer size is configured using the innodb_sort_buffer_size configuration option.

space ID
An identifier used to uniquely identify an InnoDB tablespace within a MySQL instance. The space ID for the system tablespace is always zero; this same ID applies to all tables within the system tablespace or within a general tablespace. Each file-per-table tablespace and general tablespace has its own space ID.

Prior to MySQL 5.6, this hardcoded value presented difficulties in moving InnoDB tablespace files between MySQL instances. Starting in MySQL 5.6, you can copy tablespace files between instances by using the transportable tablespace feature involving the statements FLUSH TABLES ... FOR EXPORT, ALTER TABLE ... DISCARD TABLESPACE, and ALTER TABLE ... IMPORT TABLESPACE. The information needed to adjust the space ID is conveyed in the .cfg file which you copy along with the tablespace. See Section 14.6.1.3, “Importing InnoDB Tables” for details.

See Also .cfg file, file-per-table, general tablespace, .ibd file, system tablespace, tablespace, transportable tablespace.

sparse file
A type of file that uses file system space more efficiently by writing metadata representing empty blocks to disk instead of writing the actual empty space. The InnoDB transparent page compression feature relies on sparse file support. For more information, see Section 14.9.2, “InnoDB Page Compression”.

See Also hole punching, transparent page compression.

spin
A type of wait operation that continuously tests whether a resource becomes available. This technique is used for resources that are typically held only for brief periods, where it is more efficient to wait in a “busy loop” than to put the thread to sleep and perform a context switch. If the resource does not become available within a short time, the spin loop ceases and another wait technique is used.

See Also latch, lock, mutex, wait.

SQL
The Structured Query Language that is standard for performing database operations. Often divided into the categories DDL, DML, and queries. MySQL includes some additional statement categories such as replication. See Chapter 9, Language Structure for the building blocks of SQL syntax, Chapter 11, Data Types for the data types to use for MySQL table columns, Chapter 13, SQL Statements for details about
SQL statements and their associated categories, and Chapter 12, Functions and Operators for standard and MySQL-specific functions to use in queries.
See Also DDL, DML, query, replication.

SSD
Acronym for "solid-state drive". A type of storage device with different performance characteristics than a traditional hard disk drive (HDD): smaller storage capacity, faster for random reads, no moving parts, and with a number of considerations affecting write performance. Its performance characteristics can influence the throughput of a disk-bound workload.
See Also disk-bound, HDD.

startup
The process of starting the MySQL server. Typically done by one of the programs listed in Section 4.3, “Server and Server-Startup Programs”. The opposite of shutdown.
See Also shutdown.

statement-based replication
A form of replication where SQL statements are sent from the master server and replayed on the slave server. It requires some care with the setting for the innodb_autoinc_lock_mode option, to avoid potential timing problems with auto-increment locking.
See Also auto-increment locking, innodb_autoinc_lock_mode, master server, replication, row-based replication, slave server.

statistics
Estimated values relating to each InnoDB table and index, used to construct an efficient query execution plan. The main values are the cardinality (number of distinct values) and the total number of table rows or index entries. The statistics for the table represent the data in its primary key index. The statistics for a secondary index represent the rows covered by that index.

The values are estimated rather than counted precisely because at any moment, different transactions can be inserting and deleting rows from the same table. To keep the values from being recalculated frequently, you can enable persistent statistics, where the values are stored in InnoDB system tables, and refreshed only when you issue an ANALYZE TABLE statement.

You can control how NULL values are treated when calculating statistics through the innodb_stats_method configuration option.

Other types of statistics are available for database objects and database activity through the INFORMATION_SCHEMA and PERFORMANCE_SCHEMA tables.
See Also cardinality, index, INFORMATION_SCHEMA, NULL, Performance Schema, persistent statistics, primary key, query execution plan, secondary index, table, transaction.

stemming
The ability to search for different variations of a word based on a common root word, such as singular and plural, or past, present, and future verb tense. This feature is currently supported in MyISAM full-text search feature but not in FULLTEXT indexes for InnoDB tables.
See Also full-text search, FULLTEXT index.

stopword
In a FULLTEXT index, a word that is considered common or trivial enough that it is omitted from the search index and ignored in search queries. Different configuration settings control stopword processing for InnoDB and MyISAM tables. See Section 12.9.4, “Full-Text Stopwords” for details.
See Also FULLTEXT index, search index.

storage engine
A component of the MySQL database that performs the low-level work of storing, updating, and querying data. In MySQL 5.5 and higher, InnoDB is the default storage engine for new tables, superceding MyISAM. Different storage engines are designed with different tradeoffs between factors such as memory usage versus disk usage, read speed versus write speed, and speed versus robustness. Each storage engine manages specific tables, so we refer to InnoDB tables, MyISAM tables, and so on.
The **MySQL Enterprise Backup** product is optimized for backing up **InnoDB** tables. It can also back up tables handled by **MyISAM** and other storage engines.

See Also **InnoDB**, **MySQL Enterprise Backup**, **table type**.

**stored generated column**
A column whose values are computed from an expression included in the column definition. Column values are evaluated and stored when rows are inserted or updated. A stored generated column requires storage space and can be indexed.

Contrast with **virtual generated column**.
See Also **base column**, **generated column**, **virtual generated column**.

**stored object**
A stored program or view.

**stored program**
A stored routine (procedure or function), trigger, or Event Scheduler event.

**stored routine**
A stored procedure or function.

**strict mode**
The general name for the setting controlled by the `innodb_strict_mode` option. Turning on this setting causes certain conditions that are normally treated as warnings, to be considered errors. For example, certain invalid combinations of options related to **file format** and **row format**, that normally produce a warning and continue with default values, now cause the `CREATE TABLE` operation to fail. `innodb_strict_mode` is enabled by default in MySQL 5.7.

MySQL also has something called strict mode. See Section 5.1.10, “Server SQL Modes”.
See Also **file format**, `innodb_strict_mode`, **row format**.

**sublist**
Within the list structure that represents the **buffer pool**, pages that are relatively old and relatively new are represented by different portions of the list. A set of parameters control the size of these portions and the dividing point between the new and old pages.
See Also **buffer pool**, **eviction**, **list**, **LRU**.

**supremum record**
A **pseudo-record** in an index, representing the **gap** above the largest value in that index. If a transaction has a statement such as `SELECT ... FROM ... WHERE col > 10 FOR UPDATE;`, and the largest value in the column is 20, it is a lock on the supremum record that prevents other transactions from inserting even larger values such as 50, 100, and so on.
See Also **gap**, **infimum record**, **pseudo-record**.

**surrogate key**
Synonym name for **synthetic key**.
See Also **synthetic key**.

**synthetic key**
An indexed column, typically a **primary key**, where the values are assigned arbitrarily. Often done using an **auto-increment** column. By treating the value as completely arbitrary, you can avoid overly restrictive rules and faulty application assumptions. For example, a numeric sequence representing employee numbers might have a gap if an employee was approved for hiring but never actually joined. Or employee number 100 might have a later hiring date than employee number 500, if they left the company and later rejoined. Numeric values also produce shorter values of predictable length. For example, storing numeric codes meaning “Road”, “Boulevard”, “Expressway”, and so on is more space-efficient than repeating those strings over and over.

Also known as a **surrogate key**. Contrast with **natural key**.
See Also **auto-increment**, **natural key**, **primary key**, **surrogate key**.
system tablespace

One or more data files (ibdata files) containing metadata for InnoDB-related objects (the InnoDB data dictionary), and the storage areas for the change buffer, the doublewrite buffer, and possibly undo logs. It may also contain table and index data for InnoDB tables if tables were created in the system tablespace instead of file-per-table or general tablespaces. The data and metadata in the system tablespace apply to all databases in a MySQL instance.

Prior to MySQL 5.6.7, the default was to keep all InnoDB tables and indexes inside the system tablespace, often causing this file to become very large. Because the system tablespace never shrinks, storage problems could arise if large amounts of temporary data were loaded and then deleted. In MySQL 5.7, the default is file-per-table mode, where each table and its associated indexes are stored in a separate .ibd file. This default makes it easier to use InnoDB features that rely on the Barracuda file format, such as table compression, efficient storage of off-page columns, and large index key prefixes (innodb_large_prefix).

The innodb_undo_tablespaces option defines the number of undo tablespaces for undo logs.

Keeping all table data in the system tablespace or in separate .ibd files has implications for storage management in general. The MySQL Enterprise Backup product might back up a small set of large files, or many smaller files. On systems with thousands of tables, the file system operations to process thousands of .ibd files can cause bottlenecks.

InnoDB introduced general tablespaces in MySQL 5.7.6, which are also represented by .ibd files. General tablespaces are shared tablespaces created using CREATE TABLESPACE syntax. They can be created outside of the MySQL data directory, are capable of holding multiple tables, and support tables of all row formats. See Also Barracuda, change buffer, compression, data dictionary, database, doublewrite buffer, dynamic row format, file-per-table, general tablespace, .ibd file, ibdata file, innodb_file_per_table, instance, MySQL Enterprise Backup, off-page column, tablespace, undo log.

T

.TRG file

A file containing trigger parameters. Files with this extension are always included in backups produced by the mysqlbackup command of the MySQL Enterprise Backup product. See Also MySQL Enterprise Backup, mysqlbackup command, .TRN file.

.TRN file

A file containing trigger namespace information. Files with this extension are always included in backups produced by the mysqlbackup command of the MySQL Enterprise Backup product. See Also MySQL Enterprise Backup, mysqlbackup command, .TRG file.

table

Each MySQL table is associated with a particular storage engine. InnoDB tables have particular physical and logical characteristics that affect performance, scalability, backup, administration, and application development.

In terms of file storage, an InnoDB table belongs to one of the following tablespace types:

• The shared InnoDB system tablespace, which is comprised of one or more ibdata files.

• A file-per-table tablespace, comprised of an individual .ibd file.

• A shared general tablespace, comprised of an individual .ibd file. General tablespaces were introduced in MySQL 5.7.6.

.ibd data files contain both table and index data.

InnoDB tables created in file-per-table tablespaces can use the Barracuda file format, and Barracuda tables can use DYNAMIC or COMPRESSED row format. These row formats enable InnoDB
features such as compression, efficient storage of off-page columns, and large index key prefixes (see innodb_large_prefix). General tablespaces support all row formats regardless of the innodb_file_format setting.

Up to MySQL 5.7.5, InnoDB tables inside the system tablespace had to use the Antelope file format for backward compatibility with MySQL 5.1 and earlier. The Antelope file format supports COMPACT and REDUNDANT row format. The system tablespace supports tables that use DYNAMIC row format as of MySQL 5.7.6.

The rows of an InnoDB table are organized into an index structure known as the clustered index, with entries sorted based on the primary key columns of the table. Data access is optimized for queries that filter and sort on the primary key columns, and each index contains a copy of the associated primary key columns for each entry. Modifying values for any of the primary key columns is an expensive operation. Thus an important aspect of InnoDB table design is choosing a primary key with columns that are used in the most important queries, and keeping the primary key short, with rarely changing values.

See Also Antelope, backup, Barracuda, clustered index, compact row format, compressed row format, compression, dynamic row format, Fast Index Creation, file-per-table, .ibd file, index, off-page column, primary key, redundant row format, row, system tablespace, tablespace.

table lock
A lock that prevents any other transaction from accessing a table. InnoDB makes considerable effort to make such locks unnecessary, by using techniques such as online DDL, row locks and consistent reads for processing DML statements and queries. You can create such a lock through SQL using the LOCK TABLE statement; one of the steps in migrating from other database systems or MySQL storage engines is to remove such statements wherever practical.

See Also consistent read, DML, lock, locking, online DDL, query, row lock, table, transaction.

table scan
See full table scan.

table statistics
See statistics.

table type
Obsolete synonym for storage engine. We refer to InnoDB tables, MyISAM tables, and so on.

See Also InnoDB, storage engine.

tablespace
A data file that can hold data for one or more InnoDB tables and associated indexes.

The system tablespace contains the InnoDB data dictionary, and prior to MySQL 5.6 holds all other InnoDB tables by default.

The innodb_file_per_table option, enabled by default in MySQL 5.6 and higher, allows tables to be created in their own tablespaces. File-per-table tablespaces support features such as efficient storage of off-page columns, table compression, and transportable tablespaces. See Section 14.6.3.2, “File-Per-Table Tablespaces” for details.

InnoDB introduced general tablespaces in MySQL 5.7.6. General tablespaces are shared tablespaces created using CREATE TABLESPACE syntax. They can be created outside of the MySQL data directory, are capable of holding multiple tables, and support tables of all row formats.

MySQL NDB Cluster also groups its tables into tablespaces. See Section 21.5.13.1, “NDB Cluster Disk Data Objects” for details.

See Also compressed row format, data dictionary, data files, file-per-table, general tablespace, index, innodb_file_per_table, system tablespace, table.

temporary table
A table whose data does not need to be truly permanent. For example, temporary tables might be used as storage areas for intermediate results in complicated calculations or transformations; this intermediate data would not need to be recovered after a crash. Database products can take various shortcuts to improve the
performance of operations on temporary tables, by being less scrupulous about writing data to disk and other measures to protect the data across restarts.

Sometimes, the data itself is removed automatically at a set time, such as when the transaction ends or when the session ends. With some database products, the table itself is removed automatically too.

See Also table.

temporary tablespace
The tablespace for non-compressed InnoDB temporary tables and related objects, introduced in MySQL 5.7. The innodb_temp_data_file_path configuration file option defines the relative path, name, size, and attributes for temporary tablespace data files. If innodb_temp_data_file_path is not specified, the default behavior is to create a single auto-extending 12MB data file named ibtmp1 in the data directory. The temporary tablespace is recreated on each server start and receives a dynamically generated space ID. The temporary tablespace cannot reside on a raw device. Startup is refused if the temporary tablespace cannot be created.

The temporary tablespace is removed on normal shutdown or on an aborted initialization. The temporary tablespace is not removed when a crash occurs. In this case, the database administrator may remove the temporary tablespace manually or restart the server with the same configuration, which removes and recreates the temporary tablespace.

See Also temporary table.

text collection
The set of columns included in a FULLTEXT index.

See Also FULLTEXT index.

thread
A unit of processing that is typically more lightweight than a process, allowing for greater concurrency.

See Also concurrency, master thread, process, Pthreads.

torn page
An error condition that can occur due to a combination of I/O device configuration and hardware failure. If data is written out in chunks smaller than the InnoDB page size (by default, 16KB), a hardware failure while writing could result in only part of a page being stored to disk. The InnoDB doublewrite buffer guards against this possibility.

See Also doublewrite buffer.

TPS
Acronym for "transactions per second", a unit of measurement sometimes used in benchmarks. Its value depends on the workload represented by a particular benchmark test, combined with factors that you control such as the hardware capacity and database configuration.

See Also transaction, workload.

transaction
Transactions are atomic units of work that can be committed or rolled back. When a transaction makes multiple changes to the database, either all the changes succeed when the transaction is committed, or all the changes are undone when the transaction is rolled back.

Database transactions, as implemented by InnoDB, have properties that are collectively known by the acronym ACID, for atomicity, consistency, isolation, and durability.

See Also ACID, commit, isolation level, lock, rollback.

transaction ID
An internal field associated with each row. This field is physically changed by INSERT, UPDATE, and DELETE operations to record which transaction has locked the row.

See Also implicit row lock, row, transaction.

transparent page compression
A feature added in MySQL 5.7.8 that permits page-level compression for InnoDB tables that reside in file-per-table tablespaces. Page compression is enabled by specifying the COMPRESSION attribute with CREATE TABLE or ALTER TABLE. For more information, see Section 14.9.2, "InnoDB Page Compression".
See Also file-per-table, hole punching, sparse file.

transportable tablespace
A feature that allows a tablespace to be moved from one instance to another. Traditionally, this has not been possible for InnoDB tablespaces because all table data was part of the system tablespace. In MySQL 5.6 and higher, the FLUSH TABLES ... FOR EXPORT syntax prepares an InnoDB table for copying to another server; running ALTER TABLE ... DISCARD TABLESPACE and ALTER TABLE ... IMPORT TABLESPACE on the other server brings the copied data file into the other instance. A separate .cfg file, copied along with the .ibd file, is used to update the table metadata (for example the space ID) as the tablespace is imported. See Section 14.6.1.3, “Importing InnoDB Tables” for usage information.
See Also .cfg file, .ibd file, space ID, system tablespace, tablespace.

troubleshooting
The process of determining the source of a problem. Some of the resources for troubleshooting MySQL problems include:

- Section 2.10.2.1, “Troubleshooting Problems Starting the MySQL Server”
- Section 6.2.17, “Troubleshooting Problems Connecting to MySQL”
- Section B.4.3.2, “How to Reset the Root Password”
- Section B.4.2, “Common Errors When Using MySQL Programs”
- Section 14.22, “InnoDB Troubleshooting”.

truncate
A DDL operation that removes the entire contents of a table, while leaving the table and related indexes intact. Contrast with drop. Although conceptually it has the same result as a DELETE statement with no WHERE clause, it operates differently behind the scenes: InnoDB creates a new empty table, drops the old table, then renames the new table to take the place of the old one. Because this is a DDL operation, it cannot be rolled back.

If the table being truncated contains foreign keys that reference another table, the truncation operation uses a slower method of operation, deleting one row at a time so that corresponding rows in the referenced table can be deleted as needed by any ON DELETE CASCADE clause. (MySQL 5.5 and higher do not allow this slower form of truncate, and return an error instead if foreign keys are involved. In this case, use a DELETE statement instead.
See Also DDL, drop, foreign key, rollback.

tuple
A technical term designating an ordered set of elements. It is an abstract notion, used in formal discussions of database theory. In the database field, tuples are usually represented by the columns of a table row. They could also be represented by the result sets of queries, for example, queries that retrieved only some columns of a table, or columns from joined tables.
See Also cursor.

two-phase commit
An operation that is part of a distributed transaction, under the XA specification. (Sometimes abbreviated as 2PC.) When multiple databases participate in the transaction, either all databases commit the changes, or all databases rollback the changes.
See Also commit, rollback, transaction, XA.

U
undo
Data that is maintained throughout the life of a transaction, recording all changes so that they can be undone in case of a rollback operation. It is stored in undo logs either within the system tablespace (in MySQL 5.7 or earlier) or in separate undo tablespaces. As of MySQL 8.0, undo logs reside in undo tablespaces by default.
undo buffer

See undo log.

undo log

A storage area that holds copies of data modified by active transactions. If another transaction needs to see the original data (as part of a consistent read operation), the unmodified data is retrieved from this storage area.

In MySQL 5.6 and MySQL 5.7, you can use the innodb_undo_tablespaces variable to have undo logs reside in undo tablespaces, which can be placed on another storage device such as an SSD. In MySQL 8.0, undo logs reside in two default undo tablespaces that are created when MySQL is initialized, and additional undo tablespaces can be created using CREATE UNDO TABLESPACE syntax.

The undo log is split into separate portions, the insert undo buffer and the update undo buffer.

See Also consistent read, rollback segment, SSD, system tablespace, transaction, undo tablespace.

undo log segment

A collection of undo logs. Undo log segments exist within rollback segments. An undo log segment might contain undo logs from multiple transactions. An undo log segment can only be used by one transaction at a time but can be reused after it is released at transaction commit or rollback. May also be referred to as an “undo segment”.

See Also commit, rollback, rollback segment, undo log.

undo tablespace

An undo tablespace contains undo logs. Undo logs exist within undo log segments, which are contained within rollback segments. Rollback segments have traditionally resided in the system tablespace. As of MySQL 5.6, rollback segments can reside in undo tablespaces. In MySQL 5.6 and MySQL 5.7, the number of undo tablespaces is controlled by the innodb_undo_tablespaces configuration option. In MySQL 8.0, two default undo tablespaces are created when the MySQL instance is initialized, and additional undo tablespaces can be created using CREATE UNDO TABLESPACE syntax.

For more information, see Section 14.6.3.4, “Undo Tablespaces”.

See Also rollback segment, system tablespace, undo log, undo log segment.

unique constraint

A kind of constraint that asserts that a column cannot contain any duplicate values. In terms of relational algebra, it is used to specify 1-to-1 relationships. For efficiency in checking whether a value can be inserted (that is, the value does not already exist in the column), a unique constraint is supported by an underlying unique index.

See Also constraint, relational, unique index.

unique index

An index on a column or set of columns that have a unique constraint. Because the index is known not to contain any duplicate values, certain kinds of lookups and count operations are more efficient than in the normal kind of index. Most of the lookups against this type of index are simply to determine if a certain value exists or not. The number of values in the index is the same as the number of rows in the table, or at least the number of rows with non-null values for the associated columns.

Change buffering optimization does not apply to unique indexes. As a workaround, you can temporarily set unique_checks=0 while doing a bulk data load into an InnoDB table.

See Also cardinality, change buffering, unique constraint, unique key.

unique key

The set of columns (one or more) comprising a unique index. When you can define a WHERE condition that matches exactly one row, and the query can use an associated unique index, the lookup and error handling can be performed very efficiently.

See Also cardinality, unique constraint, unique index.
variable-length type
A data type of variable length. VARCHAR, VARBINARY, and BLOB and TEXT types are variable-length types.

InnoDB treats fixed-length fields greater than or equal to 768 bytes in length as variable-length fields, which can be stored off-page. For example, a CHAR(255) column can exceed 768 bytes if the maximum byte length of the character set is greater than 3, as it is with utf8mb4.

See Also off-page column, overflow page.

victim
The transaction that is automatically chosen to be rolled back when a deadlock is detected. InnoDB rolls back the transaction that has updated the fewest rows.

Deadlock detection can be disabled using the innodb_deadlock_detect configuration option.

See Also deadlock, deadlock detection, innodb_lock_wait_timeout, transaction.

view
A stored query that when invoked produces a result set. A view acts as a virtual table.

virtual column
See virtual generated column.

virtual generated column
A column whose values are computed from an expression included in the column definition. Column values are not stored, but are evaluated when rows are read, immediately after any BEFORE triggers. A virtual generated column takes no storage. InnoDB supports secondary indexes on virtual generated columns.

Contrast with stored generated column.
See Also base column, generated column, stored generated column.

virtual index
A virtual index is a secondary index on one or more virtual generated columns or on a combination of virtual generated columns and regular columns or stored generated columns. For more information, see Section 13.1.18.9, “Secondary Indexes and Generated Columns”.

See Also secondary index, stored generated column, virtual generated column.

W

wait
When an operation, such as acquiring a lock, mutex, or latch, cannot be completed immediately, InnoDB pauses and tries again. The mechanism for pausing is elaborate enough that this operation has its own name, the wait. Individual threads are paused using a combination of internal InnoDB scheduling, operating system wait() calls, and short-duration spin loops.

On systems with heavy load and many transactions, you might use the output from the SHOW INNODB STATUS command or Performance Schema to determine whether threads are spending too much time waiting, and if so, how you can improve concurrency.

See Also concurrency, latch, lock, mutex, Performance Schema, spin.

warm backup
A backup taken while the database is running, but that restricts some database operations during the backup process. For example, tables might become read-only. For busy applications and websites, you might prefer a hot backup.

See Also backup, cold backup, hot backup.

warm up
To run a system under a typical workload for some time after startup, so that the buffer pool and other memory regions are filled as they would be under normal conditions. This process happens naturally over time when a MySQL server is restarted or subjected to a new workload.
Typically, you run a workload for some time to warm up the buffer pool before running performance tests, to ensure consistent results across multiple runs; otherwise, performance might be artificially low during the first run.

In MySQL 5.6, you can speed up the warmup process by enabling the `innodb_buffer_pool_dump_at_shutdown` and `innodb_buffer_pool_load_at_startup` configuration options, to bring the contents of the buffer pool back into memory after a restart. These options are enabled by default in MySQL 5.7. See Section 14.8.3.6, “Saving and Restoring the Buffer Pool State”. See Also buffer pool, workload.

**workload**

The combination and volume of SQL and other database operations, performed by a database application during typical or peak usage. You can subject the database to a particular workload during performance testing to identify bottlenecks, or during capacity planning. See Also bottleneck, CPU-bound, disk-bound, SQL.

**write combining**

An optimization technique that reduces write operations when dirty pages are flushed from the InnoDB buffer pool. If a row in a page is updated multiple times, or multiple rows on the same page are updated, all of those changes are stored to the data files in a single write operation rather than one write for each change. See Also buffer pool, dirty page, flush.

**XA**

A standard interface for coordinating distributed transactions, allowing multiple databases to participate in a transaction while maintaining ACID compliance. For full details, see Section 13.3.7, “XA Transactions”.

XA Distributed Transaction support is enabled by default. If you are not using this feature, you can disable the `innodb_support_xa` configuration option, avoiding the performance overhead of an extra fsync for each transaction.

As of MySQL 5.7.10, disabling `innodb_support_xa` is not permitted as it makes replication unsafe and prevents performance gains associated with binary log group commit. The `innodb_support_xa` configuration option is removed in MySQL 8.0. See Also ACID, binary log, commit, transaction, two-phase commit.

**young**

A characteristic of a page in the InnoDB buffer pool meaning it has been accessed recently, and so is moved within the buffer pool data structure, so that it will not be flushed soon by the LRU algorithm. This term is used in some INFORMATION_SCHEMA column names of tables related to the buffer pool. See Also buffer pool, flush, INFORMATION_SCHEMA, LRU, page.
